COMMISSIONER'S DECISIONS.

SMITH *vs.* BARTER.—*Appeal.*

[*Appeal from the decision of the Board of Examiners-in-Chief in the matter of the interference between the applications of George T. Smith, filed the 12th day of July, 1871, and the 20th day of May, 1872, and the patent granted to Benj. F. Barter, April 9, 1872, for an* IMPROVEMENT IN METHODS OF DRESSING FLOUR.—*Decided November 14, 1874.*]

Where two parties have each an application pending at the same time before the Office, and one of them obtains a patent, he will derive no advantage from it if an interference is declared afterward between it and the other application, but he must establish his title by the same proof as if he was still an applicant.

The right of an inventor in this country to a patent is not impaired by anything of the same nature as his invention which has been achieved abroad, provided it has not been patented nor described in any printed publication.

Evidence of what one of the parties has done in another country toward reducing the contested invention to practice is not admissible upon an interference.

The party who first reduces an invention to actual use is entitled to the patent for it, although the other may have first conceived it, if he did not exercise reasonable diligence in reducing it to practice.

THACHER, *Commissioner:*

The matter involved in this controversy is presented in two separate applications filed by Smith. The first claims an invention shown, but not claimed, in Barter's patent, consisting of a bolting-surface, through which a current of air is forced in an upward direction, carrying with it the dust mingled with the flour, which falls in an opposite direction, while a series of brushes traverse the lower surface of the bolting-cloth, to keep its meshes clear.

Smith's second application contains two claims, the first covering "two or more reciprocating bolting surfaces, or shakers, separated from each other by longitudinal partitions, the cloth upon one shaker differing in fineness from the cloth upon the other." The second claim sets forth a combination between the bolts described in the first claim and a preparatory bolt, which divides the middlings into different grades, the finer grade being delivered to the shaker clothed with the finer cloth, and the coarser to the coarser cloth. The first claim conflicts with Barter's second, and the second with his first.

The application upon which Barter's patent was granted was filed February 20, 1872. Smith's first application, covering that portion of the subject-matter first described, was filed July 12, 1871. This gives him the advantage of a record date earlier than that made by Barter, who can derive no advantage from the grant of his patent, since all the applications were before the Office at the same time. The remaining portion of the invention, covered by Smith's second application, was substantially embraced in a caveat filed by him October 23, 1871, more than three months prior to Barter's first appearance in the Office. This caveat has been filed in evidence.

The history of invention upon either side is easily ascertained, the material facts admitting but little dispute. Upon the 10th day of February, 1871, Smith began work as stone-dresser in the Washburn Mills, in Minneapolis. In the early part of April following he was placed in charge of the mill as foreman. There was in the building, at this time, a machine in use for cleaning middlings, called, after the inventor, the "Lacroix." The owners of the mill had been experimenting with it, but were on the point of abandoning its use, since it was impossible to make the flour and middlings pass through the bolting-cloths. Smith examined the machine, and, discovering the difficulty, undertook to remedy it. It had been necessary to employ a man constantly to brush the lower surface of the bolting-cloth by hand, to keep it sufficiently clear to allow the flour to fall through, instead of passing over the "tail" of the bolt and falling among the feed and refuse. It occurred to Smith, therefore, to apply an automatic reciprocating brush, or series of brushes, driven by the

feed-roll shaft of the machine over the lower surface of the bolting-cloth. The work was immediately commenced, and the machine, with this device attached, was again set running before the middle of April. It operated so well that a separate machine, embodying the invention, was begun a few days later, and was finished and set at work during the early part of May, 1871. This was the invention embraced in Smith's first application. Soon after this apparatus was applied to the first machine Smith observed that the current of air forced up through the bolting-cloths carried with it not only the dust and lighter impurities, but also the finer part of the flour. He immediately devised what he calls a "double machine," in which the difficulty was removed. It was constructed with two separate air-chambers, placed over the bolting apparatus, and having a fan above, so arranged that separate currents of air could be drawn up through each bolting-cloth into each chamber. The bolts consisted of reciprocating shakers, one clothed with fine, the other with coarse, cloth. This machine he placed under a revolving bolt, by which the middlings were divided, the fine grade being delivered to the fine cloth of the shaker, and the coarser portion to the coarse cloth. This mechanism constituted the second part of the invention, and was completed in June, or early in July, 1871. Being supplied, like the others, with travelling brushes, it fully embodied all the material parts of the disputed invention.

A single question is made at this point as to Smith's part in originating that portion of the machine embraced in his second application. It is raised by the testimony of Geo. H. Christian, who employed Smith, and who swears that he invented the "double machine" himself, except as to the automatic brushes, which he admits to be the invention of Smith. I have carefully examined all the testimony upon this point, and am satisfied that the allegation is not proved. It rests mainly upon the evidence of Christian himself, supported by proof of such circumstances and declarations as seem to point to the conclusion sought. Many of the facts established, however, are entirely consistent with an opposite view, and some of the most material assertions are so obscured by denial and redenial that it is impossible to rest a decision upon them. The following facts stand out clearly, however, and appear to substantiate the first conclusion. Smith invented the brushes put on the "Lacroix" machine; he chiefly superintended the construction of the "double machine," the first one built being short, while the long machine, which was the form preferred by Christian, was not built until after the other was finished; the men employed upon it received their orders from Smith, and supposed him to be the originator; and, finally, Christian took from him a shop-license to use the invention in dispute, dated July 23, 1871. The matter claimed by Christian is clearly embraced in this instrument, and it is shown that he manifested some anxiety to secure the right conveyed thereby. I cannot hold these facts reasonably consistent with the presumption that Christian was the inventor of the mechanism which he sought a right to use.

In behalf of Barter it is claimed, both in his statement and testimony, that the invention was conceived by him in England, in 1845; that it was reduced to actual practice in that country, in the Wolverton Mills, in 1867; but the machine was afterward taken to pieces and laid aside until some time after his arrival in this country, in 1868.

Before proceeding further, the competency of this proof must be noticed. It was admitted and considered by the Examiner of Interferences, but rejected by the Examiners-in-Chief. To admit it, not only upsets the long and well established practice of the Office, but also defeats the provisions of the 62d section of the law of 1870, which declares that no patent shall be held void because of a foreign use or discovery prior to the patentee's invention, provided it has not been patented or described in any printed publication. If such use cannot defeat rights vested by the grant of a patent, it ought not to affect the inchoate right existing in an applicant therefor. The correct doctrine in such cases is very clearly stated in *Tucker* vs. *Davis*, (2 O. G., 224):

> The mere existence of a device in a foreign country is not a fact having any significance, or to be recognized at all in connection with our patent laws. * * * A foreign inventor, whether a citizen of the United States or not is immaterial, can only benefit the public here by publishing his invention here. The original inventor, first to produce his invention in this country, either by inventing it here or by bringing it with him from abroad, is the first to have done an act capable of benefiting the public here, and the one to be rewarded by a patent. It follows that evidence of any act not coming within this limitation is not pertinent to an issue of priority, and should not be admitted.

The cases of *Hovey* vs. *Hufeland et al.*, (2 O. G., 493,) and *Bartholomew* vs. *Sawyer*, (4 Blatchford, 347,) are also directly in point.

This testimony offered by Barter can only be admitted, therefore, to prove the time when he brought to this country the knowledge of a perfected invention, and can have no significance in determining at what time he reduced it to practice here subsequent to his arrival. The material evidence in this case is that which discloses Barter's acts between the time of his arrival here and the month of July, 1871, when his adversary had completed and embodied in a machine the invention now claimed by both.

Barter, after landing in the United States, went to Chicago, where, he says, he began building a machine for cleaning middlings, and a smut-machine. He made a few patterns of the pulleys required, but they were destroyed by fire in the Preble foundry, in the summer of 1869, and he abandoned his enterprise, as he says, because he had no means to prosecute it. In December, 1869, he ran a mill in Wisconsin, where he remained until February, 1870, when he went to Minnesota, and in May of that year entered the service of Bean, Bangs & Co., at Faribault. It was to these gentlemen that he claims to have exhibited a drawing of his invention, of which an alleged copy has been filed in evidence, and marked "Exhibit B." It, without doubt, illustrates the invention in dispute, and Barter swears that it was made, shown, and explained to his employers in August, 1870. The first machine built by him was finished and put in operation in December, 1871. When it was commenced Barter cannot precisely tell, but he thinks it was in April, or, perhaps, in May, preceding. Considerable delay seems to have occurred in its construction, for it was not until late in the autumn that active steps were taken to complete it, although the want of such a machine was continually felt by the company employing him, for, in the meantime, they had reorganized their mill, and having no machine for cleaning and separating the middlings, they stored them away until the deficiency could be supplied.

There are several facts developed by the testimony which somewhat impair the force of the evidence that Barter had knowledge of this invention when he came to this country. During the summer of 1871, after Smith had completed his invention, Barter, in company with Bean, visited Minneapolis, to buy a machine for cleaning middlings. There is good reason for believing that at this time they obtained knowledge of what Smith had done. Both admit that they saw frames which were being built for Smith by one Clark, who had some kind of partnership with Smith, and held, by assignment, an interest in his invention. Smith swears positively that he showed and explained his machine to Barter. This Barter denies; but Smith's father swears that he saw them talking together by the machine, and fixes the fact by the circumstance that, at the request of his son, he brought bags to them for samples of the middlings. Upon the return of Barter and Bean to Faribault the following day, Bean wrote to one Pray, mentioning their visit to Minneapolis and their interview with Clark. The letter is filed in evidence, and the following language, referring to Clark, is found therein:

> It seems that he makes different compartments and applies the blast with different powers, and uses three machines, instead of one. I mention this, so if there is anything in it you can take advantage of it. We want a machine, and, if you can furnish it, would prefer to buy it of you. In the meantime please say nothing about my having written this, as Clark would feel hard about it.

This evidence cannot be made to harmonize with the presumption that Barter possessed knowledge of this very invention, the most important feature of which is described in Bean's letter before his visit to Minneapolis. It must be borne in mind, also, that it is claimed that the invention had been described to Bean before this visit, yet there is no intimation in his letter quoted, or in his conversation with persons at Minneapolis, that he possessed any information of this description. It is a noticeable fact, too, that the witnesses called to identify the drawing said to have been exhibited by Barter in August, 1870, (of which "Exhibit B" purports to be a copy,) are not positive in their statements. The original drawing is said to have been made on a board; and when the witnesses compare "Exhibit B" with this drawing on the board they are very cautious, and do not positively state that the two drawings illustrate identical inventions.

There is in my mind, therefore, more than a suspicion that Barter's invention, up to the time of his visit to Minneapolis, did not include the features of the perfected mechanism involved in this controversy.

But, if the evidence was entirely conclusive in favor of Barter on this point, I should hesitate to award priority to him. No principle is better established than that the first inventor is he who first reduces the invention to practical form by embodying it in a machine capable of useful operation, modified, it is true, by the proviso that if the first to conceive the invention is second in reduction to practice, his right to the invention shall not be destroyed if he was using due diligence in perfecting it. I do not understand that any exception to this rule is to be made in this instance, even if it is admitted that Barter brought full knowledge of the invention to this country. The question of right between these two parties must be determined by what Barter did toward the reduction of the invention to practice here. If he unreasonably delayed putting his invention into concrete form in the country, and in the meantime a subsequent, but independent, inventor made the same invention and reduced it to practice, the latter has the superior right. This appears to be the relative position of Smith and Barter in this controversy. If Barter had mental possession of the invention claimed by him, he had every inducement to put it into practice, especially after he entered the employment of Bean, Bangs & Co. He was employed by, and in intercourse with, millers in different places, and must have become acquainted with the demand for just such a machine, especially after going to Faribault, where his employers were earnestly inquiring for a successful middlings-purifier. Yet he delayed the construction of a single machine embodying this invention until after he had visited Minneapolis, where he, undoubtedly, became acquainted with Smith's invention. Smith, though he may have been second in conception, was unquestionably first to reduce the invention to practical form. Putting the best possible construction upon Barter's evidence, I do not think it can be said that he was using such reasonable diligence in the reduction of his invention to practice as to defeat Smith's right to a patent.

With this view of the unsatisfactory nature of Barter's evidence, and holding this to be the proper application of the rule as to reduction to practice in this case, I must affirm the decision of the Examiners-in-Chief, and award priority of invention to Smith.

TROTTER *vs.* BARTLETT.—*Appeal.*

[*Appeal from the decision of the Board of Examiners-in-Chief in the matter of the interference between the application of Charles W. Trotter, administrator of Jonathan G. Trotter, deceased, and the patent of Nathan Bartlett, for* "IMPROVEMENT IN FURNACES FOR MAKING WHITE OXIDE OF ZINC."—*Decided December 21, 1874.*]

The inventor of an apparatus who has reduced it to actual practice and then left it, is not entitled to claim improvements upon it which have been invented and applied by others, although he may have contemplated them and labored upon them, if he never reduced them to form, nor embodied them in any visible representation.

THACHER, *Commissioner:*

The claims of the respective parties are substantially identical, and are as follows:

1. The chamber H, made widest at the mouth and tapering to the escape, as and for the purpose described.
2. The mode of working zinc-oxide furnaces, by supplying the ore at the front from time to time and shifting that contained in the furnace along toward the rear, and removing the residuum thereat, as described.

Both the Examiners-in-Chief and Examiner of Interferences unite in asserting that no evidence has been adduced in the case showing that Jonathan Trotter ever constructed the improvements which form the subject of controversy, or directed others to do so, or that he even intimated that he originated the same. Of course, if this is so, no good reason can exist for granting to Trotter's legal representatives a patent. For, notwith-

standing the length of time the deceased may have been engaged in this particular line of business, or how deeply he may have realized the necessity of the improvements in question, how much he may have studied and talked of the subject, how numerous and continuous may have been his experiments in that direction, or how nearly his efforts may have been successful, yet if he fell short of completing the invention, or of attaining sufficient knowledge of the same to direct others to make it without the exercise of ingenuity on their part, he cannot be considered an original inventor at all. (*Pitts vs. Hall*, 2 Blatchf., 229.) Much less should such efforts be considered sufficient to defeat another, who, although a workman, yet independently conceived, completed, and obtained letters patent for that which his employer had been vainly seeking.

From the preliminary statement of the administrator it appears that the deceased applicant had been engaged in the manufacture of white oxide of zinc from 1852 to the time of his death, about the 15th of April, 1873, and that, during that time, he had made many improvements in the machinery and processes relating to his art, for some of which he had obtained patents. It is also alleged that the inventions described and claimed in the application were devised by him in 1870, explained during the same year to a Mr. William Dixson, and finally completed and put in practical operation about the 15th of August, 1872.

After a careful consideration of the testimony adduced, I am convinced that it entirely fails to support the latter allegations.

According to the testimony of Mr. Dixson, referred to above, he had various conversations with Jonathan Trotter during the years 1870 and 1871, in which the latter related to him his past experiences in making white oxide of zinc, and explained to him some alterations and improvements in the manufacture of the same, which he then had in contemplation; but Dixson says he is unable to describe the proposed improvements, as Trotter did not state definitely what they were. He also declares he has no knowledge of certain pencil-marks, indicating the present improved shape of the furnace-chamber made by Trotter, it is supposed, on an old patent of his, and shown by him to Dixson, as his administrator would have it believed, at the interviews above described. Dixson further testifies that he was induced by these representations of Trotter to become one of a copartnership in June, 1871, composed of Jonathan G. Trotter, Samuel C. West, and himself, and formed for the purpose of manufacturing white oxide of zinc at Elizabethport, N. J. Thereupon Trotter planned the works and became general manager of the concern. Furnaces were built and finished, and operations commenced about the last of August, 1872. The witness says he was in constant attendance at the works as a manager, under the direction of Trotter, from the time of the completion of the furnaces until the 7th of October, 1872. His testimony, too, clearly shows that up to the latter date neither the style of the furnace-chamber, which forms the subject of the first claim of both parties, nor the process, which forms the subject of their second claim, was used by his company. The chamber was square, or nearly so, and not tapering to the escape, and the process employed was to charge the furnace with ore through a hole at the top of the rear end, spread the charge entirely over the bottom of the furnace, rake the same occasionally from front to rear, and, finally, when the zinc was worked off, the charge was raked out at the rear end, and a new one introduced.

About the time last mentioned, October 7, 1872, Dixson being obliged to return to his home, in the western part of New York, and Trotter being confined, most of the time, to the house by sickness, Nathan Bartlett, the patentee, was employed by Trotter & Co. to superintend their works. When Dixson returned, in April, 1873, the improvements in controversy had been made. He did not know by whom, and he does not allege that they had been constructed by Trotter's directions, or in accordance with his wishes.

It is clearly established by the testimony of Trotter's own witnesses that, during the time Dixson was absent, Bartlett had substantially the entire management of the works, so far as the practical operation of the same was concerned. There is no satisfactory evidence whatever of any directions having been given by Trotter, or any propositions made by him, relative to the particular improvements in dispute.

James Loughman swore, on the direct examination, that he knew that all changes and alterations made in the construction and operation of the furnaces were first ordered by Trotter, or submitted to him for his approval; but he contradicts this when cross-examined. It is uncorroborated, and the contrary fact is established by the testimony of other witnesses on both sides. It is clear that the improvements in question were made under the independent personal supervision of Bartlett, who swears that he originated them during the latter part of December, 1872, and the early part of January, 1873. Previous to that time there were, it is true, openings in the front end of the furnace, before which small platforms were placed, and through which a few shovelsful of ore were occasionally introduced. This did not vary, but in the slightest degree, the usual process of introducing the entire charge through a hole in the top at the rear end, spreading the same over the floor of the furnace-chamber, and roasting it all at once.

Bartlett introduced all the ore through the openings in front by greatly enlarging the platforms, and banking thereon successive charges of the ore, which were introduced into the furnace as the previous charges were pushed forward. He then, for the purpose of concentrating the heat upon the ore just before a charge was drawn off, drew the walls of the furnace toward each other, in funnel shape, from the middle to the rear end. Both improvements proved to be of very great advantage.

When the improvement first alluded to was made Trotter was absent from the works, and when the second was constructed he was absent from the State.

The most that can be affirmed, from the evidence in the case, of the knowledge of Jonathan Trotter of these improvements is, that he knew of and approved them after they were made.

Upon such a state of facts, it is useless to invoke the general doctrine that an employer is presumed to be the inventor of the idea which he employs a workman to reduce to practice. Such a presumption is always *prima facie*, and not a conclusive one of law. It has no foundation for its support in the present case, and, if it ever had, the proofs advanced have entirely overcome it.

The decision of the Examiners-in-Chief is affirmed, and priority awarded to Bartlett.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Any person may oppose either extension.

Hearings upon the respective applications are appointed for the days named in each case.

Arguments must be filed ten days before the day of hearing.

311.—Whole number, **31,315.**—**Machinery for Grinding the Card-Teeth of Carding-Cylinders.**—Granted to CHARLES HARDY, February 5, 1861. Application filed October 30, 1874. Testimony closes January 5, 1875. Hearing January 20, 1875.

320.—Whole number, **31,324.**—**Looms.**—Granted to WILLIAM MESSERLAND, February 5, 1861. Application filed November 9, 1874. Testimony closes January 5, 1875. Hearing January 20, 1875.

323.—Whole number, **31,327.**—**Construction of the Fire-Chambers and in Operating the Fires of Reverberatory Furnaces.**—Granted to JACOB REESE, February 5, 1861. Application filed November 6, 1874. Testimony closes January 5, 1875. Hearing January 20, 1875.

326.—Whole number, **31,330.**—**Collars for Ornamental Carriage-Work.**—Granted to MOSES SEWARD, February 5, 1861. Application filed August 31, 1874. Testimony closes January 5, 1875. Hearing January 20, 1875.

374.—Whole number, **31,378.**—**Harvesting-Machines.**—Granted to RUFUS DUTTON, February 12, 1861; reissued in two divisions, numbered 4,124 and 4,125, September 20, 1870, No. 4,125 having been again reissued December 27, 1870. Application filed November 12, 1874. Testimony closes January 12, 1875. Hearing January 27, 1875.

380.—Whole number, **31,384.**—**Machines for Molding Pottery.**—Granted to WILLIAM LINTON, February 12, 1861. Application filed November 11, 1874. Testimony closes January 12, 1875. Hearing January 27, 1875.

398.—Whole number, **31,402.**—**Machines for Binding Grain.**—Granted to STEPHEN REYNOLDS, February 12, 1861. Application filed November 12, 1874. Testimony closes January 12, 1875. Hearing January 27, 1875.

439.—Whole number, **31,443.**—**Felly-Machines.**—Granted to CHARLES H. DENISON, February 19, 1861. Application filed November 19, 1874. Testimony closes January 19, 1875. Hearing February 3, 1875.

441.—Whole number, **31,445.**—**Limekilns.**—Granted to RICHARD DONALDSON, February 19, 1861, and reissued May 19, 1863. Application filed November 18, 1874. Testimony closes January 19, 1875. Hearing February 3, 1875.

498.—Whole number, **31,502.**—**Machines for Breaking Coal.**—Granted to R. A. WILDER, February 19, 1861. Application filed November 18, 1874. Testimony closes January 19, 1875. Hearing February 3, 1875.

507.—Whole number, **31,511.**—**Lamps.**—Granted to CHAS. W. CASSON, February 19, 1861, and reissued August 9, 1864. Application filed November 14, 1874. Testimony closes January 19, 1875. Hearing February 3, 1875.

521.—Whole number, **31,525.**—**Machines for the Manufacture of Hoe-Blanks.**—Granted to NATHAN BRAND, February 26, 1861, and reissued in two divisions, numbered 1,481 and 1,482, May 26, 1863. Application filed October 3, 1874. Testimony closes January 26, 1875. Hearing February 10, 1875.

529.—Whole number, **31,533.**—**Weighing Apparatus.**—Granted to AUGUSTUS B. DAVIS, February 26, 1861. Application filed November 27, 1874. Testimony closes January 26, 1875. Hearing February 10, 1875.

530.—Whole number, **31,534.**—**Scale-Beams.**—Granted to AUGUSTUS B. DAVIS, February 26, 1861. Application filed November 27, 1874. Testimony closes January 26, 1875. Hearing February 10, 1875.

542.—Whole number, **31,546.**—**Polishing Iron Bars and Rods.**—Granted to BERNARD LAUTH, February 26, 1861. Application filed November 3, 1874. Testimony closes January 26, 1875. Hearing February 10, 1875.

563.—Whole number, **31,566.**—**Drying Tunnels.**—Granted to FRANCIS H. SMITH, February 26, 1861; reissued June 30, 1868, July 11, 1871, and March 26, 1872. Application filed November 27, 1874. Testimony closes January 26, 1875. Hearing February 10, 1875.

574.—Whole number, **31,578.**—**Machines for Folding Paper.**—Granted to WILLIAM H. MILLIKEN and JOHN MILLIKEN, February 26, 1861, and reissued in two divisions, numbered 3,785 and 3,786, January 4, 1870. Application filed October 26, 1874. Testimony closes January 26, 1875. Hearing February 10, 1875.

575.—Whole number, **31,579.**—**Corn-Planters.**—Granted to FRANCIS B. PRESTON, February 26, 1861. Application filed November 27, 1874. Testimony closes January 26, 1875. Hearing February 10, 1875.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date January 5, 1875.]

7,969.—**Advertising-Desks.**—WILLIAM T. BROMWELL, St. Louis, Mo. Application filed December 18, 1874. Term of patent 3½ years.

7,970 to 7,976, inclusive.—**Carpet.**—ROBERT R. CAMPBELL, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place. Applications filed December 16, 1874. Term of patents 3½ years.

7,977 to 7,981, inclusive.—**Carpet.**—JOSEPH M. CHRITTE, Kidderminster, England, assignor to LOWELL MANUFACTURING COMPANY, Lowell, Mass. Applications filed December 16, 1874. Term of patents 3½ years.

7,982.—**Side of a Fulling-Mill Case.**—JAMES E. HUNTER, North Adams, Mass. Application filed March 21, 1874. Term of patent 7 years.

7,983 and 7,984.—**Carpet.**—CHARLES S. LILLEY, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place. Applications filed December 16, 1874. Term of patents 3½ years.

7,985.—**Carpet.**—CHARLES W. SWAPE, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place. Application filed December 16, 1874. Term of patent 3½ years.

7,986.—**Carpet.**—ROBERT ALLAN, Yonkers, N. Y., assignor to ALEXANDER SMITH & SONS CARPET COMPANY, same place. Application filed December 26, 1874. Term of patent 3½ years.

7,987.—**Smoking-Pipe.**—ISAAC DEMUTH, New York, N. Y. Application filed December 17, 1874. Term of patent 7 years.

7,988.—**Bottle.**—EUGENE R. DURKEE, Brooklyn, N. Y. Application filed December 28, 1874. Term of patent 3½ years.

7,989 to 7,991, inclusive.—**Carpet.**—EUGENE PETIT, Paris, France, assignor to ALEXANDER SMITH & SONS CARPET COMPANY, Yonkers, N. Y. Applications filed December 26, 1874. Term of patents 3½ years.

7,992.—**Nursing-Bottle.**—VALENTINE H. SMITH, Philadelphia, Pa. Application filed December 24, 1874. Term of patent 7 years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Certificate bearing date January 5, 1875.]

2,150.—Yeast-Cakes.—AMERICAN YEAST COMPANY, Fond Du Lac, Wis. Application filed November 30, 1874.

"'American Yeast.'"

2,151.—Cigars.—FREEDMAN, HESSLEIN & Co., Detroit, Mich. Application filed December 12, 1874.

"'Columbia,' and the monogram composed of the letters M. C. C."

2,152.—Neck-Ties.—HELLENBERG & LOEWENSTEIN, New York, N. Y. Application filed December 24, 1874.

"a star combined with the words 'warranted for durability.'"

2,153.—Illuminating-Oil.—WILLIAM E. JERVEY, New Orleans, La. Application filed December 21, 1874.

"'Insurance' and 'Oil.'"

2,154.—Tobacco-Pouches.—NOVELTY COMPANY, New York, N. Y. Application filed December 23, 1874.

"the representation of a rat."

2,155.—Cigars.—S. LOWENTHAL & Co., Cincinnati, Ohio. Application filed November 21, 1874.

"'Pedro.'"

2,156.—Playing-Cards.—VICTOR E. MAUGER, New York, N. Y. Application filed December 21, 1874.

"'Grand Pachas.'"

2,157.—Felon-Cure.—WILLIAM H. PUFFER, Athol, Mass. Application filed December 7, 1874.

"'The Great Medicine's Felon Cure,' and the figure of an Indian holding a bow in the right hand."

2,158.—Shirts.—THE BURLOCK MANUFACTURING COMPANY, Bridgeport, Conn., and New York, N. Y. Application filed December 4, 1874.

"'B.' 'M.' 'Co.' in a monogram, in the center of a lozenge or diamond."

INDEX OF INVENTIONS PATENTED JANUARY 5, 1875.

	Class No.	No. of Patent.
Ale and beer in casks, apparatus for aerating, Lajoie and Poncelet	19	158,503
Amalgamator, E. J. Fraser	3	158,368
Animals, gag for, A. Kurrus	144	158,502
Bed bottom, S. Pearson, (reissue)	62	6,204
Bed bottom, spring, G. W. Hatch	62	158,413
Bell, door, A. L. Swan	24	158,446
Bit stock, C. B. Rose, (reissue)	29	6,212
Blind stop, E. S. Shrock	24	158,445
Boat, torpedo, H. F. Knapp	137	158,501
Boiler attachment, wash, W. J. Bennett	91	158,458
Boilers, fire box attachment to steam, J. Lee	149	158,425
Bolt heading die, R. Gracey	14	158,484
Bolt heading machine, R. Gracey	14	158,485
Book of letter sheets, H. S. Jackson	146	158,416
Boot and shoe heel counters, machine for trimming, J. R. Moffitt	16	158,385
Bottle stopper, W. Bonrguignon	1	158,464
Bottle stopper, C. De Quillfeldt	1	158,406
Brick machine, E. F. Andrews	20	158,453
Brush and mop holder, J. O. Montignani	22	158,508
Brush, feather dusting, A. D. Griswold	22	158,412
Brush for cleaning castings, C. W. Jenkins	22	158,498
Brush, scrubbing, M. Biglin	22	158,459
Buckle, J. Adair	23	158,350
Buckle, suspension, E. J. Fraser	23	158,367
Bureaus, &c., looking glass attachment for, J. A. Knight	62	158,422
Canal boats, propelling wheel for, G. Heydrick	139	158,414
Car axle bearing, H. L. Sidman	122	158,535
Car axle box, T. H. Burridge	122	158,358
Car brake, N. N. Horton	122	158,493
Car brake, M. Madden	122	158,426
Car coupling, G. W. Call	122	158,402
Car coupling, H. Dutcher	122	158,409
Car coupling, P. L. Menk	122	158,507
Car coupling, W. S. Peck	122	158,517
Car coupling, F. Street	122	158,541
Car coupling, J. W. Treadway	122	158,543
Car lamp, J. Kirby, Jr	90	158,500
Car, passenger, D. Price	121	158,519
Car seat, E. G. Wellman	121	158,449
Car spring, B. A. Clemesy	122	158,361
Cars, construction of railway, J. E. Leeper	121	158,505
Card file, Prentice, Bebel, and Talcott	146	158,390
Carpet sweeper, G. S. Norris	62	158,511
Cartridge case, metallic, B. B. Hotchkiss	32	158,494
Chair, tilting, S. Hoffman	62	158,492
Chair, tilting, R. W. Myers	62	158,388
Cheese cutter, M. Phillips	45	158,518
Cherry pitter, W. B. Knapp	88	158,420
Chimney jack, F. M. Campbell	4	158,360
Churn, J. E. Finley	45	158,365
Churn dasher, J. E. Finley	45	158,364
Cigar mold, W. A., and A. Osenbrück	160	158,513
Cigar mold, J. Prentice, (reissue)	160	6,210
Clamp, rubber dam, F. Hickman	46	158,376
Clasp, ticket, M. L. Shattuck	146	158,533
Clothes and hat rack, R. R. Dorr	62	158,476
Clothes drier, C. T. Shafer	91	158,392
Clothes wringer, O. F. Glidden	91	158,369
Coal screen and chute, M. R. Roberts, (reissue)	79	6,211
Coal scuttle, H. Reynolds	154	158,523
Coffee filter, E. R. Shattuck	88	158,532
Colter, A. P. Webber	114	158,552
Condenser, steam, E. O. Brinckerhoff	148	158,397
Corn sheller, J. Burke	59	158,357
Cotton scraper, G. W. Beard	43	158,457
Cultivator, shovel, T. J. Houston	43	158,375
Cultivator teeth, R. P. Odell, Jr	43	158,512
Curling iron, Feder and Rosenstein	161	158,479
Dental engines, burring and finishing tool for, F. Hickman	46	158,377
Drawer, J. A. Knight	62	158,423
Drawer and folding desk combined, J. A. Knight	62	158,421
Drying rack, J. R. Stratton	46	158,540
Eaves trough hanger, E. Kirk, Jr	30	158,419
Elevator, hay, C. S. Kershaw	79	158,379
Engine, air vacuum, A. K. Rider	2	158,525
Engine, reciprocating steam, M. V. Nobles	150	158,510
Engines, steam cylinder head for compound, J. F. Holloway	150	158,378
Fence, barbed stock, F. T. Wilson	52	158,451
Filter, J. and A. Outerson	51	158,514
Fire shield, Babson and Mulford	30	158,455
Flour bolt, L. V. Rathbun	57	158,520
Flower frame, N. Steffens	63	158,538
Fruit drier, E. A. and C. W. Jones	48	158,499
Furnace and heater, Blasicek and Baner	154	158,460
Furnace doors, device for opening and closing, S. L. Denney	149	158,475
Garter, L. F. McDonald	38	158,429
Gas condenser, P. Munsinger	66	158,433
Gas regulator, A. Parsons	64	158,389
Gas regulator, S. C. Salisbury	64	158,527
Gas retort, S. P. Parham	66	158,515
Gate, M. S. McSwain	52	158,364
Generator for cooking, &c., steam, T. T. Pearson	154	158,516
Glue drier, A. H. Sandholzer	48	158,391
Grain binder, S. D. Carpenter	74	158,465
Grate E. Stimson, A. W. Smith	154	158,393
Grate, J. W. Williams	154	158,556
Grate frame, H. M. Creamer	154	158,473
Hames, attachment of bells to, M. F. Boland	72	158,463
Hammer for dressing stone, W. W. Castle	153	158,467
Harrow, combined revolving and drag, J. T. Henderson	73	158,374
Harvester cutter, Blood and Hager	74	158,462
Harvester frames, journal for, W. A. Wood	74	158,559
Harvester, grain binding, S. D. Carpenter	74	158,466
Harvester track clearer, O. DuBois, (reissue)	74	6,201
Hatchway, self closing, S. Lawrence	30	158,424
Heater and filter, feed water, E. P. Fenn	148	158,411
Heater, feed water, Brown and Fosket	148	158,398
Heater, steam, A. Van Horn	147	158,546
Heating drum, J. N. Kneeland	154	158,380
Heel trimming machine, C. E. Ballon	16	158,456
Hinge, F. J. Hattorf	24	158,480
Hoe, S. Green	141	158,373
Hoes, die for making, F. J. Fischer	141	158,366
Hog ring blank, W. D. Brown	144	158,356
Holdback, J. B. Goldsmith	31	158,370
Horse tail protector, G. R. Willmot	144	158,558
Horses, vehicle device for checking, W. T. and J. B. Burton	31	158,359
Horseshoeing apparatus, C. Schnoor	60	158,529
Hose, leak stopper for, W. W. Whitcomb	81	158,554
Inkstand, A. W. Brinkerhoff, (reissue)	146	6,200
Jack, lifting, E. E. Banning	79	158,353
Knife for shoemaking, feather edge skiving, Reynolds and Newhall	16	158,439
Lamp, car, J. Kirby, Jr	90	158,500
Lamp pendant, F. R. Seidensticker	90	158,531
Lamp, street, C. B. Boyle	90	158,396
Locomotive smoke stack, E. Cleary	94	158,469
Log slide, roller, Jackson and Humphrey	130	158,497
Loom shedding and pattern mechanism, Crompton and Wyman	95	158,362
Loom shedding mechanism, H. Wyman	95	158,395
Loom shuttle box mechanism, H. Wyman	95	158,394
Lubricator, H. McGraw, (reissue)	87	6,202
Mat, door, O. Rice	56	158,441
Mattress, sectional, G. Block	62	158,461
Mill, smut, J. Richmond	57	158,524
Mowing machine, G. H. Weeks	74	158,553
Ox shoe, J. E. Davis	60	158,473
Paddle wheel, feathering, J. S. Morgan	139	158,509
Paper making machine, J. Butler	108	158,400
Paper tube machine, A. G. Batchelder	109	158,354
Pavement, W. W. Hubbell	110	158,415
Pinch bar, W. Werts	79	158,450
Pipe, cement, M. Stephens	90	158,539
Pipe for lead corroding houses, bed, P. H. Decker	107	158,405
Planter, corn, H. Bagley	133	158,359
Planter, corn, J. Elverud	133	158,410
Planter, corn, M. Gregg	133	158,487
Planter, corn, H. P. Hall	133	158,488
Planter, corn, H. Moore	133	158,431
Planter, corn, O. P. Williams	133	158,557
Planter, hand corn, E. S. Turner	133	158,545
Planter, seed, W. C. Reynolds	133	158,440
Planter, seed, J. F. Warner	133	158,550
Plow, J. Yocom	114	158,561
Plow, gang, C. Myers	114	158,387
Plow, rotary, W. H. Foye	114	158,483
Plow, stump, V. M. Chafee	114	158,468
Press, cotton, Crenshaw and Carothers	7	158,403
Press, cotton, T. J. M. Jewell	7	158,417
Printer's quoin, B. F. Allen	117	158,351
Propelling wheel for canal boats, G. Heydrick	139	158,414
Pulley block, J. Weir	79	158,448
Pump, Goodwin and West	118	158,378
Pump, rotary, G. S. Follensbee	118	158,480
Pump, sirup, L. J. Knowles	118	158,381
Pump, steam, F. Tramp	118	158,447
Pumps, bucket for chain, J. D. Shoots	118	158,534
Purifier, middlings, E. W. Johnson	57	158,418
Railway tie, Porter and Peck	120	158,437
Rake, horse hay, A. W. Coates	77	158,471
Rake, horse hay, A. T. Hays	77	158,490
Rake, horse hay, R. Wilson, (reissue)	77	6,214
Reservoir for water works, W. H. Morrison	167	158,386
Roller, land, J. Woolridge	73	158,560
Rope and cordage machine, L. E. Higby	127	158,491
Ruffler, J. McCullough	134	158,428
Ruler, parallel, H. Andrews	146	158,452
Sad irons, uniting handles to, W. J. Reagan	91	158,521
Sash holder, R. B. Hugunin	24	158,495
Saw clamp, S. P. Babcock	131	158,454
Saw filing machine, J. Cleveland	131	158,470
Saw handle, cross cut, W. K. Stansbury	131	158,537
Saw mill head block, J. R. Jackson	130	158,496
Saw sharpener, J. and J. A. Crook	131	158,404
Seeding machine, S. Dixson	133	158,407
Separator, grain, P. Warner	159	158,549
Sewing machine caster, J. H. Plank	134	158,436
Sheep shears, F. Riedling	135	158,526
Shirt bosom, T. M. and E. Denham	38	158,474
Shoe making, feather edge skiving knife for, Reynolds and Newhall	16	158,439
Shovel, tire, Edgar and Bardell	154	158,478
Show case, A. and C. Lange	54	158,504
Sifter, flour, A. W. Smith	88	158,536
Slate frame, C. J. Shields	146	158,444
Sled, S. E. Foster	31	158,481
Soda water and sirup cock, W. Gee	1	158,483
Sower, grass seed, H. Moore	133	158,492
Spinning frames, traverse mechanism for ring, J. Scott	142	158,530
Spooling machines, bobbin holder for, T. A. Mathewson	17	158,382
Spring, torsion, R. Dudley	31	158,477
Spring, torsional, C. W. Saladee, (reissue)	31	6,205
Stalk cutter, plow, and seeding machine, combined, S. Dixson	73	158,408
Starch strainer, W. Graham	14	158,486
Stench trap, J. P. Schmidt	8	158,528
Stereoscope, M. A. E. Whitner	157	158,555
Stone dressing hammer, W. W. Castle	153	158,467
Stool, store, A. L. Bobo	62	158,355
Stove, base burning, J. Spear, (reissue)	154	6,206
Stove, base burning, J. Spear, (reissue)	154	6,207
Stove lid, W. Weaver	154	158,551
Sugar into blocks, apparatus for compacting granular, A. F. W. Partz, (reissue)	155	6,208
Sugar into blocks, compacting, A. F. W. Partz, (reissue)	155	6,209
Tag, C. B. Sheldon	146	158,443
Tanning apparatus, H. Reed	92	158,438
Telegraphy, automatic chemical, W. E. Sawyer	50	158,442
Thill coupling, J. R. Burville	31	158,399
Thill coupling, A. M. Troy	31	158,544
Thread winding guide, Manchester and Bolen	134	158,427
Tire heating apparatus, S. G. Reed	60	158,522
Towel rack and wash stand combined, R. P. Buttles	62	158,401
Toy bubble pipe, F. W. Pease	143	158,435
Toy, mechanical, H. Menoke	143	158,430
Vegetable slicer, N. Sweetland	50	158,542
Vehicle device for checking horses, W. T. and J. B. Burton	31	158,359
Vehicle shaft tip, J. B. Goldsmith	31	158,371
Vehicles, propulsion of, G. B. De Rouchervillo	31	158,363
Washing and wringing machine combined, Maughlin and Marr	91	158,383
Washing machine, J. H. Malone	91	158,506
Washing machine, H. D. Starr, (reissue)	91	6,213
Washing machine, J. H. Van De Water	91	158,547
Water works, reservoir for, W. H. Morrison	167	158,386
Wells, lining, D. L. Newcomb	51	158,434
Wheel and pulley, lubricating, J. K. McLanahan, (reissue)	87	6,203
Wrench, B. L. Walker	100	158,548

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED JANUARY 5, 1875.

	Patent No.
Adair, J., Buckle	158,350
Allen, B. F., Printer's quoin	158,351
American Butt Company, assignee	158,562
Andrews, E. F., Brick machine	158,453
Andrews, H., Parallel ruler	158,452
Babcock, S. P., Saw clamp	158,454
Babson, J., and J. E. Mulford, Fire shield	158,455
Bagley, H., Corn planter	158,352
Baldwin, G., assignee	158,473
Ballou, C. E., Heel trimming machine	158,456
Banning, E. E., Lifting jack	158,353
Bardell and Edgar	158,478
Bartlett, E. J., assignee	158,451
Batchelder, A. G., Paper tube machine	158,354
Bauer and Blazicek	158,460
Beard, G. W., Cotton scraper	158,457
Behel, Talcott, and Prentice	158,390
Bennett, W. J., Wash boiler attachment	158,458
Biglin, M., Scrubbing brush	158,459
Blazicek, F., and G. W. M. Bauer, Furnace and heater	158,468
Block, G., Sectional mattress	158,461
Blood, E. J., and A. D. Hager, Harvester cutter	158,462
Bobo, A. L., Store stool	158,355
Boland, M. F., Hame bell attachment	158,463
Bolen and Manchester	158,427
Bonrguignon, W., Bottle stopper	158,464
Boyle, C. B., Street lamp	158,396
Bradley and Hubbard, assignees	158,531
Brinckerhoff, E. O., Steam condenser	158,397
Brinkerhoff, A. W., Inkstand, (reissue)	6,200
Brown, J. R., and W. A. Foskett, Feed water heater	158,398
Brown, W. D., Hog ring blank	158,356
Bumann, F., assignee	158,420
Burger, T. W., assignee	158,417
Burke, J., Corn sheller	158,357
Burridge, T. H., Car axle box	158,358
Burton, W. T. and J. B., Vehicle device for checking horses	158,359
Burville, J. R., Thill coupling	158,399
Butcher, J. W., assignee	158,358
Butler, J., Paper making machine	158,400
Buttes, R. P., Combined towel rack and wash stand	158,401
Call, G. W., Car coupling	158,402
Campbell, F. M., Chimney jack	158,360
Carothers and Crenshaw	158,403
Carpenter, S. D., Grain binder	158,465
Carpenter, S. D., Grain binding harvester	158,466
Castle, W. W., Hammer for dressing stone	158,467
Chafee, V. M., Stump plow	158,468
Clark, J. C., administrator	158,510
Cleary, E., Locomotive smoke stack	158,469
Cleveland, J., Saw filing machine	158,470
Clooney, B. A., Car spring	158,361
Coates, A. W., Horse hay rake	158,471
Colwell, R., assignee	158,534
Creamer, H. M., Grate frame	158,472
Crenshaw, W. T., and R. J. Carothers, Cotton press	158,403
Crompton, G., assignee	158,394, 158,395
Crompton, G., and H. Wyman, Shedding and pattern mechanism for looms	158,362
Crook, J. and J. A., Saw sharpener	158,404
Crooker, G. A., assignee	158,547
Davis, J. E., Ox shoe	158,473
Deavitt, T. J., assignee	158,393
De Boucherville, G. B., Propulsion of vehicles	158,363
Decker, P. H., Bed pipe for lead corroding houses	158,405
Denham, T. M. and E., Shirt bosom	158,474
Denney, S. L., Device for opening and closing furnace doors	158,475
De Quillfeldt, C., Bottle stopper	158,406
Dixson, S., Seeding machine	158,407
Dixson, S., Combined stalk cutter, plow, and seeding machine	158,408
Dobbins, L., assignee, (reissue)	6,205
Dorr, R. R., Clothes and hat rack	158,476
Du Bois, O., Harvester track clearer, (reissue)	6,201
Dudley, R., Torsion spring	158,477

TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED JANUARY 5, 1875.

158,850. Buckles. James Adair, Kilbuck Township, Pa. [Filed Dec. 14, 1874.]

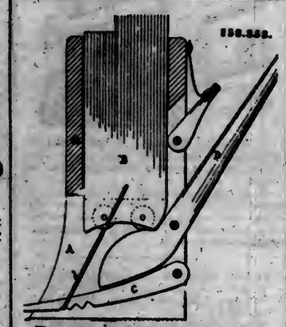
Brief.—The flange of a buckle is made discontinuous, so that a strap with either fixed or free ends may be readily attached. A bar carrying a lug may be placed at a right angle to the tongue, which closes the opening in the frame, and makes it appear continuous.

1. The combination of a movable tongue and a discontinuous rim or hook to form a buckle, substantially as described.
2. The combination of a buckle and a discontinuous keeper, substantially as described.
3. A buckle-tongue having a lateral lug or projection, for the purpose set forth.

158,851. Printers' Quoins. Benj. F. Allen, Boston, Mass. [Filed Oct. 23, 1874.]

A printer's quoin, B, constructed of suitable metal, and provided with a central screw, C, having a hexagonal or square flat-faced head c, substantially as and for the purpose set forth.

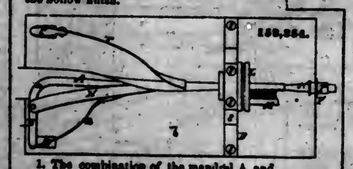
158,852. Corn-Planters. Henry Bagley, Mechanicsville, Iowa. [Filed Sept. 16, 1874.]



Brief.—To the under side of the seed-slide is attached a small partition-plate, which, with the stationary cup-shaped plate on the frame, forms a seed-cup. The slide is provided with two holes, so that when the slide is pushed backward the corn falls from one directly to the ground, and from the other into the cup, and is retained until the slide moves forward, carrying with it the partition. The seed, being released, falls to the ground. Attached loosely to the runners, and extending from one side of the frame to the other, is a bent rod on which a seat is pivoted, having attached below a short cross bar, on which rests the longitudinal bar for adjusting the seat.

1. The seed-slide J, having a plate or partition upon the under side, in combination with the stationary cup-shaped piece A, substantially as and for the purposes specified.
2. The bar or bars D D, loosely connected with the runners A A, in combination with the bar E and seat F, all constructed and operating substantially as and for the purposes specified.

158,853. Lifting-Jacks. Elmore B. Bamlin, Rochester Depot, Ohio. [Filed June 29, 1874.]



Brief.—The lifting-bar slides within the frame, and is operated by the cam-shaped lever-head, by the depression of which the bar is raised and held in position by the pawl.

The combination of sliding lifting-bar B and pivoted lifting lever-arm C, connected together by arms b, with the lever D journaled in the frame A, substantially as described, and for the object specified.

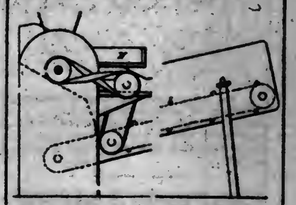
158,854. Paper-Tube Machines. Ambel G. Batchelder, Lowell, Mass. [Filed Nov. 26, 1874.]

Brief.—The strip of paper is folded around the mandrel by the series of curved elastic fingers; then passes into the rotary edge-layer, which is provided with a brush, which closes the flap; thence over the conical expander onto the evener, where the outside is finished by the hollow finish.

1. The combination of the mandrel A and the series of elastic benders E F G, arranged therewith substantially as set forth.
2. The combination of the mandrel A, the series of elastic benders E F G, arranged therewith as specified, and the auxiliary elastic bender H, to operate with the aforesaid series E F G, and between the side benders F G above the mandrel, in manner and for the purpose as explained.
3. The combination of the mandrel A, its series of strip-benders E F G, and the rotary edge-layer or tube K, arranged to operate with them as specified.
4. In combination with the mandrel A and its series of strip-benders E F G, the rotary brush M, applied to revolve around the mandrel, as explained.
5. The combination of the mandrel A, the rotary edge-layer K, the brush M, the expander N, the cylinder O, and the finisher P, arranged and applied substantially in the manner to operate as specified.

158,855. Stove-Stools. Angus L. Bobo, New York, N. Y. [Filed May 21, 1874.]

Brief.—The bracket-arm is pivoted in its supporting-casts, so that it can be turned to the right or left under the counter, or cast at right angles thereto, and it is locked in either position by the bevel wedge-shaped projections at the lower pivot of the bracket engaging with the bevel-notches in the lower pivot-cast. The cast is attached to the outer end of the bracket by a hinged pivot, so constructed and arranged that the cast can be rotated upon the pivot, or be folded down with its surface parallel to the face of the counter.



158,856. Hoop-Ring Blanks. W. D. Brown, Leroy, Ill. [Filed June 24, 1873.]

The improved ring-blank for meat-rings, made of an approximately three-quarter oval or elliptic form, so that one end may be passed through the animal's meat, and both ends joined outside the flesh, substantially as described.

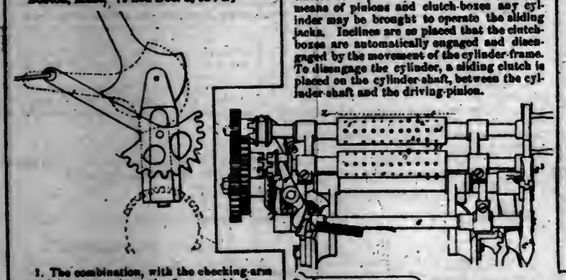
158,857. Corn-Shellers. James Burke, Ottawa, Ill. [Filed Feb. 1, 1873.]

Brief.—Protector catches and retains any ears of corn accidentally dropped while shoveling the same into the hopper, and prevents them from being thrown upon the sieve and carried off with the chaff.

The attachment to and combination with a corn-sheller of a protector, N, substantially as and for the purposes described.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

158,358. CAR-AXLE BOXES. Thos. H. Burridge, St. Louis, Mo., assignor of one-half his right to Jas. W. Butcher, same place. [Filed Aug. 17, 1874.]

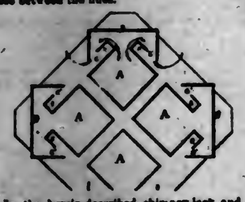


Brief.—Improvement on Patent No. 151,562.

1. The lubricating-cradle K M N O P, having bearings H I, in combination with an axle-journal and oil-box, substantially as described.

2. The counter-balance E, in combination with the rocking lubricator, as and for the purpose set forth.

158,359. VEHICLE DEVICES FOR CHECKING HORSES. W. T. Burton and J. B. Burton, Boston, Mass. [Filed Dec. 2, 1874.]



1. The combination, with the checking-arm c and its supporting-rod, of a movable lever to engage or disengage the teeth of the checking-arm with those of the hub, as and for the purpose set forth.

2. The catch b to hold the support e of the rod b in place, and combined therewith to keep the teeth of the checking-arm and the hub in engagement.

158,360. CHIMNEY-JACKS. F. M. Campbell, St. Louis, Mo. [Filed Nov. 16, 1874.]

Brief.—External air is prevented from entering the smoke-flues by the shields, and the legs or flanges. It can pass through the space between the flues.

In the herein-described chimney-jack and ventilator, the combination of the flues A, inclosing the space I, having outlet e and shield D, provided with legs c, in the manner substantially as described, and for the purpose set forth.

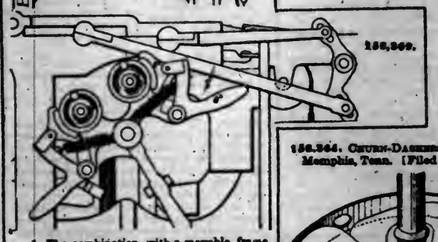
158,361. CAR-SPRINGS. Benj. A. Clooney, New York, N. Y., assignor to the New York Car-Spring Company, same place. [Filed Aug. 28, 1874.]

Brief.—To secure strength and elasticity.

1. A spring composed of half round or grooved half-round steel bars coiled into a spiral form, to operate substantially as set forth.

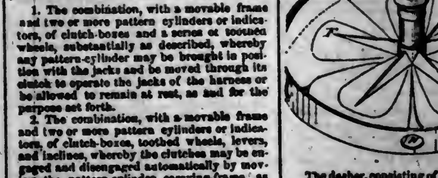
2. A spring composed of half-round or grooved half-round bars, in combination with a cap and base, and elastic cushions inserted in a recess in the cap and base, to operate substantially as set forth.

158,362. SHEDDING AND PATTERN MECHANISMS FOR LOOMS. Geo. Crompton and H. Wyman, Worcester, Mass. [Filed Nov. 16, 1874.]



Brief.—Two or more pattern-cylinders are carried on a pivoted movable frame, and by means of pinions and clutch-boxes any cylinder may be brought to operate the sliding jacks. Inclines are so placed that the clutch-boxes are automatically engaged and disengaged by the movement of the cylinder-frame. To disengage the cylinder, a sliding clutch is placed on the cylinder-shaft, between the cylinder-shaft and the driving-pinion.

1. The combination, with a movable frame and two or more pattern cylinders or indicators, of clutch-boxes and a series of toothed wheels, substantially as described, whereby any pattern-cylinder may be brought in position with the jacks and be moved through its clutch to operate the jacks of the harness or be allowed to remain at rest, as and for the purpose set forth.



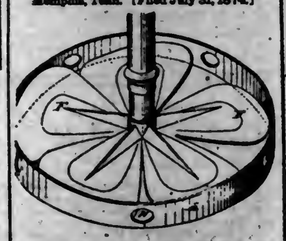
2. The combination, with a movable frame and two or more pattern cylinders or indicators, of clutch-boxes, toothed wheels, levers, and inclines, whereby the clutches may be engaged and disengaged automatically by moving the pattern-cylinder carrying-frame, as and for the purpose set forth.

3. The combination of the shaft e and arm e' f', with lever f, and clutch and pattern-cylinder for disengaging the clutch to move the pattern-cylinder without turning the operating toothed wheel or other part of the loom, as and for the purpose set forth.

4. The crank-shaft, the sleeve B', the pin or toothed wheels B' B', the crown-wheel, the shaft B' and bevel-pinions, combined with the toothed wheels and pattern-cylinders, carried in a movable frame, substantially as described.

158,363.

1. As a propeller for vehicles, the combination of lazy-tongs L P and operating mechanism consisting of the double-threaded reciprocating screws S S' and nuts N N', all to operate substantially as and for the purpose described.

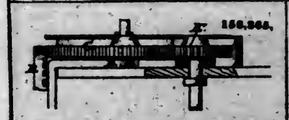


2. The combination of the vehicle or truck A', shaft V, reciprocating screw S S', nuts N N', lazy-tongs L P c, and vehicle or truck A, substantially as and for the purpose set forth.

3. In combination with the truck A A', lazy-tongs L P, and operating-screw S S', the stops b b', placed at both ends of the truck, substantially as and for the purposes described.

4. In combination with the trucks A A', the lazy-tongs L P and operating mechanism S S', the pawl and ratchet R R' upon the axle of the running-gear, substantially as and for the purposes described.

5. The combination of the vehicle A A', lazy-tongs L P c, nuts N N', and reciprocating screws S S' upon the shaft V, with suitable power for revolving the shaft V, the pawl and ratchets p' R R', and stops b b', constructed, united, and adapted to operate substantially as herein set forth.



158,364. CHURN-DASHERS. John E. Finley, Memphis, Tenn. [Filed July 31, 1874.]

The dasher, consisting of the propeller-wheel P F, the thimble T, the encircling rim R with holes H H, and the air-chamber B with holes O O, as shown and described.

158,365. CHURNS. John E. Finley, Memphis, Tenn. [Filed Mar. 26, 1874.]

Brief.—Two parallel vertical dashers are operated by horizontal gearing on top, receiving motion from a driving-wheel pivoted at the side of the churn to a bent plate, upon which the gear-wheels at top are also pivoted.

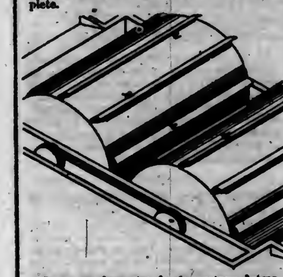
158,365.

The arrangement of the plate D on top of the lid, having bearings for supporting the dasher-pinions E E and the intermediate drive-wheel C, and bent over the sides of the churn to support the main driving-wheel B in a vertical position below the plane of the top, and to secure the lid to the churn, as shown and described.

158,366. DIES FOR MAKING HOES. Francis J. Fischer, Hamilton, Ohio. [Filed Nov. 27, 1874.]

Brief.—Two pairs of dies (the first and fourth stationary, the second and third co-operating therewith) attached to a drop. The first presents a vertically-projecting punch, surrounded by three projecting fingers, to regulate the position of the end of the plate on the punch, to be punched by the fall of the second upon it. The fourth die has a hole to limit and shape the external diameter of the socket, and a divergent groove across the face for the re-enforce; the three having a rounded conical punch, that forms the eye by driving the metal down into the hole, and a flat face perpendicular thereto for driving the metal into the re-enforce groove.

The combination of the dies represented in Figs. 1, 2, 3, and 4, constructed as described, for making hoes in the manner specified.



158,367. SUSPENSION-BUCKLES. Edwin J. Fraser, San Francisco, Cal. [Filed Nov. 4, 1874.]

A suspension-buckle or clamp-fastening, consisting of the plate A, with its upwardly-projecting hook b and ring or buckle c, in combination with the sliding band g, with its downwardly-projecting lip f, substantially as and for the purpose described.

158,368. AMALGAMATORS. Edwin J. Fraser, San Francisco, Cal. [Filed Sept. 14, 1874.]

Brief.—The pulp is carried under the surface of the mercury by the buckets s of the first cylinder, and on the opposite side of this is deflected by partitions, so that the buckets of the second cylinder shall carry it under in the same way. Amalgamation is thus complete.

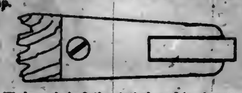
Is an amalgamator, having rotary drums, provided with buckets s c, the partitions F F, arranged with their upper edges above the surface of the mercury and their lower edges below its surface, as and for the purpose described.

158,369. CLOTHES-WRINGERS. Oscar F. Glidden, Boston, Mass. [Filed Nov. 13, 1874.]

Brief.—A bar or shelf has two cams that operate, with two sets of jaw-levers, in connection with two springs and a pair of rollers, for wringing the clothes and holding the mechanism to a tub.

The combination of the actuator G, the two sets of jaw-levers E E H H, the springs F F, and the lower roller-supporting levers, O O, all arranged upon a pivotal shaft, D, and applied to the rollers A B, substantially as specified.

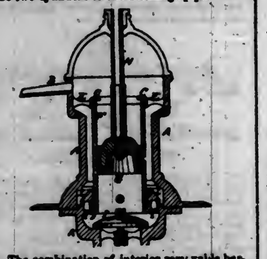
158,370. HOLDBACKS. Jacob B. Goldsmith, Rockport, Mass. [Filed July 16, 1874.]



Brief.—To release the holdback-straps in case the traces become detached.

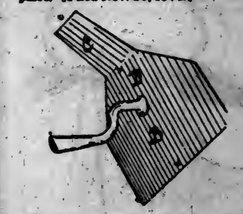
The holdback-iron formed of the bar a, having the screw-shank c, arm g, brace p, and having pivoted to the bar a the lever L, provided with an eye, a, in one of its arms, all combined substantially as shown and described.

158,371. BRAKE-TRIPS FOR VEHICLES. Jacob B. Goldsmith, Rockport, Mass. [Filed July 16, 1874.]



Brief.—To prevent the injury of the shaft-tip.

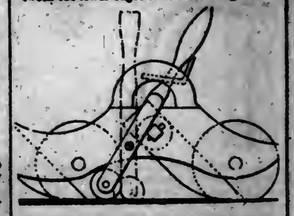
The metal shaft-tip, slotted, and having upon the pin a an elastic roller, all combined substantially as shown and described.



158,372. PUMPS. Lewis Goodwin, Gold Hill, Nev., and Saml. A. West, San Francisco, Cal. [Filed June 15, 1874.]

Brief.—The interior removable cylinder is supported at the top by a ring concentric with the outside casing, attached to it by projecting arms; at the bottom by a counterbrait in the edge of the flange projecting inwardly from the lower part of the pump. The valves are so arranged that the water passes between the two cylinders to the discharge-pipe.

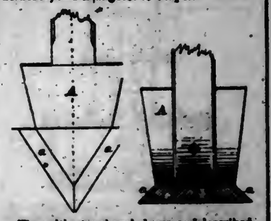
The combination of interior removable barrel F, supported by the ring C and arms E, and the flanges D, so as to stand concentrically within the casing A, with the valves I and L, the whole constructed to operate substantially as herein described.



158,373. HOES. Stephen Green, Lebanon, Mo., assignor to Barna T. Stowell, same place. [Filed Nov. 30, 1874.]

The hoe herein described, consisting of an angular blade, as shown, and a goose-neck tang attached at right angles to said blade by a collar and rivet, as specified.

158,374. CORNSTALK-ENVOLVING AND DRAG HARROWS. Jas. T. Henderson, Woodbury, Tenn. [Filed Dec. 16, 1874.]



Brief.—There are two side pieces, of runner form, in which are journaled two shafts armed with revolving cutters. Forward of each of these is a cross-beam, to which is secured a series of curved cutting-knives, which extend rearwardly and downward, terminating between the lower edges of the revolving disks.

The combination, with a harrow, having a series of revolving cutters arranged upon a transverse shaft journaled in the side frames, of the stationary cutting-blades or harrow-teeth, arranged upon a transverse shaft and extending in a diagonal rearward direction from said shaft, and terminating between the revolving cutters, substantially as herein shown and described.

158,375. CULTIVATOR-SHOVELS. Thos. J. Houston, Madison County, Ohio. [Filed Oct. 7, 1874.]

Brief.—The cutting part of the shovel is horizontal upon the ground, and is hollow underneath, and triangular in shape.

The cultivator-shovel shown and described, with the upright A and fort part C made in a single piece, so as to form the cavity a' beneath, having the angular sides a, as hereinbefore set forth.

158,376. BITMEN-DAM CLAMPS. F. Hichmann, Reading, assignor to Saml. S. White, Philadelphia, Pa. [Filed Dec. 19, 1874.]

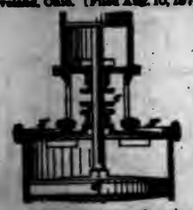
Brief.—The clamp has upon its lower part recessed jaws to hold the rubber while the clamp is being forced to its place.

156,876.

A rubber-dam clamp constructed, substantially as hereinbefore set forth, with recessed jaws to receive and carry the rubber down over the tooth.

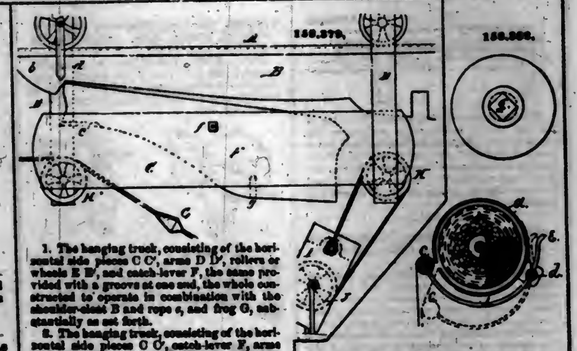
156,877. BURNING AND FINISHING TOOLS FOR DENTAL BRIDGES. F. Hickman, Reading, assignor to Saml. S. White, Philadelphia, Pa. [Filed Dec. 10, 1874.]

Brief.—The burring-wheel is arranged so that it can be set at any required angle, and has wires attached for holding a sponge to contain water for cooling the wheel.



1. The combination of the handle, the arbor-bracket pivoted thereon, the locking-rack on the bracket, and the spring locking-bolt, movable endwise in the handle, these members being constructed and operating in combination, substantially as hereinbefore set forth, whereby the angle of the arbor relatively to the handle may be varied.

2. The combination of the handle, the bracket pivoted thereon, the arbor retained in the bracket, the disk mounted thereon, the coiled spring, and the bit, these members being constructed and operating substantially as hereinbefore set forth, whereby the tool is adapted to be driven from the hand-piece of a dental engine.



3. The sponge-holder mounted on the adjustable bracket, for the purposes set forth.

156,878. STEAM-CYLINDER HEADS FOR COMPOUND ENGINES. Josephus F. Holloway, Cleveland, Ohio. [Filed Aug. 10, 1874.]

The head C for a compound engine, constructed in form of a tubular perineal, and having steading-bosses within it at top and bottom, exhaust and steam passages cast within one of its walls, and bare bolting accessions on two of its sides, in combination with one or more removable side sections, which complete the head of the lower cylinder, B, and permit access therein, substantially in the manner and for the purpose herein described.

156,879. HAY-ELEVATORS. C. B. Kershaw, Sherburne, N. Y. [Filed Dec. 16, 1874.]

1. The hanging truck, consisting of the horizontal side pieces C C', arms D D', rollers or wheels E E', and catch-lever F, the same provided with a groove at one end, the whole constructed to operate in combination with the shoulder-plate B and rope e, and frog G, substantially as set forth.

2. The hanging truck, consisting of the horizontal side pieces C C', catch-lever F, arms D D', carrying pulleys H H, and rollers or wheels E E', the latter provided with swinging arms or guides d d, substantially as and for the purpose set forth.

3. In combination with the shoulder-catch B, hanging truck provided with the catch-lever F, having groove e and hole g of the pulley-block I, and pulley J, hooks K K, rope e, and frog G, the whole constructed to operate as set forth.

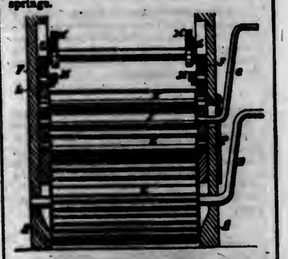
156,880. HEATING-DRUMS. J. N. Kneeland, Barr Oak, Mich. [Filed Nov. 13, 1874.]

Brief.—The spiral coil surrounds the pipe, in which is a damper, by means of which the draft may be made direct or indirect.

The combination of the coil of pipe B with the vertical flue A, the communicating-valve D, and the passages E and F, substantially as described, for the purposes set forth.

156,881. SHOT-PURSE. Lester J. Knowles, Worcester, Mass. [Filed Nov. 16, 1874.]

Brief.—The valve-chambers are provided with angular division-pieces, which form valve-seats, and also direct any foreign substances passing through the pump. The base of the cylinder is provided with a chamber for the purpose of retaining any substances that may pass over the division-plate in the inlet-chamber. Said substances are removed through a door opening into said chamber. The former is provided with hinged bolts.



1. In combination with the valve-chambers B and C, the valves F and G and valve-chamber divisions d as i e, formed substantially as shown, arranged and operating substantially as and for the purposes set forth.

2. The combination, with valve-chambers B and C, provided with division-pieces d and e, of the chamber H below the plates E, substantially as and for the purposes set forth.

3. The combination, with the base of the cylinder D, of hinged door I and hinged bolt, ling-bolts d d, substantially as and for the purpose set forth.

156,882. COMBINED WASHING AND WRINGING MACHINES. J. S. Memphin and W. C. Marr, Ottawa, Iowa. [Filed Apr. 4, 1874.]

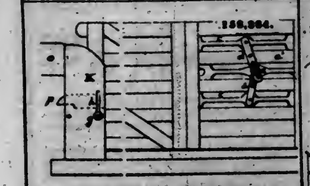
Brief.—The rollers for a washing-machine, and the rollers for a wringer, are all journaled in the same frame, are operated by separate cranks, and adjusted by a lever-frame and springs.

1. In combination with grooved standards A, cylinder C, and series of rollers E', the sliding blocks F, lever-frame H, connecting-links O, and springs I, as herein described.

2. In combination, with the spring-pressed lever-frame H and sliding blocks F, of the washer, the wringing-rollers J K, lever M, and connections L N, arranged as shown, and operating in the manner set forth.

156,883. BOBBIN-HOLDERS FOR SPOOLING-MACHINES. Thomas A. Mathewson, Pawtucket, R. I. [Filed Dec. 12, 1874.]

Brief.—Tension is given the thread, as it runs from the bobbin, by friction on the edge of the slot, or by the spring pressure-bar. The degree of tension is regulated by turning the holder on its axis and changing the position of the slot.



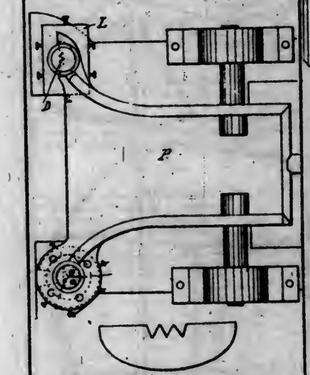
1. The combination of the cylindrical bobbin-receptacle A open at one end, and having a slit along one side, with the slot f and screw g, by which the same is secured to the frame of the machine, and by which the same can be adjusted to give any required frictional tension, substantially as and for the purpose herein described.

2. In a bobbin-holder, the combination, with the cylindrical and adjustable receptacle A, of the hinged tension-bar C, substantially as and for the purpose set forth.

156,884. GATES. Moses R. McEwain, Palo Grove, Wis. [Filed July 30, 1874.]

Brief.—The gate rises vertically at the latch end, turning about the bolt, and assisted by the counterpoise, until a projection encounters a bolt placed for its support, when the center of rotation is transferred to that point, and the bolt traverses in slots, permitting the gate to assume a vertical position, sustained upon the projection and retained by the bolt. The triple bolt is for the purpose of maintaining rigidity between the small and large sections of the gate when closed.

156,884.



1. The gate A, consisting of the sections a and a', the bolts c and f, slotted levers d, and hooks e, combined and operating together as described.

2. The gate A, provided with the bolt f, notched projection p, and weighted bar e, and slot i, in combination with the upright post E, provided with a vertical slot, h, as and for the purposes described.

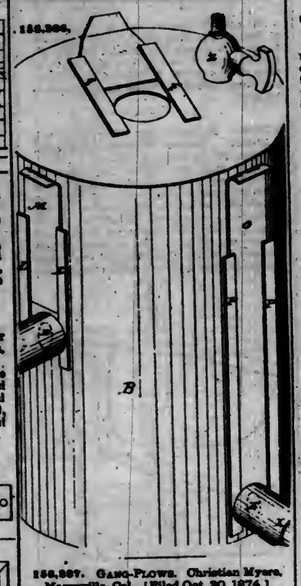
156,885. MACHINES FOR TRIMMING BOOT AND SHOE HEEL COUNTERS. J. R. Moffitt, Chelsea, Mass. [Filed Aug. 21, 1874.]

Brief.—A die is provided for cutting the notched counter-blank to be molded and pressed into form; also, a die for holding and trimming the counter after it has been formed, both operated by the same lever, and adapted for simultaneous action.

1. The combination, with the lever E, carrying the punch D and die E, of the die L and stationary punch M, substantially as shown and described, and for the purposes set forth.

2. In combination with the dies, the revolving wipers g h and the parts i j of the lever E, one of the wipers operating to elevate and the other to depress the lever, as and for the purpose described.

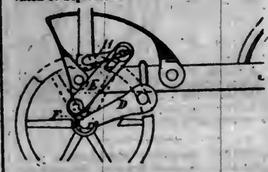
3. In a machine for making and trimming heel-counters, the stationary punch M, adapted for holding the shaped article to be trimmed, in combination with the moving die L, substantially as and for the purpose described.



4. In combination with a punch having a contour adapted for punching a notched blank for heel-counters, a sectional die having its notched part or parts adjustable, substantially as and for the purpose set forth.

156,886. RESERVOIRS FOR WATER-WORKS. Wm. Henry Morrison, Indianapolis, Ind. [Filed Oct. 1, 1874.]

Brief.—A system of reservoirs placed under ground, and, connected with the water-mains, and with supply-pipes, is employed to give a uniform and continuous supply of water.



The pressure-reservoirs B B, having the inlet-opening D, connecting with the main pipe, and the outlet-opening E, and stop-cock Z, and sliding gates M and O, or their mechanical equivalents, when operated substantially as described, for the purposes specified.

156,886.

156,887. GANG-PLOWS. Christian Myers, Marysville, Cal. [Filed Oct. 30, 1874.]

Brief.—The cranks turn upon the fixed center of the axle. A rock-shaft with crank-arms is connected by links to the axle at its lowest point, and has a lever made rigid upon it, by which the axle is turned and the plows elevated or depressed.

In a gang-plow, the fixed axle C, provided with the articulated crank-journals D, connected by links E to the ends of the double-crank rocking-shaft H, provided with the hand-lever L, working in the notched rack M, substantially as and for the purposes hereinbefore set forth.

156,888. TILTING CHAIRS. R. W. Myers, New York, N. Y. [Filed Oct. 23, 1874.]

Brief.—The outer ends of the lateral bars of the spider are provided with cams, upon which the rear ends of the springs ride, and the tension of the springs on cams is regulated by screws and nuts at their rear ends.

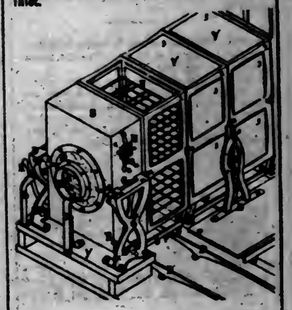
1. The combination, in a tilting-chair, of the spider B, having the cams b b, with the springs C C, substantially as and for the purposes set forth.

2. The spider B, cams b, springs C, and tension-regulating mechanism D d, in combination, substantially as and for the purpose specified.

156,889. GAS-REGULATORS. A. Parsons, Chicago, Ill. [Filed Oct. 10, 1874.]

Brief.—The diaphragm carries the perforated gas-tube up or down, and controls escape of gas by means of a valve depending from the tube. A lip or key open the tube prevents its turning while attaching the tip and its connections.

The elastic diaphragm F, arranged between the two parts of the cone A, in combination with the perforated tube B, provided with the key c and adjustable valve C, as specified.



156,890. CARD-PILES. Miles S. Prentice, Jacob Babel, and Wm. A. Talcott, Rockford, Ill. [Filed Nov. 27, 1874.]

A card-pile constructed, substantially as described, with a back, on which the cards rest, a stud, on which they are strung, a flange on one side, against which they abut, the other side being open to allow the cards to be swung outlaterally, and a clamping or pressure spring to retain the cards in place.

156,891. GLUE-DRYERS. A. H. Sandbolzer, Needham, Mass. [Filed Nov. 17, 1874.]

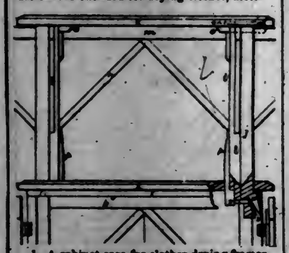
Brief.—The crates form a continuous drying-chamber. One of the end crates is made movable, and the other provided with a yielding or sliding frame, to render them adjustable for the insertion of intermediate crates. Mechanism is provided for crowding and holding the crates in close contact. When required, one of these nearest the hot-air inlet can be run out of place upon rails, transferred upon transverse rails, and inserted near the opposite end of the drier, the intermediate crates having been moved up toward the air-inlet.

1. In an apparatus for drying or evaporating glue, the following instrumentalities, to wit: In the improved glue-drier described, an open-sided crate having a cast-metal frame and sheet-metal panels, the panels being cast in, substantially as and for the purpose specified.

2. A series of open-sided detachable crates provided with pans, in combination with a device or devices for holding the crates together to form a continuous hollow trunk, through which air is passed for drying or evaporating purposes, substantially as specified.

3. In combination with the crates V¹ V V¹, the stationary crate C and movable crate B, substantially as and for the purpose specified.

4. The crate B, standards D D, levers E E, lever K, and pinions *s s*, combined to operate substantially as and for the purpose described.



5. The fixed crate C, provided with the sliding frame X¹, combined and arranged to operate substantially in the manner and for the purpose set forth.

6. In combination with the crates V V V¹ V¹, the mechanism for locking or holding a portion of the crates while one is being removed, substantially as and for the purpose specified.

7. The standards B B, levers S S, stops *t t*, cleats *u u*, and rod T, combined to operate substantially as and for the purpose set forth.

156,393. CLOTHES-DRYING. Chas. T. Shafer, Springfield, Ohio. [Filed Oct. 7, 1874.]

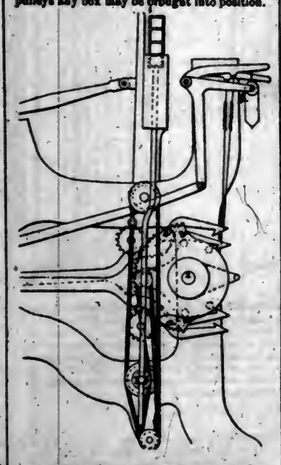
Brief.—The front and rear doors of the cabinet have their upper stiles extended for holding clothes. Other frames are hinged inside the doors. An inside frame with several pivoted frames slides upward, and the frames are turned outward for drying clothes, also.

1. A cabinet-case for clothes-drying frames, constructed as shown, with doors having their top stiles extended entirely across the opening in the front and back of the same, as described, to form frames for drying clothes when opened, in the manner set forth.

2. In combination with the case A, constructed as described, and provided with doors *a*, *b*, *c*, and *d*, having their top stiles extended in the manner shown, the drying-frames *b*¹ *d*, pivoted vertically within the same, as and for the purpose specified.

3. Frame C, with its pivoted frames *f j k l* m a and its locking and releasing devices, as shown, in combination with case A, (from which it is elevated,) provided with doors *a b c d* and pivoted frames *b*¹ *d*, all arranged as described, as and for the purpose hereinbefore set forth.

156,395. GRATES. Rene Stimson, Montpelier, Vt., assignor to Thos. J. Deavitt, same place. [Filed May 24, 1872.]



Brief.—Alternate grate-bars are connected and hinged to the grate-rim, and may be dropped below the fixed bars. Cinders can be removed through the wide spaces thus left between the stationary bars, which in the meantime retain the mass of coal.

The movable alternate grate-bars C C, hinged at their ends to the supporting-rim A, and provided with a latch or catch for holding the moving ends of such bars C C, or allowing them to be dropped, in combination with the stationary bars B B, as and for the purposes set forth.

156,394. SHUTTLE-BOX MECHANISMS FOR LOOMS. Horace Wyman, Worcester, Mass. [Filed June 26, 1873.]

Brief.—Each drop-box rod is connected with a cord extending around or partially around a vertical series of pulleys, some of which are placed on crank-arms reciprocated by segment-gears. As either crank-arm is operated its reciprocating end bears upon the cord, and in such manner as to raise or lower the box-rod, and by means of the series of cranks and pulleys any box may be brought into position.

A system of grooved pulleys, cranks, and cording, substantially as described, combined with the pattern mechanism and drop-boxes of a fancy loom, and operated and operating to control the boxes, as set forth.

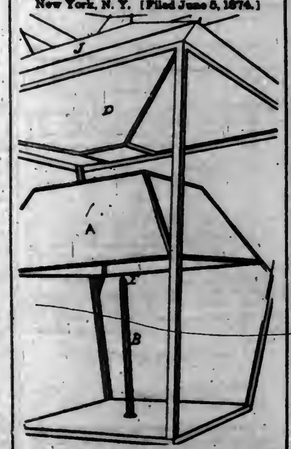
156,395. SHEDDING MECHANISMS FOR LOOMS. Horace Wyman, Worcester, Mass., assignor of one-half his right to O. Crompton, same place. [Filed Dec. 9, 1874.]

Brief.—When the heddles are down the sliding jacks are locked by means of stationary bars. The rock-shaft, for operating the jacks, is provided with a clutch device, consisting of a loose arm and a sliding pin, by means of which the pattern-cylinder can be reversed, and the shedding mechanism operated independently of the other parts of the loom. The rock-shaft carries the double pawl for driving the pattern-cylinder, and also the lever which controls the pin of the clutch device.

156,396.

1. The combination, with notched jacks, or notched and eared jacks, of stationary holding-bars for holding the harness-frames in position, substantially as set forth.

2. The combination, with notched jacks and stationary holding-bars, of an evener-bar, for placing the notched jacks in engagement with such bars, substantially as set forth.

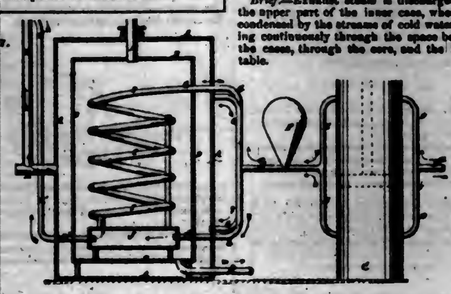


3. The combination, with the rocking-shaft for actuating the shedding or harness mechanism, of an arm or clutch adapted to be engaged with, or to be disengaged from, such rocking-shaft, substantially as and for the purpose described.

4. The combination, with the rocking-shaft for actuating the harness mechanism, of the collar *b*, arm *c*, pin *d*, and lever *e*, substantially as described.

5. The combination, with the rocking-shaft of the shedding mechanism and arm *a*, of mechanism, substantially as described, for disengaging said arm from the rocking-shaft, and a reversible pawl for reversing the pattern-cylinder, as and for the purpose set forth.

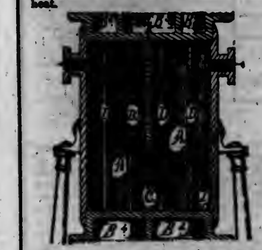
156,397. STEAM-CONDENSERS. Edwin C. Brincherhoff, New York, N. Y. [Filed Nov. 30, 1874.]



Brief.—Exhaust steam is discharged into the upper part of the inner case, where it is condensed by the streams of cold water passing continuously through the space between the cases, through the core, and the hollow table.

The combination of reflectors, A throwing the light downward and inward, D throwing outward and downward the light received through A, and H, in like manner, throwing the light received through D downward and outward, as shown and described.

156,398. STREET-LAMPS. Charles B. Boyle, New York, N. Y. [Filed June 5, 1874.]



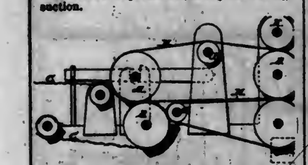
156,397.

The combination of cases A B, having intermediate water-space, the hollow table having pipes G I K, and the therewith-connected pump C, having pipes D E and air-chamber F, all as and for the purpose described.

156,399. FEED-WATER HEATERS. Joseph R. Brown and William A. Foskett, New Haven, Conn. [Filed Sept. 30, 1874.]

Brief.—The middle compartments have a greater number of tubes in them, whereby the water is retained longer in contact with the steam, thereby absorbing a greater amount of heat.

The combination, in a surface-condenser, of the case A, circulating-tubes D D D D, the compartments B¹, B², B³, B⁴, and B⁵, the compartments B² and B⁴ containing a less number of tubes than the intermediate ones, and the baffle-plate C, the parts being arranged to operate substantially as and for the purpose set forth.

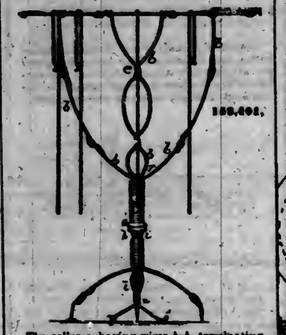


156,400. THILL-COUPLINGS. Jas. R. Burville, Bainbridge, Ohio, assignor of one-half his right to Wm. H. H. Dunn, same place. [Filed Nov. 30, 1874.]

The thill-coupling consisting of the body A, provided with the hooks *b*, the clip-band B, provided with the inclined face, the T-headed thill-iron D, the inclined bar E, bearing at one end directly against the thill-iron, and at the opposite end against the inclined face of the band, and the bolt H, all combined as set forth.

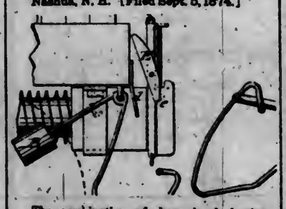
156,400. PAPER-MAKING MACHINES. Jas. Butler, Philadelphia, Pa. [Filed July 28, 1874.]

Brief.—An endless rubber belt carries web from coucher to press-rolls, lifting the web by suction.



1. The endless apron H, in combination with the rollers A, B, and D, and lapping upon both the wire-cloth apron U and felt apron F, as and for the purpose set forth.

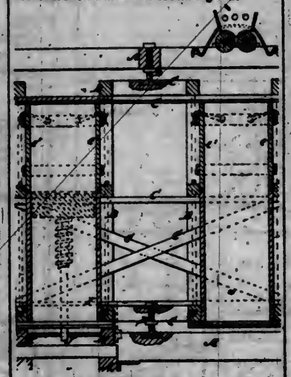
2. In combination, the roller K, doctor L, apron H, and rollers A and D, arranged and operated as set forth.



156,401. COMBINED TOWEL-RACKS AND WASH-STANDS. Reuben P. Buttles, Marshfield, Pa. [Filed May 23, 1874.]

Brief.—The adjustable bars are held in place by two concentric circles at the top of the frame. The wires forming the frame are fastened at their ends in a collar, and the foot and standard are held together by a long wire-pin, which has a point bearing against the floor.

The collar *c*, having wires *b b*, terminating at their upper ends in concentric circles, in combination with the collar *h*, provided with wires *i i*, terminating at their lower ends in hooks *p* and eyes *p'*, and central pin *r*, substantially as and for the purpose set forth.

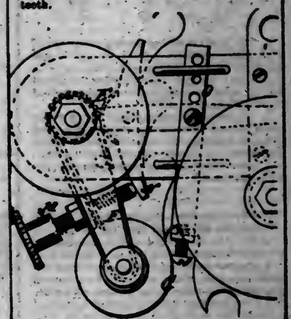


156,402. CAR-COUPLINGS. Geo. W. Call, Nashua, N. H. [Filed Sept. 5, 1874.]

The combination of draw-head, having notch *e*, frame E¹, pivoted latch E, and guard *d*, as and for the purpose described.

156,403. COTTON-PRESSES. Wm. T. Crenshaw and Robt. C. Carothers, Burton, Tex. [Filed Nov. 14, 1874.]

Brief.—While compression is taking place in one box, the other stands beneath the hopper, the bottom of which fits upon two rollers, that feed the cotton into the baling-box.

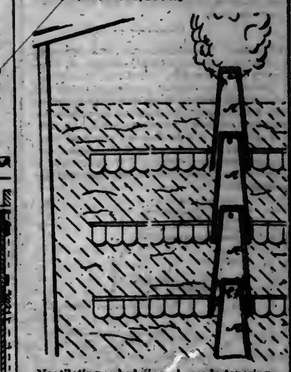


1. The hopper K, provided with perforations and the rollers L, to permit discharge of dust while the cotton is fed downward, as shown and described.

2. The bails I, hinged to the frame A, and provided with handles J, in combination with the press-box mounted on pivot-bearings D D, and provided with projecting beams at the base, as and for the purpose specified.

156,404. SAW-SHARPENERS. John Crook and Jas. A. Crook, Augusta, Ohio. [Filed Nov. 14, 1874.]

Brief.—The operative parts of the machine are mounted on a radius-bar, which is attached to the saw-arbor. The grinders are mounted in a swinging frame attached to the radius-bar, so as to be brought in contact with the teeth.



1. The adjustable bearing-pieces B, spring-clamp lever D, and the cam E, combined with the radius-bar A, substantially as specified.

2. The combination of the grinder-carrying frame F, adjusting stop-gage M, and the stop N with the radius-bar A, substantially as specified.

3. The combination of the gage O with the grinder-carrying frame F, radius-bar A, stop-gage M, and stop N, substantially as specified.

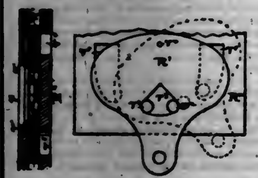
4. In a saw-gummer, the combination of the large and small grinding-wheels G H, the threaded mandrel I, and screw-collars P with pivoted carrying-frame F and bar A, as shown and described, for the purpose specified.

156,405. END-PIPES FOR LEAD-COBBOCKING HOUSES. Peter H. Decker, Moreston, N. Y. [Filed Dec. 12, 1874.]

Ventilating or bed pieces A, made tapering, and provided with blocks *a'* in the interior of their lower parts, with holes or openings in the lower and upper parts of their sides, and with caps at their upper ends, substantially as herein shown and described.

156,406. BOTTLE-STOPPERS. Charles de Quillfeldt, New York, N. Y. [Filed Nov. 30, 1874.]

Brief.—A stopper-carrying yoke is pivoted at some distance from the ends of a wire lever-frame, which swings in the eyes of a wire band attached to the neck of the bottle. The elastic stopper has a cylindrical stem, perforated for the passage of the yoke, and is tightly secured to the bottle by a sleeve-shaped and flanged cap-piece.

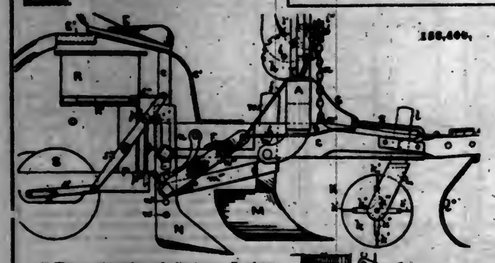


No. 166,606.

1. The bottle-stopping device, composed of a pivoted lever-frame applied to neck of bottle, with eccentrically-hinged yoke carrying the elastic stopper and cap-piece, arranged and operated substantially in the manner and for the purpose set forth.

2. The elastic stopper, hung by its perforated stem or shank to upper part of hinged yoke, in combination with the same and a sleeve-shaped cap-piece placed over the stopper below the yoke, substantially for the purpose described.

166,607. SEEDING-MACHINES. S. Dixon, Rosaville, Ill. [Filed July 26, 1874.]



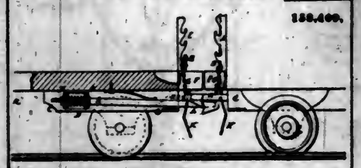
Brief.—At the bottom of the seed-box are pivoted two oscillating seed-cup boxes, having circular slots and triangular-shaped depressions, into which the seed is collected. On each side and at the bottom of the box are slots, through which project the extended ends of the seed-disks, for connection with crank mechanism.

The seed-box B, having slots r, with inclined edges r', the oscillating seed-cup boxes R' R', having slots r' and depressions r', and the plate R'', having slots r', all operating in combination, substantially as and for the purpose specified.

166,608. CORRUGATED STALK-CUTTERS, PLOWS, AND SHREDDING-MACHINES. S. Dixon, Rosaville, Ill. [Filed Feb. 24, 1874.]

Brief.—Drag-hooks for straightening the stalks; a rotating cutting-cylinder for cutting the stalks, and having a central disk-cutter for dividing the hills; a double mold-board plow for spreading a wide furrow; a pair of ridging-plows; a seed-dropping device, and a covering-roller, are all arranged to operate at the same time by the forward movement of the machine.

166,608.

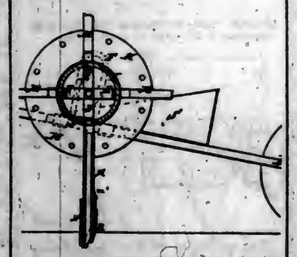


1. The combination of the beam C, plows M N', and stalk-cutter K with the seed-planting device O E E, all constructed and operating as and for the purpose specified.

2. The stalk-cutter K, having the central disk i and blades i', substantially as and for the purpose specified.

3. The beam C, connected with the axle A by brackets G G and rods g g, and adjustably connected by means of the chain s, shaft F'', fulcrum F', slotted standards H, lever I, rock A, and plates P, substantially as and for the purpose specified.

166,609. CAR-COUPLINGS. Henry Dutcher, Port Jervis, N. Y. [Filed Dec. 6, 1874.]



The peculiar heels a' and the projections or buffers a', formed upon the forward ends of the coupling-bars A, connected with the car-bodies by cross-bars B and springs D, all combined substantially as shown and described.

166,609.

166,610. CORN-PLANTERS. Jens Hyvard, Red Wing, Minn. [Filed Oct. 24, 1874.]

Brief.—The frame is attached rigidly to the rear axle, and connected with the front axle by slotted standards, which allow the axle to rise and fall to conform to the unevenness of the ground. Between the frame and the axle is inserted an adjusting-wedge, for elevating the seeding-wheels.

1. The frame E, attached rigidly to rear axle B and connected with front axle G of the seeding-wheels by slotted standard F, all combined and operating as and for the purpose described.

2. The combination, with axle G, of the seed-wheels and frame E, having slotted standards F F, of the wedge S, as and for the purpose described.

166,611. FEATHER DUSTING-BRUSHES. A. D. Griswold, New York, N. Y., assignor to Myrtilla Griswold, same place. [Filed Dec. 1, 1874.]

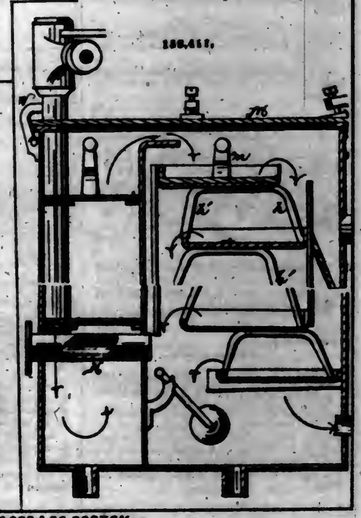
Brief.—A feather dusting-brush wholly constructed of feathers mounted on elastic stems.

166,611.

As a new article of manufacture, a feather dusting-brush, constructed of a series of bunches of feathers or of single feathers, each of said bunches or single feathers being secured to one end of an elastic stem or prolongation, without the intervention of a head, and the other end of the said elastic stem secured directly to the head of the handle, substantially in the manner and for the purpose described.

166,612. FEED-WATER HEATERS AND FILTERS. Edward P. Fenn, Kansas City, Mo. [Filed June 5, 1874.]

Brief.—The filtering-pans are kept in position by guides and cam. The steam, ascending, comes in contact with the water while descending, and is prevented from escaping direct by a deflector, L. The top or lid is easily removed by unscrewing the clamp-fastenings.



1. The combination, with the pans G, of the guides c, brackets b, feet b b', and cam-levers n, substantially as and for the purposes herein set forth.

2. The combination of the shell A, pans G G, steam-inlet H, steam-outlet K, and the steam-director L, said steam-director being arranged, with relation to the steam-outlet and the pans, substantially as and for the purposes herein set forth.

3. The combination, with the shell A and lid M, of a series of screw-clamp fastenings, each consisting of the bent link or bar N, hinged or jointed at s, the set-screw p, and inclined raised surface s, all constructed and arranged substantially as and for the purposes herein set forth.

166,613. CORN-PLANTERS. Thomas Hall, Jr., Bloomington, Ill. [Filed Dec. 7, 1874.]

Brief.—The seed-slide is operated by a lever, and the seed-tube is provided with a spring-arm, which presses the seed into the ground.

166,613.

1. The combination of the seed-slide D, lever E, and spring-arm F, substantially as and for the purpose specified.

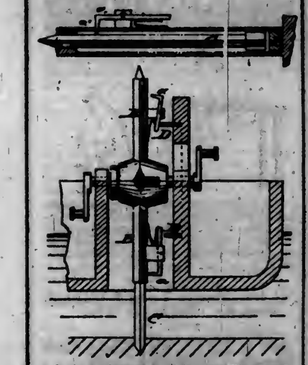
2. The combination of the seed-slide D, lever E, spring-arm F, and seed-tube C, substantially as and for the purpose specified.

166,614. SEED-PLANTERS. Thomas Hall, Jr., Bloomington, Ill. [Filed Dec. 7, 1874.]

Brief.—The seed-slide is operated by a lever, and the seed-tube is provided with a spring-arm, which presses the seed into the ground.

166,614.

1. The combination of the seed-slide D, lever E, and spring-arm F, substantially as and for the purpose specified.

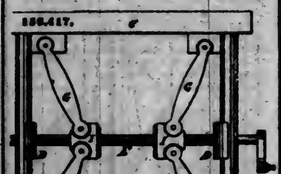


2. The combination of the seed-slide D, lever E, spring-arm F, and seed-tube C, substantially as and for the purpose specified.

166,615. SPRING BED-BOTTOMS. Geo. W. Hatch, Fond du Lac, Wis. [Filed Oct. 24, 1874.]

In a bed-bottom, the wire springs C, each formed of a series of bends, c, having an upward inclination, straight connecting portions b, and eyes b', said springs being arranged lengthwise of the slats B, as shown and described.

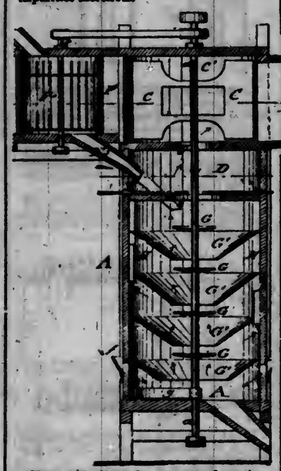
166,616. PROPELLING-WHEELS FOR CANAL-BOATS. Gustav Kuydrisk, New Ulm, Minn. [Filed Oct. 3, 1874.]



1. As an improvement in propelling canal-boats, a rotating propelling-wheel having radial guide-sleeves with spurred sliding extension propelling-arms retained and cushioned therein, substantially in the manner and for the purpose set forth.

2. The combination of spring-levers e, entering through perforation e' of the sleeve B, with sliding propelling-arm C, for retaining the same inside of the sleeve until detached, as described.

3. The combination of spring-levers e with arc-shaped flange or rod D of the wheel-box, for engaging ends of levers and releasing sliding propelling-arms for entering into the bottom of the canal at the proper time, as specified.



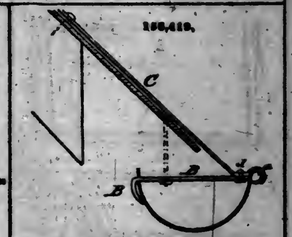
166,617. COTTON-PRESSES. Tryon J. M. Jewell, New York, N. Y., assignor of his right to T. W. Burger and E. Gardinier, same place. [Filed May 1, 1874.]

The single screw B, formed with threads running in opposite directions, and having its bearings in the disconnected and independent blocks D, arranged to slide upon the posts B, the nuts I, and the toggle-joints G pivoted at top in fixed and permanent relation to the top beam C, and at bottom at or near the extremities of the platen F, the whole combined for joint operation, substantially as and for the purpose specified.

166,618. MIDDLINGS-PURIFIERS. Edwin W. Johnson, Forreston, Ill., assignor to himself and Joseph U. Knoble, same place. [Filed Oct. 10, 1874.]

Brief.—Middlings, after being subjected to a whipping or beating action, are passed over a series of revolving saucers and stationary inverted conical funnels, and subjected to ascending air-currents, for removing the light impurities therefrom.

166,618.



The combination of a superposed suction-fan, C, whose case has the side conductor E and bottom hole b', with the subjacent chamber D A, the former having small inlet spout F' and central aperture b, while the latter has successive saucers and funnels G G', all arranged substantially as and for the purpose specified.

166,619. HAYES-TROUGH HANGERS. Edwd. Kirk, Jr., Sheridan, Ill. [Filed Nov. 14, 1874.]

The combination, with the brace B, slotted at d', and the strap C, having sleeve e, of the nutted bolt d, as and for the purpose described.

166,620. CHERRY-PITTERS. Wm. B. Knapp, Tecumseh, Mich., assignor to himself and F. Bemmann, same place. [Filed Aug. 10, 1874.]

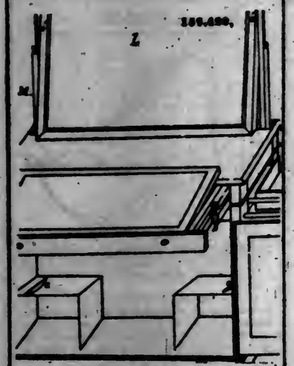
Brief.—The pitter consists of a tube open at both ends, a knob or handle being secured around one end, while the other end is notched or toothed. The cherry is pressed against the toothed end, and the pit drops through the tube, leaving the cherry whole and ready for use.

166,620.

A cherry-pitter consisting of a tube, A, open at both ends, having a knob or handle, B, placed upon one end, and teeth c' formed upon its other end, substantially as herein shown and described.

166,621. CORRUGATING DRAWERS AND FOLDING DESKS. John A. Knight, Auburn, Me. [Filed Mar. 23, 1874.]

Brief.—To the inside of the drawer brackets are attached, to which is pivoted the flexible writing-desk, which can be made rigid by folding arms that are connected thereto.

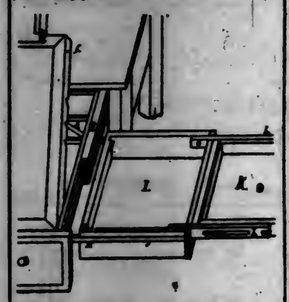


166,621.

A drawer, provided with brackets g g, in combination with the flexible desk-surface A and folding arms D D, by means of which the desk-surface may be made rigid when said arms are extended, or flexible and capable of being rolled into a narrow compass when the folding arms are closed, substantially as described, and for the purpose set forth.

166,622. LOOKING-GLASS ATTACHEMENTS FOR BUREAUS, &c. John A. Knight, Auburn, Me. [Filed Mar. 23, 1874.]

Brief.—A frame sliding in supplemental slides bears a looking-glass frame, so that the glass can be raised above the top of the bureau, and inclined at any desired position.



160,489.

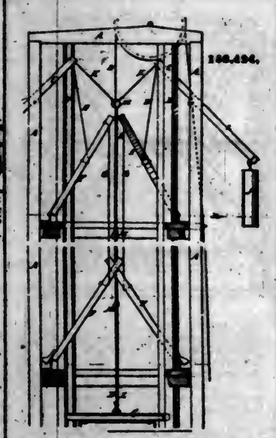
The combination of the frame *e'*, provided with the looking-glass L, of the frame K, and supplemental sliders M M, substantially as described, and for the purpose specified.

160,490. DRAWERS. John A. Knight, Auburn, Me. (Filed Mar. 28, 1874.)

Brief.—Two supplementary drawers slide into the main drawer from the side of the case, and are contained in said drawer. The lid of the main drawer, which is used for writing purposes, is provided on its under surface with a looking-glass.

1. The combination, with the drawer A, of the frame e and adjustable lid C, pivoted at *f*, and provided with a looking-glass, O, on its under surface, substantially as described, and for the purpose specified.

2. The supplementary drawers G, H, and I, having extension-slides and swinging tray K, in combination with the drawer A, provided with the inner hinged and adjustable lid C, substantially as described, and for the purpose set forth.



160,491. SELF-CLOSING HATCHWAYS. S. Lawrence, New York, N. Y. (Filed Dec. 19, 1874.)

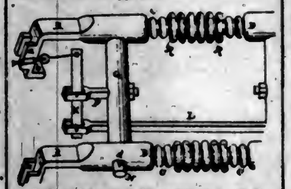
Brief.—The hatch-doors are connected with each other by ropes, the upper ones being connected by weighted levers. A rope connected to the hoisting-rope at intervals branches at the top to connect with the weighted levers. As the car is elevated the closing-rope is slackened, and the weighted levers open the doors. When the car has descended the rope is tightened and the levers are drawn down, thus closing the doors.

1. The combination of the cords G H K L, the levers I, and the weights J with the hatchway-covers F, the frame A, and the carriage C, substantially as herein shown and described.

2. The combination of the rings M with the cord L and the hoisting-rope D, substantially as herein shown and described.

160,492.

160,493. FIRE-BOX ATTACHMENTS TO STEAM-BOILERS. John Lee, Hazleton, Pa. (Filed Oct. 17, 1874.)



Brief.—The rivet-joints are protected within the fire-box from extreme heat by a hollow casting, suspended by thimbles communicating with the water-space of the boiler.

The combination, with boiler and fire-box, of a hollow casting, B, having the projecting tubes C C, as and for the purpose specified.

160,494. CAR-BRAKES. Michael Madden, Harrisburg, Pa., assignor of one-half his right to William C. McFadden, same place. (Filed Oct. 1, 1874.)

Brief.—Forward and rear shoes on each side connected to ends of spiral spring, which is expanded by action of levers on cross-bars, when brakes are applied.

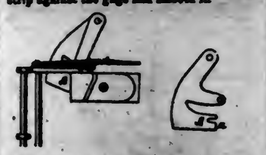
1. The plungers A, in combination with the springs B, substantially as and for the purpose set forth.

2. The plungers A, in combination with the transverse bars G, said plungers being connected in pairs by the springs B, for operation substantially as shown and described.

3. The brake-rigging frame A E G, in combination with the lever K, draft-jaw bar F, and connecting-rod I, all for operation substantially as set forth.

160,495. THREAD-WINDING GUIDES. E. L. Manchester and J. A. Bolen, Springfield, Mass. (Filed Dec. 7, 1874.)

Brief.—The thread-guide is provided with a grooved wheel to bear on the spool and guide the thread, rendering the friction and wear much lighter than where the ordinary guide bears upon the spool.



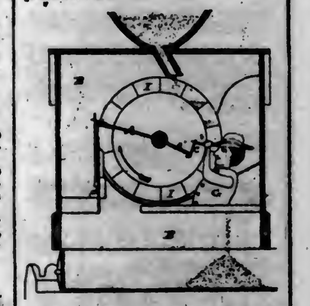
160,496.

The combination of a revolving laying device, F, with a thread-spooling guide, substantially as specified.

160,497. BUFFLERS. James McCullough, Aspinwall, Neb. (Filed July 26, 1874.)

Brief.—Material for ruffle and band supported on spindles projecting from standard rising from presser. The ruffler-blade is a horizontally-vibrating arm, actuated through a connecting-rod and bell-crank lever. The blade engages the strip of cloth resting on a separator-plate, and one of the teeth of the blade bears on the cloth harder than the other, and acts to throw the edge of the passing strip against the gage and smooth it.

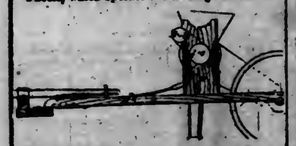
The combination, with the presser-foot having the cloth-supporting spindle and the separator-plate P, of the pivoted supporting-plate A, having depressed point *a*, and the connecting-arm H and elbow-lever, all constructed, arranged, and operating as set forth.



160,498. GARTERS. Louisa F. McDonald, Belfast, Me. (Filed Oct. 10, 1874.)

A garter composed essentially of the elastic A, loop B, buckle C, and plates D *& E*, combined and arranged in the manner described, for the purpose set forth.

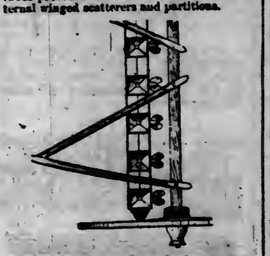
160,499. MECHANICAL TOYS. H. Mencke, Providence, R. I., assignor of one-half his right to C. Vigneron, same place. (Filed Apr. 1, 1874.)



Brief.—Arms extending from both sides of the shaft, and also from both ends of the shaft, give motion to double sets of figures, seen through the windows engaged at different pretended work.

The sand-mill toy herein described, consisting essentially of the box B, provided with the axle H, arms A A' on each side of the wheel I, the hopper F, figures G, and openings W, substantially as and for the purpose set forth.

160,501. CORN-PLANTERS. Hiram Moore, Green Lake Township, Green Lake County, Wis. (Filed June 11, 1872.)

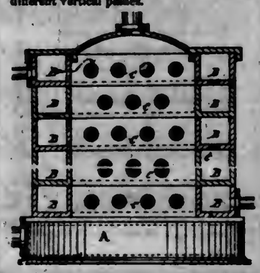


Brief.—To a tongue flexibly secured to the main cross-beam by a staple are attached two diagonal braces, extending backwardly and rearwardly, and passing under hooks on the main frame, for preventing the dropping-frames from rising too high. These frames are flexibly attached to the main frame, and their rear ends are supported by bearing-wheels, which operate the seeding devices.

The loose tongue with its diagonal braces, the draft-frame, the planting-frames, their supporting-wheels, and the pivoted links connecting the draft-frame and planting-frame, these members being constructed, combined, and operating substantially as hereinabefore set forth.

160,502. GRASS-SEED SOWERS. Hiram Moore, Green Lake Township, Green Lake County, Wis. (Filed June 11, 1872.)

Brief.—To the under side of the thills is attached a trough having hoppers therein, beneath which revolves a sectional shaft having seed-wheels, for delivering the seed to tubes provided at their lower ends with external winged scatterers and partitions.

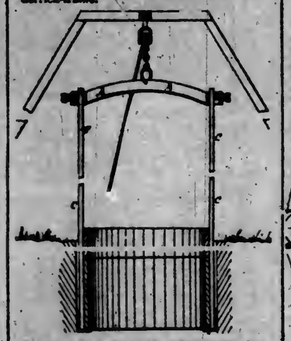


1. The combination of a seed-tube, an external winged scatterer, I, and a vertical partition between the scatterer and tube, these members being constructed to operate substantially as set forth.

2. The combination of the axle, the thills, the hopper, the sectional feed-wheel shaft, and the sleeve and pins connecting the shaft-sections, these members being constructed and operating substantially as set forth.

160,503. GAS-CONDENSERS. Peter Munsinger, Philadelphia, Pa., assignor to Morris, Tasker & Co., same place. (Filed Nov. 10, 1874.)

Brief.—The water-chambers are annular, placed one above the other, and have horizontal water-tubes passing between their inner sides, those of the alternate chambers in different vertical planes.

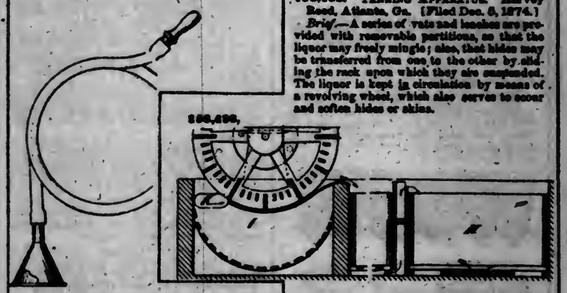


1. The series of chambers B, having perforated bottoms and provided with water-tubes C, in combination with the gas box or case A, substantially in the manner and for the purpose above described.

2. In a gas-condenser having a series of water-chambers, B, a gas box or case, A, and water-tubes C, having open communication with said chambers, the combination of the induction water-pipe *b*, with chamber B at one end of the condenser and a water-exit pipe at the other and same end as the gas-inlet, whereby as the water passes to the exit-end of the condenser its temperature is gradually raised by the action of heat of the gas upon the surfaces of the tubes, and the gradual condensation of the gas is effected as it passes between the tubes, substantially as described.

3. In a gas-condenser, the combination of the water-tubes C in different vertical planes in the alternate chambers, whereby the gas is deflected as it passes between the tubes, substantially as described.

160,504. LINING WELLS. D. L. Newcomb, Kenton, Ohio. (Filed Sept. 23, 1874.)



Brief.—The lining is let down from above, after the completion of the well, by means of long rods, leading from the lower portion to a cross-bar above, suspended by a tackle to a derrick-frame.

The mode of lining or tubing wells from top downward by means of a cross bar or beam, A, in combination with strips of wood or metal, or ropes or chains, C, made fast to and supported by said cross bar or beam A, the rope and tackle F G, and a suitable scaffold, substantially as shown and described.

160,505. TOY BUBBLE-PIPES. F. W. Pease, Metuchen, N. J. (Filed Aug. 20, 1874.)

Brief.—More convenient to use, and obviates the fragility of the common pipe.

As an improved article of manufacture, a bubble-pipe composed of a flexible tube, mouth-piece, and a bowl provided at its edges with one or more ledges or grooves for holding and supplying the solution, made and arranged to operate substantially as shown and described.

160,506. SEWING-MACHINE CASTERS. Jno. H. Plank, Bloomfield, Iowa. (Filed May 23, 1874.)

Brief.—Improvement on Patent No. 138,606, June 3, 1873. A bent lever, the lower portion forming rectangular legs, is pivoted to one of the tongues of the socket-plates in such manner that the casters at one end may be lifted off the floor, and the weight of the machine transferred to the rectangular legs, braced back against shoulders of the end piece; the opposite movement of the lever releasing the legs as a support, and restoring the whole to normal position.

The legs H and a lever, I, pivoted to one of the tongues D of the socket-plates A, and arranged in relation to the shoulders K as described, for supporting and steadying the machine, substantially as specified.

160,507. RAILWAY-TIES. Saml. L. Porter and Duane Peck, Rochelle, Ill. (Filed Sept. 10, 1874.)

Brief.—A railroad-tie consisting of two inverted hollow castings, having flat upper surfaces for rails to rest upon; said castings being united by rods or stays passing diagonally from one to the other, crossing midway between the rails, and there secured by upper and lower clamping-plates, the outer ends of the rods being notched into extensions on the castings. Projections on top of the support take into notches in foot of rail, which latter is held down on support by round-headed bolts.

1. The rail-joint support A A, having extensions C C' and cross-bars C C, as and for the purpose described.

2. The combination, with the braces C C, of the central re-enforcements D E, connected and arranged as shown and described.

3. The guide-flanges *b*, attached to bed-pieces, and having lips *b'* adapted to work in recesses of rail, as and for the purpose specified.

4. The combination of recessed rails, beds having holders *b' b'*, and adjustable clamping-bolts, to allow the rail to be raised or lowered without moving the beds.

160,508. TANNING APPARATUS. Harvey Reed, Atlanta, Ga. (Filed Dec. 9, 1874.)

Brief.—A series of vats and leaches are provided with removable partitions, so that the liquor may freely mingle; also, that hides may be transferred from one to the other by sliding the rack upon which they are suspended. The liquor is kept in circulation by means of a revolving wheel, which also serves to scour and soften hides or skins.

160,508.

1. The combination, in a series of tan-vats, of removable partitions and racks for suspending the hides, substantially as specified.

2. The combination of a series of tan-vats, a

series of leaches, and a propelling wheel, arranged as described, the leaches and the vats provided with passages for an endless current of the liquor to be forced around through the leaches and vats in succession, substantially as specified.

3. The combination of a series of removable leaches and removable partitions, substantially as specified.

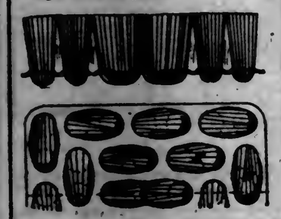
4. The wheel M, provided with internal and external projecting blades, as arranged, adapted to soften and cover hides or skins, and to keep the liquor in continuous circulation, substantially as and for the purpose described.

168,439. FEATHER-EDGE SKIVING-KNIFE FOR SHOE-MAKERS. Silas H. Reynolds and Geo. B. Newhall, Lynn, Mass. [Filed July 1, 1874.]

Brief.—The knife, as slotted and pivoted, may be rotated as the cutting edge is worn away.

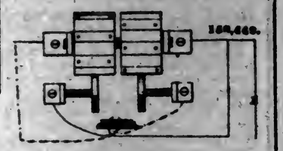
The knife *c*, formed as a segment of a circle, provided with a slot or slots, *c*, and turning upon its pivot *b*, all substantially as shown and described.

168,440. SEED-PLANTERS. W. C. Reynolds, Collierstown, Va. [Filed Aug. 15, 1874.]



Brief.—Within the hopper, and upon side supports, is placed a false bottom, having side openings, through which the seed passes to the slide. This bottom is intended to partially relieve the slide from the superincumbent weight of seed.

A false bottom, F, for seeder-hoppers, provided with adjacent support and side apertures, as and for the purposes specified.



168,441. DOOR-MAT. Orrin Rice, Adrian, Ill. [Filed Mar. 21, 1874.]

Brief.—The sheet-metal plate is punched in such a manner that the flanges of the openings take into the tufts of corn-husks that are woven into them, and then hold them from being forced out of place.

The improved mat, formed of the corn-husk tufts A and the sheet-metal back-plate B, provided with pairs of holes, the ends of each tuft being drawn through the respective holes of a pair, and held therein in the manner described.

168,442. AUTOMATIC OR CHEMICAL TELEGRAPHY. Wm. E. Sawyer, Washington, D. C. [Filed Nov. 10, 1874.]

1. A sheet, roll, or strip of paper, perforated for telegraphic transmission, in lines running from left to right, as in an ordinary printed page, substantially as shown and described.

2. The combination of a line, main transmitting-battery, contact-point brush or roller therefor, a local battery, and contact-point brush or roller therefor, with a circuit through the primary wire of an induction-coil, and a contact-point brush or roller throwing the secondary wire of the induction-coil into line and connecting the line to earth, substantially as set forth.

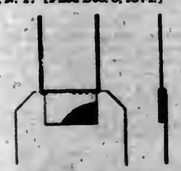
3. The combination, with a line, its battery and contact-point brush or roller therefor, or an induction-coil and contact-point brush or roller therefor connecting the line to earth, and throwing the secondary induced current into the line, for the purpose of clearing the same of tailings, as set forth.

4. The combination, with a line and its transmitting-battery, of an induction-coil, the secondary current from which is thrown into the line immediately after each signaling-pulsation, substantially as described.

5. The method of operating an automatic or chemical telegraph by first simultaneously, or nearly so, closing the transmitting-circuit and the local primary circuit of an induction-coil, and then, upon breaking the transmitting-circuit, and instantly before breaking the local primary circuit, of the induction-coil, closing the circuit of the line through the secondary wire of the induction-coil and to earth, substantially as and for the purpose specified.

6. In combination with the main-line circuit, a metallic point, brush, or roller connected or connecting to an induction-coil and to earth, substantially as and for the purposes specified.

7. The combination of a metallic point, brush, or roller closing the circuit of a local battery through the primary wire of an induction-coil, and a metallic point, brush, or roller closing the circuit of the secondary wire thereof to the line, the local circuit being broken at or just after the completion of the secondary-wire circuit, as set forth.



8. In a chemical-telegraph receiving-instrument, the combination, with a sheet within a sheet-circuit, of the primary and secondary wires of an induction-coil and resistances, as set forth.

9. A non-inductive resistance, composed of a length of wire arranged in parallel returning layers, substantially as shown and described.

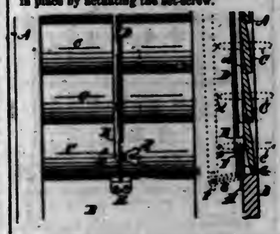
10. The combination, with a line or circuit, of a commutator, or circuit-changer or current-diverter, and two series of apparatus or batteries composed of different parts or sections or two circuits, or two parts of one apparatus or battery, the series, parts or sections, or circuits restored to being alternately connected to the line by the commutator, substantially as and for the purposes specified.

11. In chemical telegraphs, the method of producing a clear sharp record, assuming a positive-battery current to be the impulse to be recorded, by charging the line in the following manner: First, transmitting an induced positive-impulse; second, a battery positive impulse; third, an induced negative impulse, followed or not by a negative-battery impulse, or with the polarities named reversed, substantially as set forth.

168,443. TAGS. Covedre B. Sheldon, New York, N. Y. [Filed Dec. 5, 1874.]

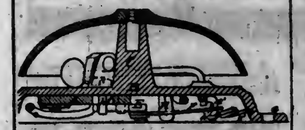
As a new article of manufacture, the tag constructed, as described, by fastening the ends of the twine under the folded corners of the card at an obtuse angle to the parallel sides of the twine.

168,444. SLATE-FRAMES. Chas. J. Shields, Adrian, Mich. [Filed Nov. 5, 1874.]



Brief.—The pencil-holder slides in the hole bored for it, and has a projecting tang, by which to slide it to the mouth of the hole to receive the pencil. It is held in place by the friction of a spring.

The sliding pencil-holder having the spring and thumb-piece, in combination with the slate-frame, adapted to receive the same, substantially as shown, and for the purpose specified.

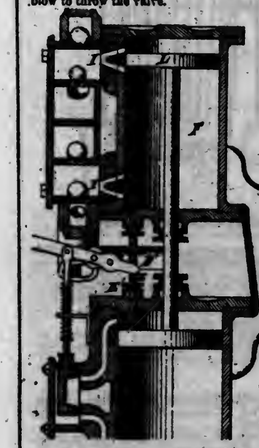


168,445. BLIND-STOPS. Edwd. S. Shrock, Lincoln, Ill. [Filed July 22, 1874.]

Brief.—A slotted connecting-bar is hinged or pivoted at its lower end to the blind-rail, while its upper end is connected by means of a thumb or set screw to the end of the slat-rod. The adjustment of the slats is desired position is readily effected, and they are held in place by actuating the set-screw.

The slotted bar G, hinged or pivoted to the rail B by means of a staple or plate, H, and arranged to operate in combination with the rod D, plate F, and set-screw F, substantially as and for the purpose specified.

168,446. DOOR-BELLS. Amos L. Swan, Cherry Valley, N. Y. [Filed Apr. 11, 1874.]

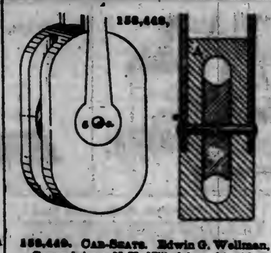


1. The combination, with the slotted sector-lever A, and the horned cam E pivoted thereto, of the fixed stop *h*, connecting said sector-lever and cam, substantially as specified.

2. The combination, with the sector-lever A and horned cam E, pivoted together, of the fixed stop *h*, hammer-crank *c'*, spring *g'*, connection F, and stop H, adjustable for single or double strokes, substantially as specified.

168,447. STEAM-PUMPS. Fuller Trump, Springfield, Ohio, assignor to Jas. Loffel & Co., same place. [Filed Dec. 4, 1874.]

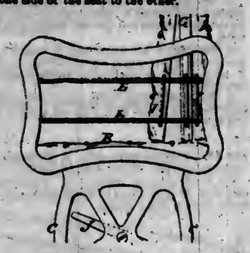
Brief.—The pump-piston being suddenly relieved of pressure causes it to receive a sudden impulse, which gives the tappets a quick blow to throw the valve.



1. In combination with the steam-cylinder, the valve of which is actuated by a tappet at each stroke of the piston, a pump-cylinder constructed with double ports, the channels of which open on opposite sides of the piston of the pump when near the end of the stroke, substantially as set forth.

2. In combination with the cylinder F and piston-head L, and double ports *l*, the tappet-rod E, lever D, valve-stem and springs of the steam-valve, substantially as set forth.

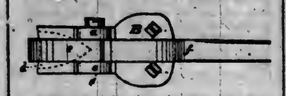
168,448. PULLEY-BLOCKS. John Weir, New York, N. Y. [Filed Dec. 12, 1874.]



1. The U-shaped bail C, having tapered or flared extremities, embedded into the wood of the block, the said extremities receiving the riveted ends of the sheave-axle *a*, substantially in the manner shown, and for the purpose specified.

2. The U-shaped bail C, having tapered or flared extremities, with circular or polygonal bosses *c c*, to receive the riveted ends of the sheave-axle *a*, when the said extremities and bosses are embedded into the wood of the block, nearly or quite flush with the same, substantially in the manner shown, and for the purposes set forth.

168,449. CAR-SEATS. Edwin G. Wellman, Canandaigua, N. Y. [Filed Aug. 20, 1874.]



Brief.—A seat with a three-part back centrally divided, said back sliding on rods from one side of the seat to the other.

1. The three-part back, having sections F F, made each in two parts, divided on the line H, as and for the purpose described.

2. The combination of three connected joints F G F, having each a staple, I, with rods E E on the arms, as and for the purpose specified.

168,450. PINCH-BARS. William Wertz, Camden, N. J. [Filed June 27, 1874.]

1. The bar or lever A, with curved lifting-face *e* and reverse curve *f*, substantially as and for the purpose set forth.

2. The construction of the front end of the shoe B with a concave, *d*, as and for the purpose specified.

168,452. PARALLEL RULERS. H. Andrews, New Haven, Conn. [Filed July 13, 1874.]

Brief.—The parallel lines are ruled from the adjustable inclined bar, and the space between the lines depends upon the inclination of this bar.

1. The stationary bar A, provided with teeth in one edge, combined with the movable bar B, provided with a pawl, *d*, constructed so as to pass freely over the teeth in one direction, but to act against the teeth in the opposite direction, substantially as described.

2. In combination with the stationary bar A, provided with teeth in one edge, the movable bar B, provided with the pawl *d*, the adjustable bar C, substantially as described.

168,451. RABBIT STOCK-FENCES. Francis T. Wilson, Ames, Iowa, assignor to himself and B. J. Bartlett, same place. [Filed Oct. 2, 1874.]

Brief.—Two short pointed pieces are inserted into an eye formed in the horizontal wire, crossing each other and secured by a staple, so as to present points in four directions.

The combination of the pieces B and staple D with the eye A on the rod C of a wire fence, substantially as specified.

168,453. BRICK-MACHINES. Edwin F. Andrews, St. Louis, assignor of two-thirds his right to Alfred W. Roper, St. Louis, and Jos. D. Roebuck, Glasgow, Mo. [Filed Dec. 10, 1874.]

Brief.—Cams on a transverse shaft operate a tilt-hammer, and simultaneously, in the first instance, press against a block, (afterward tilted out of the way,) to move the mold forward for reception of the clay. The hammering thereon being completed, the mold is again automatically advanced to have its contents struck onto a table. The unceasing rotation of the cams now acts on other devices, to return the mold-carriage for another operation.

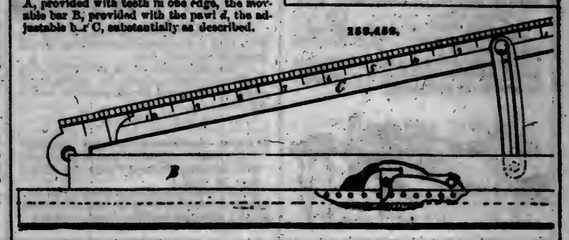
1. The combination of trip-hammer E F I, fixed mold-bottom U, and sliding portion S, substantially as set forth.

2. The sliding bottomless portion S, having extension S', to receive the clay, and combined with the reciprocating knife Y, all as set forth.

3. The combination of the sliding portion S with discharging-plunger *x*, having a guide, *y*, entering the groove *z* in the mold, all substantially as and for the purpose set forth.

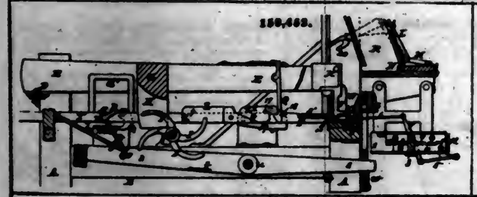
4. The combination of the plunger or ram *x*, lever *s*, jointed arm or cam-yoke *a*, cam I', and sliding frame T, forcing the yoke into the course of the cam as the bottomless mold arrives at its discharging position, as described.

5. The combination of the reciprocating frames 4 and 9, having inclined lugs 8 and 10, and associated with rest I between the bars of the frame 3, all substantially as and for the purpose set forth.



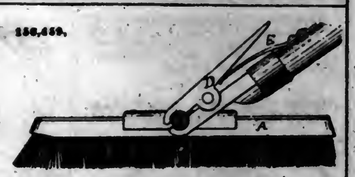
6. The combination of the feeler N, bell-cranks L and P, hammer-helve E, lugs or pins K, and hook Q, substantially as and for the purpose set forth.

7. The combination of the pin K, bell-crank L, feeler N, mold S U, hammer F, helve E, hook Q, and bell-crank P, to cause the filling of the mold until the same is filled to a certain height, when the filling is stopped, all substantially as set forth.



8. The combination of cams I', mold-slide T, tilting bearing-block Z, sliding block *b*, pin or lug *a*, ratchet-rod *c*, dog *c*, helve K, and fixed and adjustable stops *g* and *g'*, all substantially as set forth.

9. The combination of pivoted block or arm *j*, cam I', sliding frame T, cam-yoke *a*, lever *s*, pins *l*, hooks *k*, and ledges *m*, all substantially as and for the purpose set forth.



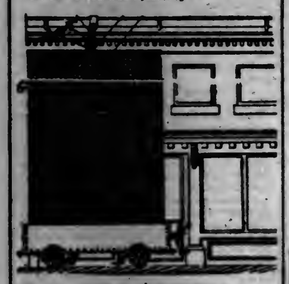
168,453.

156,453.

156,459.

A scrubbing-brush consisting of brushes A A; united by a plate, B B, having neck b and a holder, D E F, as shown and described.

156,454. SAW-CLAMPS. S. P. Babcock, Adrian, Mich. [Filed July 20, 1874.]



Brief.—Abutments within the jaws bear alternately to each other upon the saw, and prevent vibration. The movable jaw is adjusted for blades of different thickness by means of a bolt, which secures the straining-iron adjustably to the board.

1. The combination of the jaws A B, the former having the projections *i i*, and the latter the projection *j*, constructed and arranged as and for the purpose set forth.

2. The combination, with the jaw B, having the springs *c c* and the board D, of the lever H, straining-iron K, and bolt S, for adjusting the jaw B, as and for the purpose set forth.

156,455. FIRE-SHIELDS. John Babson, Boston, Mass., and J. B. Mulford, New York, N. Y. [Filed Oct. 3, 1874.]

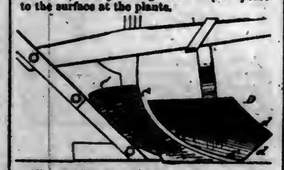
A screen or apron, C, of asbestus-cloth, employed as a protection of buildings or other property from fire, in manner substantially as herein set forth.

156,456. HEEL-TRIMMING MACHINES. Cyrus C. Ballou, Albany, assignor to East New York Boot, Shoe, and Leather Manufacturing Company, New York, N. Y. [Filed Aug. 20, 1873.]

Brief.—The centering-spring is flattened in reverse directions, to permit it to play horizontally as well as vertically.

1. The combination of the cutter-head F, having the side flanges J J, with the knives H H, as and for the purpose herein set forth.

2. The cutter-head F, having projections *f f'* interlocking into the circular grooves of the rollers K and L, as and for the purpose specified.



3. The inside roller, K, when arranged in relation to the shaft B, bushing E, and spring M, substantially as and for the purposes set forth.

4. The shaft B and cutter-head F, in combination with the spring D, and adjusting-screw N, substantially as and for the purpose herein described.

5. The centering-spring B, when flattened in reverse directions, as and for the purposes specified.

156,457. COTTON-SCRAPERS. G. W. Beard, Grenada, Miss. [Filed Nov. 16, 1874.]

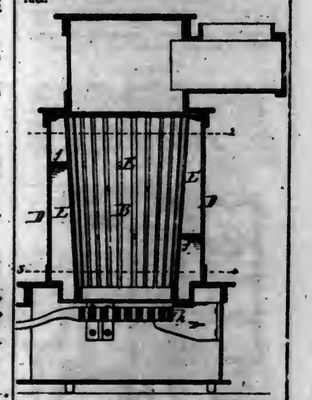
Brief.—A concave scraper on a curved standard, its edge rising from the plow-point to the surface of the plants.

The combination, with bar-share plow C, of the scraper D, concaved on its working-face, and having the edge *d'* corresponding to that *c'* of plow, the said scraper and plow being secured to separate standards, and relatively arranged, as and for the purpose specified.

156,458. WASH-BOILER ATTACHMENTS. William J. Bennett, Beaver Dam, Wis. [Filed Dec. 11, 1874.]

Brief.—A secondary or false bottom has upturned lips, to prevent fabrics from stopping the cavities intended for the ascending seds. A slide-valve is also used to close the orifices at the inner sides of top ends of tubes at the ends of the false bottom.

1. The plate A, provided with the semicircular slots *a*, and upwardly-bent lips *b*, for the purposes herein set forth.



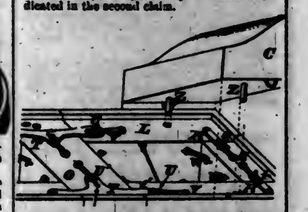
2. The combination of the perforated tube C, shield D, with rod *d* and the spring G, all substantially as and for the purposes herein set forth.

156,460. SCRUBBING-BRUSHES. Michael Biglin, Marr, assignor of one-half his right to M. F. Reap, Pleasant Valley, Pa. [Filed Nov. 21, 1874.]

Brief.—A casting attaches two brushes side by side, leaving a journal between the two, to which a clamping-handle is loosely attached.

156,460. FURNACES AND HEATERS. Felix Blasiczk and Georg W. M. Bauer, Vienna, Austria. [Filed Oct. 26, 1874.]

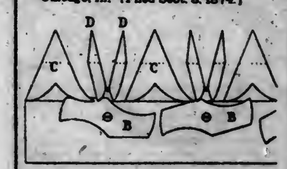
Brief.—The webs between the bars direct the uprising air lawardly through the mass of fuel.



1. The combination, in a fire-box, of a casing, D, and a series of vertical plates or bars, E, arranged with their rear edges in contact with the said casing, to form intermediate air-channels, communicating at their lower ends with an air passage or chamber, all as and for the purpose set forth.

2. The combination, with the bars E, arranged within the casing D, of air-deflecting ribs *f* between the bars, as specified.

156,461. SECTIONAL MATTRESSES. George Block, Newport, Ky. [Filed Aug. 28, 1874.]



Brief.—The mattress consists of an upper and a lower section, each composed of several members, and the members of the lower section are coupled together by the devices indicated in the second claim.

1. The divided mattress consisting of the upper section A, composed of separable members C D E, and the lower section B, composed of two or more separable members coupled together, substantially as described.

2. The coupling devices consisting of slotted straps S T, staples Q U U', and hooks R V V', in combination with the several members I J K L M N O of the lower section B, substantially as set forth.

156,462. HARVESTER-CUTTERS. Edwin J. Blood, Vernon, Wis., and Albt. D. Hager, Chicago, Ill. [Filed Sept. 3, 1874.]

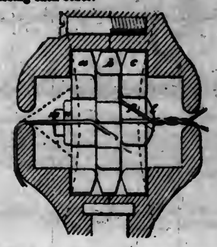
A finger-guard composed of alternate fingers C D D, constructed as shown and described, and finger E, with straight and slant ing sides, when combined and arranged to operate, in connection with knives B, in the manner substantially as and for the purpose set forth.

156,463. ATTACHMENTS OF BELLS TO HAMES. Mathew F. Boland, Philadelphia, Pa. [Filed Dec. 10, 1874.]

1. The bridge C, formed by prolonging and bending the metallic side band of a hame, and riveting the end of the band on the opposite side, substantially as described.

2. The bridge C, constructed as described, in combination with the bell D, substantially as and for the purpose specified.

156,464. BOTTLE-STOPPERS. Wendel Bourguignon, Providence, R. I. [Filed Oct. 24, 1874.]

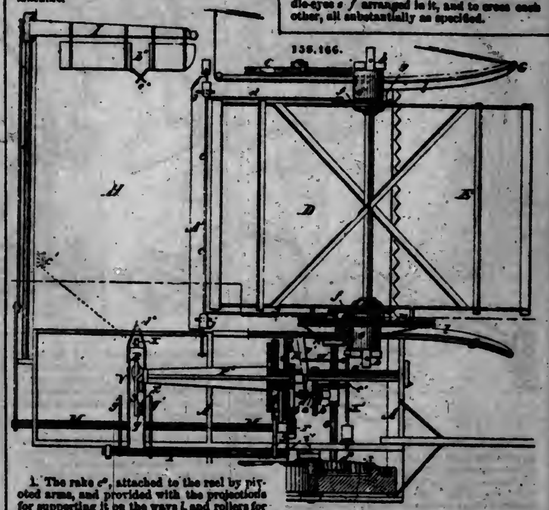


Brief.—By revolving a collar placed around the neck of the bottle, and having oppositely-inclined slots, the cap containing the cork is fastened in the bottle or removed therefrom.

In combination with the oppositely-inclined grooved band C, the cap A, provided with arms B B' and suitable fastening-pins *b b'*, constructed to operate substantially as and for the purpose set forth.

156,465. GRAIN-BINDERS. S. D. Carpenter, Madison, Wis. [Filed Dec. 8, 1874.]

Brief.—Three spur-wheels, united by a bolt, are located in a shuttle, which, as it moves along, causes the wheels to rotate and twist the band. When this is accomplished the wheels are caused to move at unequal rates of speed, when the wire is severed by the spurs or teeth passing each other.



1. The herein-described twister, consisting of the three spur-wheels *a b c*, when constructed and arranged to operate substantially as described.

2. The shuttle-race D, provided with the cogs, constructed and arranged as herein described, whereby the twister is caused to twist the band, cut off the wire, and retain the spool end of the same, substantially as and for the purpose set forth.

3. The twister-wheels *a*, *b*, and *c* united by and journaled on a bolt which has no other support, the said wheels and bolt being fitted loosely within the shuttle, substantially as shown and described.

156,466. GRAIN-BINDING HARVESTERS. S. D. Carpenter, Madison, Wis. [Filed Dec. 8, 1874.]

Brief.—The cut grain that falls upon the platform is carried by a rake back upon a secondary platform, where it is carried by a sibling rake to the binding arrangement, and, when bound, automatically thrown from the machine.

156,466.

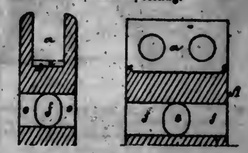
1. The rake *c'*, attached to the reel by pivoted arms, and provided with the projections for supporting it on the ways *l*, and rollers for supporting it on the platform, in combination with the actuating-cams *e*, all constructed and arranged to operate as and for the purpose set forth.

2. The cams *e*, arranged to be adjusted as set forth, whereby the movement of the rake *c* can be regulated, as described.

3. The rock-shaft Y, provided with the arms *g'*, arranged in relation to the binder in such a manner that said arms shall rest under the bundle while being bound, said shaft Y having attached the pivoted rods, arranged to be operated by the pin *i* of wheel *e*, substantially as described, whereby, when the bundle is bound, the arms *g'* are caused to remove it from the machine, as set forth.

4. In combination with the reel E and rake *c*, the cams *e*, levers *f*, and rods *h*, arranged to operate the rake, as set forth.

5. The platforms D and H, in combination with the reciprocating rake I and hinged cut-off A', arranged to operate substantially as and for the purpose set forth.



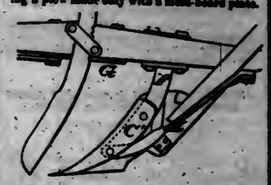
6. The swinging arm *s*, constructed and operated substantially as described, in combination with the rock-shaft M, provided with the pinion *r*, for imparting an intermittent reciprocating motion to the rake I, as set forth.

7. The wheel *u*, secured upon the shaft *n'*, and carrying the elbow-lever *r'*, in combination with the cam *t* and the shaft *o'*, with its pinion *p'*, arranged to operate as described, for imparting motion to the compressing or binding arms, as set forth.

8. The sheave or pulley X, inclosed within the spring-case *n'*, for guiding the binding-wire of a reaping and binding mechanism.

156,467. HAMMERS FOR DRESSING STONE. Wm. W. Castle, Belfast, Me. [Filed Dec. 9, 1874.]

Brief.—The hammer-head has recesses for holding the dressing chisels. Each of the recesses has two projecting lips, which prevent the chisel-heads from upsetting.

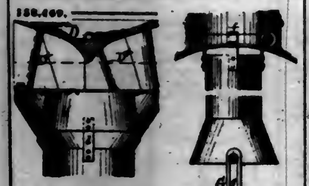


1. In a hammer for dressing stone, the head A, provided with the lips *e e*, arranged with each of its cutter-holding recesses *a*, as and for the purposes set forth.

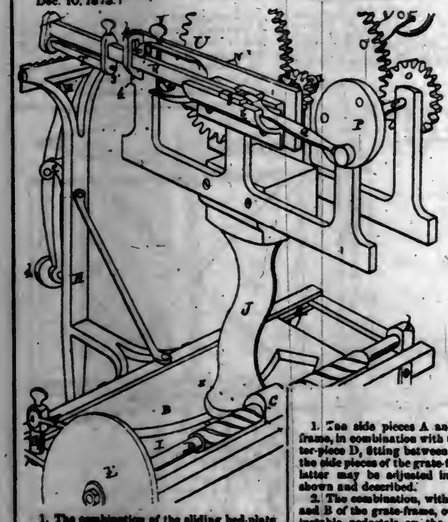
2. The head as provided with the two handle-eyes *s f* arranged in it, and to cross each other, all substantially as specified.

156,468. STUMP-PLOWS. Vesco M. Charles, Clay City, Ill. [Filed Oct. 3, 1874.]

Brief.—Devices for bracing and strengthening a plow made only with a mold-board plate.



In a plow, the combination, with the narrow-flanged mold-board C, of the bifurcated standard F, and the portion *h*, curved and fitted to the back of the mold-board, the diagonal brace E, and brace I, substantially as and for the purpose set forth.

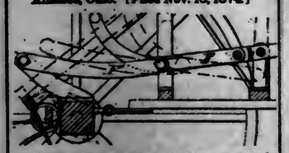


156,469. LOCOMOTIVE SMOKE-STACKS. Edwd. Cleary, Houston, Tex. [Filed Dec. 10, 1874.]

In combination with a smoke-stack, constructed as described, the petticoat-pipe F, provided with the springs *f* and the slotted bar G, substantially as and for the purpose shown and described.

No. 158,469.

No. 158,470.



1. The combination of the sliding bed-plate B, provided with the segmental slot l and nut C, the adjustable standard J carrying the filing mechanism, the screw D, the disk E, provided on its face with a series of concentric circles divided as described, and the adjustable index F, all constructed and arranged to operate substantially as and for the purposes herein set forth.

2. In combination with the reciprocating filing-bar R, the pressure-spring U with roller l, for the purposes herein set forth.

3. The combination, with the reciprocating filing-bar R, of the pressure-spring U, roller l, and adjusting-screw V, substantially as and for the purposes herein set forth.

No. 158,470. SAW-FILING MACHINES. Jerome Cleveland, Tecumseh, Mich., assignor to himself and H. Haines, same place. [Filed Dec. 10, 1873.]

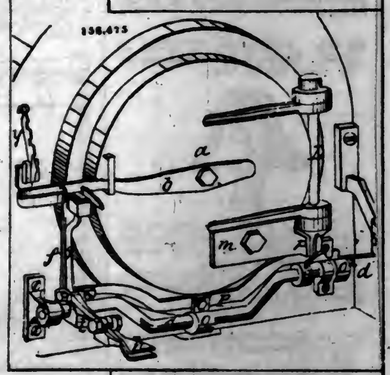
No. 158,471. HORSE HAY-RAKES. A. W. Coates, Alliance, Ohio. [Filed Nov. 16, 1874.]

The foot-lever G G', pivoted over a front-closed and rear-open box, g, and combined on a hay-rake with the toggle F F', as and for the purposes specified.

No. 158,472. GRATE-FRAMES. H. M. Creamer, Brooklyn, N. Y. [Filed Sept. 5, 1874.]

Brief.—The frame is adjustable both vertically and horizontally, to adapt it for different-sized fire-places.

No. 158,472.



1. The side pieces A and B of the grate-frame, in combination with the adjustable center-piece D, fitting between the upper ends of the side pieces of the grate-frame, whereby the latter may be adjusted in width, as herein shown and described.

2. The combination, with the side pieces A and B of the grate-frame, of the vertically-adjustable pedestals on the lower ends of the side pieces for adjusting the same in height, substantially as and for the object specified.

3. An adjustable or variable grate-frame, consisting of two separate pieces constructed to join at the top and center, two separate pedestals, a separate center-piece, and means of uniting them, combined substantially as herein described.

No. 158,473.

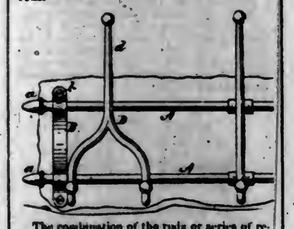
A shirt bosom provided with the graduated scale D, by which to cut out the front neck-piece, and the graduated scale E, by which to cut out the rear neck-piece, substantially as described.

No. 158,473. OX-SHOES. John R. Davis, Bradford, Vt., assignor of one-half his right to George Baldwin, same place. [Filed Nov. 21, 1874.]

Brief.—The foot or upper surface of the shoe is provided with two cavities for the reception of the soft parts of the divided hoof, and the tread-surface with double side calks.

1. The sectional ox-shoe, having the recess *b* for the reception of the pad, and the recess *b'* for the reception of the head of an ox's hoof, substantially as specified.

2. In a sectional ox-shoe, the combination of the calks *d d'* and the flanges *e e'* upon the lower lateral edges thereof, substantially as and for the purpose set forth.

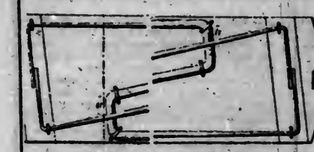


No. 158,474. DEVICES FOR OPENING AND CLOSING FURNACE-DOORS. Saml. L. Denney, Gap, Pa. [Filed Nov. 16, 1874.]

Brief.—By depressing the first lever the latch is disengaged. By continuing the pressure the lower lever is depressed, which operates a shaft having an arm that connects with the door near the hinge. The door is closed by a second arm on the shaft, which operates on a lug projecting from a plate on the door.

The combination of the shaft *e*, stands *d d*, levers *c* and A, lifting-rod *g*, horizontal lever F, arms *c' c''*, plate *m*, spring *w*, and catch-spring X, substantially in the manner as herein set forth.

No. 158,475. CLOTHES AND HAT RACKS. R. R. Dorr, Burlington, Iowa. [Filed July 22, 1874.]

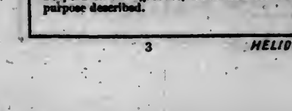


Brief.—The rods are provided with screw-cap nuts, and the hooks are adjustable on the rods.

The combination of the rods or series of removable rods A A, brackets B, screw-cap nuts *a*, and adjustable hooks D, substantially as and for the purpose specified.

No. 158,476. SHEET-BOOMS. Thos. M. Denham and Edward Denham, New Bedford, Mass. [Filed Nov. 26, 1874.]

No. 158,477. TORSION-SPRINGS. Richd. Dudley, Erie, Pa. [Filed Dec. 10, 1874.]

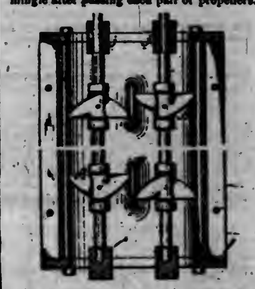


1. The torsion-spring B, formed with a curve at its head *b*, said head being so bent as to allow the long arm of the opposite spring to pass over or under the same, substantially as described.

2. A torsion-spring, B, having the long arm B of a tapering form, substantially as and for the purpose specified.

No. 158,478. FIRE-SHOVELS. Jas. Edgar, New York, and Alfred Bardell, Brooklyn, N. Y. [Filed Nov. 26, 1874.]

Brief.—The edges of the upper sheet being bent over the edges of the lower, a smooth surface is formed for the grasp of the hand.



The combination of the protector C with the extension or handle B of a sheet-metal fire-shovel, the protector being constructed to cover and overlap the edges of the handle, and secured thereon, substantially in the manner herein shown and described.

No. 158,479. CURLING-IRONS. Sigmond Feder and L. Rosenstein, Memphis, Tenn. [Filed Aug. 16, 1874.]

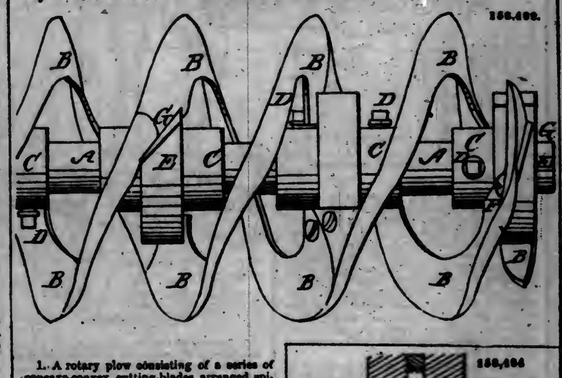
In a curling-iron composed of the concentric tubes A B, the combination of the point B' and nozzle B* with the point A' and nozzle A*, substantially as shown and specified.

No. 158,480. ROTARY PUMPS. G. S. Follensbee, Lewiston, Me. [Filed June 20, 1874.]

Brief.—The propellers upon the parallel shafts are placed opposite each other, and are separated by diaphragms to counteract the whirling movement of the currents, which mingle after passing each pair of propellers.

1. The combination of the casing D of oblong or elliptical sectional form, its partitions *a* and parallel shafts B B', carrying propellers A A, arranged adjacent to the said partitions, substantially as described.

2. The combination of the flanged sections *b b'* of the casing, the longitudinal grooves formed in the same, and the rope packing *d*, adapted to said grooves, all as and for the purpose described.



No. 158,481. SLEDS. Stephen E. Foster, Minneapolis, Minn. [Filed Dec. 6, 1874.]

The plates *a e*, provided with a semicircular depression and bolts *b b*, in combination with bars C, cross-beam B, and runners A A, substantially as and for the purpose set forth.

No. 158,482. ROTARY PLOWS. Wm. H. Foyo, San Francisco, Cal. [Filed Dec. 22, 1874.]

Brief.—Circular knives, made in sections, are coiled around a shaft in continuous spiral form. These knives are concavo-convex in cross-section, and are sufficiently thin to be somewhat flexible. They are secured to movable collars upon the shaft, by which means they can be sprung apart or compressed, to vary the width of furrow

1. A rotary plow consisting of a series of concavo-convex cutting-blades arranged spirally around a supporting and driving shaft, substantially as described, for the purpose specified.

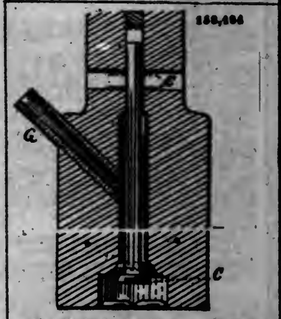
2. The spiral cutting-blades adapted for adjustment upon the shaft, for the purpose of regulating their cut, and the consequent width of the furrows, substantially as described.

3. The combination of the adjustable collars and slotted wedges with the concavo-convex cutting-blades and the main supporting-shaft, substantially as described, for the purpose specified.

4. A rotary plow having two sets of concavo-convex blades arranged spirally around the supporting-shaft, so as to extend outward in opposite directions from the center thereof toward the ends, substantially as described, for the purpose specified.

5. The blades of a rotary plow, each made with a spiral curve, and with a concavo-convex form transversely, substantially as described, for the purpose specified.

No. 158,483. SODA-WATER AND SYRUP COCKS. William Gee, New York, N. Y. [Filed Dec. 1, 1874.]



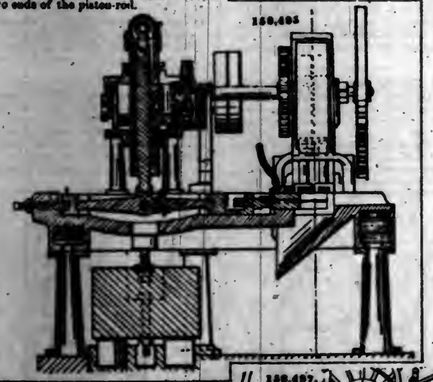
Brief.—The soda-water passes under the main valve of the cock into the passage in the stem, and enters the chamber in the elbow, from whence it passes into the tube through the perforations, by means of which an unbroken column is produced, and also a gentle draft of the syrup, which causes both to be thoroughly mixed as they enter the tumbler.

The perforated tube E, in combination with the chamber *t* in the elbow *f*, substantially as and for the purpose shown and described.

No. 158,484. DIES FOR HEADING BOLTS. Robt. Gracey, Alliance, Ohio, assignor of two-thirds his right to Chas. E. Marchand and Thos. E. Morgan, same place. [Filed July 10, 1874.]

Brief.—The die is in the main rectangular, but at the orifice is to a slight depth circular, and of a diameter equal to that of the die proper diagonally. The valve, to permit, when open, the flow of water, closes by contact with the bolt-blank, but, so soon as contact has ceased, opens again by the weight of its stem, or, that failing, by the force of a spring.

No. 158,484



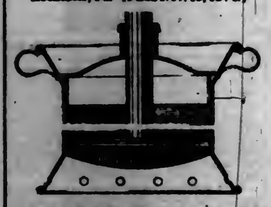
1. A die for forming heads upon bolts and screws, having a cavity in its outer surface for shaping the heads, an aperture extending therefrom, in which a valve is placed for controlling the flow of water through said cavity for the purpose of washing away any oxide or dirt which may accumulate therein, and for keeping the die cool while in use, and the latter provided with a tube or passage for conducting the water to the aperture through which the valve-stem moves, substantially as described.

2. In a die for forming heads upon bolts and screws, the combination of a heading-cavity, the valve C, stop E, spring F, and water-induction pipe G, the parts being arranged to operate substantially as and for the purpose set forth.

156,486. MACHINES FOR HEADING BOLTS. Robt. Ormsby, Allianee, Ohio, assignor of two-thirds his right to Chas. E. Marchand and Thos. B. Morgan, same place. [Filed July 10, 1874.]

Brief.—The movable section of the griping-die is actuated, through the medium of toggle-links, by the weight of a heavy cam-yoke, to close the die, and by a cam that raises the yoke and toggles to open it. The header is actuated, through the medium of toggle-links, by a steam-engine, to raise the toggles and retract the header, and by a weight to distend the toggles and impart the blow, the weight and toggles being connected, respectively, to the two ends of the piston-rod.

1. The combination, substantially as described and shown, of the devices for griping the bolt-blank, comprehending the dies E K, toggle-links L, cams X, and weighted cam-yoke Y, the devices for heading the bolt, comprehending the header H, toggle-links J, and the weight S, and the steam-engine for elevating said toggle-links J and weight S.

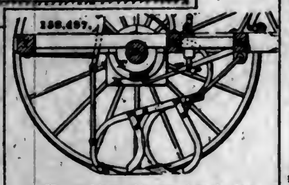


2. The mode of combination of the drop-weight S, the toggle-links J, and the steam-engine, said toggle-links and weight being connected to the two extremities of the piston-rod of said engine, substantially as shown and described.

3. The combination, as described and shown, of the toggle-links L, cams X, and the weighted cam-yoke Y with the dies E K.

4. The combination, with the devices as specified in the first claim for griping and heading the bolt-blank and the steam-engine, of cam E and weighted lever d, for reciprocating the valve of said engine.

5. The combination of the weight S, rods T T, adjusting-nuts b b, cross-head E, piston-rod P, connecting-rod V, toggle-levers J J', and heading-die H, the parts being arranged substantially as described and shown, whereby the heading-die, which forms a stop for the blank when it is inserted, is made adjustable for the purpose of determining the amount of metal which shall constitute the head of the bolt or other device.

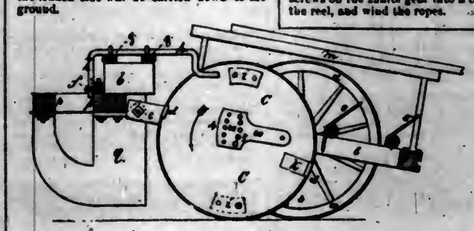


156,496. STARCH-STRAINERS. W. Graham, Rochester, Pa. [Filed Nov. 18, 1874.]

In starch-strainers having perforated walls A, the combination of the plunger B, grooved disk C, and gum ring D, substantially as shown and described.

156,497. CORN-PLANTERS. Marshall Gregg, California, Mo., assignor of one-half his right to William A. Lyons, Chamois, Mo. [Filed Sept. 9, 1874.]

Brief.—Within the frame are secured seed boxes, through which passes the axle of the bearing-wheels for agitating the seed. Upon this axle is secured a cam-wheel, which strikes as it revolves the projecting ends of the slides moving in the seed-boxes below the axle. The slides are retracted by spring-bars, which are forced apart (carrying the seed-slides out of contact with the cam-wheel) by a T-shaped lever working between them.



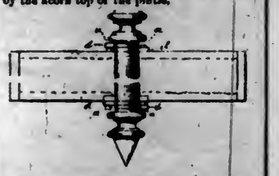
1. The seed-boxes M, secured to the frame, and having the axle-shaft B passing through them, in combination with the seed-dropping device D D, as and for the purpose set forth.

2. The combination of the cam E, fast upon the axle-shaft, the slides D, the inner ends of which bear against the cam, the springs F F, and seed-boxes M, secured to the frame directly over the axle, substantially as set forth.

3. The combination of the cam E, seed-slides D D, springs F F, and spreader or two-armed lever P, substantially as and for the purpose set forth.

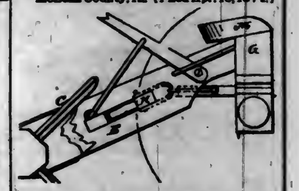
156,498. CORN-PLANTERS. Henry P. Hall, Bloomington, Ill. [Filed Sept. 12, 1874.]

Brief.—Within adjustable bearings, near the center of the frame, is placed a wheel provided on its periphery with markers and cams, the latter striking in their rotation the rear ends of bent rocking arms, which actuate the seed-slides. To check inaccuracies in planting, the cam-wheel has a lead inserted into its periphery, so that when the wheel is raised the loaded side will be carried down to the ground.



1. The wheel C, provided with the markers *d d*, weight *h*, and cams *i i*, and made adjustable in adjustable plates or bearings *n n*, attached to a frame connected with a corn-planter, for the purposes herein set forth.

2. The combination of the adjustable weighted marking-wheel C, provided with cams *i i*, the crank-shafts A A, and the sliding bar *f*, which forms or is connected to the dropping mechanism of a corn-planter, substantially as and for the purposes herein set forth.

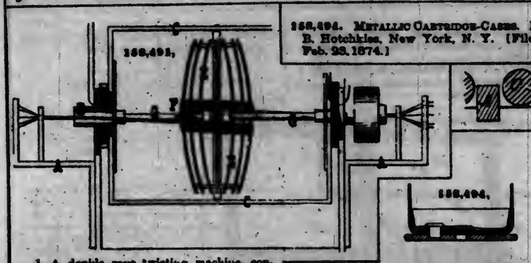


156,499. HINGES. Frederick J. Hattorf, New Haven, Conn. [Filed Dec. 5, 1874.]

Brief.—A pair of permanent attaching plates, constructed with a trunnion at each end, and a flange upon their outer edge, are fitted with a corresponding pair of plated or ornamental covering plates carrying the eye and pintle, and constituting the hinge proper. These covering-plates are held in place by suitable link-connections, which engage both the pintle and the trunnions, and are secured by the acorn top of the pintle.

The permanent plates A B, each constructed with the flange C upon its outer edge, and with a trunnion, *c*, at each end, combined with the jointed covering-plate D and links *d d*, substantially as described.

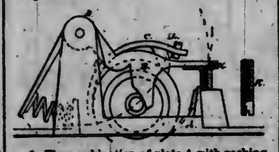
156,500. HORSE HAY-RAKES. A. T. HAYS, McLean County, Ill. [Filed Apr. 16, 1874.]



The combination, with the front axle, sand-board, and wheels of a wagon, of the bolster G, the inclined arms E E, rigidly connected to the bolster, the coupling I flexibly connected to the cross-bar H, and king-bolt *b*, and the rake-head A, provided with turn-teeth C C at each end, and turn-teeth D D at the center, all substantially as and for the purposes herein set forth.

156,501. ROPE AND CORDAGE MACHINES. Luther B. Kirby, Belleville, N. J. [Filed June 30, 1874.]

Brief.—A two-part reel is journaled in the spinning-frame at right angles to it. The spinning-frame has hollow bearings, and the strands, led through these at either end, are twisted into ropes. Pinions on shafts at either side of the frame gear into stationary cog-wheels, and, as the frame revolves, endless screws on the shafts gear into a cog-wheel on the reel, and wind the ropes.



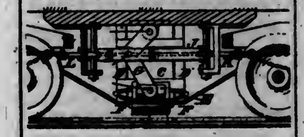
156,494. METALLIC CARTRIDGE-CASES. B. B. Hotchkiss, New York, N. Y. [Filed Feb. 23, 1874.]

A metallic cartridge-case having a valve opening inward, substantially as and for the purposes herein specified.

156,495. SAW-HOLDERS. R. B. Hugunin, New York, N. Y. [Filed Dec. 30, 1874.]

Brief.—A ratchet-wheel composed of a series of wheels fastened together, and having their teeth at irregular distances from each other, is secured upon the set-shaft and acted upon by a set of pawls of different lengths.

1. The combination of plate A with rocking arm B, roller M, and the arm-adjusting screw E, substantially as and for the purposes specified.



2. The combination of plate A with rocking arm B, roller M, arm-adjusting screw E, and the double-armed balance-clamp adjusting-screw L, substantially as and for the purposes specified.

3. The combination of plate A with roller-arm B, roller M, arm-adjusting screw E, and depression extending inwardly from the plate furnished with screw-thread at its deepest point, substantially as and for the purposes specified.

4. The combination of plate A, roller-arm B, roller M, and the arm-adjusting screw E, having a neck, F, and a bearing, H, and working through a slot or opening, G, in arm B, substantially as and for the purposes specified.

156,496. CAR-BRAKES. Numon N. Horton, Kansas City, Mo. [Filed Nov. 26, 1874.]

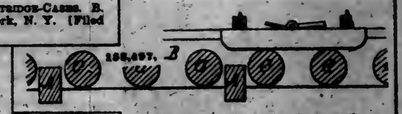
Brief.—Brake-shoes applied to rails, and operated and retracted in vertical guides by force applied near their bottom. Levers and chains so combined that the brake will be operated by a draft from either end of the car.

1. The combination of the brake-shoes C C, to work within vertical guides D D, the transverse beam I, bearing on said shoes near their lower ends, and the springs E E for elevating the shoes when released, all constructed and to operate substantially as set forth.

2. The combination of the brake-shoes C C, transverse beam I, toggle-lever G, and universal knuckle-joint H, as and for the purposes set forth.

3. The combination, with the brake-shoes C C and transverse beam I, of the toggle G, the yoke J, and the horizontal levers K L, for permitting the movement of the toggle in one and the same direction by a draft from either end of the car, as set forth.

156,502. HEAD-BLOCKS FOR SAW-MILLS. John R. Jackson, Putnamville, Ind. [Filed Sept. 5, 1874.]



Brief.—The rollers in the stringers for a roller-sled for logs are made detachable by cross-trees provided with cars and wedges. The sled is provided with side rollers and a crank brake-lever with friction-shoes.

Ratchet-wheel *e*, dogs *g*, frame *v*, gage *o*, pawls *s*, and the two levers *t* and *k*, all arranged and combined as and for the purpose described.

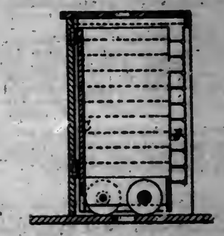
156,497. ROLLER LOG-SLIDES. Chancey B. Jackson and Chas. N. Humphrey, Philipsburg, Pa.; said Humphrey assignor of his right to Hoover, Harris & Co. [Filed Nov. 21, 1874.]

Brief.—Set-screws are arranged with the balance-arms, roller, and springs of a sash-holder, so as to graduate the pressure at will, without removing the fixture from the sash-frame.

1. The log-sled D, having horizontally-rotating anti-friction wheels E, in combination with the crank-shaft B, provided with shoes *s s* and rollers O O, journaled in the stringers B B, the upper surfaces of which are provided with metallic strips *b b*, substantially as described and for the purpose set forth.

2. The detachable rollers C, stringers B, and cross-trees A, combined and arranged substantially as specified.

156,498. STEEL BRUSHES FOR CLEANING CASTINGS. Chas. W. Jenkins, Richmond, Va. [Filed July 8, 1874.]



Brief.—The removable tufts of steel are held in place in the back of the brush by a hinged cover.

The body A, provided with conical openings, in combination with the grooves D and their conical heads, and the cover B, as and for the purpose set forth.

156,499. FRUIT-DRIERS. Edgar A. Jones, Sturgis, and Chas. W. Jones, Centreville, Mich. [Filed Aug. 26, 1874.]

Brief.—The car is placed in a heated chamber to be filled with fruit. As each sliding shelf or screen is inserted in the car, a corresponding damper in the wall of the chamber is closed to prevent access of cold air. When the car is filled it is removed to a drying-chamber.

1. In a fruit-drier, the hot-air chamber, permanently closed on two sides, with a door to admit a car, and having its front closed by L-shaped slats, provided with suitable means for retaining them in proper position, as and for the purpose set forth.

2. The combination, with the hot-air chamber A, of the car or truck C, closed on three sides, and provided with fruit-screens, and having its open front closed by the L-shaped slats on the front of said chamber, corresponding in number to said screens, as and for the purpose set forth.

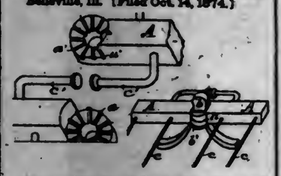
156,500. CAR-LAMPS. John Kirby, Jr., Adrian, Mich. [Filed July 24, 1874.]

Brief.—A car-lamp frame adapted to a candle-holder and its globe is fitted to receive a lamp and its chimney.

In a car-lamp having a smoke-pipe, E, and upper and lower spring globe-holders E F, and a frame, the combination of the annular reflector F, having the chimney-holding springs *e*, with the brace-ring *e*, as and for the purpose described.

No. 158,500.

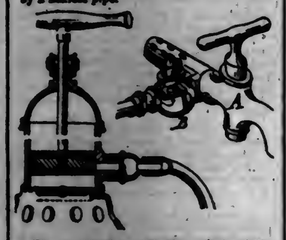
158,501. TORPEDO-BOATS. H. F. Knapp, New York, N. Y. [Filed Sept. 23, 1873.]



1. The combination of the propeller D and propeller-shaft C with the percussion-torpedo E, all arranged as specified.

2. The rudder J, combined with the spring L and plates g, as and for the purpose described.

3. The combination of the flexible tube N with the cylinder M, piston g, rudder J, and spring L, all arranged as specified.



158,502. GAGE FOR ANIMALS. A. Kuntze, Belleville, Ill. [Filed Oct. 14, 1874.]

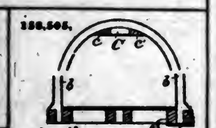
The combination of the bars A A', journal a, having groove a' and cogs a², prongs c, clamps c', screws b b', all constructed to operate as and for the purpose set forth.

158,503. APPARATUS FOR AERATING ALE AND BEER IN CASES. Moses Lajoie and Mathias Poncelet, Detroit, Mich. [Filed Nov. 7, 1874.]

Brief.—A check-valve in connection with a cock, and an air-pump connected therewith by a flexible pipe.

The combination, with the cock A, of the check-valve B, and an air-pump connected therewith by a flexible pipe, substantially as and for the purpose set forth.

158,504. SHOW-CASES. Adam Lange and Carl Lange, St. Louis, Mo. [Filed Aug. 12, 1874.]

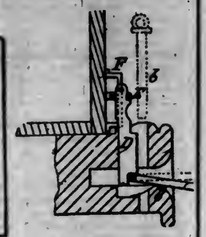


Brief.—A round front case combined with a square case, and so connected as to form one complete show-case.

158,505.

The bottom and top cases A B, having panels E, a, c', c², and c³, side panels d d', panes d² d³ D d' c', and transparent doors F, forming the complete show-case, as herein shown and described.

158,505.

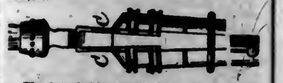


158,506. CONSTRUCTION OF RAILWAY-CARS. John B. Looper, Godfrey, Ill. [Filed June 6, 1874.]

Brief.—Improvement on Patent No. 147,777.

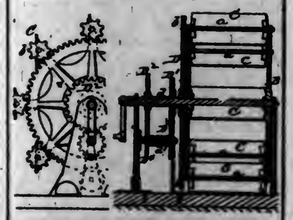
1. The air-passage C and lintels c c', in combination with the body composed of the inner and outer shells a a', ribs B, and bottom sills A A' A², substantially as and for the purpose set forth.

2. The air-tight doors D, having rubber facing d, in combination with a car having open bottom air-spaces b, and the body of which is composed of ribs B and inner and outer shells a a', substantially as shown and described.



158,507. CAR-COUPLINGS. Peter L. Monk, Paris, Ill. [Filed Apr. 25, 1874.]

The lever E, secured by staple F and supported by spring c, in combination with the vertically-movable notched pin D and front bearing b', substantially as and for the purpose set forth.



158,508. BRUSH AND MOP HOLDERS. John O. Montignani, Albany, N. Y. [Filed Oct. 23, 1874.]

Brief.—The clamps that hold the mop or brush are cast with sockets at their ends for the reception of the two prongs of the split handle.

The detachable metallic clamping-jaws C C, each constructed with a socket, c, and notches or serrations, in combination with a handle, A, having the elastic arms a a, and carrying the sliding clamping-ring D, the whole being arranged for operation, substantially as and for the purpose described.

158,509. FEATHERING PADDLE-WHEELS. J. S. Morgan, Hazleton, Ind. [Filed Oct. 27, 1874.]

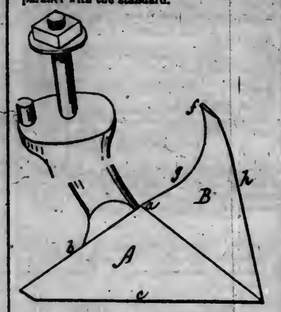
The combination, with the shaft A and bands B B, of the pivoted buckets or paddles C C, with pinions b b, the gear-wheels D D' placed loosely on the shaft, the gear-wheel D² secured to the shaft, and the gear-wheels D³ D⁴ placed on a counter-shaft, c, all constructed and arranged to operate substantially as and for the purposes herein set forth.

158,510. RECIPROCATING STEAM-ENGINES. John C. Clark, Elmira, N. Y., administrator of Milton V. Nobles, deceased, assignor to Elmira Steam-Engine Company, same place. [Filed Oct. 10, 1874.]

1. In a steam-engine, the rotary valve D, consisting of a transverse body, w, and two segment-shaped wings, n n', extending from the opposite sides thereof in different but parallel planes, thereby forming in the face and back of the valve segment-shaped steam and exhaust recesses, substantially as specified.

2. The combination, with the rotary valve D, having the semicircular wings n n', and the rear rotating exhaust-recess r, of the steam-chest A², the cylindrical head C, forming the valve-seat, its rim-ports s s', and annular exhaust-channel s', communicating with the exhaust-pipe, substantially as specified.

3. The rotary valve D, having the semicircular wings n n' and transverse body w, in combination with the rim-ports s s' of a steam-chest, substantially as described.

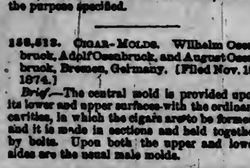


4. The combination, with the steam-chest A², steam-cylinders A A', and steam-passages a a', of the rotary valve D, having the semicircular wings n n', forming steam and exhaust recesses, and the head C, having the annular groove s', communicating with the exhaust-outlet s', substantially as specified.

5. The sleeve g, having the shoulders h opposite each other, and the pin i on crank-shaft E, in combination with the double-plane rotary valve D, steam-passages a a', and the rotating exhaust-recess r, for the purpose of reversing the engine, in the manner set forth.

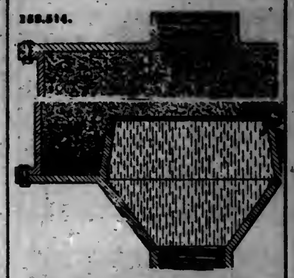
6. The combination, with the transverse body w, of the rotary valve D, its semicircular wings n n', and the rim-ports of the steam-chest, of the elastic packing p p, recessed into the ends of said transverse body, substantially as specified.

158,512. CULTIVATOR-TEETH. Rodney P. Odell, Jr., Parma Centre, assignee of one-half his right to S. K. Odell, North Greece, N. Y. [Filed Dec. 3, 1874.]



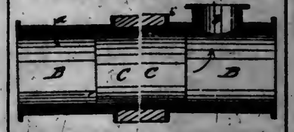
Brief.—The tooth on one side is curved upward, ending in an oblique point, standing parallel with the standard.

A cultivator-tooth, consisting of the wing A and land-side B, formed in a single piece, the wing being made in the form of an equilateral triangle, with the square corner d, and the land-side provided with the upright curved point f, standing back from the rear of the tooth, as herein shown and described, and for the purpose specified.



158,513. GEAR-MOLDS. Wilhelm Osenbruck, Adolf Osenbruck, and August Osenbruck, Bremen, Germany. [Filed Nov. 19, 1874.]

Brief.—The central mold is provided upon its lower and upper surfaces with the ordinary cavities, in which the cigars are to be formed, and it is made in sections and held together by bolts. Upon both the upper and lower sides are the usual male molds.

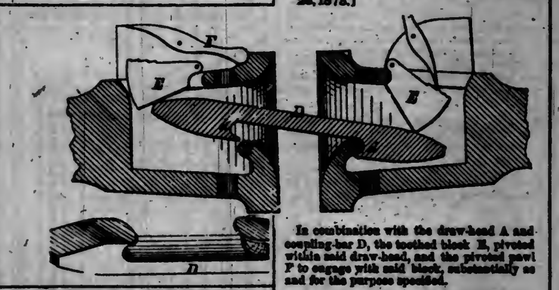


The combination, in a cigar-mold, of the central body A, constructed with sockets E in its upper and lower surfaces; the top and bottom parts B C, each constructed with the segments G, having sockets, and fitting within the upper and lower sockets E of the central body A; and the cross-bands F, connecting the parts together, substantially in the manner and for the object specified.

158,514.

158,515. GAS-RETORTS. Saml. P. Parham, New York, N. Y. [Filed Aug. 15, 1874.]

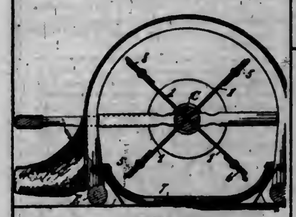
Brief.—The lining is of wrought-iron, and is cemented at the ends to the neck-pieces of the retort. A slight air-space is left between it and the clay shell, to permit expansion.



As a new article of manufacture, a retort for making an illuminating-gas directly from liquid naphtha, consisting of clay shell A, lining C, extending beyond both ends of the clay-shell and into the necks of the retort, and the end tubes B a B b, all attached as shown and described.

158,516. STEAM-GENERATORS FOR COOKING, &c. Thos. T. Pearson, Hopewell Corners, Canada. [Filed May 9, 1874.]

A steam-generator for cooking and other purposes, constructed substantially as described—that is, having a generating-chamber, A, a water-chamber, B, aperture E, tube F, and hole D, arranged to operate as described.



158,517. CAR-COUPLINGS. Winfield S. Peck, North Norwich, N. Y. [Filed Apr. 28, 1873.]

In combination with the draw-head A and coupling-bar D, the toothed block E, pivoted within said draw-head, and the pivoted pawl F to engage with said block, substantially as and for the purpose specified.

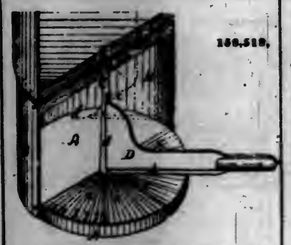
158,518. CHIMNEY-CUTTERS. M. Phillips, Springfield, Ill. [Filed Oct. 30, 1874.]

Brief.—A triangular knife, pivoted near the top of its perpendicular, has edges upon its base and perpendicular, to cut downwardly and toward the slotted central column, which rotates with it to the desired line of cutting.

1. In combination with the shaft or axle, the leather or other elastic arms I I, for supporting the beaters or fans, mortised and secured in the axle and locked to each other, substantially as shown and described.

2. The beater or beaters C, formed of leather or other similar flexible material, constructed and applied substantially as shown and described.

3. In combination with the drop flaps or pans D, the elastic plate f, applied substantially as described, and serving to press the flap: downward, and also to prevent the escape of dust.

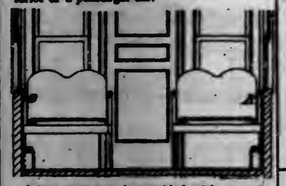


4. In combination with the case, the pasteboard end pieces B, having the elastic pieces f applied to them, substantially as and for the purpose set forth.

158,519. FILTERS. John Outerson and A. Outerson, Windsor Locks, Conn. [Filed Sept. 10, 1874.]

Brief.—The filtering medium is composed of paper-maker's half-stuff.

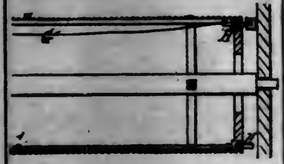
A filter composed of paper-makers' half-stuff, contained in a suitable vessel.



156,519.

In combination with the cheese-box A B, and with the slotted bar C journaled therein, the knife D, having two cutting-edges, *d* and *d*, relatively arranged substantially as and for the purpose specified.

156,520. PASSENGER-CARS. Daniel Price, Lockport, N. Y. [Filed June 22, 1874.]



Brief.—Metallic lining throughout the interior of a passenger-car.

A passenger-car, A, provided with a metal lining, B, substantially as shown and described.

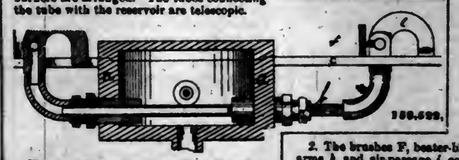
156,521. FLOUR-BOLTS. Lewis V. Bathbun, East Pembroke, N. Y. [Filed May 26, 1874.]

Brief.—Devices for cleaning the meshes of the bolting-cloth.

1. In a bolting-reel for flouring-mills, the whipping-cord G, located within the reel and directly beneath the cloth, the spring H, to which the end of the cord is attached, and the cam *l*, against which the spring acts, the whole combined as described, to produce the whipping motion on the inner surface of the cloth, as and for the purposes specified.

2. The bolt *h*, spring *f*, offset *i*, and inclined end *k*, in combination with the cords G and cam *l*, as and for the purposes specified.

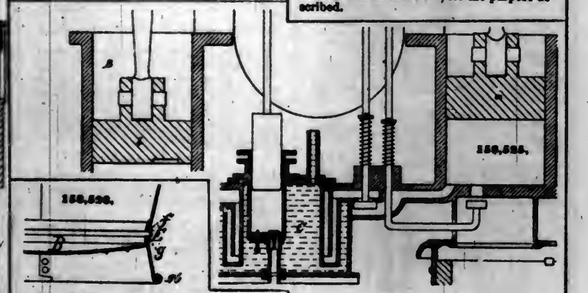
156,522. UNITING HANDLES TO SAD-IRONS. William J. Reagan, Boyer's Ford, Pa., assignor to Boyer's Ford Iron Foundry, same place. [Filed Nov. 4, 1874.]



Brief.—The handle is formed with double-beveled recesses, and united to the body of the sad-iron in the process of casting.

The within-described sad-iron handle, having a transverse dovetailed and beveled recess or recesses, as and for the purpose set forth.

156,523. TIRE-HEATING APPARATUS. Saml. G. Reed, Wellesley, Mass. [Filed June 15, 1874.]



Brief.—Each of the tire-supports radiating from the chamber is accompanied by a row of gas-burners and a guard, the latter turning as upon a pintle on the tube on which the burners are arranged. The tubes connecting the tube with the reservoir are telescopic.

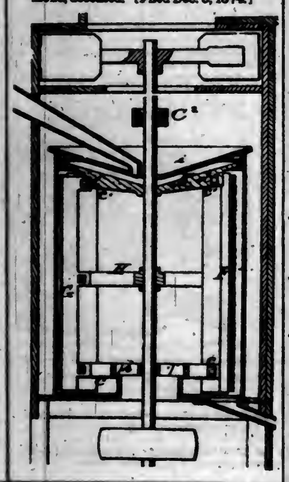
156,522.

The combination, substantially as described, of the cylinder *a*, slotted supports *c c c*, telescoping pipes *b b b*, guards *e e e*, and swiveled burners *f f f*, as and for the purpose set forth.

156,524. COAL-SCUTTLES. H. Reynolds, Green Point, N. Y. [Filed Aug. 12, 1874.]

156,525.

156,526.



The solid bottom B of a coal-hod, having an upturned flange, D, and in the flange an external bead, E, forming the shoulders *f g*, the former to receive the lower edge of the body A, and the latter to rest upon the upper edge of the base C, the bottom B and the lower portion of the upturned flange being embraced within the upper portion of the base C, as shown and described.

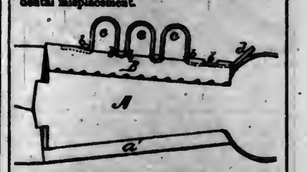
156,525. BEATER-BLADES. Alex. K. Rider, Walden, N. Y., assignor to Rider, Worcester & Co., same place. [Filed May 20, 1874.]

Brief.—The pump draws a part of the heated air from the main cylinder; the remainder is condensed by the cooler.

The exhaustive pump B, combined with the main cylinder A and cooler or condenser C, so as to work with a partial vacuum, substantially as set forth.

156,526. BRUSH-MILLS. William Richmond, Lockport, N. Y., executor of James Richmond, deceased. [Filed Dec. 6, 1874.]

1. The brushes F F, provided with serrated lugs *b b*, which engage with corresponding serrations on the arms *c* and flanges *c'*, in combination with the beater-blades G attached directly to the brush-heads by the bolts *d*, and spiders H, substantially as described, and for the purpose set forth.



2. The brushes F, beater-blades G, oblique arms *h*, and air-passage *i*, combined and arranged with case D in the manner and for the purposes described.

3. The notched lugs *b b* and the brushes F, combined with teeth on arms C and flanges C', and with bolts *d* for adjusting the brushes, substantially as described.

4. Smut-mill brushes F, having angular or double-beveled backs *e e*, for the purpose described.

156,527. SHEEP-SHEARS. Frederick Riedling, Upper Sandusky, Ohio. [Filed Dec. 5, 1874.]

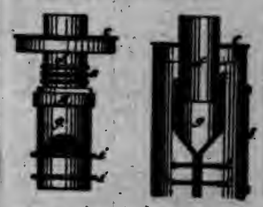
Brief.—A detachable leather covering is closely fitted to the shank of a pair of sheep-shears, and a continuous leather strap is so arranged that, passing through suitable slots in this covering, it is made to form adjustable loops or finger-stalls, the use of which gives a better clasp, and prevents slipping or accidental misplacement.

1. The combination, with the shank of a pair of sheep-shears, of the loops *s* of continuous strap C, held by a suitable securing device, substantially as specified.

2. The combination, with the covering B, having slots *h* of the continuous strap C, arranged in the said slots, so as to form adjustable loops or finger-stalls *s*, substantially as specified.

156,527. GAS-REGULATORS. Silas C. Sellsbury, New York, N. Y. [Filed Aug. 19, 1874.]

Brief.—The valve is supported apart from its seat by legs, which also keep it apart from the tube in which it moves. The valve-seat and a superposed seat are adjustable. The valve and seats are inclosed in a case slightly tapered to fit closely into a gas-pipe. The whole may be coupled between gas-pipes.



1. The valve B, provided with astem, G, and lugs *c c*, in combination with adjustable rings C and I, and tube A, to keep the valve in proper position.

2. As a new article of manufacture, a valve, B, provided with a stem, G, and lugs *a a*, adjustable rings C and I, and tube A adapted to fit within the supply-pipe, in the manner set forth.

156,528. STENCH-TRAPS. John P. Schmitz, San Francisco, Cal. [Filed Mar. 9, 1874.]

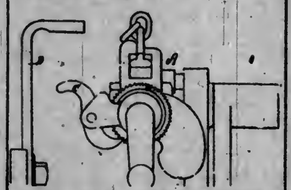
Brief.—A pipe with ribs, elastic piece, clamp, and elastic rings, all in combination, to make the apparatus self-acting.

1. The circular elastic rings *i i*, in combination with the elastic piece *g*, having flattened or collapsed ends, substantially as and for the purpose described.

2. The cover C and the pipe *f* with its ribs or rings O, substantially as shown and described, for the purposes set forth.

3. The stench-trap, consisting essentially of the case A, having door *h*, the cover C, the pipe *f* with ribs O, the elastic piece *g*, the clamping-board K, and the elastic rings *i*, all constructed and arranged substantially as shown and described.

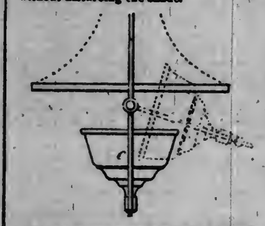
156,529. HORSESHOEING APPARATUS. C. Schnoor, Davenport, Iowa. [Filed Oct. 30, 1874.]



Brief.—The adjustable support is adapted to the knee.

The adjustable knee-support E, constructed and arranged to operate substantially as shown and described.

156,530. TRAVERSE MECHANISMS FOR RING SPINNING-FRAMES. John Scott, Lowell, Mass., assignor to Lowell Machine-Shop, same place. [Filed Dec. 9, 1874.]



Brief.—The builder is a vibrating frame, connected by means of a chain to the ring-rail and reciprocating it. The end of the chain is attached to a rack in gear with a worm; and in order to move the rack endwise, so as to vary the amount of movement of the ring-rail, the worm-shaft has on one end a ratchet-wheel and a weighted lever carrying a loosely-pivoted pawl engaging the ratchet, and at each upward movement of the builder the pawl strikes the abutment, and turns the ratchet and worm-wheel. As the builder moves down, the weighted carrier moves the pawl over the ratchet-teeth, and prepares it for a repetition of the operation.

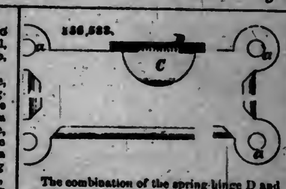
The adjustable abutment D, the vibratory pawl C, and gravitating vibratory pawl-carrier B, provided with the stop *r'*, in combination with the yarn-load builder A, all being substantially and to operate as and for the purposes specified.

156,531. LAMP-PENDANTS. Frederick R. Seidensticker, West Meriden, Conn., assignor to Bradley & Hubbard, same place. [Filed Dec. 16, 1874.]

Brief.—The lower hinged part may be swung aside to permit the removal of the lamp-fount without disturbing the shade.

A lamp-pendant, consisting of the two parts A C hinged together, substantially as and for the purpose specified.

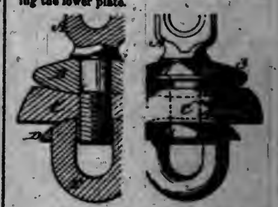
156,532. COFFEE-FILTERS. E. R. Shattuck, Olean, N. Y. [Filed Aug. 26, 1874.]



The combination of the outer reticulated cylinder A, having a detachable reticulated cover, B, provided with a central aperture, *c*, and a bail, E, and the inner cylinder C, having a fixed reticulated top, and an open bottom, the latter rigidly secured within the former cylinder, as specified, and for the purpose set forth.

156,533. TICKET-CLASPS. M. L. Shattuck, New York, N. Y. [Filed Oct. 15, 1874.]

Brief.—A piece of sheet metal, with three sides bent over to form a frame, has a spring-flap on the fourth side to hold the card in place.



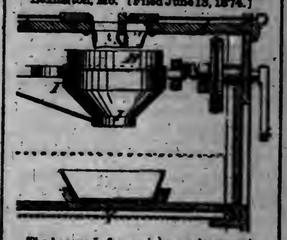
156,534.

The combination of the spring-hinge D and oscillating leaf or flap C with the card-holder A, having the bottom and side flanges *b* and eatable openings *a*, substantially as described, for the purpose specified.

156,535. BUCKETS FOR CHAIN-PUMPS. J. D. Shoots, Horseheads, N. Y., assignor of one-half his right to Robt. Colwell, same place. [Filed Nov. 12, 1874.]

Brief.—The rubber disk is made with beveled edges, and may be expanded by turning the lower plate.

The combination of the ring A with depending screw, the convex plate B, the rubber disk C, concave on both faces and inclined on its periphery, the plate D, with convex surface, and the loop E, all substantially as set forth.



156,536. BEARINGS FOR CAR-AXLES. H. L. Sidman, Jersey City, N. J. [Filed Nov. 24, 1874.]

Brief.—Smooth bearing-surface at top. Longitudinal grooves at sides for retaining surplus oil.

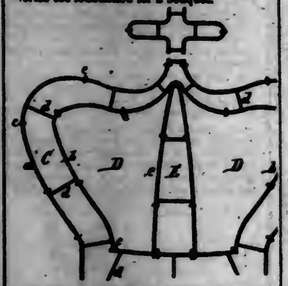
A bearing for axle-boxes with parallel longitudinal oil-channels B and a central bearing-surface, *c*, substantially as shown and described.

156,537. FLOUR-SIFTERS. A. W. Smith, Lexington, Mo. [Filed June 13, 1874.]

The hopper I, for receiving and supporting the ordinary sieve H, and supported between the pivoted frame and the sliding plate O, and actuated substantially as described, for the purposes herein set forth.

156,538. CROSSCUT-SAW HANDLES. Wm. E. Stansbury, Detroit, Mich. [Filed July 15, 1874.]

Brief.—Crosscut-saws of varying breadths are secured to their handles by means of a slotted rod, stationary screw-collar, and cylindrical nut.



No. 156,537.

In connection, the hollowed handle A, fitted with the collar C and cylinder-nut D, and the slotted rod E, extending through the handle A and secured by a nut, *b*, the several parts constructed and arranged substantially as described and shown.

No. 156,538. FLOWER-FRAME. H. Steffens, New York, N. Y. [Filed Dec. 9, 1874.]

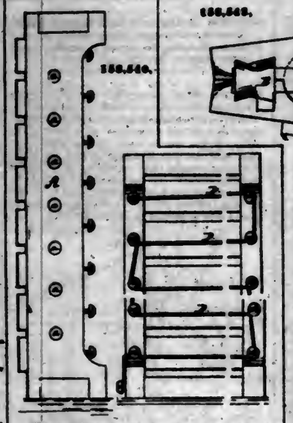
Brief.—A skeleton frame constructed of small wire, having the general form of a crown, forms the foundation for a bouquet.

1. In a flower-frame, the lateral wires a b, arranged about in a line with each other, and connected together, one within the other, by transverse wires *c* and bottom wires *d*, to form a crown-shaped figure, in combination with the interior wire *e*, substantially as described, whereby is created the compartments C D D E, as and for the purpose specified.

2. In a flower-frame, the wires a b, constructed and arranged, one within the other, to form a crown-shaped figure, the outer one of said wires being bent to form a cross or other suitable-shaped figure on top of the crown, and all connected together by wires *c d*, substantially in the manner shown and described.

No. 156,539. CEMENT PIPES. Melvin Stephens, Brooklyn, N. Y. [Filed Nov. 3, 1874.]

Brief.—Near the end of the pipe is a recess of less diameter than the extreme end of the pipe. The socket has a contracted mouth, which, when the parts are joined, is opposite to the recess, confining the cement or other packing material.

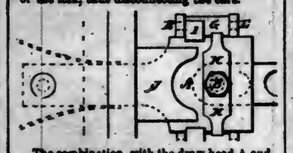


1. The socket *a*, having a contracted mouth, in combination with the pipe *c*, made with a depression, *b*, adjacent to the end of the mouth, substantially as and for the purposes set forth.

2. The cement-lined pipe, made with the sheet-iron of the socket contracted at the mouth, for the purposes specified.

3. The cement-lined pipe, made with the sheet-iron at the smaller end contracted, or made with a groove at *b*, so as to leave the end of the pipe of larger diameter than the groove or recess around the pipe, for the purposes set forth.

No. 156,540. BEEHIVE-RACKS. J. B. Stratton, Waterloo, N. Y. [Filed June 4, 1874.]



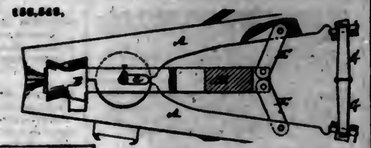
Brief.—The perforated side pieces of the frame and the slatted bottom allow free circulation around the yeast-cakes being dried. The cakes are set on edge upon the bottom slats, and are maintained in nearly a vertical position by the wires.

The combination of the grating or slats B, and the cords, wires, or slats D, with the perforated frame A, in the manner hereinbefore set forth and described.

No. 156,541. CAR-COUPLINGS. Frank Street, Council Bluffs, Iowa. [Filed May 20, 1874.]

Brief.—In case a car should leave the track, the projection would strike the short arm of the lever, and throw the long arm up in contact with the head of the pin, and raise it out of the link, thus disconnecting the cars.

The combination, with the draw-head A and headed coupling-pin B, of the standards E, rollers G with arms H I, and the projection J on the front of the car, all constructed substantially as and for the purposes set forth.

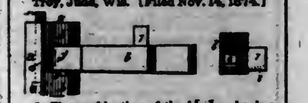


No. 156,542. VEGETABLE-SLICERS. Nathan Sweetland, Providence, R. I., assignor to the American Butt Company, same place. [Filed Oct. 9, 1874.]

Brief.—The revolving plate carrying the knife has also a gage-bar held by a set-screw, to limit the thickness of the slice, the substance being held in a stationary hopper, and pressed down by a follower.

The combination, in a vegetable-slicing machine, of the revolving disk K, fixed knives R R, and adjustable throat-plates T T, constructed and operated in the manner specified.

No. 156,543. CAR-COUPLINGS. James Wilson Treadway, Crown Point Centre, N. Y. [Filed Dec. 1, 1874.]



1. The horizontal pivoted jaws A A, forming a draw-head and bumper, having toggle-joints to open and close the same, and a lateral draw-bar, H, in combination with a fixed center pin or bolt, *b*, upon which the said opening and closing jaws may be rotated, substantially as and for the purpose described.

2. The combination of the toggle-joints G G and B E, the fulcrate jaws A A, and the slide B, essentially as described.

3. The combination of the convex clamps I I with the fulcrate jaws A A and a center-pin or king-bolt, *b*, substantially as specified.

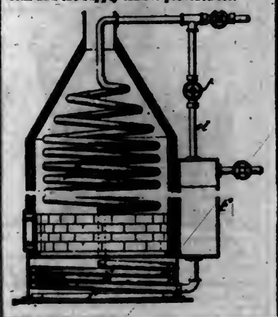
No. 156,544. THILL-COUPLINGS. Ahiezer M. Troy, Judd, Wis. [Filed Nov. 14, 1874.]

1. The combination of the block *c*, having the recess *d*, ear *b*, and notch *b*, with the block *g*, having the ear *b'*, and the two extensions *e*, the screw-bolt *h*, pin 2, and part *j* 3, all to operate substantially as set forth.

2. The combination of the block *c*, having a dovetailed recess in one end, with the block *g*, made to fit in this recess, and provided with the two extensions *e*, substantially as shown.

3. The combination of the thills *i*, having hollow ends, with the part *j* and cam 3, provided with the head 7 and set-screw 8, substantially as specified.

No. 156,545. HAND CORN-PLANTERS. Edwd. S. Turner, Hester, Mo. [Filed Oct. 15, 1874.]



Brief.—To the main arm is secured the hopper, within which is pivoted to rotate the seed-disk, having suitable orifices, and provided on its periphery with notches, which engage with a lever on the pivoted arm, for imparting motion to the disk. The flow of seed is graduated by a cut-off.

In a hand corn-planter the rotary dropper B, actuated by the spring-lever D, and provided with chambers to receive the corn, in combination with the hollow block C, cut-offs *e e*, plate *c*, and support-block F, as constructed and arranged with the hopper *b*, substantially in the manner and for the purpose as set forth.

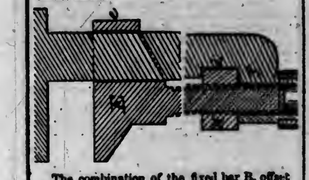
No. 156,546. STEAM-HEATERS. A. VON HOYA, Brooklyn, E. D., N. Y. [Filed Dec. 9, 1874.]

Brief.—By means of the branch pipe and the stop-cocks the circulation through the coils and the supply-tank is provided for.

In a steam-heater, the combination, with the steam-generating coil B and water-supply tank F, of the branch pipe *d*, having stop-cock *f*, and steam-pipe *e*, having stop-cock *c*, substantially as and for the purpose described.

No. 156,547. WASHING-MACHINES. James H. Van De Water, Conquest, N. Y., assignor of one-half his right to G. A. Crocker, Ashtabula, Ohio. [Filed Nov. 7, 1874.]

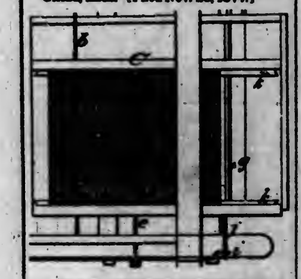
1. The combination, with the sucker *a b* and the yielding web of radial arms, of the driving-eccentric *f*, connected to the sucker-rod by the jointed connection *g*, to produce the advantages herein stated.



2. The combination, with the reciprocating sucker *a b*, of the web of hinged radial vanes *k*, substantially as and for the purpose herein set forth.

3. The radial vanes *k*, in combination with their carrying-sleeve *m* and the spring *n*, substantially as herein set forth.

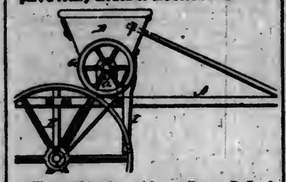
4. The combination, with the web of radial arms *k*, of the sleeve *m* and the curb *o*, whereby these parts form stops *r s* to limit the movement of the arms upon their hinges, as described.



No. 156,548. WRENCHES. Benj. L. Walker, Sing Sing, N. Y. [Filed Dec. 10, 1874.]

Brief.—The main bar is offset from the handle. The screw-stem of the movable jaw passes into the handle, and receives the end thrust direct.

The combination of the fixed bar B, offset from the tubular shank *b*, and carrying the fixed jaw D, the movable jaw E, having its screw-threaded shank G working in the tubular shank *b*, and the nut H, engaging with the threaded shank, and supported on the tubular shank at the offset *f* of said fixed bar, substantially as shown and described.



No. 156,549. GRAIN-SEPARATORS. P. Werner, Gilead, Mich. [Filed Nov. 26, 1874.]

A shoe which is composed of sections C C', supported on rods *b b'*, and reciprocated in opposite directions from crank-shaft B, as described, the upper section being provided with inclined ledges *k*, for the purpose set forth.

No. 156,550. SEED-PLANTERS. J. F. Warner, Dakota City, Neb. [Filed July 20, 1874.]

Brief.—Upon the frame are secured forked standards for the reception of a transverse shaft, which passes through the seed-box. This shaft has upon it, and within the seed-box, seed-wheels, for raising the seed to the delivery-spouts. At either end of the shaft, and resting upon the circumference of the driving-wheels, are small wheels, which impart a rotary motion to the seed-shaft.

The combination, with a sulky, A B C, of the platform E, secured thereon, and provided with slotted standards *e a* at its ends, the removable seed-box D, placed on the platform, and provided with shafts *d d*, and the wheels G G, secured on said shafts, and impinging against the outer periphery of the driving-wheels C C, all substantially as and for the purposes herein set forth.

No. 156,551. LIDS FOR STOVES. Wm. Weaver, Phœnixville, Pa. [Filed Dec. 16, 1874.]

Brief.—V-shaped radial flanges, thicker at their outer than at their inner ends, serve to elevate the cooking-vessel above the plane of the lid-top.

As a new article of manufacture, a stove-plate, *c*, having a number of radial flanges formed upon its top, substantially as shown.

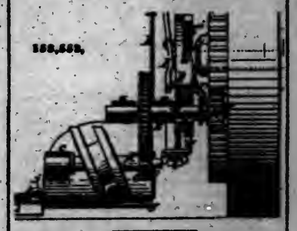
No. 156,552. COLTERS. Alanson P. Webber, Saratoga, Ill. [Filed Oct. 3, 1874.]

Brief.—The shaft of the colter has enlarged ends, which have bearings in blocks attached to main standard, the latter being slotted to the bottom under the shaft.

1. The fork A, having the lower portion cut away, in combination with the parts D, furnishing bearings for the colter-shaft upon the outside of the fork, as and for the purpose herein specified.

2. The interposed plate E, in combination with the fork A and bearings D, for excluding the dirt and forming an oil-cup, substantially as described.

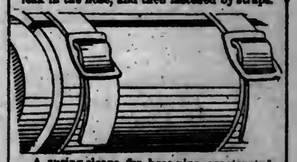
No. 156,553. MOWING-MACHINES. George H. Weeks, Aurora, N. Y., assignor of one-half his right to Charles E. Gould, same place. [Filed Oct. 16, 1874.]



1. The combination of the segmental bracket E', stirrup D, elongated passage *b*, bearing-offsets G, pinion-shaft F, and axle C, whereby the stirrup, notwithstanding it is fitted upon the pinion-shaft, and is capable of raising and lowering it as required, is prevented from pulling upon and straining said shaft F when the machine is in operation, substantially as set forth.

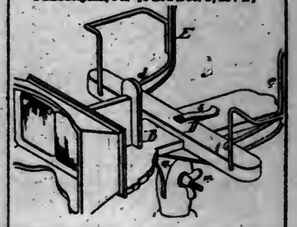
2. The combined caster-wheel and draft-pole iron, constructed with a swivel-box, F, for the shaft of the caster-wheel to swivel in, with two hinging-brackets, *b*, for the draft-pole to hinge upon, and with two ears, *m*, for the adjusting-lever Q to be pivoted to, in combination with the tongue S, the caster-wheel F', the draft-frame E, and the adjusting-lever Q, substantially in the manner and for the purpose described.

3. The combination of the dovetail *g* on the end of the sickle-bar, the dovetail socket *h* in the driving-head M, the hooking-coupling *i*, and the pin *j*, substantially in the manner shown and described.



4. The inverted arch-shaped pendent hanger J on the under side of the bed-plate of the draft-frame, and in line with the cutting apparatus, constructed with end bearings for a short shaft, and with guiding-ledges on its bottom to confine and guide the driving-head of the sickle, and serving for supporting the cutting apparatus and the device which reciprocates the sickle, and also shielding said device and the pinion, which is on the same shaft with it, substantially as and for the purpose described.

5. The sickle-driver arranged on the pinion-driving shaft K, and within the hanger J, formed of two oval disks, L' D', which are placed diagonally on the shaft a short distance apart, with their faces parallel, in combination with the ball N on the perpendicular extension of the heel of the sickle-bar, and passed directly into the groove formed between the working faces of the disks, substantially in the manner and for the purpose described.

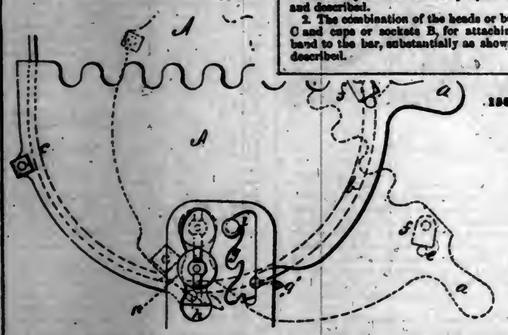


No. 156,554. LEAK-STOPPERS FOR HOSE. Wm. W. Whitcomb, Boston, Mass. [Filed Feb. 16, 1874.]

Brief.—A sleeve made of vulcanized rubber or other suitable material, in the form of a short section of a cylinder slit throughout its length, has incorporated a spring of tempered sheet-steel. The sleeve is sprung around the leak in the hose, and then fastened by straps.

A spring-sleeve for hose-pipe, constructed substantially as herein described, having a spring of one sheet of steel, with suitable covering.

No. 156,555. STEREOSCOPES. M. A. B. Whitner, Philadelphia, Pa. [Filed Dec. 9, 1874.]

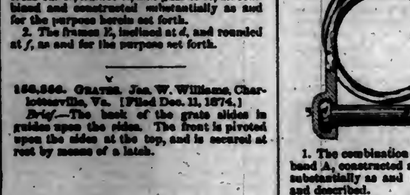


1. In a stereoscopic instrument, the within-described picture-holder, consisting of the cross-bar D, frames E, and guards H, all combined and constructed substantially as and for the purpose herein set forth.

2. The frames E, inclined at *d*, and rounded at *f*, as and for the purpose set forth.

156,555. GRATES. Jas. W. Williams, Charlottesville, Va. [Filed Dec. 11, 1874.]

Brief.—The back of the grate slides in guides upon the sides. The front is pivoted upon the sides at the top, and is secured at rest by means of a latch.



1. The combination of the slotted toothed legs B and the thumb-screw *p*, with the basket-grate A, enabling the grate to be raised, lowered, or tilted, as and for the purpose specified.

2. The curved sliding back plate *c*, in combination with the side plates of basket-grate A, and its bottom bars *d*, for purposes herein described.

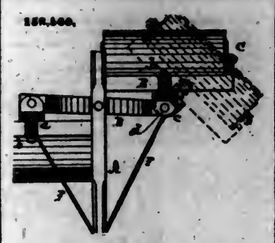
3. The dumping axial bar-grate *b*, in combination with the slotted side plates of basket A, and locking-button *p*, as and for the purposes set forth.

156,556. COMB-PLANTERS. O. P. Williams, Bayous City, Mo. [Filed July 11, 1874.]

Brief.—Pivoted to a segment is the cross-beam, to which is hinged the bow-shaped beam, upon the rear end of which are secured corrying-plows. To the segment, and extending forward, is a connecting-rod, which is attached to the front transverse rocking bar, having bearing at each side of the platform. To this rocking bar is attached a crank-lever, which extends up within reach of the operator, for adjusting the plows.

The covers G G, applied upon the free ends of a U-shaped downwardly-bent beam, *f f*, pivoted at its front end to a cross-beam, K, and sustained by stirrups *r*, the segments *l* playing freely on axle *s* at each side of the platform B, and connected, by links *m*, to a front transverse rocking bar, *n'*, having bearings at each side of the platform, by means of arms *n*, and the lower *p* on one end of the rocking bar *n'*, constructed and arranged as and for the purpose specified.

156,557. HORSE-TAIL PROTECTORS. Geo. B. Willmot, West Meriden, Conn. [Filed Dec. 26, 1874.]

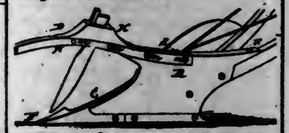


156,558.

1. The combination of the bar E and elastic band A, constructed and arranged to operate substantially as and for the purpose shown and described.

2. The combination of the heads or buttons C and cups or sockets B, for attaching the band to the bar, substantially as shown and described.

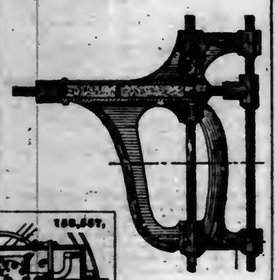
156,559.



1. The tongue A and fixed cross-bar B, in combination with the roller-frames E E, double swivel, Fig. 2, arranged in front and rear of the bar, the rear roller being pivoted to the end of the bar B, having a floating and circular movement, as and for the purpose specified.

2. The double swivel, Fig. 2, composed of the bolt *b*, cars *c*, and bolt *d*, in combination with the roller-frame E, and cross-bar B, the rollers being attached to the ends of the said bar B, one in front and the other in rear, as specified.

156,560. PLOWS. John Yocum, Dunnville, Canada, assignor of one-half his right to L. Mansocar, same place. [Filed Oct. 26, 1874.]

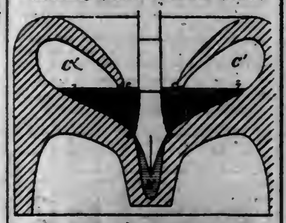


Brief.—The land-side plate extends from the bottom of the plow to the top of the beam, having a grooved extension to receive the beam, and a colter-socket cast upon it. It has a recess to receive the sole and point, and flanges for the mold-board.

1. The land-side plow-plate E, having the extension beam-piece H *h*, provided with a groove for the beam B, and a raised socket, K, for the colter, all constructed as shown and described.

2. The combination of the plate E D S, beam B, mold-board C, point F, and land-side handle G, as constructed and operating as shown and described.

156,561. JOURNALS FOR HARVESTER-FRAMES. Wm. A. Wood, Albany, N. Y. [Filed July 9, 1874.]



1. A metal harvester-frame provided with removable thimble-bearings for the shafts mounted therein, substantially as and for the purpose set forth.

2. The combination of removable thimble-bearings with the frame of a harvesting-machine in the process of manufacture, substantially as described.

156,562. LAND-ROLLERS. John Woolridge, Dean's Corners, Ill., assignor of two-thirds his right to A. B. Smith, same place. [Filed Nov. 13, 1874.]

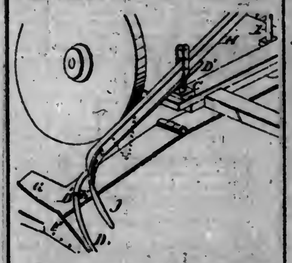
Brief.—A fixed bar is secured transversely to the rear end of the tongue, and at one end, upon the front side, a roller is horizontally swiveled, and to the rear side of the opposite end of the cross-bar a roller is horizontally swiveled, having also a radial movement around its point of attachment.

156,563. INKSTANDS. A. W. Brinkerhoff, Upper Sandusky, Ohio. Patent No. 126,514, dated May 7, 1872. [Filed Oct. 4, 1873.]

1. An ink-chamber, C, of an inkstand, having an interior conical bottom surface, *b*, narrow dipping ink-well E, the diameter of the highest part of which is less than the broadest portion of an ordinary writing-pen, for the purpose of preventing the nib of the pen from striking the bottom of the well.

2. An inkstand having the interior conical bottom surface *b*, terminating at its lowest part in a deep narrow dipping ink-well, E, having a nearly upright wall, substantially as and for the purposes specified.

REISSUES



6,906. INKSTANDS. A. W. Brinkerhoff, Upper Sandusky, Ohio. Patent No. 126,514, dated May 7, 1872. [Filed Oct. 4, 1873.]

1. An ink-chamber, C, of an inkstand, having an interior conical bottom surface, *b*, narrow dipping ink-well E, the diameter of the highest part of which is less than the broadest portion of an ordinary writing-pen, for the purpose of preventing the nib of the pen from striking the bottom of the well.

2. An inkstand having the interior conical bottom surface *b*, terminating at its lowest part in a deep narrow dipping ink-well, E, having a nearly upright wall, substantially as and for the purposes specified.

6,901. TRACK-CLEARERS FOR HARVESTERS. Orin Du Bois, San José, Cal. Patent No. 137,361, dated Apr. 1, 1873. [Filed June 20, 1874.]

Brief.—A bar extends diagonally from the point of the grain-divider to the frame of the machine, for the purpose of inclining the grain or grass, and to throw the cut away from that which is uncut.

1. In a mowing or reaping machine, the arm or finger H, made adjustable by means of the standards C and I, substantially as described.

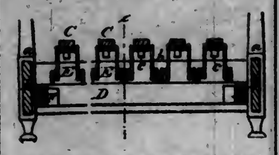
2. The sharp-edged dividing or separating plate F, with its housing G, in combination with the rod D, substantially as and for the purpose above described.

6,902. LUBRICATORS. Henry McGrew, Detroit, Mich. Patent No. 134,436, dated Dec. 31, 1872. [Filed Jan. 10, 1874.]

1. In an oil-cup, the combination of a jointed or hinged valve-stem having a valve, and a valve-seat, constructed and arranged that the valve may have a vibratory movement in the seat, substantially as and for the purpose described.

2. In combination with said jointed valve-stem D, the supplementary stem D' and valve *f'*, with relation to the seat *e'* in the outflow of an oil-cup, substantially as and for the purposes described.

3. The combination of the shell A, cap A', glass cup B, plug C, stem *c*, boss *b*, washers *d d*, valve-seat *e*, jointed valve-stem D, and valve *f*, as shown and described, for the purposes specified.

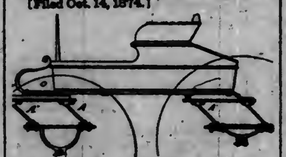


4. The combination of the shell A, cap A', glass cup B, plug C, stem *c*, boss *b*, washers *d d*, valve-seats *e e'*, jointed valve-stem D, supplementary valve-stem D', and valves *f f'*, as shown and described, substantially as and for the purpose set forth.

6,903. LUBRICATING WHEELS AND PULLEYS. J. King McLanahan, Hollidaysburg, Pa. Patent No. 143,830, dated Oct. 21, 1873. [Filed Apr. 11, 1874.]

The combination, with a wheel and its oil-chamber revolving therewith, and having a feeding-passage leading to the axle, of a feeding-stem extending into said feeding-passage, and serving, at each revolution of the wheel alternately to dip into the oil, and to feed the dipped portion into said feeding passage, substantially as specified.

6,904. END-BOTTOMS. Saml. Pearson, Cincinnati, Ohio, assignor to R. G. Gory. Patent No. 40,494, dated Aug. 18, 1863; reissue No. 5,904, dated Oct. 14, 1873. [Filed Sept. 24, 1874.]

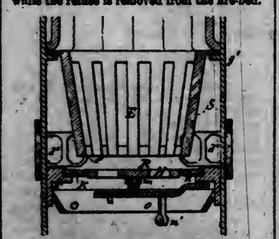


1. The combination of the double helical spring, a slat, C, and an independent connecting device or pin, *c*, substantially as and for the purpose described.

2. The spring E, having double helices with spaces between them, through which a slat the full length of the bed may pass without obstruction, in combination with a slat, C, substantially as and for the purpose described.

3. A bed-bottom in which the slats are disconnected from each other, and sustained by the springs E, having the bent stirrup *d* to prevent lateral displacement of the slat, substantially as described.

4. In combination, a reversible slat, C, spring E, and pin *c*, substantially as and for the purpose described.



6,905. TORSIONAL SPRINGS. C. W. Saladee, Pittsburg, assignor to L. Dobbins, Erie, Pa. Patent No. 113,451, dated Apr. 4, 1871. [Filed Oct. 14, 1874.]

The U-shaped torsional springs A, rigidly secured at or near their corners N, that the strain may be divided, substantially as and for the purpose set forth.

6,906. BASE-BURNING STOVES. Jas. Spear, Philadelphia, Pa. Patent No. 100,336, dated Mar. 1, 1870; reissue No. 6,460, dated June 17, 1873. [Filed Dec. 3, 1874.]

Brief.—Through the windows the condition of the contents of the stove may be observed, while the refuse is removed from the fire-bed.

1. The combination of a receptacle or chamber to contain the ignited fuel and refuse therefrom, a horizontally-vibrating grate-surface or fire-bed of larger diameter than the inside of the clinker-discharge end of the said chamber, and the clinker-cleaning opening R, to admit a poker to clean the upper surface of the grate, substantially as herein described.

2. The combination of a fire-chamber, a grate-surface or fire-bed, consisting of a dumping-grate, H, and a surrounding ring, K, and a clinker-cleaning opening, R, above the ring, substantially as herein described.

3. The combination of a fire-chamber, the ring K, forming part of the grate-surface or fire-bed, and the clinker-cleaning opening R, above the ring, substantially as herein described.

4. The combination of a fire-chamber having its clinker-discharge end E grated or illuminating and projecting downward within the air-chamber S, a grate-surface or fire-bed projecting beyond the inside diameter of the slate and clinker discharge end of the fire-chamber, and the clinker-cleaning opening R, substantially as herein described.

5. The combination of a fire-chamber having its clinker-discharge end projecting downward within the air-chamber S, a grate-surface or fire-bed consisting of a dumping-grate, H, and a surrounding ring, K, and the clinker-cleaning opening, R, above the ring, substantially as herein described.

6. The combination of the vertical clinker-cleaning opening R and mica lights S^2, in doors opposite the opening, substantially as herein described.

7. The combination of the vertical clinker-cleaning opening R, mica lights S^2, and clinker-cleaning doors C, opposite the opening, substantially as herein described.

8. The combination of a fire-chamber, the clinker-cleaning opening R, between the fire-chamber and grate-surface, clinker-cleaning doors C, opposite the said opening, and mica lights S^2, opposite the illuminating-section E of the fire-chamber, substantially as described.

9. The combination of a fire-chamber and a grate-surface or fire-bed, which is supported from the wall of a stove, on a plane below the clinker-cleaning opening R, by means of lugs b^2 and cross-bar N, substantially as herein described.

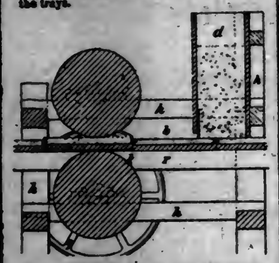
10. The combination of a fire-chamber and a grate-ring, K, supported from the wall of the stove, on a plane below the clinker-cleaning opening R, by means of lugs b^2, substantially as herein described.

11. The combination of a fire-chamber having its discharge-end E illuminating, the grate-ring K, and the clinker-cleaning opening R, above the ring, substantially as herein described.

12. The combination of a fire-chamber having its slate and clinker discharge end contracted and projecting downward, a grate-ring, K, and a clinker-cleaning opening, R, above the ring, substantially as herein described.

6,907. BASE-BURNING STOVES. Jas. Spear, Philadelphia, Pa. Patent No. 100,336, dated Mar. 1, 1870; reissue No. 6,460, dated June 17, 1873. [Filed Dec. 3, 1874.]

Brief.—Space is left between lower end of fire-pot and the fire-bed, for the removal of refuse.



1. The combination of a fire-chamber, a grate-surface or fire-bed projecting beyond the inside diameter of the slate and clinker discharge end thereof, the clinker-cleaning opening R, and grate-supporting lugs C, projecting from the fire-chamber, substantially as herein described.

2. The combination of a fire-chamber and a grate-ring, D, supported on a plane below the clinker-cleaning opening R by means of lugs C, projecting from the fire-chamber, substantially as herein described.

3. The combination of a fire-chamber, the grate-ring D, supported on a plane below the clinker-cleaning opening R by means of lugs G projecting from the fire-chamber, and a central vibrating or dumping grate, H, supported from the ring, substantially as herein described.

6,209. APPARATUS FOR COMPACTING GRANULAR SUGAR INTO BLOCKS. A. F. W. Partz, Oakland, Cal. Patent No. 132,894, dated Dec. 10, 1872. [Filed Sept. 24, 1874.]

Brief.—Granular sugar passes constantly down through the box d, the bottom of which is formed by a tray, which receives the sugar. The height of the sugar in the tray is determined by the adjustable slide in the lower part of the box front. A series of these trays is constantly presented to the box, from which they ran on rails to pressing rollers, by which the sugar is compacted to the dimensions of the trays.

The combination of the bottomless filling-box d with the pressing-roller p, the tracks r, and molds b, substantially as and for the purpose herein described.

6,209. COMPACTING SUGAR INTO BLOCKS. A. F. W. Partz, Oakland, Cal. Patent No. 132,894, dated Dec. 10, 1872. [Filed Sept. 24, 1874.]

The process above described of compacting loose granular sugar in independent molds by passing the molds with the sugar between pressing-rollers.

6,210. CIGAR-MOLDS. John Prentice, New York, N. Y., assignor, by mesne assignments, to Wm. H. Terwilliger and J. S. Lockwood. Patent No. 80,764, dated Jan. 12, 1869. [Filed Apr. 16, 1874.]

Brief.—The upper and lower molds are made of thin flexible metal, so that as one enters the other, they yield as they close in upon the cigar, and resume their natural position when separated. The male mold has sharp edges to avoid a fin on the cigar.

1. A cigar-mold constructed of elastic metal or other suitable material, so that one part of the mold will close or shut into the other with a springing or yielding action, the part that receives being provided with comparatively sharp edges, substantially as herein shown and described.

2. A yielding cigar-mold, composed of sheet metal, capable of contracting when one part is pressed into the other, and again resuming its form when released, substantially as described.

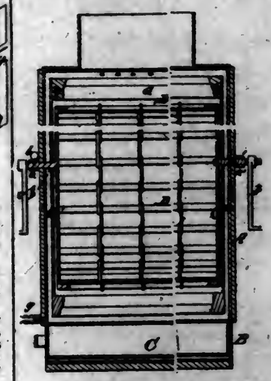
3. In combination with the molds a b, the backings c b, provided with hinge 2, projections 4, shoulder 5, and catches 6, substantially as for the purposes set forth.

6,211. COAL SCREENS AND CHUTES. M. R. Roberts, San Francisco, Cal. Patent No. 140,077, dated June 17, 1873. [Filed Aug. 4, 1873.]

1. The receiving-hopper B B', in combination with the reservoir O, with its screen or grating side D, chute F, with its toothed gate h, and one or more independent screens, I, all combined and arranged substantially as and for the purpose above described.

2. The metal blank or false bottom K, in combination with the receiving-hopper B B', reservoir O, chute F, and gate h, substantially as and for the purpose above described.

3. The combination of the hopper B B', for receiving the coal from a swinging bucket, the reservoir O, arranged to receive the coal as it passes from the hopper, with the chute F and gate h, all constructed to operate substantially as and for the purpose set forth.

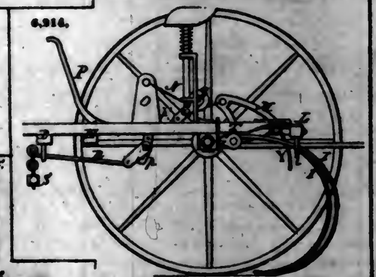


4. In combination with the elongated hopper, the screen D, reservoir O, and chute F, with its gate h, the combination being substantially such as is herein set forth.

6,212. BIT-STOCKS. Clemens B. Ross, Sunderland, assignor, by mesne assignments, to the Miller's Falls Manufacturing Company, Miller's Falls, Mass. Patent No. 62,044, dated Apr. 16, 1867. [Filed Nov. 17, 1873.]

Brief.—Two longitudinally-moving gripping-jaws, having wedge-shaped outer ends, are operated in suitable grooves in the bolster by a revolving screw-rod. The stock is attached to the head, so that it can be operated without revolving the head.

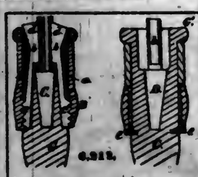
6,213. WASHING-MACHINES. H. D. STAFF, TEXAS, TEX.: assignor of one-half interest to Rice S. Flournoy, same place. Patent No. 147,905, dated Feb. 24, 1874. [Filed July 11, 1874.]



Brief.—The grated cylinder and the blades of the outer cylinder are so arranged on the same journals that they may be revolved in opposite directions at the same time, and the grated cylinder may be held stationary by a set-screw bearing against one of its journals. The outer drum and the grated cylinder are provided with suitable doors at the top for the introduction of the article to be washed, and the water is introduced through the perforated top.

The combination, with the grated cylinder D and the outer cylinder G^1, of the gudgeons E E', attached, respectively, to the heads G^2 G^3, the tubular bearings a a', attached centrally to the heads of the drum A, set-screw b, and the cranks F F', substantially as and for the purpose set forth.

6,214. HORSE HAY-RAKES. Robt. Wilson, Ithaca, N. Y. Patent No. 156,005, dated Oct. 13, 1874. [Filed Dec. 12, 1874.]



Brief.—A chain connected at its rear end to an arm projecting upward from the rake-head, and at its front end to a standard on the thills, is depressed by means of a hand-lever provided with a grooved friction-roller, which acts upon the chain when the teeth are to be lifted.

1. In combination with the pivoted rake-teeth I I' and the pressure-bar L, the bell-rank M, chain N, lever P, forked bar Q, and grooved pulley q, substantially as and for the purpose specified.

2. In combination with the locking-bar T, the vertically-adjustable bearing V, substantially as specified.

3. The three-pronged lever P, pivoted to the frame of a rake, and adapted for use in connection with a draft-rod, E, and the device for raising the rake-teeth, substantially as specified.

1. The combination of the G, having socket D, a lo[ck]-head, G^1, longitudinally [ad]-justable bolt E, having wedge-[sh]aped ends b b, and a revolving screw [d] operating on said bolt.

2. The com[bi]nation with the shaft g of ste[m] J, with the groove [a], forming the collar C [as] specified.

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 7.—NO. 2. TUESDAY, JANUARY 12, 1875. PRICE { $6,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1875 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

COMMISSIONER'S DECISIONS.

REES *vs.* RICHARDS AND BERRY.—*Appeal.*

[*Appeal from the decision of the Board of Examiners-in-Chief in the matter of the interference between the applications of Edmund H. Rees and the letters patent granted to Richards and Berry, October 7, 1873, for* "IMPROVEMENT IN TENONING-MACHINES."—*Decided December 18, 1874.*]

If the party who first conceived a machine followed up the idea diligently, and was the first to reduce it to actual practice, he is entitled to a patent for it, although his competitors had complete working drawings of it previously prepared, and had obtained a patent.

But he can claim the machine only in the form in which he had constructed it, and not in other modifications, which he does not appear to have contemplated, though they are analogous in principle.

THACHER, *Commissioner:*

The subject-matter involved in this interference is defined by the Primary Examiner as "the arrangement of a rotating cutter in a vertically-reciprocating frame between two horizontal tables." The purpose of the invention is to tenon long sills without turning the timber end for end. To accomplish this the tool is made to cut in both directions, and, sinking below the plane of the table after the downward cut is made, it allows the stuff to be moved longitudinally, to bring the other end to the tool.

Upon the part of Richards and Berry, the evidence alleges that Berry conceived the invention in January, 1872. At that time Richards was absent in Europe, and until he returned, upon the 15th of February, nothing was done, save that Berry described the proposed machine to one Orton. Both were in the employment of Richards, London & Kelley, of Philadelphia, Berry as machinist and draftsman, and Orton as foreman of the works. The patterns were begun February 26, 1872, and a complete working drawing, Berry says, was finished about March 14th following. The latter has been filed in evidence as an exhibit. This testimony is corroborated by Orton, who is the only witness called to give direct proof of the allegations upon which the patentees chiefly rest their right.

Rees testifies that when this invention was made he was general superintendent of the Mansfield, Ohio, Machine Works. It is stated that he conceived it in the latter part of the year 1871, and that a full sized working machine was set at work March 15, 1872. Between these dates "Exhibit D and E" was made. This drawing shows an end tenoner having a single table only. Rees swears that when the drawings were made the other table had not been finished, and admits that, as represented in the exhibit, the cutters could not pass below the plane of the table. To accomplish the work on both ends in the manner proposed they were obliged to lay a thick piece of plank upon the table shown in the drawing, and to employ an auxiliary table on the other side of the cutter-head. This arrangement is shown in a model marked "Rees Exhibit Model M." The extra table was made, Rees says, for the first machine, and was used March 15, 1872. Chas. F. Royce was at the time employed in the Mansfield Works, and swears that Rees showed him sketches and explained the idea of the machine to him at various times. The sketches, he thinks, were exhibited about "a week or a month" subsequent to the 10th day of December, 1871, when he began work at Mansfield. He was present and saw the machine tested, and operated it until he could instruct another man. He swears that it was set at work to tenon long stuff a day or two after it was first started, which was the last of February or the first of March, and he describes an arrangement

identical with that shown in "Rees Model M," already mentioned. Walters testifies to substantially the same effect. He says that Rees explained the object of the machine to him in January, 1872, saying that he would "use a wooden table on one end for the present," and would construct an iron table when he had seen it work. Walters was foreman of the works, and built the first machine, which, he says, was finished March 13, 14, or 15, 1872, and tried the 15th or 16th, and a day or two afterward the other table was added and a trial made upon long sills.

William Anderson, who was the pattern-maker at the works, testifies that he was employed upon the machine the nine last days of January, 1872, and during other periods following until he began work on the "double table," the 12th day of April, for which he made patterns from sketches given him by Rees upon that date.

Nelson Abbott, who was the superintendent of the works, saw the machine used on long sills the day after it was first tried. He swears that the extra wooden sill-table was then used.

Rees swears that the idea of his invention was suggested to him upon seeing a car-borer, which had been furnished to the Mansfield Works by J. A. Fay & Co., of Cincinnati. It is shown that this machine was forwarded to them upon the 27th of November, 1871.

Daniel L. Lyon testifies that he was at the Mansfield Works in the early part of February, 1872, and that Rees showed him this car-borer and explained his invention to him in connection therewith.

B. F. Burlingame testifies that in the last of March or first part of April, 1872, Rees came to his place and described to him the machine illustrated in "Exhibit Model M." About the tenth of the latter month he visited Rees and saw it in operation. He describes the tables then employed, which were identical with those seen in the model.

I have examined the alleged discrepancies in the evidence presented in behalf of Rees, but fail to discover such material contradictions, upon substantial and material points, as to warrant a rejection of his claims. There seems to be no reasonable doubt that he originated this invention in the latter part of 1871, and the evidence establishing the date of the embodiment of his idea in a working machine is clear and satisfactory.

On the other hand, there is some reason for doubt whether the patentees had made any invention in this direction prior to the production of working drawings about the middle of March, 1872. It is true Berry alleges that detailed sketches of some parts of the machine were made prior to the 26th day of February, 1872, and Orton says that he saw sketches early in March. The evidence of such sketches rests entirely upon the statement of these two interested parties, and is not conclusive, the original sketches not having been produced, and the proof showing that, at the best, they were mere fugitive drawings. It is also developed by Rees, in his rebutting testimony, that upon the 6th day of March, 1872, E. J. Barney, superintendent of the Barney and Smith Manufacturing Company, of Dayton, Ohio, wrote to Richards, London & Kelley in regard to an end-tenoning machine, alluding in the letter to the inconvenience of turning the lumber as experienced in the form of machine usually employed, and proposing a construction almost identical with that now in dispute. Upon the 11th of March an answer was returned by the firm that the apparatus proposed was practicable, and upon the 23d tracings were sent, with specifications, showing it. Upon the 22d of the same month Richards, London & Kelley wrote to J. N. Mileham, superintendent of the Buffalo Car-Works, for whom a "tenoner" had been ordered February 5, 1872, of the old pattern, in which the stuff was turned end for end, that they had changed the machine so far as to require a new set of patterns; that they should build it in such manner that the stick could be passed along, through, or by the side of, the machine, cutting the tenons on one end by the cutters going down, and on the other end by bringing the cutter-heads up, and, in this connection, they said, "this change we made to suit other parties, and we know you have no objections to such a machine."

The presumption that the change mentioned was the one suggested by Barney is very strong, and prevents much reliance being placed upon testimony going to prove an earlier date for the invention on the part of Richards and Berry than some time in March, 1872. But, even if this testimony was entirely credible, I do not think it would disturb applicant's right to his invention. He was the first to originate and describe the same to others, after which he proceeded with due diligence to embody his idea in practical working form, in which he was also first.

Richards and Berry were second in originating the invention, and all that they have to show, prior to the construction and use of a working machine by Rees, is a working drawing, which cannot effect the standing of Rees as the first to reduce to practice, in view of the fact that he was diligently prosecuting his efforts in this direction, although the earliest actual use of his first machine was subsequent to the date of this drawing.

Upon the issue defined in the declaration of interference, I have no hesitation in awarding priority to Rees. This issue, however, is somewhat general, being limited only to machines in which, in the language of the declaration, "a cutter-head reciprocates between two tables." But it is plain that there is considerable difference in mechanical construction between the first working machine devised by Rees, and illustrated by his Exhibit M, and that shown in the Richards and Berry patent. In the former apparatus the tables are not united as in the machine adopted by the patentees. It comprised simply a rest placed upon one side of the cutters, with an independent auxiliary table, which was placed upon the other side when long stuff was worked, a thick plank being bolted to the permanent stand to raise the sill to a sufficient height. The two supporting-surfaces, however, were not in the same horizontal plane, and the whole mechanism differed in construction and adaptation from the apparatus shown in the patent, although identical therewith in principle. I am satisfied that Rees is not entitled to claim as his invention subject-matter which is not substantially embraced in his first machine. Whether or not there is a patentable difference between the machine of the patentees and that first constructed by applicant I am not called upon to decide, as a patent for the peculiar construction adopted by Richards and Berry, and which the evidence shows they were first to devise, has already been granted, and the question is, therefore, beyond the jurisdiction of the Commissioner of Patents. But as Rees was not the first to originate this particular construction, he is not entitled to show it in his application, and the latter must, therefore, be amended by striking from the record everything in relation thereto. With this restriction, the decision of the Examiners-in-Chief, awarding priority to Rees, is affirmed.

WARE *vs.* BULLOCK.—*Appeal.*

[*Appeal from the decision of the Board of Examiners-in-Chief in the matter of the interference between the application of Reuel W. Ware for letters patent for an* IMPROVEMENT IN CARRIAGE-SPRINGS *and the patent granted to Jacob Bullock, December 9, 1873, for a similar invention.—Decided November 24, 1874.*]

Where a party has a caveat pending in the Office, if another obtains a patent for the same invention without notice to the former, he will gain no advantage by it, but must establish his case as if he were an applicant.

Mere descriptions of an invention, and fugitive sketches which have not been preserved, will receive little consideration in determining the questions of priority between two rival applicants.

Whoever first reduces an invention to practice and makes an application of it to use will usually be held the prior inventor.

THACHER, *Commissioner:*

The Examiner of Interferences and the Examiners-in-Chief have reached opposite conclusions in this case upon substantially the same state of facts. I have, therefore, given it a more critical attention than would be necessary were the tribunals agreed in their finding, in order to set at rest the doubt raised by the conflicting decisions below.

The parties stand before the Office precisely as if both applications were still pending, Bullock's patent having issued without notice of the caveat filed by Ware the previous year. He has, however, the earlier record date, his application being filed June 7, 1873, while Ware did not appear in the Office, except by his caveat, until January 31, 1874.

The invention in controversy is a carriage-spring, composed of metal and wood, the two being united at the ends and in the middle. This device Ware says he conceived in the summer of the year 1871, and he proves very satisfactorily that he disclosed it to one Jeremiah Eells, a carriage-maker, in October, urging, as the latter test fies, that he join with him in obtaining a patent, the demands of business being so great that he had no time to devote to it. This proposal was rejected, and during the winter that ensued nothing was done with the invention. But, in April, 1872, he bought from Eells a skeleton-wagon, to which the spring was applied, the witness directing him to parties from whom he could obtain the metallic portion. Upon the tenth day of June a caveat describing it was filed in the Office, and on the first of July a new wagon was ordered containing the invention, and having a metallic plate stamped with the words "Patent Pending," attached to it. Ware's model was finished, he says, in September, 1872, but was not filed until his application was made.

Bullock testifies that he conceived the invention in the summer of 1869, and disclosed it to a certain Charles Fox in the month of May, the discovery being made by means of a letter containing a rough draft of the device. To his son George, also, and to one A. C. Pomeroy, he swears that he described and illustrated it by sketches, the character of which will be noticed hereafter. Of the whole number made by Bullock, two have been filed in evidence, made in the "back part" of an old account-book. He also testifies that he made a model in August, 1871, with the aid of Fox, but, unfortunately, he has failed to lay the slightest foundation for this allegation in his preliminary statement, and I must, therefore, exclude it. It was not until the autumn of 1872 that the invention was embodied, and Bullock testifies to a still later date, swearing that the first use of the invention was in the very last part of January, 1873.

If the case rested upon this testimony, the question of priority would be of comparatively easy solution. But evidence has been introduced to show that Bullock, prior to his embodiment of the device, or to any distinct and well-ascertained act of invention, obtained knowledge of Ware's invention. One John Powell is brought forward, who swears positively that in the autumn of the year 1872, while working in Bullock's carriage-shop, he saw the wagons which Eells was building for Ware at Hancock, and communicated the invention to his master, whose subsequent reduction to practice was a copy of the invention thus disclosed to him.

This statement would have less weight, were it not for the testimony by which it is followed. Eells is produced, who made the first wagons built for Ware. It appears that one of these was stored in a barn in Hancock, owned by Marvin Wheeler, and the witness swears that Bullock, being in his shop about the first of January, 1873, was conducted by him to the barn and shown the Ware carriage. "He examined the combination-springs," Eells says, "and I asked him if he ever saw anything like them. He said he never did."

The first buggy built by Bullock was sold to James G. Fisher, who swears that he was in the shop before it was finished, and heard Powell remark that it "was got up after a wagon that was got up in Hancock," and this evidence is corroborated by Bristol, a workman in the shop, who says he heard the conversation, and by a Mr. Hotchkiss, who also bought one of the wagons subsequently built, who saw the Fisher wagon, and was told by Powell that it was of the same style as one in Hancock, devised by "a railroad man."

An attempt is made to cast discredit upon this testimony by showing that the first carriage made by Bullock was not delivered to the purchaser, Fisher, until the last part of January, 1873; that the springs were not on it at the time of the alleged conversation; and that Powell could not, therefore, have been present and made the statements to which he so positively swears. But this is met by the evidence of Fisher, who distinctly remembers that the wagon was in his carriage-house upon Thanksgiving Day, in November, 1872, and whose testimony in this regard is corroborated by that of his daughter, who was at his house, and by Bristol, who painted the wagon in the fall, and declares that the springs were on, and that Powell, to the best of his recollection, was there. As the latter did not leave

Bullock's employment until some time in December, I see no reason for doubting the statement. However, it is still further corroborated by the two Hotchkisses, father and son, who saw the wagon at the shop and got into it to test the springs.

The photograph, Exhibit I, is filed as an exact representation of the Ware wagon, shown him by Eells, who swears positively to its identity. The objections made to the introduction of this exhibit must fail. Photographs are constantly admitted in courts of justice as instruments of evidence. The photograph is used in this case for the purpose of establishing identity between the Ware invention and that subsequently embodied by Bullock, not to prove the date of the former, and, for this purpose, is competent evidence.

The evidence presented by Bullock is given solely by himself, his son, George; his son-in-law, Fox; and Pomeroy, the latter only testifying to some rough sketches made on a work-bench in a blacksmith's shop, and immediately erased. He is the only witness who is not, in some degree at least, identified in interest with Bullock. I am not disposed to give undue prominence to this consideration, but, in the determination of all questions of right, it must have its appropriate weight. Such testimony is admissible, but its authority and conclusiveness is a matter of judgment. There are circumstances, aside from those already mentioned, which affect the credibility of these witnesses. The letter of 1869 is presented without the envelope; a model is sworn to as having been built in 1871, while the preliminary statement alleges no such fact; sketches are made in the end of an old ledger and upon a bench, most of which are afterward lost, or immediately erased. These are the acts of invention upon which Bullock's claim is based. It has been repeatedly held by the Office that such evidence is subject to the gravest suspicion, and cannot be considered proof unless supported by clear and unexceptionable testimony of disinterested witnesses. I would not rest an award of priority upon this ground alone, but, taken in connection with other circumstances mentioned, its bearing in this case is important.

The Board of Examiners-in-Chief have found in favor of Ware, the first, in their opinion, to perfect the invention, embody it in practical form, and confer its benefits upon the public. This view appears to be a reasonable deduction from the facts shown. If Bullock's statement is to be admitted, he conceived the device in May, 1869, and from that time until August, 1871, he did nothing further than to illustrate it by sketches. In the month last named, he says, he made a model embodying it, but this allegation, resting only on the testimony of himself and his son-in-law, Fox, and being entirely at variance with the substantive acts of invention recited in his preliminary statement, cannot be accepted as satisfactorily proven. The next step was the actual embodiment of the invention in December, 1872, or January, 1873. Ware, on the other hand, conceived the matter in dispute in 1871, and embodied it in the spring of 1872, as early as the month of April. In June he filed his caveat and proceeded to make and sell wagons having this spring.

Upon such a statement of facts, the Board properly held Ware to be the first inventor, in contemplation of law, and their decision is accordingly affirmed.

BLOOMFIELD BROWER.—*Appeal.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the application of Bloomfield Brower for letters patent for* IMPROVEMENT IN WRITING-PENS.—*Decided December* 15, 1874.]

The practice of plating articles of metal with nickel in order to harden their surfaces and give them a polish is common, and to apply it to pens is a mere double use, and is not entitled to a patent.

THACHER, *Commissioner:*

Applicant claims—

A metallic writing-pen, nickel plated.

The principal objects attained by the now well-known art of nickel-plating are the preservation of the articles to which it is applied from corrosion, and the production of a bright silvery appearance.

Applicant, however, to avoid the force of the objection of double use—metallic articles of various kinds having for a long time been nickel-plated—insists that new results, in addition to those above mentioned, are produced when this process is applied to a pen, viz: The production of extreme hardness at the points, and also exemption from cramp in the hand sometimes experienced from the constant use of ordinary metallic pens.

It is believed that the advantages thus claimed for this device are fictitious. The nickel of commerce possesses the same relative degree of hardness as iron, with which it is so intimately associated; and, unless effected by some process not indicated by applicant, the nickel-plating would be no harder than the points of the steel pens to which he proposes to apply it.

In regard to the exemption from cramp in the hand, alleged as sometimes arising from constant use of steel pens, the applicant very briefly lays claim to this result for his device without advancing any explanation of his discovery, or adducing any satisfactory evidence in its support.

I concur in the opinion of the Examiners-in-Chief that the only quality alleged as entitling this pen to novelty is its greater durability, and that this is to be attributed to its resisting the corrosive action of ink. As this benefit is obtained by nickel plating in all cases, to employ it upon a pen is a mere double use, and therefore not patentable.

The decision in the case of *Osborne and Dayton*, Commissioner's Decisions 1870, p. 149, refusing letters patent for a nickel-plated bird-cage, is precisely in point.

The decision of the Examiners-in-Chief is affirmed.

JAS. S. RAY.—*Appeal.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the application of James S. Ray for letters patent for an* IMPROVEMENT IN COFFIN-HANDLES.—*Decided November* 17, 1874.]

A hollow metal coffin-handle having its ends inserted into rings in bars on the casket, and then indented into the rings, and farther attached by inserting plugs, being found an improvement both in point of economy and security, held entitled to a patent.

THACHER, *Commissioner:*

The invention consists in a hollow drawn metal handle attached to the bars on the casket by inserting its ends into the rings formed in the bars, and striking up indentations from the interior of the tube into the metal of the rings. A tip is afterward plugged into each end of the handle in the usual manner. The several parts are all old, and are shown in the references united either by a wedge-plug, which enlarges the end of the tube and jams it against the ring, or by enlarging the tube at the point where it is embraced by the bar. In view of these references, and of the familiar method of fastening the ferrules of canes, the case has been rejected on the ground that applicant has applied a well-known mechanical expedient to an old device to accomplish a known result.

There is no doubt that he has produced a cheaper article than any shown in the cases cited, and one in which the parts are more securely united. I think sufficient ingenuity is shown in their combination, as a whole, to warrant the very limited claim made by the last amendment. It covers the combination of the handle, the pivoted bar, and the tip, the two former being united by indenting the metal prior to the insertion of the plug. The specification sets forth the state of the art, and as the public can by no possibility be misled as to the scope of the claim, the benefit of the doubt raised by the case must be given to the applicant.

The decision of the Board is reversed.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, EASTERN DISTRICT OF MICHIGAN.

THE GOODYEAR DENTAL VULCANITE COMPANY *et al. vs.* GEORGE WILLIS.

[*In equity.—November term*, 1874.]

The principles upon which the several circuit courts of the United States are bound by the decisions of each other examined and discussed.

The adherence to decisions is by no means confined to those which precede the case in question in the same tribunal. Those of co-ordinate courts are equally influential.

The circuit courts of the United States, although divided in jurisdiction geographically, constitute a single system, and where one court has fully considered and deliberately decided a question, every suggestion of propriety and fit public action demand it should be followed until modified by the appellate court.

The circumstances of the appeal to the Supreme Court in the case of *Gardner* vs. *Goodyear Dental Vulcanite Company* (3 PAT. OFF. GAZ., 295) considered.

The conditions under which the use of one material instead of another in constructing a known machine or article may be patentable, considered and explained. *Hotchkiss* vs. *Greenwood*, (11 How., 248,) and *Hicks* vs. *Kelsey*, (18 Wall., 670,) cited and discussed.

Cummings applied for a patent in April, 1855, and was rejected in 1856. He filed a new application in 1864, and the patent was then granted. The invention went into public use in 1859. *Held*, That where successive applications are made in the procuration of a patent, where there is no proof of actual abandonment the subsequent application will be deemed a continuation of the first.

The invention having been patented in England by a third person: *Held*, That, in order to support the objection resting upon the issuance of a foreign patent, proof should be given connecting the complainant with its procuration.

[This was a bill in equity filed against the defendant, a dentist, for infringement of reissued Letters Patent No. 1,904, granted to The Dental Vulcanite Company, assignee of John A. Cummings, for "Improvement in Artificial Gums and Palates." The claim in the patent is for "the plate of hard rubber or vulcanite, or its equivalent, for holding artificial teeth, or teeth and gums, substantially as described."

Cummings filed his caveat May 14, 1852. Applied for a patent April 12, 1855. This application was rejected May 19, 1855, and again rejected August 14, 1855, and again rejected by the Commissioner of Patents February 6, 1856. In 1859 a motion was made before the Commissioner for a rehearing, or for an appeal to the Board of Examiners, which motion was denied. On March 25, 1864, a renewed application was filed. On April 7, 1864, the Patent Office wrote to Cummings acknowledging that injustice had been done in the former rejection, and the patent was thereupon allowed, and was issued on June 7, 1864. There was evidence that tended to show poverty on the part of the inventor and efforts by him to raise money to prosecute his application during these periods. The invention went into public use about 1859.]

[*Benjamin F. Lee*, for complainants.
John F. Follett and Calvin C. Burt, for defendant.

EMMONS, *J.:*

In ordinary circumstances the condition of judicial opinion in reference to all the points involved in the record would render unnecessary their discussion upon principle, and in a case where such rulings have been so numerous, and directly upon the points, and so elaborate in argument, it is unusual to do more than refer to them generally, as settling the points in issue. Such, however, is the exceptional feeling and excitement existing in the minds of the numerous defendants in suits brought on this patent in this and adjoining districts, resulting, we believe, from the want of knowledge on their part of the real history of previous litigations, and the character and number of opinions which have been already pronounced, that it is deemed a duty by my brethren and myself to reproduce that which we are well aware is already familiar to the bench and bar. It will attract the attention here of all those interested in these litigations, while the sources from which such information is to be obtained are inaccessible to, or at least are not examined by, them. It was asserted with much earnestness and confidence by defendant's counsel that a careful review of the judgments already pronounced sustaining the complainants' patent, and contrasting the record before us with those upon which such opinions were based, would result in our taking up the questions before us and deciding them upon principle, wholly unembarrassed by judicial action elsewhere. We have listened for three days to an argument of great ability and research, and with much confidence retain the opinion we entertained at the outset, that in all the subordinate federal jurisdictions these questions should be deemed at rest until the court of last resort should reverse some of the judgments already rendered. We think the learned counsel for the defendant much underrated the effect which it is our duty to give to judgments pronounced by co-ordinate courts, where precisely the same points are brought in litigation before us. The learning upon this subject is familiar, but the motives with which we discuss these matters at all will be subserved by referring to a few of the leading judgments upon this subject here. Those to which we refer have applied the principle in patent cases, but it is by no means peculiar to them. It is a principle of general jurisprudence, a disregard of which

would produce a conflict of opinion in the federal judiciary, alike unseemly and impolitic.

In 3 Story, 133, *Washburn* vs. *Gould*, Justice Story, sitting in the Massachusetts circuit, said: "The rule of comity always observed by the Justices of the Supreme Court in cases which admitted of being carried before the whole court was to conform to the opinions of each other, if any had been given." Justice McLean had previously given a ruling upon the same point in the Ohio circuit in 3 McLean, 250, *Brooks* vs. *Bicknell*, and Justice Story therefore said, "although his mind was not without much difficulty on this point, he should rule for the plaintiffs, in accordance with the opinion of Mr. Justice McLean." In 3 Fisher, 363, *Am. Wood Paper Co.* vs. *Fiber Disintegrating Co.* before Benedict, J., eastern district of New York, there had been previous suits on the same five patents in other districts, and especially a suit in the eastern district of Pennsylvania, which decided the points in issue as to two of the patents. Judge Benedict said, as to these two patents, "The determination of the court in the case referred to furnishes an authority from which I should not feel at liberty, had I the inclination, to dissent." In 3 Fisher, 443, *Goodyear* vs. *Berry*, Leavitt, J., southern district of Ohio, a patent had been sustained in several other circuits. Judge Leavitt says: "In so far as principles involving the validity of these patents have been settled by these decisions, they will be regarded as final and authoritative on this court." In 4 Fisher, 624, *Tighlman* vs. *Mitchell*, southern district of New York, Blatchford, J., quotes with approbation our remarks in *Tighlman* vs. *Werk*, southern district of Ohio, 1868, in which it is said, "Although the record in this case in reference to some views which a superior court may possibly take contains some material additional proofs, still they are not such as to authorize the same court to overrule its former deliberate adjudications, and to disregard the judgments of a co-ordinate one in a case in all respects substantially like it." In 6 PAT. OFFICE GAZ., p. 154, *Goodyear Dental Vulcanite Co.* vs. *Root*, Justice Hunt, sitting in the northern district of New York, considers as authoritative the previous decisions in Massachusetts on the same patent. To the support of the generality sustained by these judgments it is unnecessary to say that numerous citations might be added, all showing that, in the opinion of the most enlightened jurists, we should be guilty of grossly violating well-established judicial usage and propriety should we disregard the adjudications already made in reference to the validity of the patent before us.

The principle which inclines a court to adhere to its own decision of a similar point, although subsequently convinced it was erroneous, though not in all respects applicable here, furnishes a strong analogy, and a reason on which our own actions should be based. (See Ram. on Legal Judgment, 203, *et seq.*) It there abundantly appears that the adherence to decisions is by no means confined to those which precede it in the same tribunal. Those of co-ordinate courts are equally influential. The Queen's Bench, common pleas, and the exchequer, where there is a common appellate court to review the decisions of each, follow with the utmost respect each other's adjudications.

Upon reasons having much influence here, appellate courts often follow a series of adjudications made by subordinate tribunals where they have been acquiesced in, and have become, in some sense, a rule of property. It is not because they are obligatory but from the unfitness of shifting rules. This is by no means closely applicable here, where judgments are recent and refer to the individual rights of the complainant. But many of the evils, it is quite apparent, which this class of judgments seeks to avoid would be produced should we disregard the rule. In the elaborate treatment of this general subject in the book to which we have referred, both by the English and American authors, it is significant that they make no distinction between prior decisions of the same and co-ordinate tribunals. It is enough to call for the application of the principle that the courts have the same jurisdiction under the same government to decide the same points, that there is a common appellate court finally to adjust the difference between them.

If one system of co-ordinate courts more than another calls for the application of this general principle it is that of the circuit courts of the United States. They all have similar special jurisdiction, and are all, in an eminent degree, looked to for all those rules of right and property created under the Federal Statutes, and in reference to the subjects coming within the Federal Constitution. Although divided in jurisdiction geographically, they constitute a single system; and when one court has fully considered and deliberately decided a question, every suggestion of propriety and fit public action demand it should be followed until modified by the appellate court.

The comment at the bar upon this subject assumed that the final decrees and elaborately-reasoned decisions of circuit judges, with full citations and criticisms of authorities, often involving the entire history of the law upon the subject discussed, are to be ranked with what are termed *nisi prius* decisions. They are in all respects judgments *in banc*. They not only have the deliberation and care of judgments in the high courts of chancery in England and this country, but the court of itself bears the same relation to the whole judicial system that such courts do to those in which they exist. There is but one appellate court above them. A superior tribunal also reviews the judgments of the English chancery, and so of nearly all the like state tribunals.

Although we would by no means confine our acquiescence in the decisions of our brother judges to cases where the particular patent has been adjudged to be valid, or that a particular device infringes upon it, still we think that eminently beyond other cases is the rule applicable to them. The right of the complainant is a special franchise granted by the political power. A special organism is created for the purpose of ascertaining his right to the grant. When issued, the several federal courts are authorized to review the rectitude of this action, and from their determination an appeal lies to the court of last resort. It is an indivisible system for ascertaining the rightfulness and the limits of the patent, and when, in any co-ordinate department of it, judgment has been pronounced, that duty should be deemed performed until reversed by an appellate tribunal. It would present an unseemly spectacle for the same governmental grant to receive half a dozen different constructions in as many co-ordinate courts, all authorized to define it and inform the citizens what it

means, and all having the force of law cotemporaneously under the same government. We cannot speak with great certainty, but do affirm with much confidence, that the expenses paid in our country for patent litigations are rapidly approximating the entire sum demanded for royalties. Until some special tribunal is instituted for the determination of these questions, and some general mode of reviewing these public grants, which shall test definitely the rightfulness of the grants, it will result in a large saving of money to the great masses of our citizens who are using these improvements, to let them and their advisers of the profession understand that a fair and full examination in one court, followed by a judgment, will, in the other co-ordinate tribunals, be acquiesced in as law, if there is no appeal and reversal.

It is said a present party defendant before the court could not have appealed from the former judgment. The court, as this one has repeatedly done, will carefully guard against any such hardship as to conclude the citizen by a proceeding to which he was not a party, of which he had no notice, and where, in fact, no appeal has been taken. If a desire by a defendant is expressed to test in a superior court the rectitude of what has been already adjudicated, and a complainant should refuse to stipulate that the proofs taken in another cause might be filed in the one pending, the rule would not be followed in the granting of preliminary injunction. Nor is there any hardship upon the complainant. If he insist that the record upon which a former judgment is rendered is full and fair, it is but just that he should suffer it to be imported into a present proceeding before he could ask a preliminary injunction. The defendant can then examine, and if he desires to add to it before the final hearing he can do so; if not, he can appeal to the Supreme Court upon the record as it is, and test the validity of what has been decided. Such a practice we believe far more beneficent and inexpensive to the defendant, as it is economical of the time of the court.

The following decisions, noticed, we think, in the order in which they were made, every one of them upon records *precisely* like that before us, or less favorable to the complainants, decide (most of them with much fullness of argument) every point necessary to authorize a decree for complainants. In 3 Fisher, 87, *Dental Vulcanite Co.* vs. *Wetherbee*, before Justice Clifford, in 1868, the bill was filed to restrain an infringement of the patent now before us. The defendant there, as here, insisted that the patent was invalid because it did not embrace that which was the subject of a patent. That if it did, it was void for want of novelty, and that Cummings was not the inventor. That if he invented he abandoned it. That there was a forfeiture of his rights, if any he had, under the statute, because he suffered it to go into use more than two years before he applied for his patent. That the reissue was void, because not warranted by the original patent. The cause was argued by counsel as eminent as any in the nation. Justice Clifford, after taking much time for deliberation, in a painstaking judgment, overruled every objection taken by the defense. *Goodyear Dental Vulcanite Co.* vs. *Gardner* was a similar case before the learned Justice, in 1868, and the same defense, among others, was substantially taken. The application for a preliminary injunction was argued by B. F. Curtis and Causten Browne, for complainants, and B. F. Thurston and S. D. Law and John A. Foster, for defendants. It is seldom that more professional ability is brought to the discussion of a similar application. Justice Clifford again, in his judgment, sustained the patent and overruled all the objections to it. (See pamph. rep. of case.) This cause was subsequently brought to final hearing on pleadings and proofs, and in 4 Fisher, 224, will be found the opinion of Justice Clifford rendered in favor of complainants after much deliberation, leave having been expressly given the respondents to reargue the questions of law and fact presented in the Wetherbee case. We will note, in connection with this case in the Supreme Court, the imputations cast upon it by the defense, observing here only that there is no accusation of impropriety in the case, before or at the time of the motion for interlocutory injunction. In 5 Patent Office GAZETTE, p. 585, *Goodyear Dental Vulcanite Co.* vs. *Smith*, the same defenses were in evidence as in the case now before us, the records being identical, with the exception of a small amount of additional testimony on the part of the defense in this case, of so little importance that it was not noticed at the bar by either side.

The cause was argued at great length by able counsel before Judge Shepley, who rendered an elaborate judgment in favor of complainants. In 6 Pat. Office GAZETTE, p. 154, *Goodyear Dental Vulcanite Co.* vs. *Root*, the same questions were presented to Justice Hunt, sitting in the northern district of New York, who, after argument, again sustained the patent. Subsequently, in suits by the same complainants against Charles S. Stockton and Frank A. Cummings, argument was had by the same counsel on the same record as in the Smith case, before Judge Nixon, in the district of New Jersey, who again sustained the patent at September term, 1874. A decree in favor of complainants against William H. Gates was granted at October term, 1874, on the same record as in the Smith case before Judges McKennan and Cadwalader, in the eastern district of Pennsylvania.

The case of *Goodyear Dental Vulcanite Company* vs. *Gardner*, *ante*, was appealed to the Supreme Court, and every ruling necessary for the support of the judgment in the court below affirmed by that tribunal. The effect of this judgment, as an authority here, is earnestly assailed, because the court, before the opinion was actually delivered, although judgment had been rendered, dismissed the appeal. We do not see, in the reasons for this dismissal, anything which decreases the obligation on our part to follow the rule of law necessarily involved in the judgment. The complainants, in the court below, for the purpose of securing an argument and a hearing, had advanced money for the fees of the defendant's counsel. For this reason the appeal in the Supreme Court was dismissed; but before this fact was brought to the attention of the court, the cause had been fully argued and judgment rendered, as in other cases. The circumstances under which the defense was prosecuted insured more than ordinary diligence on the part of counsel. The record before us shows that they were retained by the associated dentists, in convention at New York. They received a retainer in hand, with the promise of a large conditional fee of between $15,000 and $20,000, in case they succeeded in reversing the decision of the court below. The fact that money

had been advanced by these complainants was fully stated to this association, and, after much deliberation and advice of their counsel, they elected to test the questions at issue upon the record, as it then remained in the Supreme Court, because they were advised that no better one could be made for their interests. Gardner, at that time, was well understood by all parties in interest to be but a nominal defendant. The real parties in interest, who alone were prosecuting the defense, were fully advised of every fact, and in circumstances as well calculated to insure a favorable result as any which by any possibility could be presented upon the known facts, the case was decided against them. This judgment, as evidence of the law, and of what the court of last resort must evidently decide in like case, is obligatory upon us here. No such counter imputation has been made of the bar, and there may be facts outside of this record which would render such a suggestion extremely unjust to the real parties in interest, and who alone promoted the defense in the Supreme Court; but if all the conditions are before us, it would seem that a case of much ill faith on their part is presented. They were fully apprised of the facts. The complainants knew that they were so apprised of them. Both sides were equally cognizant of the just and necessary rule upon which the appeal after decree was dismissed. We are constrained to say that we do not see how, with anything like honor, they could refuse to abide by a judgment fairly obtained with full argument, in circumstances to which they, after much consideration, assented.

This series of decisions, without one in conflict with them, presents conditions in which it is our undoubted duty to apply the principle which makes the judgments of co-ordinate courts obligatory where they have been upon the same points and the same subject-matter.

As we have already intimated, ordinarily we should terminate our consideration of this case here. A matter so often and so authoritatively decided would not be discussed, upon principle, did we not believe that a brief reference to the reasons upon which these adjudications rest would be locally beneficial.

Defendant's counsel, in the first place, insist that the subject-matter, as they construe the claim, is not patentable. That in view of the state of the art—of what had been done before—the production of this plate did not involve invention, and that it had been in use by the dental profession. Our consideration of this head will be very brief—little more than a reference to a few of the reasons given in the adjudications which we have already cited. We know of no better statement of the claim than that given in the very able opinion of Judge Shepley in the case of these complainants *vs.* Daniel H. Smith. He says—

> It is for a set of artificial teeth, as a new article of manufacture, consisting of a plate of hard rubber or vulcanite with teeth, or teeth and gums, secured thereto, in the manner described in the patent, by embedding the teeth and pins in the vulcanizable compound, so that it shall surround the teeth and pins while the compound is in a soft state before it is vulcanized, so that when the compound is vulcanized the teeth are firmly secured by the pins embedded in the vulcanite, and there is a tight joint between the vulcanite and the teeth.

This definition includes alike the process of producing and the thing produced. Defendant's counsel earnestly contended that this case comes within the cases of *Hotchkiss* vs. *Greenwood*, (11 How., 248,) and *Hicks* vs. *Kelsey*, (18 Wall., 670,) which they insist hold that where one material is substituted for another in the production of a manufacture substantially like what already existed, a mere increase in efficiency would not sustain a patent. To apply that principle here would be an undue extension of the doctrine held by those cases. We approve, substantially, what was said by Judge Shepley, of the case of *Hotchkiss* vs. *Greenwood*, that, "In effect, the court decided that the peculiar effect claimed was not new, and therefore not patentable, and not that the combination might not have been patentable, had any effect been shown which was new, peculiar, and useful. If the knobs of porcelain or clay used by the complainants in that case had been new, or if, being old, the complainants, by a novel use of them in the old combination, had accomplished a new and useful result, differing not merely in degree but in kind from the result of the old combination, the patent would clearly have been valid, and the case cited is certainly not an authority to the contrary." In *Hicks* vs. *Kelsey*, the court says: "The use of one material instead of another in constructing a known machine is, in *most cases*, so obviously a matter of mere mechanical judgment, and not of invention, that it cannot be called an invention, *unless* some new and useful result, *an increase of efficiency*, or a decided saving in the operation, is clearly attained." This recent case fully concedes what otherwise we should attempt to show from the adjudications. We think, as it clearly intimates, that cases may exist where the degree of superiority may be such as to amount, within the law of patents, to a difference in kind. It is a mere matter of phraseology, and describing it either way should work no difference in principle. Here the dental profession had for many years striven to produce joints between the artificial teeth and plate that should be permanently impervious to the fluids of the mouth. Treating this as the specific object of effort anterior to the patentee's production, it had never been done at all. His manufacture is wholly new, and, if necessary to the support of his highly meritorious claim, we would, in this regard, thus treat it. In view of this feature, and of the greatly-added strength, its far greater adaptability to the surfaces of the mouth, in some uses its lightness, its elasticity, its resistance to chemical action, its vastly diminished cost, and several other important features detailed by the experts, the whole constitutes a product so substantially different from everything that preceded it as to bring it within the true spirit of the law which protects property in useful inventions.

We cannot take time to review the testimony of the experts. What Judge Shepley said of the record before him is literally applicable to that before us. He says: "To overcome the presumption that it is a new manufacture arising from the grant of the letters patent, the respondent has not introduced the opinion of any expert who is willing, in view of the state of the art as known to him and proved in the case, to testify that this was not, at the date of the original application, a new manufacture. Reliance is placed upon the evidence introduced in the case by the respondent to convince the court of the fact, upon which respondent's experts were not convinced, that the manufacture patented, as distinguished from those which had preceded it, was not a new manufacture."

In connection with what we have already said as to differences created by increased efficiency in degree only, and that which, according to existing technical distinctions, is a difference in kind, we were much impressed with the answer of Edward S. Renwick, one of the leading experts for the defendant. A question called upon him to say distinctly whether the use of vulcanite in the mode described did not involve invention. He concedes, assuming Cummings did not invent vulcanite, that if the change of material introduced a property which was different in kind from those before known in dental plates, and was valuable, it would impart a useful property they did not before possess, and that would constitute a new manufacture. A consideration of his entire testimony, and that of the great body of experts in this case, will show, we think, manifestly, that they deemed *that* a difference in *kind*, which is as wide in fact and practical utility as that which characterizes this dental plate. Vulcanite was well known and its properties familiar. Gutta-percha was also well known, and had been actually manipulated in the dental art. The whole profession had been earnestly directing its attention specifically to the object so successfully accomplished by this invention, yet no one, until Cummings suggested it, approximated the results he obtained, nor was this great improvement rapidly adopted after its mention in journals peculiarly accessible to the profession. It made its way slowly, and only with the aid of much urgency and industry, and against persistent opposition, to nearly universal adoption. The proof develops no one instance of its use not traceable directly to knowledge derived from Cummings. However plausible may be the argument that because the properties of vulcanite were well known, and the mere forms of these plates and teeth familiar, the history of this invention demonstrates that, as a matter of fact, the highest skill of a learned profession, with all its elements for years before them, not only failed to discover it originally, but required years of argument and experiment before they would adopt it. As we should naturally expect in such conditions, there is an absence in the record of expert testimony, showing that this claim, as judicially construed, did not involve invention. No case ever before us more eminently called for the application of the rule so frequently relied on to uphold the novelty of inventions, which deduces the fact of novelty from the extent of the revolution immediately resulting in that department of the arts in which they are employed.

Formally, the objection was taken that the reissue was not warranted by the original patent. The present claim, as construed by the court, is so undeniably indicated in the original patent that, although we did not understand the counsel for the defense as by any means waiving the point, we did understand by what passed at the bar, and explanations that were made in answer to interrogatories from the bench, that little reliance was placed upon this position. No useful purpose would be subserved in noticing it further. We have no doubt whatever the reissue was warranted by the original patent.

It is also insisted that the complainants' manufacture was anticipated by several pre-existing dental plates. It is not deemed necessary to contrast any of these devices with that before us. It has been frequently done by other tribunals before which they have also been proved, and in every instance judicially pronounced to be wholly unlike that described in complainants' claim. There is not sufficient similarity to demand at our hands a comparison. We quote again from the opinion of Judge Shepley, already noticed, the conclusion at which he arrives after a careful and minute discussion of a part, and a general reference to the residue, of the exhibits here claimed as anticipating the patent. After discussing the cast-tin plates made by Hawes and Royce, he says: "Without going into a detailed examination of the Wildman plates, made by casting tin around the roots of the teeth upon gold or silver plates, the unsuccessful attempts to use gutta-percha, the experiments of Dr. Hill with a secret compound of gutta-percha and some metallic salt, it is sufficient to state that none of these, much less any of the printed publications of which notice is given in the answer, suggest or describe an article of manufacture substantially like that described and claimed in the reissued patent on which this suit in equity is based."

It was also urged on the argument here, as it has been in the other cases referred to, that the rights of the complainants had been forfeited under section 7 of the act of 1836, as amended by the act of 1839, which provides that if the claimant shall suffer his invention to go into public use with his consent and allowance for more than two years prior to his application for a patent, it shall be deemed abandoned; and that it was also forfeited under section 8 of the act of 1836, and the additional act of 1839, providing that if the invention shall be patented in a foreign country more than six months prior, and be introduced into public and common use in the United States before the application for a patent, it shall be deemed void. Defendant's counsel concede that if the application for this patent was made in 1855 instead of 1864, then these objections have no application, because no use whatever was proven in this country, nor was the patent issued in England before that date. If the application made in 1864 was but a continuation of the proceeding launched in 1855, so that we may consider the application then made as that upon which the patent rests, neither the two years' period under the one section nor the six months under the other would apply. That within the meaning of these provisions, where successive applications are made in the procuration of a patent, where there is no proof of actual abandonment, the subsequent application will be deemed a continuation of the first, is fully sustained by the following adjudications. (1 Fisher, 377, *Bell* vs. *Daniels;* Leavitt, J., southern district of Ohio, 1858.) The application filed January, 1838, was then rejected. There was no withdrawal. In March, 1840, a new application was filed, and a patent granted 1840. The court says: "This question is decided by section 7 of the act of 1836. That section provides that when a patent is refused the application shall still be in force, unless the applicant, in a manner pointed out, elects to withdraw it." (3 Fish., 616, *Blandy* vs. *Griffith*, southern district of Ohio; Swayne, J., 1869.) The application filed May 3, 1856; June 15, 1857, rejected on appeal; May 26, 1858, last application filed; patent granted August 3, 1858. Sales by inventor continuous from summer of 1855. The applicant never exercised his right of withdrawal. Mr. Justice Swayne says, p. 617,

'The application of May 26, 1858, was in itself too late; but we think it may be properly held to have been in the nature of a petition for the review of the previous rulings, and to have related back to the prior application, and that the final action of the Commissioner was not original and independent action, but a renewal and prolongation of the former proceedings, and a reversal of the previous rejections." In 1 Wall., 317, *Godfrey* vs. *Eames*, application January, 1855; rejected May, 1855; withdrawal and new application, 1857; sales in fall of 1854; patent granted March 2, 1858. Mr. Justice Swayne, delivering the opinion of the court, said: "In our judgment, if a party choose to withdraw his application for a patent and pay the forfeit, intending at the time of such withdrawal to file a new petition, and he accordingly do so, the two petitions are to be considered as parts of the same transaction, and both as constituting one continuous application within the meaning of the law." (Pp. 325-6.) All the following judgments sustain and apply the same principle. The last application is deemed an indivisible part of the proceeding commenced by the first. They all hold that the original application is that upon which the law considers the patent depends. 5 Fish., 250, *Clark* vs. *Scott*, Blatchford, J.; 7 Blatchf., 521, *Singer* vs. *Braunedorf*, Blatchford, J.; 5 Fish, p. 198, *McMillan* vs. *Barclay*, McKennan, J.; 5 Fisher, 473, *Johnson* vs. *Fasman*, Woods, J.; 3. Pat Off. GAZ, p. 630, *Jones* vs. *Sewell*, Clifford, J.; 1 Fish., p. 11, *Adams* vs. *Edwards*, Woodbury, J.; 1 Fisher, 527; *Adams* vs. *Jones*, Grier and McCandless, JJ.; 1 Fisher, 546, *Sayles* vs. *C. & N. W. R. R. Co.*, Drummond, J. These decisions dispose of the objection that the rights of the patentee were forfeited because the application was not made in time. This disposition of the objection of forfeiture renders unnecessary what we should otherwise deem it proper to show, that in order to support that part of it resting upon the issuance of a foreign patent, proof should be given connecting the complainant with its procuration.

No objection was more strenuously urged than that predicated upon 1 Wall., 317, *Godfrey* vs *Eames*, which the defendant claims intimates that there may be an abandonment in fact, intermediate the first and succeeding applications, which will so sever the proceeding as to make the patent rest in legal contemplation upon the last, and if two years before *it* the thing has gone into public use with the consent or allowance of the patentee, it shall be deemed abandoned. To answer this objection, and negative the idea that Cummings, by his delay in the prosecution of his claim, intended to abandon it, the complainants have put into the record voluminous proofs, showing a continuous and persistent assertion of his right and intention to maintain it. The testimony shows numerous and fruitless attempts to procure assistance to defray the expenses of his application by offering shares of the patent, if obtained, and otherwise, and in the later periods of his delay such a degree of ill health, poverty, and general depression on his part, as shows good reason why he did not prosecute more vigorously his application. The facts do not warrant, nor was the argument pressed, that there was fatal delay prior to 1859. At that time, Cummings had become insolvent, and his health seriously impaired by chronic diseases, which ultimately terminated his life. The testimony leaves no room for doubt that after this period he wholly ceased to furnish any considerable part of the support of his family. His wife's small separate property was first mortgaged and then sold, to procure what is proved to be the small and sometimes too scanty expenditure upon which they lived. The praiseworthy efforts of his wife as the keeper of a boarding-house, the pawning of her few personal ornaments, and her general care and support of a diseased and dispirited husband, present a picture as affecting as it is demonstrative of Cummings's inability, from sheer poverty, to prosecute his application. The only diligence of which, in his physical and pecuniary condition, he was capable, he manifested by such a constant reiteration of his rights as showed that the idea, in the words of some of the witnesses, "had taken complete possession of his mind," and incapacitated him for all other business. His offer of portions of the future patent were frequently repeated during the whole period till 1864, when, after its partial use by the profession had demonstrated its utility, for the first time his proposition was accepted, the means obtained, and the patent procured. His history and condition during this entire time exclude the idea that he intended to abandon his claim. The *prima facie* evidence of a contrary intention springing from the fact that he did make the last application is not overcome by the evidence *aliunde*, but is proven to be consonant with the real intention of the inventor.

There is one most remarkable feature in several of the discussions of this subject before other tribunals, and which with great emphasis presented itself in this. We do not refer to it to censure counsel in the present cause, as those of equal eminence have elsewhere, in the presence of excited defendants, made similar denunciations. That Goodyear should have a patent for vulcanite, and compel dentists to pay a royalty for using it, and that Cummings should procure a patent for a dental plate made of that same substance, and compel them also to pay a tribute for its use, is treated as an astounding novelty and an atrocious fraud. The accident that subsequent transfers have lodged the present patent in the same hands which held that of Goodyear, presents to the unprofessional mind, unacquainted with the wholly distinct character of the two rights, plausible grounds for this unfounded criticism. A large share of the strong feeling and the strong conviction that injustice has been done the dental profession has sprung from what seems to us a wholly unjustifiable perversion of the most familiar truisms in patent law. It is but the simple—the every day recurring—case where one patentee employs the invention of a prior one. In such instances, it must be true that he who uses the manufacture or article which involves both, must pay a royalty to each inventor. Cummings' invention neither authorized him nor any one else to use the invention of Goodyear, nor could the latter make these dental plates with his material without the consent of Cummings or his grantees. When Goodyear's patent expired he and his associates had just as much right to become the assignees of Cummings as any other citizen. The accidental circumstance that the same man issued licenses first under one patent and then under the other is unimportant and even trivial. Such instances in this department of business are very frequent, and the union of such interests, instead of being injurious, is beneficial to the public, not only from the economy but the convenience of procuring licenses. Self-evident as all this is to the legal profession and to those dealing in this species of property, an impolitic and much-to-be-regretted impression has been created in the minds of the dental profession, that they have been wronged and actually oppressed by what has been termed "the mercenary marriage or illicit connection of these two rights." It would seem too evident to require additional illustration that the rights under this patent, and the obligations of those who use it, are in no way changed in the slightest degree by the immaterial fact that Goodyear once had a patent for vulcanite that has now expired. *Its* use is free alike to the dentists and these complainants. The one charges and the other pays neither more nor less than if vulcanite was a natural substance common as ordinary clay. It is the real valve of Cummings' invention alone which is sold, and which they purchase or not, as they please, being free to use *vulcanite* without any royalty whatever, for any purpose not involving his invention.

Our purpose in thus referring to a few of the reasons which induce us to decide this case in favor of the complainants upon principle, irrespective of the prior adjudications, has been to suggest to the numerous other defendants having like cases pending what we believe to be the uselessness of additional argument before subordinate tribunals. If this patent is to be held invalid after so many judgments sustaining its validity, we are clearly of the opinion that it should be done by the court of last resort. The interests of the numerous defendants now litigating in the circuits would be far better promoted by an early appeal to the Supreme Court than in wasting so much time and money by the creation of numerous similar records, and paying for repeated arguments before co-ordinate courts. We do not think they can be effective there without a violation of the well-established and necessary principle to which we referred in the outset, which renders authoritative upon us the long list of adjudications elsewhere rendered.

Decree for complainants.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Any person may oppose either extension.

Hearings upon the respective applications are appointed for the days named in each case.

Arguments must be filed ten days before the day of hearing.

374.—Whole number, 31,378.—Harvesting-Machines.—Granted to RUFUS DUTTON, February 12, 1861; reissued in two divisions, numbered 4,194 and 4,125, September 20, 1870, No. 4,125 having been again reissued December 27, 1870. Application filed November 12, 1874. Testimony closes January 12, 1875. Hearing January 27, 1875.

390.—Whole number, 31,394.—Machines for Molding Pottery.—Granted to WILLIAM LINTON, February 12, 1861. Application filed November 11, 1874. Testimony closes January 12, 1875. Hearing January 27, 1875.

398.—Whole number, 31,402.—Machines for Binding Grain.—Granted to STEPHEN REYNOLDS, February 12, 1861. Application filed November 12, 1874. Testimony closes January 12, 1875. Hearing January 27, 1875.

439.—Whole number, 31,443.—Folly-Machines.—Granted to CHARLES H. DENISON, February 19, 1861. Application filed November 19, 1874. Testimony closes January 19, 1875. Hearing February 3, 1875.

441.—Whole number, 31,445.—Limekilns.—Granted to RICHARD DONALDSON, February 19, 1861, and reissued May 19, 1863. Application filed November 18, 1874. Testimony closes January 19, 1875. Hearing February 3, 1875.

498.—Whole number, 31,502.—Machines for Breaking Coal.—Granted to R. A. WILDER, February 19, 1861. Application filed November 18, 1874. Testimony closes January 19, 1875. Hearing February 3, 1875.

507.—Whole number, 31,511.—Lamps.—Granted to CHAS. W. CARDON, February 19, 1861, and reissued August 9, 1864. Application filed November 14, 1874. Testimony closes January 19, 1875. Hearing February 3, 1875.

521.—Whole number, 31,525.—Machines for the Manufacture of Hoe-Blanks.—Granted to NATHAN BRAND, February 26, 1861, and reissued in two divisions, numbered 1,481 and 1,482, May 26, 1863. Application filed October 3, 1874. Testimony closes January 26, 1875. Hearing February 10, 1875.

529.—Whole number, 31,533.—Weighing Apparatus.—Granted to AUGUSTUS B. DAVIS, February 26, 1861. Application filed November 27, 1874. Testimony closes January 26, 1875. Hearing February 10, 1875.

530.—Whole number, 31,534.—Scale-Beams.—Granted to AUGUSTUS B. DAVIS, February 26, 1861. Application filed November 27, 1874. Testimony closes January 26, 1875. Hearing February 10, 1875.

549.—Whole number, 31,546.—Polishing Iron Bars and Rods.—Granted to BERNARD LAUTH, February 26, 1861. Application filed November 3, 1874. Testimony closes January 26, 1875. Hearing February 10, 1875.

562.—Whole number, 31,566.—Drying Tunnels.—Granted to FRANCIS H. SMITH, February 26, 1861; reissued June 30, 1868, July 11, 1871, and March 26, 1872. Application filed November 27, 1874. Testimony closes January 26, 1875. Hearing February 10, 1875.

574.—Whole number, 31,578.—Machines for Folding Paper.—Granted to WILLIAM H. MILLIKEN and JOHN MILLIKEN, February 26, 1861, and reissued in two divisions, numbered 3,785 and 3,786, January 4, 1870. Application filed October 26, 1874. Testimony closes January 26, 1875. Hearing February 10, 1875.

575.—Whole number, 31,579.—Corn-Planters.—Granted to FRANCIS B. PRESTON, February 26, 1861. Application filed November 27, 1874. Testimony closes January 26, 1875. Hearing February 10, 1875.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date January 12, 1875.]

7,993.—Font of Printing-Types.—DAVID WOLFE BRUCE, New York, N. Y. Application filed December 8, 1874. Term of patent 14 years.

7,994.—Font of Printing-Types.—JULIUS HERRIET, New York, N. Y., assignor to DAVID WOLFE BRUCE, same place.—Case A. Application filed December 8, 1874. Term of patent 14 years.

7,995.—Font of Printing-Types.—JULIUS HERRIET, New York, N. Y., assignor to DAVID WOLFE BRUCE, same place. Application filed December 8, 1874. Term of patent 14 years.

7,996.—Cooking-Range.—NICHOLAS S. VEDDER, Troy, and TOBIAS S. HEISTER, Lansingburg, assignors to NICHOLAS S. VEDDER, Troy, N. Y. Application filed December 30, 1874. Term of patent 3½ years.

7,997.—Franklin Stove.—NICHOLAS S. VEDDER, Troy, and TOBIAS S. HEISTER, Lansingburg, assignors to NICHOLAS S. VEDDER, Troy, N. Y. Application filed December 30, 1874. Term of patent 3½ years.

7,998.—Heating-Stove.—NICHOLAS S. VEDDER, Troy, and TOBIAS S. HEISTER, Lansingburg, assignors to NICHOLAS S. VEDDER, Troy, N. Y. Application filed December 30, 1874. Term of patent 3½ years.

7,999.—Cooking-Stove.—NICHOLAS S. VEDDER, Troy, and TOBIAS S. HEISTER, Lansingburg, assignors to NICHOLAS S. VEDDER, Troy, N. Y. Application filed December 30, 1874. Term of patent 3½ years.

8,000.—Medal.—HENRY G. BRACK, New York, N. Y. Application filed December 12, 1873. Term of patent 3½ years.

8,001.—Carpets.—HEINRICH F. GOETZE, Boston, Mass., assignor to ROXBURY CARPET COMPANY, same place. Application filed December 30, 1874. Term of patent 3½ years.

8,002.—Reed-Organ Cases.—JOHN R. LOMAS, New Haven, Conn., assignor to B. SHONINGER, same place. Application filed December 31, 1874. Term of patent 14 years.

8,003.—Carpets.—THOMAS J. STEARNS, Boston, Mass., assignor to ROXBURY CARPET COMPANY, same place. Application filed December 30, 1874. Term of patent 3½ years.

8,004.—Cooking-Stoves.—NICHOLAS S. VEDDER and FRANCIS RITCHIE, Troy, and TOBIAS S. HEISTER, Lansingburg, assignors to NICHOLAS S. VEDDER, Troy, N. Y. Application filed December 30, 1874. Term of patent 3½ years.

8,005 and 8,006.—Base-Burning Stoves.—NICHOLAS S. VEDDER and FRANCIS RITCHIE, Troy, and TOBIAS S HEISTER, Lansingburg, assignors to NICHOLAS S. VEDDER, Troy, N. Y. Applications filed December 30, 1874. Term of patents 3½ years.

8,007.—Fancy Cassimere.—FREDERICK SNOW BOSWORTH, Providence, R. I., assignor to WETBOSSET MILLS, same place. Application filed January 2, 1875. Term of patent 3½ years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each certificate bearing date January 12, 1875.]

2,159.—Cooking-Stoves.—BONNET, DUFFY & CO., Quincy, Ill. Application filed December 29, 1874.

"'Franklin Cook.'"

2,160.—Baking-Powders.—HAMILTON & CO., Fort Wayne, Ind. Application filed December 18, 1874.

"'Crown Baking-Powder.'"

2,161.—Cigars.—S. LOWENTHAL & CO., Cincinnati, Ohio. Application filed December 12, 1874.

"a representation of a winged dragon displayed on a heraldic shield."

2,162.—Piano-Fortes.—ARION PIANO-FORTE COMPANY, New York, N. Y.—Case A. Application filed January 7, 1875.

"the representation of a human figure, intending to be Arion riding on a dolphin."

2,163.—Piano-Fortes.—ARION PIANO-FORTE COMPANY, New York, N. Y.—Case B. Application filed January 7, 1875.

"'Arion Piano-Forte.'"

2,164.—Nursing-Bottles.—M. S. BURR & CO., Boston, Mass. Application filed December 21, 1874.

"the representation of an eagle and the words 'The Eagle Nursing-Bottle.'"

2,165.—Sewing Silk and Twist.—W. H. COPCUTT & CO., Yonkers, N. Y.—Case A. Application filed January 4, 1875.

"'Merchants Union.'"

2,166.—Sewing Silk and Twist.—W. H. COPCUTT & CO., Yonkers, N. Y.—Case B. Application filed January 4, 1875.

"'THE FAVORITE.'"

2,167.—Medicines.—DUNDAS DICK & CO., New York, N. Y. Application filed January 2, 1875.

"the representation of five maple-leaves."

2,168.—Cooking-Stoves.—FULLER, WARREN & CO., Troy, N. Y. Application filed January 2, 1875.

"'REPORTER.'"

2,169.—Varnishes.—A. E. HOPPOCK & CO., Newark, N. J. Application filed December 28, 1874.

"'S. P. S.'"

2,170.—Soap.—DANIEL F. PACKER, Mystic river, Conn. Application filed January 2, 1875.

"the representation of three cakes of soap, with the words 'Florida Water Soap' thereon."

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 31, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of these classes.

HARVESTING; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks)	6,500
SEWING-MACHINES and attachments	2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes	4,000
PRINTING; including presses, type, and printers' furniture	2,500
FELTING and HATS; including caps, bonnets, flock, &c.	1,900
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments)	1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs	1,400
CARRIAGES and WAGONS	6,000
BRIDGES; including ferry-guards, girders and columns, piers	408
CARDING, CLOTH, CORDAGE, KNITTING, SILK, SPINNING, WEAVING	4,800
RAILWAYS, complete, about	3,500
ELECTRICITY, (in progress,) to July, 1871	888
TEXTILE, (in progress,) to July, 1871, about	4,800

The OFFICIAL GAZETTE of the United States Patent Office is published weekly by the Patent Office. It is printed by authority of an act of Congress, which provides for its gratuitous distribution to libraries at the rate of eight for each congressional district.

The GAZETTE contains the decisions of the Commissioner of Patents, and such decisions of the courts in patent causes as are believed to possess general interest to inventors and patentees.

During the past year a complete synopsis of foreign patent laws, prepared by members of the British Legation in foreign countries, has been printed in the GAZETTE. Also an epitome of the proceedings of the Vienna International Patent Congress, with the action of that body to perpetuate itself. Matters of this character will receive further attention in the GAZETTE.

The claims of all patents granted are printed in the GAZETTE, bearing the same date as the issue of the patent, accompanied by a brief synopsis of the invention and a portion of the drawing.

The illustrations are photographic reproductions on a reduced scale of the drawings accompanying the original application, and preserve their fidelity, which was sometimes lost under the old plan of drawing or tracing and engraving.

Application for extension of patents, and the action of the Office in such cases, have their earliest publication in the GAZETTE. Disclaimers filed in the Office are nowhere else published.

Changes in the rules of practice of the Office are announced in the GAZETTE, which affords a much readier mode of communication with parties interested than to await a new edition of the Rules of Practice.

Finally, any matter believed to be of interest to inventors in their official intercourse with the Office, will receive in the GAZETTE the attention the subject warrants.

The following abbreviated forms of the Patent Office classification by subject-matter may be of assistance to persons ordering copies of specifications and drawings by class. Of course the classes vary somewhat in number of patents, and in following a branch of industry it may be necessary to group several classes to secure absolute completeness. These groupings will readily suggest themselves to the inventor or mechanic.

Copy of classification in full for the use of subscribers furnished on application.

Aërated liquor apparatus	1	Leather	92		
Air and gas engines	2	Locks and latches	93		
Amalgamators, ore-mills	3	Locomotives	94		
Architecture	4	Looms	95		
Artificial limbs, &c.	5	Manures	96		
Baking	6	Mathematical instruments	97		
Baling-presses	7	Medical compounds	98		
Baths, closets, &c.	8	Metallurgic processes	99		
Bee-hives	9	Metal working	100		
Bell and brass founding	10	Meteorological instruments	101		
Bleaching, dyeing, &c.	11	Musical instruments	102		
Blowers	12	Nails and spikes	103		
Boats	13	Needles, pins, &c.	104		
Bolts, nuts, rivets	14	Ordnance	105		
Bookbinding	15	Organs	106		
Boots and shoes	16	Paints and varnishes	107		
Braid, thread, &c.	17	Paper-making	108		
Breech-loaders	18	Paper manufactures	109		
Brewing, cider, &c.	19	Paving	110		
Bricks	20	Photography	111		
Bridges	21	Planes	112		
Brushes and brooms	22	Plating	113		
Buckles, buttons, &c.	23	Plows	114		
Builders' hardware	24	Pottery	115		
Butchering	25	Poultry, care of	116		
Candles, soap, &c.	26	Printing	117		
Carburetors	27	Pumps	118		
Carding and roving	28	Punching and shearing	119		
Carpenters' tools	29	Railroads, (the "Way")	120		
Carpentry	30	Railroads, (rolling stock,) A	121		
Carriages and wagons	31	Railroads, (rolling stock,) B	122		
Cartridges and bullets	32	Revolvers	153		
Casting	33	Rock-drilling and blasting	124		
Casting soft metals	34	Rolling metals	125		
Chemical processes	35	Roofing	126		
Clocks and watches	36	Rope and cordage	127		
Cloth-dressing, &c.	37	Safes and vaults	128		
Clothes-making	38	Salt	129		
Coffins	39	Saw-mills	130		
Coopering	40	Saws	131		
Cotton	41	Scales and weights	132		
Counting and registering	42	Seeders and planters	133		
Cultivators	43	Sewing-machines	134		
Cutlery	44	Sheep, care of	135		
Dairy apparatus	45	Sheet metal working	136		
Dental instruments	46	Ship-building, (the hull)	137		
Distilling and rectifying	47	Ship-building, (masting, &c)	138		
Driers	48	Ships, propulsion of	139		
Edge tools	49	Silk	140		
Electrical apparatus	50	Spades, shovels, &c.	141		
Excavating and grading	51	Spinning	142		
Fences and gates	52	Sports	143		
Files and rasps	53	Stabling, stalls, &c.	144		
Fine arts	54	Starch	145		
Fire-arms	55	Stationery	146		
Fiber-cloths	56	Steam-heaters, &c.	147		
Flour-mills	57	Steam-boilers, (construction)	148		
Food, preservation of	58	Steam-boilers, (furnaces, &c)	149		
Food for stock, preparing	59	Steam-engines	150		
Forging	60	Steam-pistons, &c.	151		
Fuel	61	Steam-valves	152		
Furniture, &c.	62	Stone, lime, and cement	153		
Garden and orchard tools	63	Stoves and ranges	154		
Gas, distribution of	64	Sugar and molasses	155		
Gas-heaters	65	Surgical instruments	156		
Gas, manufacture of	66	Surveying and optical instruments	157		
Gearing	67	Telegraphs	158		
Glass	68	Thrashing, &c.	159		
Governors	69	Tobacco	160		
Grinding and polishing	70	Toilet articles	161		
Gunpowder	71	Trunks and satchels	162		
Harness and saddlery	72	Tube and wire	163		
Harrows, rollers, &c.	73	Type and stereotype	164		
Harvesters, A	74	Umbrellas, fans, &c.	165		
Harvesters, B	75	Ventilators	166		
Hats and felting	76	Water, distribution of	167		
Hay-bedders, &c.	77	Water-wheels	168		
Hemp and flax	78	Willow and rattan	169		
Hoisting machinery	79	Wire-working	170		
Hoop-skirts and corsets	80	Wood-screws	171		
Hose and belting	81	Wood-lathes	172		
Hydraulic engineering	82	Wood-working, (machine-tools)	173		
Ice-making	83	Wood-working, (special machinery, A)	174		
India rubber	84	Wood-working, (special machinery, B)	175		
Iron and steel	85	Wood-working, (special machinery, C)	176		
Jewelry	86				
Journals, bearings, &c.	87				
Kitchen and table utensils	88				
Knitting, netting, &c.	89				
Lamps and lanterns	90				
Laundry apparatus	91				

BOUND VOLUMES OF PATENTS.

The bound volumes of patents, containing the specifications and drawings of patents in full from May 30, 1871, to within a few months of date, may be consulted at the following places:

Astor Library, New York city.
American Society Civil Engineers, New York city.
Bronson Library, Waterbury, Ct.
Court of Appeals, Syracuse, N. Y.
Cooper Union Library, New York city.
Cornell University, Ithaca, N. Y.
City Library Association, Springfield, Mass.
Congressional Library, Capitol.

And at the United States District Courts of—

Alexandria, Va.	Erie, Pa.	New Haven, Ct.
Atlanta, Ga.	Fort Smith, Ark.	New Albany, Ind.
Brooklyn, N. Y.	Grand Rapids, Mich.	New Orleans, La.
Buffalo, N. Y.	Huntsville, Ala.	Ottumwa, Iowa.
Baltimore, Md.	Jacksonville, Fla.	Omaha, Neb.
Boston, Mass.	Key West, Fla.	Pittsburg, Pa.
Burlington, Vt.	Leavenworth, Kan.	Portland, Me.
Cincinnati, Ohio.	Louisville, Ky.	Portland, Oregon.
Cleveland, Ohio.	Lynchburg, Va.	Philadelphia, Pa.
Chicago, Ill.	Mobile, Ala.	Parkersburg, W. Va.
Charleston, S. C.	Milwaukee, Wis.	St. Louis, Mo.
Detroit, Mich.	New York city.	San Francisco, Cal.
		Wilmington, Del.

At the—

Davenport, N., Law Library, Troy, N. Y.
Engineers, Chief of, Washington, D. C.
Free Public Library, Worcester, Mass.
Free Public Library, Boston, Mass.
Franklin Institute Library, Philadelphia, Pa.
Free Public Library, New Bedford, Mass.
Grosvenor Library, Buffalo, N. Y.
Illinois Industrial University, Champaign, Ill.
Mercantile Library, New York city.
Mercantile Library, Galveston, Texas.
Mechanics' Institute, San Francisco, Cal.
Mercantile Library, Philadelphia, Pa.
New Britain Institute, New Britain, Ct.
Odd-Fellows Library, San Francisco, Cal.
Ohio Mechanics' Institute, Cincinnati, Ohio.
Peabody Institute, Baltimore, Md.
Public Library, Cincinnati, Ohio.
Public Library, Chicago, Ill.
Public Library, Indianapolis, Ind.
Public Library, Lawrence, Mass.
Public Library, Lynn, Mass.
Public School Library, St. Louis, Mo.
Patent Office, Great Seal, London, England.
Stevens Institute of Tech., Hoboken, N. J.

Also at the following State libraries:

Albany, N. Y.	Des Moines, Iowa.	Montpelier, Vt.
Augusta, Me.	Frankfort, Ky.	Nashville, Tenn.
Atlanta, Ga.	Harrisburg, Pa.	New Orleans, La.
Annapolis, Md.	Hartford, Ct.	Providence, R. I.
Austin, Texas.	Indianapolis, Ind.	Richmond, Va.
Boston, Mass.	Jackson, Miss.	Raleigh, N. C.
Concord, N. H.	Jefferson City, Mo.	Sacramento, Cal.
Columbus, Ohio.	Lansing, Mich.	Salem, Oregon.
Columbia, S. C.	Little Rock, Ark.	Springfield, Ill.
Carson City, Nev.	Lincoln, Neb.	Topeka, Kan.
Dover, Del.	Montgomery, Ala.	Trenton, N. J.

Also at State Historical Societies of Madison, Wis., and St. Paul, Minn.; and at Territorial libraries of—

Boise City, Idaho.	Santa Fé, N. Mexico.	Washington, D. C.
Cheyenne, Wyoming.	Tucson, Arizona.	Yankton, Dakota.
Denver, Colorado.	Virginia City, Mon.	

Watertown Library, Watertown, Mass.
Yale College Library, New Haven, Ct.
Y. M. C. A. Library, New York city.
Y. M. C. A. Library, Pittsburg, Pa.
Y. M. C. A. Library, Scranton, Pa.
Y. M. M. L. A., Cincinnati, Ohio.

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount be not received at the Office within that time, the patent will be forfeited, and the invention therein described will become public property, as against the applicant therefor, unless he shall make a new application within two years from the date of notice of the original allowance.

INDEX OF INVENTIONS PATENTED JANUARY 12, 1875.

	Class No.	No. of Patent.
Acid, manufacture of liquid carbonic, H. Beins, (reissue)	35	6,220
Air cooling and purifying apparatus, E. E. Page	58	158,599
Bag fastener, J. Macphail	57	158,722
Bale tie, M. D. Copeland	7	158,683
Bale tie, J. W. Philp	7	158,733
Bandage winder, A. M. Cone	156	158,680
Bedstead, bureau, C. Brada	62	158,670
Bench vise, C. Burton	29	158,674
Bird cage attachment, G. Fleidner	176	158,695
Bird cages, metallic mat for, O. Lindemann, (reissue)	170	6,231
Blind slat adjuster, D. Aaron	24	158,562
Blind stop, J. Dougherty	24	158,630
Blind stop, A. T. Elford	24	158,634
Boiler for water heaters, W. Taylor	147	158,735
Boiler, sectional steam, J. F. Taylor	148	158,754
Boilers, water and steam indicator for, W. L. Carman	148	158 675
Book rack, D. J. Stein	62	158,751
Books, machine for rounding and backing, J. E. Coffin	15	158,679
Boot and shoe lasting, G. W. Copeland	16	158,682
Boot and shoe sole edge trimming machine, R. F. Burns	16	158,569
Boot and shoe soles, machinery for forming an imitation stitch on, Dunbrack and Vesey	16	158,633
Brick machine, W. E. Gard	20	158,584
Brick truck and stand, W. E. Gard	20	158,583
Brush, tooth, C. Bulkley	22	158,673
Burial case, G. Van Winkle	39	158,654
Burner, gas, A. Fulton	64	158,582
Burner, lamp, J. Gleason	90	158,700
Butter tub, J. G. Koehler	45	158,592
Button, shirt and collar, J. B. Carter	23	158,624
Can, oil, F. Lehr	107	158,721
Car coupling, J. Hardey	122	158,705
Car coupling, P. F. McClure	122	158,597
Car coupling, D. McCurdy	122	158 724
Car coupling, D. McCurdy	122	158,731
Car coupling, G. T. Perkins	122	158 662
Car coupling, A. Wonderly	122	158,742
Car door, freight, G. W. Phelon	122	158,749
Car platform, street, J. B. Slawson	122	158,656
Car replacer, R. D. Watson	122	158,585
Car starter, A. S. Gear	122	158,583
Car truck, J. A. Anderson	122	158,563
Car truck, railway, J. Turner	122	158,760
Car wheel, W. J. Coobran	122	158,678
Carriage seat, extension, J. V. Randall	31	158,738
Carriage step, G. A. Keene, (reissue)	31	6,229
Carriages and sleighs, handle for children's, Hawke and Hill	31	158,706
Cartridge shells, machine for heading metallic, S. W. Wood	32	158,614
Casting ingots, mold for, Foster and Lockwood	31	158,696
Chair foot rest, T. Head	62	158,637
Chimney guard, R. Priesman	90	158,602
Cigars, packing, S. Jacoby	160	158,714
Cistern top and filter, combined, E. D. Stacey	167	158,605
Clock movement holder, W. H. Brickett	36	158,619
Clutch, machine, A. B. Bean, (reissue)	87	6,215
Coal, &c., from a hopper, feeding, J. B. Wilford	79	158,769
Coal, &c., loading, C. H. Bass	79	158,567
Column, iron, G. B. Davids	4	158,689
Conservatory, window, J. T. Crawford	61	158,686
Cooler and filter, water, A. H. Peterson	53	158,649
Cooler, milk, L. J. Roberts	45	158,603
Copying presses, water proof pad for, C. and J. G. Rowland	146	158,651
Corn sheller, L. B. Holt	59	158,711
Cuff, J. W. A. Clinett	38	158,627
Culinary vessel, G. R. Moore	154	158,598
Cultivator, R. S. Higgins	43	158,709
Cultivator, revolving, N. S. Wood	43	158,663
Cultivator, wheel, J. Stofford	43	158,752
Curtain fastening, Weller and Hopkins	31	158,658
Cylinders, lining for, E. Hill, Jr	150	158,587
Dental instruments, hand piece for, J. W. Gilbert	46	158,635
Digger, post hole, W. M. Ryan	51	158,669
Dish washer, W. N. Cosgrove	88	158,684
Ditching machine, H. H. Gray	51	158,701
Drawing rolls, clearer for, Gambrill and Sheridan	142	158,698
Dredger, G. Kuhn	51	158,717
Drier, lumber, H. S. Taylor	48	158,753
Drill, rock, J. Hanrahan	124	158,704
Drying apparatus, W. J. Johnson	103	158,590
Elevator, L. L. Whitlock	79	158,613
Elevator, grain, H. L, P.F., and E. D. Chase, (reissue)	79	6,227
Elevator, grain, H. L, P. F., and E. D. Chase, (reissue)	79	6,228
Engine, compound, S. Archbold	150	158,666
Engine, hand fire, H. Nameyer	118	158,729
Engine, rotary, O. Adams	150	158 664
Engine, rotary, J. S. Fairfax	150	158,579
Engine, rotary, E. Frank	150	158,697
Engine, traction, W. C. Luce	150	158,595
Evaporator, centrifugal, Wendel and Florich	155	158,764
Excelsior, machine for making, J. G. Moore	173	158,647
Fabric, compound, G. V. Shepard	89	158,746
Fare registering device, J. A. Brown	42	158,568
Faucet, H. B. Leach	167	158,593
Fence, portable, J. W. Johnson	52	158,589
Fire arm sight, T. Dunstone	55	158,577
Flour bolt, D. T. Choat	57	158,616
Forms, machine for turning irregular, B. H. Connor	174	158,629
Fruit picker, B. F. Price	63	158,736
Furnace and atomizing apparatus, hydrocarbon, R. D. Turner	149	158,759
Furnace for steam boilers, E. P. Chancellor	149	158,625
Furnace grate bar, C. Toope	149	158,757
Fuse, electric, C. A. and I. S. Browne	50	158,672
Game apparatus, C. B. Wainwright	143	158,655
Gas governor, F. W. Wiesebrock	64	158,768
Gas regulator, F. W. Wiesebrock	64	158,767
Globe, E. E. Fitz	146	158 581
Grain cradle, J. W. Settle	49	158,745
Grain drill, J. King	133	158,716
Grain for the manufacture of starch, spirits, &c, treatment of, Adamson and Simonin, (reissue)	145	6,226
Grain scourer, D. M. Richardson	57	158,740
Grass and bristles, machine for combing and cutting, J. Pickering	22	158,650
Grate, J. B. Larkin	154	158,719
Grate, A. Richmond	154	158,741
Grate, J. D. Slichter	154	158,750
Hame fastener, O. M. Coburn	72	158,624
Harvester, C. W. and W. W. Marsh, (reissue)	74	6,223
Harvester, C. W. and W. W. Marsh, (reissue)	74	6,224
Harvester and thrasher, broom corn, R. C. Hinton	74	158,638
Harvesters, &c., wheel for, B. G. Turner	74	158,758
Heater, fire place, W. L. Phillips, (reissue)	154	6,233
Heater radiator, steam, C. C. Walworth	147	158,618
Heaters, boiler for water, W. Taylor	147	158 755
Hides and skins, compound for unhairing, H. Mower	92	158,648
Hinge, D. W. Long	24	158,643
Hoes, hydraulic, L. H. Downing	81	158,631
Hubs to axles, attaching, B. B. Howard	31	158,639
Hydrant, M. Burnett	167	158,622
Ingot mold, T. P. Moorwood	33	158,728
Ironing board and step ladder combined, I. L. Landis	91	158,718
Jack, lifting, J. Beers	79	158,618
Jar, covered, W. C. King, (reissue)	58	6,222
Journal box, Deming and Wickes	87	158,575
Ladder, fire-escape, Oberndorf and Frank	30	158,730
Lamp, traveler's, T. R. Almond	90	158,615
Lantern, J. Kluts, (reissue)	90	6,230
Leather dressing machine, J. K. Tullis	92	158,761
Leather, manufacture of, C. J. Tinnerholm	72	158,608
Locking device for slide rests, M. J. Shimer	100	158,747
Locomotive and other engines, variable exhaust for, E. A. Hill	148	158,710
Loom picking mechanism, W. Stearns	95	158,606
Lubricating box, J. Whitaker	87	158 765
Medicine dropper, J. Barnes	1	158,561
Metal bending machine, E. A. Peck	125	158,600
Mills, shoe and die for stamping, W. Hainsworth	3	158,702
Mosquito bar frame, W. F. Howe	63	158,713
Musical instrument, brass, H. G. Lehnert	102	158,594
Nail driving machine, W. S. Watson	16	158,763
Pail, sectional dinner, C. H. Amann	88	158,616
Paper cylinders, apparatus for drying, J. F. Jones	104	158,640
Paper pulp, manufacture of, J. F. Jones	104	158,641
Photometer balance, electrical, W. W. Goodwin	50	158,636
Piles for beams, manufacture of, Z. S. Durfee	125	158,578
Pitman, T. E. Chandler	67	158,571
Pitman connection, L. H. Davis	67	158 690
Planing machines, feed roller for, Brown and Meyer	173	158,671
Planter, cotton seed, Miller and Reeves	133	158,727
Planter, hand potato, J. Sawyer	133	158,743
Plow, A. B. Farquhar	114	158,580
Plow, Prawl and Wemple	114	158,735
Plow beam, C. Kimplen	114	158,642
Plow beam, metal, M. McDowell	114	158,725
Plow irons, roll for welding, W. M. Watson	114	158,657
Polishing and grinding wheels, elastic clamp for, Bannister, Perkins, and Stoddard	70	158,617
Press, screw, J. J. Crawford	7	158,685
Presser feet to their bars, device for attaching, J. J. Schneider	134	158,744
Printing, letter press map, C. H. Waite	117	158,611
Privy vaults, machine for cleaning, S. R. Scharf	96	158,743
Propeller, screw, E. B. Porter	139	158,734
Purifier, middlings, J. W. Wilson	57	158,771
Quilting frame, T. N. Wheeler	38	158,659
Radiators, automatic valve for steam, J. Elder, Jr	147	158,692
Railway rail joint fastening, P. McCarty	120	158,645
Rake, horse hay, P. Mast	77	158,723
Reflector and sight protector, M. H. Mendenhall	90	158,726
Refrigerator, S. H. Crump	59	158,687
Resawing machine, J. Gerhardt	130	158,699
Roller and seeding machine, combined land, J. H. Holland	73	158,712
Rolling metal, machine for, L. Thomas, (reissue)	125	6,216
Running gear, J. Becker, Jr	31	158,667
Saw gummer, S. L. Tibbals	131	158 756
Saw mill, H. D. Hall	130	158,703
Saw mill dog, W. M. Ferry	130	158,693
Seat support, spring, Hawley and Pearsall	31	158.707
Sewing machine, J. B. McCune	134	158,596
Sewing machine button hole cutting attachment, I. S. Craig	134	158,574
Sewing machine presser roller, M. M. Barnes	134	158,565
Sewing machine tuck marker, J. Y. and A. K. Detwiler	134	158,576
Shoe nailing machine, P. H. Barstow	16	158,560
Shoe upper, J. L. Perry	16	158 601
Slate frame, S. B. Bushfield, (reissue)	146	6,221
Soap, manufacture of, C. Lehmann	26	158,720
Spike, J. J. Adgate	103	158,665
Spoke tapering machine, P. Coon	173	158,681
Sponge cup, B. Brower	146	158 620
Sponge holder, Conradson and Forsell	62	158,573
Spool machine, G. E. Lyman	175	158,644
Stitch imitation and stitch dividing mechanism, C. S. Dunbrack	16	158,632
Stone cutting machine, L. Dutertre	153	158,691
Stone, manufacture of artificial, J. L. Rowland, (reissue)	153	6,234
Stove, heating, G. Comstock	154	158,572
Stove, magazine cooking, W. B. Treadwell	154	158,653
Stove polish, device for holding and mixing, J. C. Wightman	70	158,660
Stove, reservoir cooking, G. G. Wolfe, (reissue)	154	6 217
Stove, reservoir cooking, G. G. Wolfe, (reissue)	154	6,218
Stove, reservoir cooking, G. G. Wolfe, (reissue)	154	6,219
Straw cutter, J. K. O'Neil, (reissue)	59	6,232
Table ware, covered, H. C. Wilcox	89	158,661
Telegraphic signal apparatus, J. M. Kafes	50	158,715
Thills, device for coupling and uncoupling, F. P. Stone	31	153,607
Tile machine, Chandler and Taylor	20	158,570
Tobacco, plug, C. Siedler	160	158,604
Towel rack, J. A. Reynolds	62	158,739
Toy wind wheel, W. G. Fischer	143	158,694
Trap, fly, J. H. Bustis	63	158,623
Truck, hand, H. M. Underwood	31	158,610
Valve, balanced slide, W. Obenchain, (reissue)	152	6,225
Valve gear, cut off, H. Bilgram	152	158,669
Vehicle spring bolster, E. Buck	31	158,621
Vehicle top joint, T. F. Darcy	31	158,688
Vehicle wheel hub, A. N. Price	31	158,737
Vessel, center board, C. Hemje	137	158,708
Vessels from running on shore, safety device for preventing, E. D. Gird	137	158,586
Vise, bench, C. Burton	29	158,674
Voting apparatus, H. W. Spratt	42	158,652
Wagon bolster, L. F. Whitman	31	158,766
Washing machine, J. S. Shrawder	91	158,748
Washing machine, H. G. Williams	91	158,770
Water closet, R. C. Clark	8	158,697
Water closet valve, E. Mills	8	158,646
Water for pneumatic pressure, apparatus for raising, E. A. Cheesebrough	119	158,676
Water wheel, S. N. Knight	168	158,591
Weather strip, W. T. Valentine	30	158,762
Windmill, S. D. Hopkins	118	158,5-8
Wrench, O. T. Bedell	100	158,668

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED JANUARY 12, 1874.

	Patent No.
Aaron, D., Blind slat adjuster	158,562
Adams, O., Rotary engine	158,664
Adamson, W., and C. F. A. Simonin, Treatment of grain for the manufacture of starch, spirits, &c., (reissue)	6,226
Adgate, J. J., Spike	158,665
Almond, T. R., Traveler's lamp	158 615
Amann, C. H., Sectional dinner pail	158,616
American Hot Rolled Shafting Company, assignee, (reissue)	6,216
Anderson, J. A., Car truck	158,563
Archbold, S., Compound engine	158 663
Ash, J. E., assignee	158,601
Bannister, S., J. C. Perkins, and W. H. Stoddard, Elastic clamp for polishing and grinding wheels	158,617
Barnes, J., Medicine dropper	158,564
Barnes, M. M., Sewing machine presser roller	158,565
Barstow, P. H., Shoe nailing machine	158,566
Bass, C. H., Loading coal, &c	158,567
Bean, A. B., Machine clutch, (reissue)	6,215
Becker, J., Jr., Running gear	158,667
Bedell, O. T., Wrench	158,668
Beers, J., Lifting jack	158,618
Beins, H., Manufacture of liquid carbonic acid, (reissue)	6,220
Bilgram, H., Cut off valve gear	158,669
Blodgett, M., assignee	158,648
Brada, C., Bureau bedstead	158,670
Bradford, H., assignee	158,709
Bradford, L., assignee	158,750
Brickett, W. H., Clock movement holder	158,619
Brodin, P. A., assignee	158,608
Brower, B., Sponge cup	158,620
Brown, J. A., Fare registering device	158,568
Brown, S. N., and H. W. Meyer, Planing machine feed roller	158,671
Browne, C. A. and I. S., Electric fuse	158,672
Buck, H., Vehicle spring bolster	158,621
Bulkley, C., Tooth brush	158,673
Burnett, M., Hydrant	158,622
Burns Machine Company, assignee	158,569
Burns, R. F., Boot and shoe sole edge trimming machine	158 569
Burton, C., Bench vise	158 674
Bushfield, S. B., Slate frame, (reissue)	6,221
Bustis, J. H., Fly trap	158 623
Carman, W. L., Water and steam indicator for boilers	158,675
Carter, J. B., Shirt and collar button	158 624
Chancellor, E. P., Furnace for steam boilers	158 625
Chancellor, W. N., assignee	158,643
Chandler, T. E., Pitman	158,571
Chandler, T. E., and F. Taylor, Tile machine	158,570
Chase, H. L., P. F., and E. D., Grain elevator, (reissue)	6,227
Chase, H. L., P. F., and E. D., Grain elevator, (reissue)	6,228
Cheesebrough, E. A., Apparatus for raising water for pneumatic pressure	158,676
Choat, D. T., Flour bolt	158,626
Clark, P. J., assignee, (reissue)	6,230
Clark, R. C., Water closet	158,677
Cluett, J. W. A., Cuff	158,627
Coburn, O. M., Hame fastener	158 628
Cochran, W. J., Car wheel	158,678
Coffin, J. E., Machine for rounding and backing books	158,679
Comstock, G., Heating stove	158,572
Cone, A. M., Bandage winder	158,680
Connor, B. H., Machine for turning irregular forms	158,629
Conradson, E. G., and A. Forsell, Sponge holder	158,573
Coon, P., Machine for tapering spokes	158,681
Copeland, G. W., Lasting boot and shoe	158,682
Copeland, M. D., Bale tie	158,683
Corey, T., assignee	158,632, 158,633
Cosgrove, W. N., Dish washer	158,684
Craig, I. S., Button hole cutting attachment for sewing machines	158,574
Crawford, J. J., Screw press	158 685
Crawford, J. T., Window conservatory	158,686
Crump, S. H., Refrigerator	158,687
Darcy, T. F., Vehicle top joint	158 688
Davids, G. B., Iron column	158 689
Davis, L. H., Pitman connection	158,690
Deming, D. A., and S. W. Wickes, Journal box	158,575
Denmead, T., assignee	158,669
Detwiler, J. Y. and A. K., Sewing machine tuck marker	158,576
Dougherty, J., Blind stop	158,630
Downing, L. H., Hydraulic hose	158,631
Dunbrack, C. S., Stitch imitation and stitch dividing mechanism	158,632
Dunbrack, C. S., and W. B. Vesey, Machinery for forming an imitation stitch on boot and shoe soles	158 633
Dunstone, T., Fire arm sight	158,577
Durfee, Z. S., Manufacture of piles for beams	158,578
Dutertre, L., Stone cutting machine	158 691
Elder, J., Jr., Automatic valve for steam radiators	158,692
Elford, A. T., Blind stop	158,634
English, J. K., assignee	158 716
Fairfax, J. S., Rotary engine	158,579
Farquhar, A. B., Plow	158,580
Ferry, W. M., Saw mill dog	158 693
Fischer, W. G., Toy wind wheel	158 694
Fitz, E. E., Globe	158,581
Fleidner, G., Bird cage attachment	158,695
Florich and Wendel	158,764
Forsell and Conradson	158,573
Foster, D., and W. Lockwood, Mold for casting ingots	158 696
Frank, E., Rotary engine	158,697
Frank and Oberndorf	158,730
Fulton, A., Gas burner	158,582

	Patent No.
Gambrill, B. F., and J. L. Sheridan, Clearer for drawing rolls	158,698
Gard, W. E., Brick truck and stand	158,583
Gard, W. E., Brick machine	158,584
Gear, A. S., Car starter	158,585
Gerhardt, J., Reseiving machine	158,699
Gilbert, J. W., Hand piece for dental instruments	158,635
Gird, E. D., Safety device for preventing vessels from running on shore	158,586
Gleason, J., Lamp burner	158,700
Goodwin, W. W., Electrical photometer balance	158,636
Gray, H. H., Ditching machine	158,701
Hainsworth, W., Stamping mill shoe and die	158,702
Hall, H. D., Saw mill	158,703
Hanrahan, J., Rock drill	158,704
Hardey, J., Car coupling	158,705
Hawks, G. E., and E. A. Hill, Handle for children's carriages and sleighs	158,706
Hawley, F. A., and A. Fearsall, Spring seat support	158,707
Head, T., Chair foot rest	158,637
Hedman, E., assignee	158,608
Hemje, C., Center board vessel	158,708
Higgins, R. S., Cultivator	158,709
Hill, A. A., assignee	158,736
Hill, E., Jr., Lining for cylinders	158,587
Hill, E. A., Variable exhaust for locomotive and other engines	158,710
Hill and Hawks	158,706
Hinton, R. C., Broom corn harvester and thrasher	158,638
Hoit, L. B., Corn sheller	158,711
Holland, J. H., Combined land roller and seeding machine	158,712
Hopkins, S. D., Windmill	158,588
Hopkins and Weller	158,658
Howard, B. B., Attaching hubs to axles	158,639
Howe, W. F., Mosquito bar frame	158,713
Hutchinson, J., assignee	158,609
Jacoby, S., Packing cigars	158,714
Johnson, J. W., Portable fence	158,589
Johnson, W. J., Drying apparatus	158,590
Jones, E. A., assignee	158,727
Jones, J. F., Apparatus for drying paper cylinders	158,640
Jones, J. F., Manufacture of paper pulp	158,641
Kates, J. M., Telegraphic signal apparatus	158,715
Keene, G. A., Carriage step, (reissue)	6,229
Keith, W. H., assignee	158,601
Kimplen, C., Plowbeam	158,642
King, J., Grain drill	158,716
King, W. C., Covered jar, (reissue)	6,222
Kintz, J., Lantern, (reissue)	6,230
Knight, S. N., Water wheel	158,591
Koehler, J. G., Butter tub	158,592
Kuhn, G., Dredger	158,717
Landis, I. L., Combined ironing board and step ladder	158,718
Larkin, J. B., Grate	158,719
Leach, H. B., Faucet	158,593
Lehman, C., Manufacture of soap	158,720
Lehnert, H. G., Brass musical instrument	158,594
Lehr, F., Oil can	158,721
Lindeman, O., Metallic mat for bird cages, (reissue)	6,231
Lockwood and Foster	158,606
Long, D. W., Hinge	158,643
Luce, W. C., Traction engine	158,595
Lyman, G. E., Spool machine	158,644
Macphail, J., Bag fastener	158,722
Maitland, J., assignee	158,665
Marsh, C. W. and W. W., Harvester, (reissue)	6,223
Marsh, C. W. and W. W., Harvester, (reissue)	6,224
Mast, P., Horse hay rake	158,723
McCarty, P., Railway rail joint fastening	158,645
McClure, P. F., Car coupling	158,597
McCune, J. B., Sewing machine	158,596
McCurdy, D., Car coupling	158,724
McDowell, M., Metal plow beam	158,725
Mendenhall, M. H., Reflector and sight protector	158,726
Meriden Britannia Company, assignee	158,661
Meyer and Brown	158,671
Miller, B. F., and W. J. Reeves, Cotton seed planter	158,727
Mills, E., Water closet valve	158,646
Moore, G. R., Culinary vessel	158,598
Moore, J. G., Machine for making excelsior	158,647
Moorwood, T. P., Ingot mold	158,728
Morris, J. M., assignee	158,737
Mower, H., Compound for unhairing hides and skins	158,648
Numeyer, H., Hand fire engine	158,729
Obenchain, W., Balanced slide valve, (reissue)	6,225
Oberndorf, A., Jr., and E. Frank, Fire escape ladder	158,730
O'Neil, J. K., Straw cutter, (reissue)	6,228
Oquist, J., assignee	158,608
Over, O., assignee	158,716
Page, E. E., Air cooling and purifying apparatus	158,599
Parsons, L. D., assignee	158,680
Pearsall and Hawley	158,707
Peck, E. A., Machine for bending metal	158,600
Perkins, G. T., Car coupling	158,731
Perkins, Stoddard, and Bannister	158,617
Perry, J. L., Shoe upper	158,601
Petersen, N., assignee	158,608
Peterson, A. H., Water cooler and filter	158,649
Phelon, G. W., Freight car door	158,732
Phillips, W. L., Fire place heater, (reissue)	6,233

	Patent No.
Philp, J. W., Bale tie	158,733
Pickering, J., Machine for combing and cutting grass and bristles	158,650
Pittsburg Steel Casting Company, assignee	158,702
Porter, E. B., Screw propeller	158,734
Prawl, P., and F. H. Wemple, Plow	158,735
Price, A. N., Vehicle wheel hub	158,737
Price, B. F., Fruit picker	158,736
Priesman, R., Chimney guard	158,602
Randall, J. V., Extension carriage seat	158,738
Reeves and Miller	158,727
Reynolds, J. A., Towel rack	158,739
Richardson, D. M., Grain scourer	158,740
Richmond, A., Grate	158,741
Roberts, L. J., Milk cooler	158,600
Rowland, C. and J. G., Water proof pad for copying presses	158,651
Rowland, J. L., Manufacture of artificial stone, (reissue)	6,234
Rubber Step Manufacturing Company, assignee, (reissue)	6,229
Ryan, W. M., Post hole digger	158,609
Sawyer, J., Hand potato planter	158,742
Seaman, R., assignee	158,767, 158,768
Scharf, S. E., Machine for cleaning privy vaults	158,743
Schneider, J. J., Device for attaching presser feet to their bars	158,744
Settle, J. W., Grain cradle	158,745
Shepard, G. Y., Compound fabric	158,746
Shepard, H. W., assignee	158,767, 158,768
Sheridan and Gambrill	158,698
Shimer, M. J., Locking device for slide rests	158,747
Shrawder, J. S., Washing machine	158,748
Siedler, C., Plug tobacco	158,604
Silsby, H. C., assignee	158,575
Simonin and Adamson, (reissue)	6,226
Simpson, J. B., assignee	158,609
Slawson, J. B., Street car platform	158,749
Silchter, J. D., Grate	158,750
Spratt, H. W., Voting apparatus	158,652
Stacey, E. D., Combined cistern top and filter	158,605
Stearns, W., Loom picking mechanism	158,606
Stein, D. J., Book rack	158,751
Sternberg, J. H., assignee	158,665
Stoddard, Bannister, and Perkins	158,617
Stofford, J., Wheel cultivator	158,752
Stone, F. P., Device for coupling and uncoupling thills	158,607
Taylor and Chandler	158,570
Taylor, F., assignee	158,571
Taylor, H. S., Lumber drier	158,753
Taylor, J. F., Sectional steam boiler	158,754
Taylor, W., Boiler for water heaters	158,755
Thomas, L., Metal rolling machine, (reissue)	6,216
Tibbals, S. L., Saw gummer	158,756
Tinnerholm, C. J., Manufacture of leather	158,608
Tipe, W. M., assignee	158,609
Toope, C., Furnace grate bar	158,757
Treadwell, W. B., Magazine cooking stove	158,653
Tullis, J. K., Leather dressing machine	158,761
Turner, B. G., Wheel for harvesters, &c	158,758
Turner, J., Railway car truck	158,760
Turner, R. D., Hydrocarbon furnace and atomizing apparatus	158,739
Underwood, H. M., Hand truck	158,610
Valentine, W. T., Weather strip	158,762
Van Winkle, G., Burial case	158,654
Vesey and Danbrack	158,633
Wainwright, C. B., Game apparatus	158,655
Waite, C. H., Letter press map printing	158,611
Walworth, C. C., Steam heater radiator	158,612
Wanzer, R. M., assignee	158,596
Watson, R. D., Car replacer	158,656
Watson, W. M., Roll for welding plow irons	158,657
Watson, W. S., Nail driving machine	158,763
Weiler, J. B., and F. G. Hopkins, Curtain fastening	158,658
Wemple and Prawl	158,735
Wendel, C., and W. Florich, Centrifugal evaporator	158,764
Wheeler, C., assignee	158,665
Wheeler, T. N., Quilting frame	158,659
Whitaker, J., Lubricating box	158,765
White, S. S., assignee	158,635
Whitlock, L. L., Elevator	158,613
Whitman, L. F., Wagon bolster	158,766
Wickes and Deming	158,575
Wiedmann, A., & Co., assignees	158,694
Wiesebrock, F. W., Gas regulator	158,767
Wiesebrock, F. W., Gas governor	158,768
Wightman, J. C., Device for holding and mixing stove polish	158,660
Wilcox, H. C., Covered table ware	158,661
Wilford, J. B., Feeding coal, &c., from a hopper	158,769
Williams, H. G., Washing machine	158,770
Wilson, J. W., Middlings purifier	158,771
Wolfe, G. G., Reservoir cooking stove, (reissue)	6,217
Wolfe, G. G., Reservoir cooking stove, (reissue)	6,218
Wolfe, G. G., Reservoir cooking stove, (reissue)	6,219
Wonderly, A., Car coupling	158,662
Wood, N. S., Revolving cultivator	158,663
Wood, S. W., Machine for heading metallic cartridge shells	158,614

TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED JANUARY 12, 1875.

158,562. BLIND-SLAT ADJUSTER. David Aaron, Marysville, Cal. [Filed June 27, 1874.]

The crank *h*, spring *k*, and tube *c*, in combination with a slotted arm, *j*, screw *i*, and connecting-rod *f*, so as to allow the arm *j* self-adjustability, as set forth.

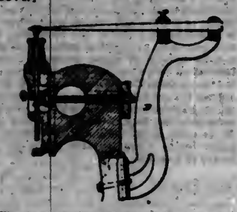
158,563. CAR-TRUCKS. Jas. A. Anderson, Cleveland, Ohio. [Filed Oct. 28, 1874.]

Brief.—Short independent axle for each wheel, with bearings in flanges of oil-cups; said cups being attached by cam to an immovable frame.

In a railway-car truck, the wheels B supported by pins *b*, in combination with the lames C made with offsets to cover the hub of the wheel, and provided with an oil-chamber, *c*, and lid *c'*, substantially as and for the purpose described.

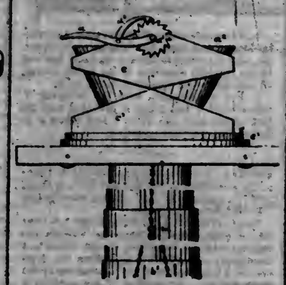
158,564. MEDICINE-DROPPERS. J. Barnes, Brooklyn, N. Y. [Filed July 21, 1874.]

The combined stopper and drop-discharger, consisting of a dropping-tube, a compressible bulb, and a bottle-stopper, substantially as described.



158,565. PRESSER-ROLLERS FOR SEWING-MACHINES. Merrick M. Barnes, Boston, Mass. [Filed July 31, 1874.]

Brief.—The presser-roller frame is hinged to a support attached to the presser-bar, and has an arm that engages a screw on the support, to hold the presser-roller in working action. The drawing shows the presser-roller turned aside from its working position.

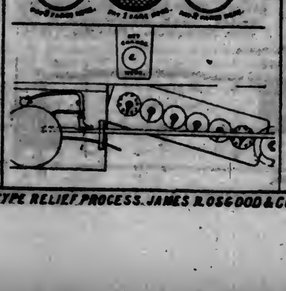


The combination, substantially as set forth, of the swinging arm of the presser-foot with its grooved spring, tapering pin, and spring, and the adjusting-screw with its shoulder, whereby the presser-foot may be firmly locked automatically when shut, all arranged for the purpose set forth.

158,566. SHOE-NAILING MACHINES. P. B. Barstow, Trenton, N. J. [Filed Sept. 5, 1874.]

The horizontal wood spring D', supported in recesses upon bracket D, in combination with adjusting set-screw D' and hammer-spindle C, all substantially as and for the purpose described.

158,567. MODES OF LOADING COAL, &c. Charles H. Bean, Brooklyn, N. Y. [Filed Nov. 14, 1874.]

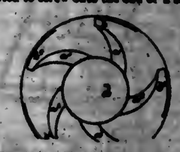


1. The construction and use of a telescopic coal-feeder, for the purpose of letting down gently from a height, coal and other similarly affected articles, substantially as described.

2. In combination with the telescopic coal-feeder, the tipping and balancing frames *c* and *c'*, and the circular turning plates *a* and *a'*, or their equivalents, for producing the turning and inclining operation, as described, and for the purpose specified.

3. In combination with the telescopic coal-feeder, the chains *b* and *b'*, the windlass *a'*, the lever *e*, and the ratchet *e'*, or their equivalents, substantially as described, and for the purposes specified.

158,568. FARE-REGISTERING DEVICES. J. A. Brown, Boston, Mass. [Filed Nov. 27, 1874.]



Brief.—The passenger passes the fare through the door marked with the number of fares he wishes to pay, the swinging of the door automatically recording an alarm, and operating the registering device.

A device for registering fares of conductors and other conveyances, consisting of a series of two or more doors connected with any suitable indicator and an alarm-bell, each door being provided with a sign to indicate the amount to be paid through it, and the whole operating substantially as and for purposes stated.

158,569. SHOE-TREEING MACHINES FOR BOOT AND SHOE SOLES. Robert P. Burns, New York, N. Y., assignor to the Burns Machine Company, same place. [Filed Oct. 23, 1874.]

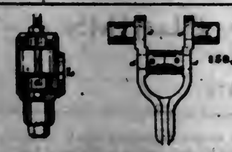
Brief.—The hollow circular cutter-head is provided with longitudinal spiral cutters, also vertical knife-blades supported upon the inner face of the shield, all cast in one piece, and adapted to screw onto the end of a shaft.

1. The hollow circular cutter-head E, having the spiral cutters *a*, *a'*, *a''*, *a'''*, and *a''''*, arranged parallel to its axis; also, provided with a circular disk or shield at its outer end, the periphery of which extends beyond the spiral cutters, and having upon its inner face the vertical cutters *b*, *b'*, *b''*, *b'''*, and *b''''*, all constructed from one solid piece of metal, arranged and operating substantially as and for the purposes herein shown and described.

2. In combination with the hollow circular cutter-head E, provided with the two sets of cutters and shield, the double adjusting-gage F, operating substantially as and for the purposes described and set forth.

3. In combination with the hollow circular cutter-head E, provided with the two sets of cutters and shield, the double set of guides I I, adjustable by means of thumb-screws K, substantially as and for the purposes as described.

158,570. TILE-MACHINES. Thos. B. Chandler and Franklin Taylor, Indianapolis, Ind. [Filed Oct. 20, 1874.]



Brief.—An oblong case surmounted by an upright cylinder containing a vertical revolving spindle with lateral blades, at the bottom of which an eccentric friction-wheel reciprocates a frame in the box, with a plunger at each end, forcing out therefrom tiles formed of the clay supplied by the blades.

The pressure-box E, provided with packing-plates K K, the piston Z, having the recess H, and provided with piston-heads J J, with adjustable packing-plates K' K', in combination with the operating mechanism, consisting of the shaft B, crank P, and roller O, as and for the purpose specified.

158,571. PITMAN. Thos. B. Chandler, Indianapolis, Ind., assignor of one-half his right to Franklin Taylor, same place. [Filed Oct. 20, 1874.]

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

158,571.

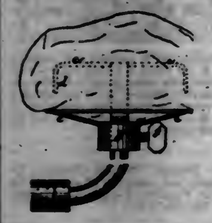
The pitman, consisting of a flexible rod, D, hollow wrist-pins C C, wrist B B, and spherical boxes B C, combined as described, substantially as and for the purpose specified.

158,572. HEATING-STOVES. G. Comstock, Keokuk, Iowa. [Filed Sept. 11, 1874.]

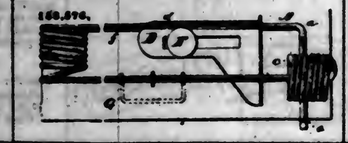
Brief.—The pipe-collar is supported upon the base-plate through the medium of a supporting-arm. The base-plate and rounded body form a convenient space for foot-warming.

1. The combination of the rounded horizontal sheet-metal body A and the rest T from pipe-connection N to base-plate H, substantially as set forth.

2. The combination of the double-plate columns F' and the base-plate H, to support the stove, substantially as set forth.



3. The combination of the rounded horizontal body A and the end plates having double plates F' outside of the body down to the base-plate H, substantially as set forth.



4. The combination of the separate base-support H and the rounded horizontal sheet-metal body A, substantially as set forth.

5. The combination of the rounded horizontal stove-body A, having circulation of hot smoke below the ash-chamber, with a base-plate, H, projecting outward at or below the bottom of one or both sides of body A, substantially as set forth.

158,573. SPONGE-HOLDERS. R. G. Conradson and A. Ferrell, Brooklyn, N. Y. [Filed Apr. 17, 1874.]

Brief.—A straight or bent stem is provided on its upper end with three forks, and terminating at the ends in prongs bent downward at right angles to the forks. The stem is made pointed at the other end to pierce the sponge, as it can be pressed up against the prongs. A circular sleeve is slipped over the pointed end of the stem, and pressed against the sponge, and held in this position by aid of a set-screw applied to the side of the sleeve-holder.

158,574.

In combination with stem A, provided with forks c and prongs d and handle I, the sleeve D, holder e, and set-screw g, substantially as and for the purpose set forth.

158,575. BUTTON-HOLE-CUTTING ATTACHMENTS FOR SEWING-MACHINES. Isaac S. Craig, Somerville, Mass. [Filed June 5, 1874.]

Brief.—The cutter is arranged upon the end of a swinging arm, which is hinged at its other end to the table-top, and is operated by means of a screw-bolt, which passes through it and through a slot in the table-top; the said bolt being provided on its lower end with a head, having its upper or inside surface beveled off in a direction opposite to that of the screw-thread, so that, as said bolt is revolved, the screw-thread thereon, operating in the hinged arm in connection with the widened surfaces of the head, acting on the under side of the table, forces the cutter down upon the cutter-block, which is made adjustable by means of a screw.

1. The combination, with the stationary cutter-block f and table T, of the lever B, its cutter, and the screw D, having its head inclined in the opposite direction to its screw-thread, all combined and operating as set forth.

2. The combination, with the table-top T, cutter-block f, and clamp d, provided with the locking-pin p, of the slide a and screw c, as and for the purpose specified.

158,576. JOURNAL-BOXES. David A. Deming and Sterling W. Wicker, Seneca Falls, N. Y., assignor to H. C. Silsby, same place. [Filed June 19, 1873.]

Brief.—The oil flows from a top reservoir into a nearly annular chamber outside the bearing, and, by apertures, to the inside and out again; also, by other pipes from the reservoir, to a longitudinal groove on the top of the inner surface. By rotation of the shaft both supplies circulate around it, and pass out to complete the circulation.

1. The combination, in journal-boxes of rotary steam engines and pumps, of the chambers D' and D with the pipes b b, the opening H, and the holes S S, substantially as and for the purposes hereinbefore described.

2. The groove K K, M M, and N N, the pipes c c, the opening H, and the holes S S, when the several parts are combined in journal-boxes of rotary steam engines and pumps, in the manner and for the purposes substantially as specified.

158,578. TUCK-MARKERS FOR SEWING-MACHINES. John Y. Detwiler and A. E. Detwiler, Toledo, Ohio. [Filed May 7, 1874.]

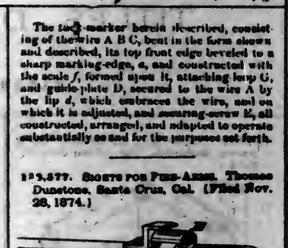
158,578.

The tuck-marker herein described, consisting of the wire A B C, bent in the form shown and described, its top front edge beveled to a sharp marking-edge, e, and constructed with the scale f, formed upon it, attaching loop G, and guide-plate D, secured to the wire A by the lip d, which embraces the wire, and on which it is adjusted, and securing-screw E, all constructed, arranged, and adapted to operate substantially as and for the purposes set forth.

158,577. SHOETS FOR FIRE-ARMS. Thomas Dunstone, Santa Cruz, Cal. [Filed Nov. 28, 1874.]

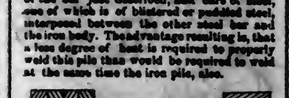
1. The cylindrical rotating carrier or sleeve B, provided with one or more sights, D and E, and constructed to operate substantially as and for the purpose herein described.

2. The guard G and the set-screw F in combination with the rotating sleeve B and sights D and E, substantially as herein described.



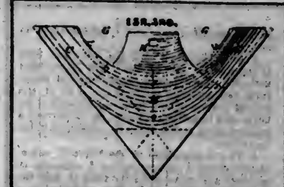
158,579. MANUFACTURE OF PILES FOR BEAMS. Robert S. Durfee, New York, N. Y. [Filed Aug. 18, 1873.]

Brief.—A pile of iron bars is first welded and rolled to form. Another pile is then made of the bar just described, and bars of steel, one of which is of blistered or puddled steel, interposed between the other steel bar and the iron body. The advantage resulting is, that a less degree of heat is required to properly weld this pile than would be required to weld at the same time the iron pile, also.



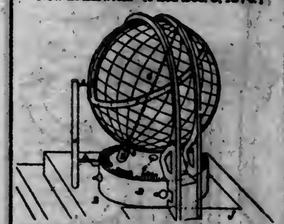
The process of making beams, girders, and rails, substantially as described and shown.

158,579. ROTARY ENGINES. J. S. Fairfax, Baltimore, Md. [Filed May 26, 1874.]



In combination with an outer casing, a revolving cylinder made of suitable material, and having its periphery wrought into undulating spiral grooves with roughened surfaces, for the purpose of affording greater frictional resistance to the impinging particles of the motive fluid, and of utilizing the same by revolving it into a rotary motion, as described.

158,580. PLOWS. Arthur B. Farquhar, York, Pa. [Filed Sept. 10, 1874.]



The sweep B, made of a triangular plate of steel, the shorter sides forming the cutting-edges, and shaped to present a level point rising to the rear in regular curved lines, and having the notches G cut away, as shown and described, forming the wings C, with curved edges I, all as and for the purpose set forth.

158,580.

158,581. GLOBES. Elias B. Fitz, St. John, New Brunswick. [Filed Dec. 9, 1874.]

1. The arched standards H I, in combination with the inclined globe G and disk D, substantially as and for the purposes stated.

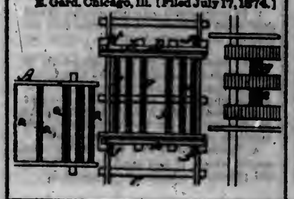
2. The standards H I, mounted upon a frame or support independent of the base A, and arranged to slide thereupon to and fro with respect to the globe, substantially as and for purposes stated.

3. The pointers e and e, in combination with the globe and the horizon-ring K and band L, substantially as and for purposes stated.

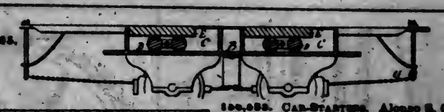
4. The graduated disk D, pointers e and e, and globe G, substantially as and for purposes stated.

5. In combination with the globe G, the rotary disk D, supporting the same, and provided with a scale of divisions representing the signs of the ecliptic, substantially as and for the purposes set forth.

6. The combination of the base A, standards H I, disk D, globe G, pointers e and e, and ring K, the whole being substantially as and for purposes stated.



158,582. GAS-BURNERS. Andrew Fulton, Albany, N. Y. [Filed Dec. 21, 1874.]



Brief.—There is a shoulder upon the screw-nipple for preventing the escape of gas, and a conical valve and conical seat for guiding the float.

The body or base A, with an annular chamber, a, for the reception of glycerine or other suitable fluid, and an upwardly-projecting screw-nipple, b, formed with an annular rim or shoulder, d, in combination with the hollow cap B, diaphragm f, having a conical valve-seat, and the float C, with conical valve h, as and for the purpose described.

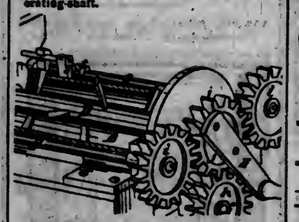
158,583. BRICK TRUCKS AND STANDS. W. B. Gard, Chicago, Ill. [Filed July 17, 1874.]

158,585.

1. A truck, G, for handling bricks, in combination with the hack-frames, combined to operate substantially as and for the purpose specified.

2. A truck, G, for handling bricks, provided with elevating and lowering lifters m m m, combined to operate substantially as and for the purpose specified.

3. The combination of the sliding lifters m m m, cords or chains n n and p p, winding-shaft r, and pulleys s s, substantially as and for the purpose specified.



4. A hack-frame, B, provided with elevating-timbers d d, combined substantially as and for the purpose specified.

5. A transferring-truck, D, in combination with rollers y y and ways A A, substantially as and for the purpose specified.

6. A brick-handling apparatus, composed essentially of a roller-way, A, hack-frames B B, and handling-truck G combined, operating together substantially as herein specified.

158,584. BRICK-MACHINES. W. B. Gard, Chicago, Ill. [Filed July 20, 1874.]

Brief.—Clay is forced through the opening in the pug-mill into the transversely-located molding-chamber, within which the bricks are molded by reciprocating pistons. The plungers are connected by rods engaging with gearing at one end, and with cam-slots on the plungers at the other end. At the moment the brick is compressed by the reciprocating plungers, it is ejected by a transverse plunger operated by cam-gearing thereon and the operating-shaft.

1. In a machine for molding and compressing bricks, a mold-box, C, forming the discharge end or bottom of the pug-mill, and provided with molding and compressing plungers G H H, which have a reciprocating movement therein, substantially as and for the purpose herein specified.

2. In a machine for molding and compressing bricks, the combination of compressing-plungers G H H, moving transversely to the pug-mill in a mold-box, C, with a screw or other driver, N, in the pug-mill, which presses the clay into the mold-box, substantially as and for the purpose herein specified.

3. The combination of a mold-box, C, having inner clay-receiving apertures a a and outer brick-discharging apertures b b, with reciprocating plungers G H H, which compress and mold the bricks therein, and pass them from the said inner to the said outer apertures, substantially as and for the purpose herein specified.

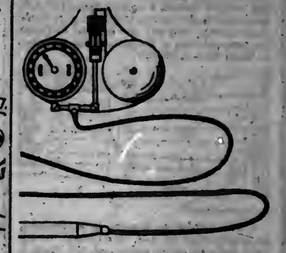
4. The combination of the plungers G H H, having respective vertical or transverse cam-slots d d, with the driving-cranks L M M, the latter exceeding the former slightly in length, substantially as and for the purpose herein specified.

5. The hollowed inner surfaces e e of the cam-slots d d in the outer plungers H H, formed in relation to the cam-slot e of the inner plunger G, substantially as and for the purpose herein specified.

6. The hollowed surfaces e e of the cam-slot e in the inner plunger G, in combination with the discharging-apertures b b of the mold-box C, substantially as and for the purpose herein specified.

7. The brick-discharging followers p p, operating as described, in combination with the mold-box C, having discharge-apertures b b, substantially as and for the purpose herein specified.

158,585. CAR-STARTERS. Alonzo S. Gear, Boston, Mass. [Filed Dec. 9, 1874.]



Brief.—Car-body on rollers, and provided with projections, which communicate its impetus to the truck, and so assist in starting the wheels. Rest-rods form ways permitting longitudinal, but preventing vertical, motion.

1. In combination with the car-body A and its projections E E, the truck-frame B, boxes C C, and rolls D D, substantially as described.

2. In combination with the car-body A and truck-frame B, the bent rods H H, substantially as and for the purpose set forth.

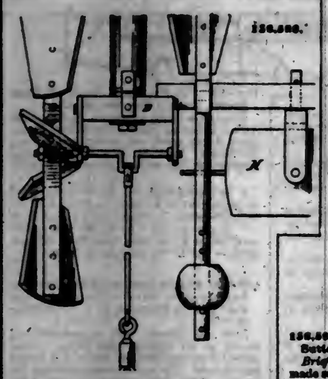
158,586. SAFETY DEVICES FOR PREVENTING VESSELS FROM RUNNING ON SHORE. Edward D. Gird, Syracuse, N. Y. [Filed May 14, 1874.]

Brief.—A cylinder open at one end, and having an air-chamber and piston, is suspended from the vessel by means of a hollow flexible tube. The water, passing through the opening in the cylinder, presses against the piston, which, being forced upward, compresses the air, and forces it through the tube to the pressure-gage or register, and operates the piston in the cylinder B, which presses against the spring. This piston also operates the rod connected with the bell. The approach of shoal water is indicated on the register, and the decreased pressure on the pistons releases the spring, and causes an alarm to be sounded on the bell.

The combination of the cylinder F, the line J, the cylinder B, spring X, rod V, and ball K, constructed substantially as and for the purpose set forth.

158,587. LININGS FOR CYLINDERS. Ebenezer Hill, Jr., South Norwalk, Conn. [Filed Oct. 10, 1874.]

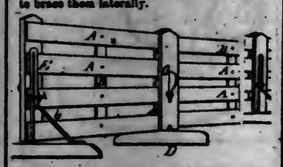
Brief.—The lining is held in the cylinder by the flange or screws at the bottom, and is secured firmly therein by the screw stuffing-box.



The combination of a lining, B, having a flange, b, and a stuffing-box, C, provided with a screw-thread to secure the lining in a cylinder, A, when constructed substantially as shown, and for the purpose specified.

158,588. WINDMILLS. Samuel D. Hopkins, Trumansburg, N. Y. [Filed Nov. 14, 1874.]

Brief.—A depending hanger carrying a horizontally-revolving beam, provided with a regulating-vane, and carrying the cranked axle and line, and a weighted rod connected with the regulating-vane, and having at its upper end a vane, whereby the regulating-vane on the horizontal beam is limited in its movement, and always retained in position, so that the currents of air act upon it for moving it, and bringing the fan-wheel into position for receiving the currents of air.



156,589.

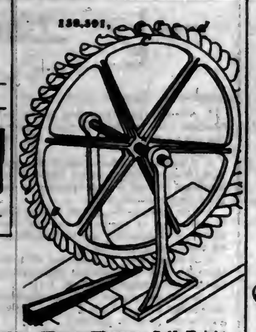
The combination, with a depending hanger, horizontal revolving beam D, and vane H, of a weighted rod carrying at its upper end a vane, and connected with the vane on the horizontal bar, substantially as and for the purpose described.

156,590. PORTABLE FENCE. J. W. Johnson, Columbus, Tex. (Filed Oct. 10, 1874.)

Brief.—The panels are sustained by links and wedges against a support formed of rod-iron, bent double at top, and having its lower ends secured to a sill, one serving to clamp the lower portion of the panels, and the other to brace them laterally.

1. The bracket or support E, constructed, as described, of rod-iron, bent to form the upright a, double at its upper end, the brace b, and open clamp d, and fastened to the base-block D, substantially as and for the purposes herein set forth.

2. The combination of the panel A B U, support D E a b d, link h, and key G, as shown and described, for the purposes herein set forth.

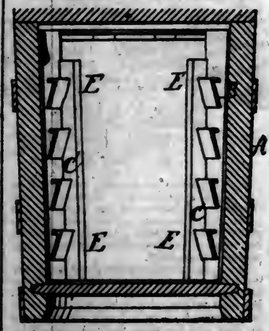


156,600. DRYING APPARATUS. W. J. Johnson, Boston, Mass. (Filed Nov. 10, 1874.)

Brief.—Hot air may be passed through the drying-chamber, and steam admitted to the ends, which surrounds it except on the front.

The internal hot-air chamber B, provided with induction and eduction pipes F D, and the stove or furnace G provided with the pipe O, in combination with the steam-chest A surrounding the chamber B, substantially as and for the purpose described.

156,591.



156,591. WATER-WHEELS. S. N. Knight, Sutter Creek, Cal. (Filed Nov. 21, 1874.)

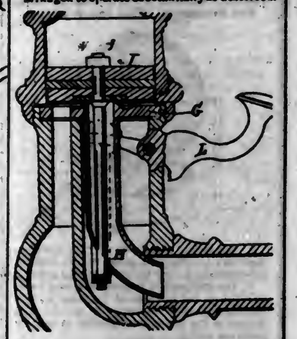
Brief.—The buckets of this water-wheel are made scoop-shaped, and the base of the scoop or outer side of each bucket which is farthest from the wheel-rim is cut out in a semicircular form, so as to provide a sufficient opening for the entrance of the stream of water into the buckets, while their sides extend upward close to the bucket next above.

A water-wheel, having the scoop-shaped buckets *d d d* secured to its outer rim C, as above described, each of said buckets having a semicircular recess, *i*, in its outer side, substantially as and for the purpose above described.

156,592. BUTTER-TUBS. John G. Koehler, Philadelphia, Pa. (Filed Oct. 7, 1874.)

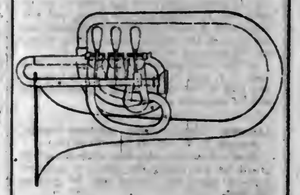
1. The combination, with the receptacle E of a butter-tub, A, of the ice-chambers F, removably fitted to said receptacle at the ends thereof, the projecting ledges C, and the shelves D, substantially as and for the purpose set forth.

2. The receptacle E, constructed with the upright strips E, extending transversely near the sides thereof, in combination with the ice-chambers F, removably fitted in the receptacle between the strips E and sides of the receptacle, and separated from the storage portion of the receptacle by said strips E, the parts being constructed, arranged, and operating substantially as and for the purpose set forth.



156,593. FAUCETS. Henry B. Leach, Boston, Mass. (Filed Oct. 26, 1874.)

1. The curved tube H, depending from the under side of the valve-seat concentric with the discharge-orifice through said seat and arranged to change the flow of the water from a vertical to a horizontal direction, and discharge it into a delivery-nozzle of greater capacity, substantially as described.



2. The removable valve-seat disk G, provided with the opening *b*, in combination with the curved tube H depending from the under side thereof, and the valve I, substantially as described.

3. In combination with the valve-seat disk G and curved tube H, the valve I, provided with the stem *f* projecting downward therefrom and passing through the wall of the curved portion of said tube and secured at its lower end to suitable devices for imparting a reciprocating motion thereto, substantially as described.

4. The combination of the valve I, valve-stem *f*, divided connecting-rod J, arranged to embrace and move upon the tube H, and the forked pivoted lever L, all constructed and arranged to operate substantially as described.

156,594. BRASS MUSICAL INSTRUMENTS. H. G. Lehnert, Philadelphia, Pa. (Filed May 29, 1874.)

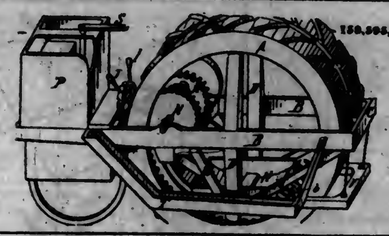
1. In a musical instrument, the pipe D, having the parts E, F, and G, arranged relatively, as shown, thereby forming a ring to go over the hand of the player and rest upon each shoulder, bell in front, substantially in the manner described.

2. The reversible shank *b* of the mouth-piece A, provided with a bend, *f*, substantially as set forth, to accommodate either side of the mouth, and adapt it otherwise for different players.

3. The tubes H H' H'' H''', inclined relatively to the tuning-slide or water-key, and to each other to carry away the water freely, substantially as set forth.

156,595. TRACTION-ENGINES. Wm. C. Leon, Fort Byron, Ill. (Filed Aug. 18, 1874.)

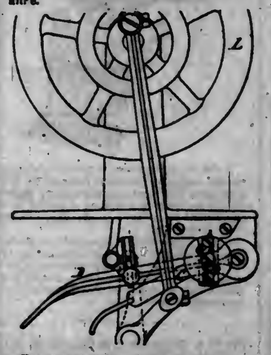
Brief.—A floor within the wheel, supported by the frame of the vehicle for the engine; geared wheels for communicating power from the engine to the wheels; and a supplemental traction-frame.



1. In combination with the uprights D and rails B and C, the floor E, supported from the same by the supports M, for the purpose set forth.

2. In combination with traction-wheels or rims without lugs, provided with internal segmental racks, the geared wheels H, shaft G, and shifting devices, substantially as specified.

3. In combination with the main frame of a traction-engine, the traction-frame V, substantially as and for the purposes shown.



4. In combination with the wheels or rims, geared wheels H and shaft G, the shaft K and pinions J, substantially as specified.

156,596.

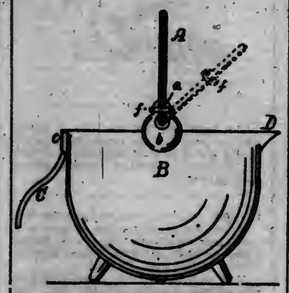
156,596. SEWING-MACHINES. J. R. McCune, Hamilton, Canada, assignor to R. M. Wanzer, same place. (Filed June 20, 1874.)

Brief.—By moving the slotted lever the blocks are moved to or from each other, so that the pin of the feed-regulating lever may come to rest against such blocks as it is elevated or depressed to reverse the feed, and insure that the forward and reverse stitch be alike.

The slotted disk-lever C and movable blocks *a e*, combined with the feed-regulating lever D, having pins *i* and *k*, all operating substantially as and for the purpose specified.

156,597. CAR-COUPLINGS. Patticon F. McClure, Junction City, Kans. (Filed Nov. 13, 1874.)

1. The combination, in the draw-heads F F, of the links A A', having their front edges beveled and provided with projections upon their faces, against which the coupling-pins impinge, substantially as and for the purpose set forth.



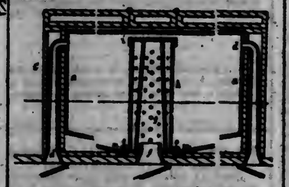
2. The combination, in the draw-heads, of the links A A', having their front edges beveled, and the inclined projections *b b*, provided with guides *a a*, the links at one of their ends being of T-shape form, adapted to fit and work in grooves or recesses formed in the sides of the draw-head.

3. In an automatic car-coupler, the levers B B' and pins D D', in combination with the links A A', all constructed substantially as set forth.

4. The automatic car-coupler, consisting of the levers B B', pins D D', links A A', provided with bevel projections *b b* and guides *a a*, all constructed to operate as set forth.

156,598. CULINARY VESSELS. G. R. Moore, Philadelphia, Pa. (Filed Dec. 15, 1874.)

Brief.—A culinary vessel with lugs on one side for an adjustable handle, a hinged ball that may be stayed, and a lip, all for pouring out liquids.



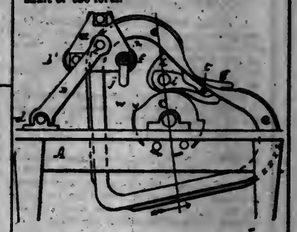
1. The combination of the stopped or stayed ball A and the detachable handle C upon the culinary vessel B, as and for the purpose specified.

2. The combination of a stopped or stayed ball, A, and the pouring-out lip E upon a culinary vessel B, as and for the purpose specified.

3. The prong *a* of the ear *b*, in combination with the ball A and ring *f*, as and for the purpose specified.

156,599. AIR COOLING AND PURIFYING APPARATUS. B. Emerson Page, Boston, Mass. (Filed Dec. 7, 1874.)

Brief.—The air rising from the chamber to be cooled passes successively against two perforated pipes, which deprive it of its impurities and moisture. The channels between the two and the central imperforate pipe conduct the drip to the central trough. The perforated tubes separate the same should the current be reversed, so as to ascend large lateral tubes *d d*, and descend through central smaller tubes.



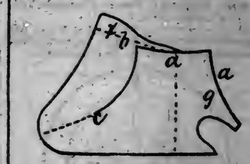
1. The combination of the perforated tubes *g* and A with the tank A, substantially as and for the purpose hereinbefore set forth.

2. The combination of the tubes *d d* with the tank A, chamber B, and perforated tubes *g* and *h*, substantially as hereinbefore described.

3. The combination of the valves *e f*, tubes *f* and *d*, tank A, and chamber B, all arranged as and for the purpose hereinbefore set forth.

156,600. MACHINES FOR BENDING METAL. Bert A. Peck, Sycamore, Ill. (Filed Sept. 10, 1874.)

Brief.—An irregular form, composed of flanges and web, in conjunction with a gang of rollers mounted on trunnions and hinged arms, held to form by rollers mounted on an eccentric pin. The metal is passed under a latch, where it is clamped and held, while the form is rotated, by means of the cam on the shaft of the form.



1. A gang of two or more compression-rollers, *b b'*, and friction-rollers *f f*, all supported in a frame supported on trunnions, in combination with the arms D D, and an irregular form, substantially as and for the purposes set forth.

2. The eccentric-pin *n p* and friction-rollers *f f*, in combination with compression-rollers *b b*, supported in a frame on trunnions, and an irregular form, substantially as and for the purposes specified.

3. An irregular form, B, with stationary eccentric C, in combination with the latch *g*, substantially as and for the purposes specified.

156,601. SHOE-UPPERS. John L. Perry, Turner, assignor of one-half his right to J. E. Ash, same place, and W. E. Keith, North Auburn, Me. (Filed Aug. 17, 1874.)

The improved shoe-upper described, the same consisting of a single piece of leather cut on the line *a b c* to form the heel-stay *a*, and having the part *g* provided with the edge *d*, corresponding with the line or edge *b c*, substantially as and for the purpose specified.

156,602. CHIMNEY-GUARDS. E. Priesman, Sacramento, Cal. (Filed Aug. 5, 1874.)

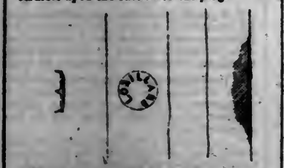
Brief.—A ring, rigidly upheld and surrounded by a coil of wire, constitutes a flexible guard for a lamp chimney or shade.

A lamp-shade guard, consisting of the bracket-rod E, arranged to be secured against the wall, in combination with the ring A and encircling spring C, all constructed and operated as set forth.

156,603. MILK-COOLERS. Luke J. Roberts, Waterbury, Vt. (Filed Apr. 14, 1874.)

Brief.—The separable pans receive and tilt together.

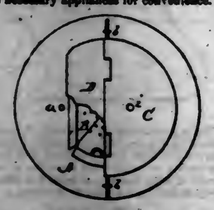
158,603.



1. The combination and arrangement of the separable pans A and B with table C and standard D, and a suitable support, E, whereby the whole device may be horizontally revolved, substantially as and for the purposes set forth.

2. The rotary table C, attached to standard D by the hinge and hook, substantially as and for the purposes set forth.

158,604. PLUG-TOBACCO. Chas. Sieller, New York, N. Y. [Filed Nov. 27, 1874.]



Brief.—A label of tin, having raised letters, is pressed into the plug, over which the finishing leaf is placed, so that the letters are discernible upon the outside of the plug.

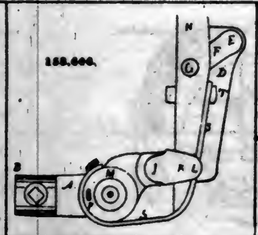
Plug tobacco having a label lying beneath the ultimate wrapper of tobacco leaf, and discernible through said leaf, substantially as and for the purposes herein specified.

158,605. COMBINED CISTERN-TOPS AND FILTERS. Ephraim D. Emery, Corsicana, Tex. [Filed July 9, 1874.]

Brief.—A covering for cisterns, which has combined therewith a filtering apparatus, and the necessary appliances for convenience.

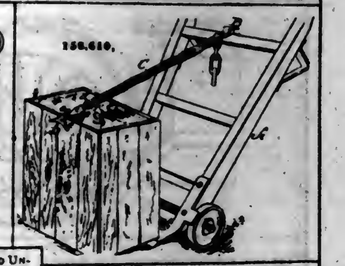
The combination of the disk A, provided with opening *a* and staples *b b*, the conical perforated filter B, and the cover C D, having opening *f*, all constructed substantially as and for the purposes herein set forth.

158,606. LOCK PICKING MECHANISM. W. Sherren, Manchester, N. H. [Filed June 2, 1874.]



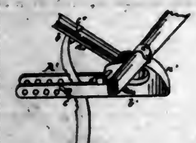
Brief.—To give a parallel motion to the picker, the stick is hung, by means of a swinging arm, to the upper end of an arm extending up from the support on the lay rock-shaft. The lower end of the stick works against the face of a reaching arm having a projection to hold the stick in place. The stick is drawn back by a cutted spring arranged around a cup-shaped stud, and within a cup-shaped pulley connected by a strap with the stick.

---



1. The combination of the arm D, extending up from the stud A, pivot E, swinging arm F, picker-staff H, reaching arm K, and projection L, constructed to operate substantially as described, for the purpose set forth.

2. In combination with the arm D, pivot E, and reaching arm F, the cutted spring stud M, pulley N, and strap S, substantially as described.



158,608.

158,610.

158,607. DEVICES FOR COUPLING AND UNCOUPLING TRELLS. Frank P. Stone, Chicago, Ill. [Filed June 20, 1874.]

The combination of the lever A, having claws *a*, notches *a'*, and the shank A' having hook *a'* and arms *b'* for attaching or detaching the tongue or shafts of vehicles, substantially as specified.

158,609. MANUFACTURE OF LEATHER. C. J. Tinnerholm, Keokuk, Iowa, assignor to N. Petersen, New York city, and A. Brodin, Eric Hedman, and John Oquist, Keokuk, Iowa. [Filed Sept. 10, 1874.]

Brief.—Liming solution: Lime, brimstone, sal-ammoniac, prussiate potassa, water. Bating solution: Iron filings, brimstone, water. Tanning solution: Terra-japonica, sumach, alum, tartaric acid. Whitening solution: Tartaric acid, muriatic acid, cream-tartar, sulphur, water.

1. The compounds herein described for the several successive processes of liming, bating, tanning, and whitening, as and for the purpose described.

2. As an improvement in the art of manufacturing leather, the treatment of hides or skins with the compounds named in the several successive steps described, substantially as and for the purpose set forth.

158,609. POST-HOLE DIGGERS. William M. Ryan, Macomb, Ill., assignor of one-half his right to W. M. Tipe and J. B. Simpson, same place. [Filed May 21, 1874.]

Brief.—A closed cylinder, sharp at the lower end, and provided with a bifurcated handle, united into a single shaft above the cylinder, constitutes the excavating device. A plunger operated by a lever pivoted to the handle, and connected to said handle by a slotted connecting-rod, provides means for discharging the earth from the interior of the cylinder.

In a post-hole digger, in combination, the cylinder A, handle B, connecting-rods *c c*, plunger *c*, and lever D, all arranged as specified.

158,610. HAND-TRUCKS. H. M. Underwood, Kenosha, Wis. [Filed June 16, 1874.]

Brief.—A cant-hook with chain adjustable on and detachable from hand-trucks in ordinary use.

1. In combination with the hand-truck having the hook B attached, the adjustable and detachable chain C, having the hook D attached to its free end, as set forth.

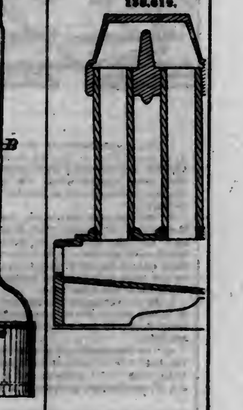
2. In combination with the chain C, the hook consisting of the flat plate *a*, the wooden handle *c*, and the eyebolt *d*, as set forth.

158,611. LETTER-PRESS MAP-PRINTING. C. H. Waite, Chicago, Ill. [Filed June 5, 1874.]

1. As an improvement in the art of making colored maps, the process of printing the tint-color upon the sheets (in advance of the lettering) by means of plates so engraved as to be adapted to letter-press printing, substantially as specified.

2. The plates herein described for the letter-press printing of colored maps, having the the interior of the geographical or other divisions ruled out, and the borders solid, so as to make tinted colored maps with heavy borders, substantially as described.

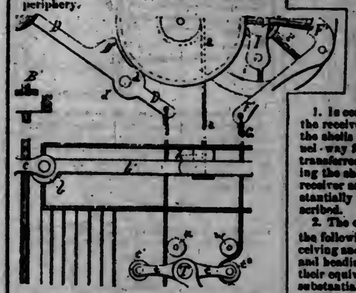
158,612. STEAM-HEATER RADIATORS. C. C. Walworth, Boston, Mass. [Filed Dec. 21, 1874.]



Brief.—The parts being first carefully fitted, the return head is forced into position by powerful pressure.

The improved heat-radiator, having its return-bends and heat-radiating pipes formed and connected as described and shown, so as to produce a steam-tight connection, as set forth.

158,609.



158,613.

158,613. ELEVATORS. Lewis L. Whitlock, Brooklyn, N. Y. [Filed Dec. 27, 1873.]

Brief.—In addition to a rope wound on a drum, there are two others, tightened and slackened simultaneously—one to throw into gear with the drum a shaft having on it a set of friction-wheels, the other slackened to release a weighted brake-lever. In the reverse action the shaft drops by gravity over a central support, and the brake operates. Should this rope sever, the weight at the other end of the lever brings a cam to bear on the drum's periphery.

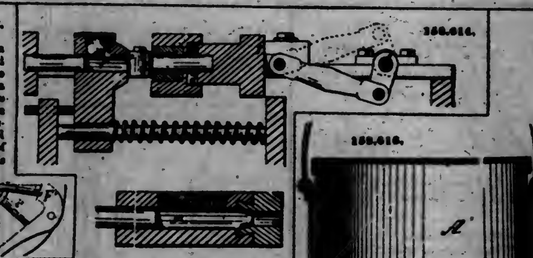
1. The combination of the friction lifting-wheel A with the driving friction-wheel E, the latter poised upon a rocker-frame, I, and arranged to be disengaged at pleasure by mechanism situated in the car X, substantially as described and shown.

2. The double-grooved conical friction-pinions E E', of different diameters, keyed to the stationary shaft *f*, and sliding loosely longitudinally thereon, so that either the pinion E or E' may be brought into gear with the V-grooved lifting-wheel A by being slid backward or forward on the shaft, for the purpose of giving different velocities to said wheel A, substantially as and for the purposes set forth.

3. In combination with the friction lifting-wheel A and drum A', the lever D, said lever provided with a friction-brake, D', and adjustable weight D'', and an eccentric stop, *d*, whereby the speed of the wheel A may be gradually stopped by the friction-brake, or, in case of accident, the wheel may be instantly checked by the stop, substantially as described.

4. The combination of the friction-pulley E, rocker-box I, link F, lever F', line G, stationary friction-pulleys *u w*, and movable friction-pulleys *t' t''*, substantially as and for the purposes shown.

5. In combination with the lines G G', the horizontal bar *t*, adapted to be oscillated from side to side, so as to operate on either or neither of the lines G G', substantially as and for the purposes described.



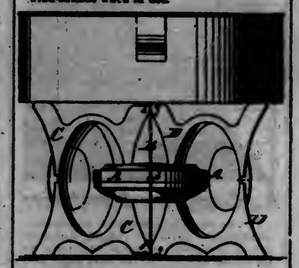
6. The combination of the lines G G', lever S T, bar *t*, provided with the friction-rollers *t' t''* at its ends, stationary friction-rollers *u w*, pinion *r*, disk R, and handle D', all constructed, arranged, and adapted to operate substantially as and for the purposes described.

7. In combination with the car X, weighted eccentrics *b b'*, links *c*, and idle-pulleys *c' c''*, the stationary rods B B', said rods passing between the idle-rollers *c' c''* and the eccentrics *b b'*, and forming guides and stops for the car, as described.

158,614. MACHINES FOR HEADING METALLIC CARTRIDGE-SHELLS. S. W. Wood, Cornwall, N. Y. [Filed June 1, 1874.]

Brief.—A reciprocating plunger is attached to the sliding cross-head, and acts to push the shell from the receiver through the guide-channel *a*, and upon the end of the mandrel. The cross-head, upon its forward movement, abuts against the receiver, and the two then move forward together. The front face of the guide-channel and the face of the plunger are flush at the termination of their forward movement, and act to head the shell, which has been carried into the die by the mandrel. Two spring-lips are, when the shell is forced into the die, pushed apart by the nose of the guide-way, and tend, when said way retracts, to spring in back of the flange on the shell, and strip it from the mandrel when it moves back.

158,614.



1. In combination with the die and mandrel, the receiver, with its aperture for receiving the shells to be headed one by one, and channel-way for guiding each shell when being transferred, and the reciprocating tool for moving the shell through the channel-way of the receiver and transferring it into the die, substantially as and for the purpose herein described.

2. The combination, as herein described, of the following devices, viz., the receiver for receiving and guiding the shells, the transferring and heading tool, the mandrel and the die, or their equivalents, having a mode of operation substantially such as described.

3. In combination with the receiver, the transferring and heading tool, mandrel and die, substantially as described, the mechanism for imparting to the mandrel two reciprocating motions toward and from the transferring and heading tool to one reciprocating motion of the transferring and heading tool toward and from the mandrel.

158,615. TRAVELERS' LAMPS. Thomas R. Almond, Pittsburg, Mass. [Filed Nov. 23, 1874.]

Brief.—A lamp hung between folding plates, adapted to close about the lamp in transportation, or open around it for supports and wind-shields when in use.

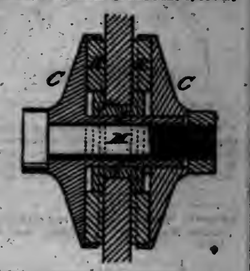
1. The combination of the lamp A with the two plates C D, between which it is supported, said plates converging at a point outside of the lamp to constitute wind-shields, substantially as specified.

2. The converging plates C D, provided with recesses, into which the lamp A may be folded, to constitute a receptacle for said lamp during transportation, and vertical wind-shields, while the lamp hangs horizontally between them when in use, substantially as specified.

3. The perforated middle plate B combined with the plates C D of a lamp-support, and with the lamp A, as set forth.

4. The portable lamp A, when in combination with the folding stand C D, and provided with the gauze *c*, and with the asbestus spread over the screen lying directly beneath the gauze, substantially as specified.

158,616. SECTIONAL DINNER-PAILS. Chas. H. Ames, Columbus, Ohio. [Filed Sept. 26, 1874.]

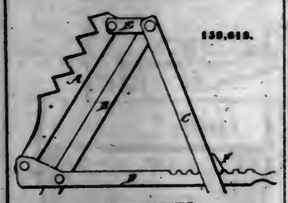


Brief.—The pail is composed of several pan-sections, each having an independent bottom, which may be fitted one within the other, and then, together with the spring-bail, all packed within the top section.

158,616.

The combination of the detachable pan-sections A A'' A''' A', the lower section, A', provided with eyes *d d*, and the upper section, A, having pins *c c*, the detachable hooked and perforated strips C C, and the spring-bail B, substantially as and for the purpose set forth.

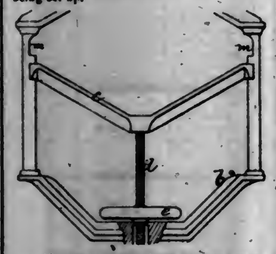
158,617. ELASTIC CLAMPS FOR POLISHING AND GRINDING WHEELS. Bert Bannister, John C. Perkins, and Wm. H. Stoddard, Kalamazoo, Mich. [Filed June 6, 1874.]



The clamping-collar C, formed entire with the sleeve *i*, and receiving through it the mandrel M, in combination with the elastic eye J, elastic rings K K, loose collar O, and clamping-nut N, and with the grinding-wheel A, substantially as described.

158,618. LISTING-JACKS. J. Bruen, Darke County, Ohio. [Filed Nov. 28, 1874.]

Brief.—On the front and longer end of a pivoted pair of legs the bearing-piece, with a series of shoulders thereon, works with a parallel motion by a link at the top, and a pivot on the end of a lever beneath, which is pivoted to the leg. This lever has notches, which, by means of a catch, render the device adjustable.



A carriage-jack formed of the notched bar A, the legs B and C, the bar E, the notched lever D, and the catch F, constructed and combined substantially as herein shown and described.

158,619.

158,619. CLOCK-MOVEMENT HOLDERS. W. H. Brickett, Boston, Mass. [Filed Sept. 15, 1874.]

Brief.—For holding clock movements while being set up.

1. The improved device for holding clock-movements described, the same consisting of the foot-piece *a*, hollow standard *x*, frame *b*, screw *d*, and nut *e*, combined to operate substantially as specified.

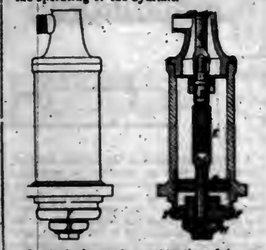
2. In the improved device for holding clock movements described, the notches *n n*, as and for the purpose set forth and described.

158,620. SPONGE-CUPS. Bloomfield Brower, New York, N. Y. [Filed Oct. 1, 1874.]

As a new article of manufacture, a sponge-cup, A, having an internal lip or projection, C, around its upper part, and a cap or cover, B, open on the front, all made in one piece, substantially as and for the purpose set forth.

158,621. SPRING-BOLSTERS FOR VEHICLES. Henry Beck, Polo, Ill. [Filed Nov. 14, 1874.]

1. The combination, with the detachable bar C and the bolster B of the curved metallic springs S, substantially as specified.



2. The combination, with the bolster B, of the detachable bar C, having springs S, with short re-enforcing arms *e* and primary arms *f'*, rigidly secured into the recesses *d* of the said bar, substantially as and for the purpose set forth.

3. The combination of the bar C, having recessed springs S of the bolster B, having plates *p*, substantially as specified.

4. The combination with the bar C, having notches *c* and curved springs S, of the guiding-standards *b* of bolster B, substantially as specified.

158,622. HYDRANTS. Marshall Burnett, Hyde Park, Mass. [Filed Dec. 9, 1874.]

Brief.—An auxiliary valve applies to the under side of the main valve, to close and open perforations in the latter, by which means water may be admitted above it, and the pressure upon it relieved, so facilitating the operating of the hydrant.

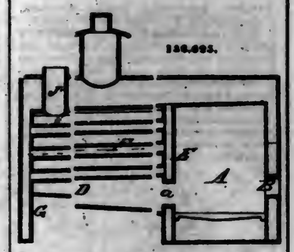
In the hydrant, the combination of the auxiliary valve H with the valve-stem E and with the main valve F, provided with one or more openings, *s*, and arranged to slide on the said valve-stem from the auxiliary valve to a shoulder or cross head, *a*, in the stem, all being substantially as specified.

158,623. FLY-TRAPS. Jacob H. Bustin, El Paso, Ill. [Filed June 20, 1874.]

Brief.—The circular feed-board has hooked arms to receive the inner cage, and the outer cage overlaps the rim of the inner cage.

In a fly-trap, the combination of a circular feed-board, A, having the radial hooked arms *b*, bent inward and upward to form a seat for the conical cage B', and the outer cage F having the annular base *e* overlapping the base B, substantially as shown and for the purpose set forth.

158,624. SHIRT AND COLLAR BUTTONS. J. B. Carter, Hartsville, Ind. [Filed Dec. 16, 1874.]



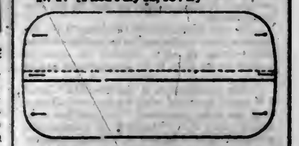
Brief.—The button is secured in a correspondingly-shaped button-hole, which is of smaller size than the largest diameter of the button.

A button constructed, as herein described, with a doubly-conical head, *a b*, and wings *c* projecting radially therefrom, and some or all of them extending to the flange, as shown.

158,625. FURNACES FOR STEAM-BOILERS. Edmund P. Chancellor, Parkersburg, W. Va. [Filed Nov. 26, 1874.]

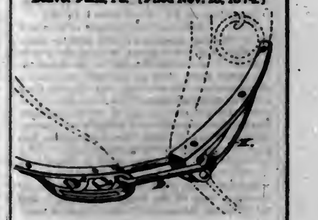
Brief.—The front ends of the tubes are protected from the intense heat by a water partition, the products of combustion having free access around the tubes to the uptake.

158,625.



In a horizontal boiler, the furnace A, provided with the opening *a*, in combination with the chamber D, surrounding water-tubes, horizontal tubes F, communicating with the water-back E and water-leg G, and smoke-pipe J', all constructed and arranged substantially as specified.

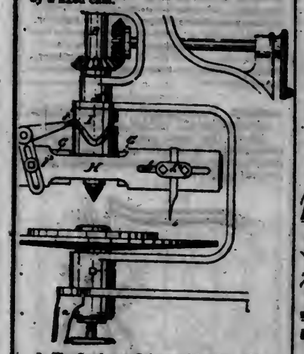
158,626. FLOUR-BOLTS. David T. Chase, Cedar Falls, Iowa. [Filed Dec. 10, 1874.]



The combination, with a revolving flour-bolt, of the air tube or trunk C, having adjustable aperture *a*, and adjustable upon the girders G G, the flexible pipe D, and fan E, all substantially as and for the purposes herein set forth.

158,627. CUFFS. J. W. Alfred Chastk, Troy, N. Y. [Filed July 13, 1874.]

As a new article of manufacture, a detachable cuff made with a back having two sections, each section having a folded edge between which the cuff is turned right-side out, and the two sections then stitched or otherwise connected together at their folded edges, making the closing seam, substantially as described.



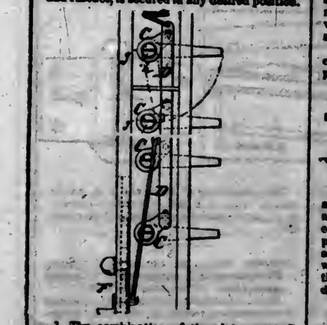
158,628. HAME-FASTENERS. C. M. Coburn, Beaver Falls, Pa. [Filed Nov. 13, 1874.]

The link D and the gnarled hooks *a* in combination with the cam-lever H, substantially as set forth.

158,629. MACHINES FOR TURNING IRREGULAR FORMS. Benjamin H. Connor, Cincinnati, Ohio. [Filed June 16, 1874.]

Brief.—The material is placed upon a table under a revolving bar, which carries the cutter, the latter being guided in its movements by a fixed cam.

1. The fixed cam I, in combination with a rotating head, G, carrying the angle-lever J and slide H, all constructed and operating substantially as described.

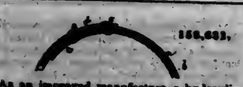


2. A cam, I', made in sections *i i*, interchangeable with each other and mounted in the grooved rings *r r*, in the manner substantially as and for the purpose set forth.

3. The guide-stand *s* and vertically-moving slide *t*, in combination with the cam I' and slide H, as and for the purposes specified.

4. The detachable rims *i' i'*, fastened to the frame and holding the sections composing cam I' in position, as above described.

158,630. BLIND-STOPS. James Dougherty, New York, N. Y. [Filed Sept. 18, 1874.]

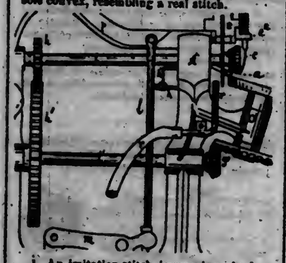


Brief.—A crank is placed upon the prolonged tenon of a blind-slat. One end of this crank is connected with an upright, which operates all the slats, and, by means of a pawl and ratchet, is secured in any desired position.

1. The combination of the slat-cranks C with the rod D, spring E, sliding rack F, pawl *e*, and buttons *d* and *f*, all being concealed within the frame of the blind, excepting the buttons *d* and *f*, for operation substantially as described.

2. The crank C, made with the inwardly-projecting tooth *g*, combined with the prolonged tenon of a blind-slat, substantially as and for the purpose specified.

158,631. HYDRAULIC HOSE. Leverett H. Downing, North Andover, Mass. [Filed June 10, 1874.]



158,631.

As an improved manufacture, a hydraulic hose, or suction thereof, formed of a single sheet of canvas or cloth, covered on both sides with a vulcanizable water-proof composition, and wound twice or more times upon itself, and fastened at its laps by nails, and subsequently vulcanized, all being substantially as described and represented.

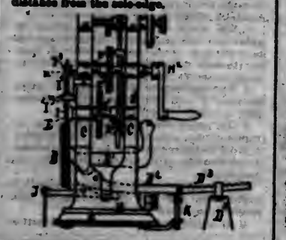
158,632. STITCH-IMITATION AND STITCH-DIVIDING MECHANISMS. Charles S. Dunbrack, Swampscott, Mass., assignor to T. Corey, trustee. [Filed Feb. 26, 1874.]

Brief.—The boot or shoe sole, resting upon a rotary disk, is fed underneath the marking-wheel, which has a toothed periphery, the teeth being convex upon their outer edges, and the hollows or furrows between the teeth concave, making the impressions upon the sole convex, resembling a real stitch.

1. An imitation-stitch impressing-wheel, *a*, having concave furrows, for the purpose shown and described.

2. The combination of the imitation-stitch impressing-wheel *a* and the collar *b*, having concave furrows, for the purpose shown and described.

3. The combination of the imitation-stitch wheel *a*, the collar *b*, and the circular guard *c*, for the purpose shown and described.



4. The combination of the imitation-stitch impressing-wheel *a*, the collar *b*, the circular guard *c*, the gage *f*, and the disk *e*, all operating together substantially as and for the purpose shown and described.

5. The stitch-divider *d* upon the head-piece *a*, in combination with the movable jaw *p*, the rod *i*, and pedal *n n'*, all operating together with the disk *e* and the gage *f*, for the purpose shown and described.

6. The combination of the screw K, the clamp K', and the movable jaw *p*, for the purpose shown and described.

158,633. MACHINERY FOR FORMING AN IMITATION-STITCH UPON THE SOLES OF A BOOT OR SHOE. Charles S. Dunbrack, Swampscott, and Wm. B. Veasey, Milford, Mass., assignors to T. Corey, trustee. [Filed July 3, 1874.]

Brief.—The sole is fed forward by means of a serrated wheel, its edge brought underneath an imitation-stitch device attached to the outer end of a revolving shaft. A guide-disk depending from overhanging adjustable arms serves to press the sole down upon the feed-wheel; also, to present it in position to receive the imitating stitch impression at a uniform distance from the sole-edge.

1. An imitation-stitch device, substantially as described, consisting of the marking-wheel *a*, the collar *b*, and the guide-disk *e*, combined with the adjustable arms *g g'*, the pivoted arm *h*, and the rod *i*, substantially as described.

2. The combination of the marking-wheel *a*, the collar *b*, the guide-disk *e*, the adjustable arms *g g'*, the pivoted arm *h*, the rod *i*, and the pedal *n n'*, substantially as described.

3. The combination of the marking-wheel *a*, the collar *b*, the guide-disk *e*, the adjustable arms *g g'*, the pivoted arm *h*, the rod *i*, the pedal *n n'*, and the gage *f*, substantially as described.

4. The combination of the marking-wheel *a*, the collar *b*, the guide-disk *e*, the adjustable arms *g g'*, the pivoted arm *h*, the rod *i*, the pedal *n n'*, the gage *f*, and the stitch-divider *d*, substantially as described.

5. The combination of the clamp K', the movable jaw *p*, the adjustable arms *g g'*, the pivoted arm *h*, the rod *i*, the pedal *n n'*, the gage *f*, and the stitch-divider *d*, substantially as described.

6. The combination of the screw K, the clamp K', the movable jaw *p*, the adjustable arms *g g'*, the pivoted arm *h*, the rod *i*, the pedal *n n'*, the gage *f*, and the stitch-divider *d*, substantially as described.

1. In an imitation fair stitch machine, the combination of the marking device F and the feed-wheel D, revolving upon a movable lever, D^1, substantially as shown, and for the purpose described.

2. The combination of the ratchets E^2 and F^1, the pawls F and F^2, the levers F^3 and D^2, springs *n* and *n'*, rod F^4, and the eccentric G, to produce forward and backward and continuous movement, substantially as shown, and for the purpose described.

3. The combination of the levers D^1 D^2 D^3, and weight D^4, for the purpose shown and described.

4. The combination of the levers D^3, D^2, and J, for the purpose shown and described.

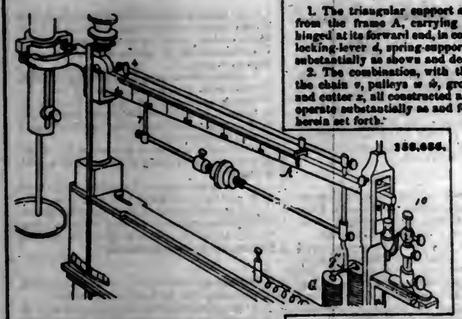
5. The combination of the adjustable guard I, the guard-holder I^1, having movable arms *s s*, the spring I^2, and nuts I^3 and I^4, for the purpose shown and described.

158,634. BLIND-STOPS. Alfred T. Elford, Oakland, Cal. [Filed July 21, 1874.]

Brief.—Consists in attaching blind-slats by means of long tenons, secured by the ordinary blind-staple to an operating-rod, which works entirely within a recess or side groove, and is controlled and adjusted by a lock-knob or set-screw, the construction dispensing with all outside attachment except the operating-knob, and enabling the slats to be readily adjusted and held at any desired angle of inclination.

The slats B, having long tenons C, in combination with the side grooves G and sockets H, when the same are operated by means of the rod D, to which rod the tenons are attached by blind-staples, and by the lock-knob E, or its equivalent, all constructed, arranged, and operating substantially as described and shown, for the purposes set forth.

158,635. HAND-PIECES FOR DENTAL INSTRUMENTS. Jno. W. Gilbert, Philadelphia, Pa., assignor to Samuel S. White, same place. [Filed Dec. 29, 1874.]



Brief.—The hand-piece of a dental engine carries a revolving mandrel, a cone-pulley revolving freely about it, and a cone-sleeve revolving with it, and moving freely endwise thereon. By a thumb-lever the operator moves the sleeve away from or into contact with the cone-pulley, and thus retains or stops the tool, which is connected in any known way to the said mandrel.

In a dental instrument, the combination of a revolving mandrel, a driven cone-pulley revolving freely thereon, a cone-sleeve revolving with the mandrel and moving freely endwise thereon, and mechanism controlled by the operator for stopping and starting the mandrel, all the mechanism being mounted upon the instrument itself, substantially as specified.

158,636. ELECTRICAL PROPULSION.—BALANCES. Wm. W. Goodwin, Camden, N. J. [Filed Aug. 21, 1874.]

Brief.—Sliding pan S set at 0, and candle balanced by moving weight F. *i* is then slid on arm A to number indicating grains to be consumed, the candle holding down the balance-arm against F and S till the amount is consumed, when they pull down the balance-arm, which completes at 10 and H an electrical circuit to C, which, attracting its armature, holds the balance secure against any vibrations, and maintains the circuit-connection for any other desired operations.

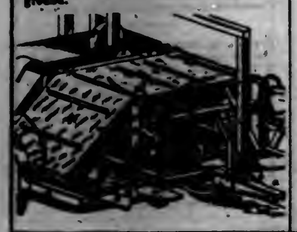
1. The combination, in a balance for photometers, substantially as described, of the micrometrical adjusting-weight F and the bar 6 with the power-arm of the lever A.

2. The electro-magnet G and the armature-bar g', in combination with the power-arm of the lever A, arranged as described, for the purpose of holding down the lever A, with its platinum stem 10 in contact with the mercury in the cup H, as set forth.

158,637. FOOT-REST FOR CHAIRS. Thos. Mead, Lowell, Mass. [Filed June 27, 1873.]

Brief.—A foot-rest is hinged to the front of the chair, and is provided with an actuating-spring having an arm working in a gaige on the foot-rest, so as to automatically turn the rest under the seat. The back of the chair is recessed to receive the legs of the foot-rest when it is turned under the seat. A button is attached to the under side of the front rail of the chair, to hold the rest in an extended position against the action of the spring.

1. The hinged foot-rest, provided with an actuating-spring, *c*, having an arm, *d*, working in a guide, *g*, as described, to automatically turn or fold the rest beneath the seat of the chair.



2. The button E, in combination with the spring-actuated and folding foot-rest, for the purpose and in the manner set forth.

3. A hinged and spring-actuated automatically-folding foot-rest, in combination with, and folding under, a chair, as set forth.

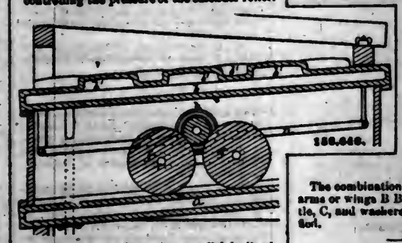
4. A hinged and automatically-folding foot-rest, in combination with a chair constructed with a recess in its back to receive the inverted legs C of the rest, as described.

158,638. BROOM-CORN HARVESTERS AND THRASHERS. Robert C. Minton, Clinton, Mo. [Filed May 26, 1874.]

Brief.—The corn is elevated by an endless apron to a table, where the tops are cut off and delivered to a thrashing-cylinder, while the stalks are carried to the opposite side of the machine and deposited in pivoted arms, from which they are discharged in sheaths upon the ground.

3. In a broom-corn harvester and thrasher, the combination of a thrashing-cylinder, T, wheel P, and catch *x*, with the carrier N, substantially as shown and described.

4. The hooks A' and B', arranged as described, and operated by means of their respective levers D' and E', substantially as and for the purposes herein set forth.



158,639. MEANS OF ATTACHING HUBS TO AXLES. Benj. B. Howard, West Bridgewater, Mass. [Filed Nov. 4, 1874.]

The hub A and the axle B, provided with the grooves *a* and *a*, in combination with the shoe D, fixed to the axle, and the removable coupling-cap E, provided with the flanges *e f* to enter said grooves, and the latches *g g* to connect it with the shoe, all as and for the purpose set forth.

158,640. APPARATUS FOR DRYING PAPER CYLINDERS. J. F. Jones, Marcellus Falls, N. Y. [Filed Nov. 20, 1874.]

Brief.—Two parallel inclined steam-heaters with guiding-rails, a pair of paper-molds with a calender-roller, and supplemental rolls for controlling the pressure of the calender-roller.

1. In a steam-drier, the parallel inclined steam-heaters *a b*, guiding-rails, and rail *n* for passing the molds and calender-rollers through the drying apparatus, combined substantially as and for the purposes set forth.

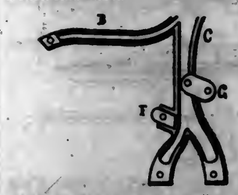
2. The molds or cylinders *f f*, linked together and held at a proper distance apart to be acted upon by the calender-roller in passing through the drying apparatus, substantially as and for the purposes specified.

3. The combination of the weighted calender-roller *h* with the paper-molds, substantially as herein described.

4. The adjustable rolls or bearings *n*, for regulating the pressure of the calender-roller *s* at the commencement of the drying process, in combination with the calender-roller and paper-molds.

5. The molds *f* and calendering-roller *h*, in combination with the drying-chamber, substantially as above described.

6. In a drying apparatus, the combination of the forms *b'* for drying the barrel-heads on with the upper surface of the heater *b*, as specified.



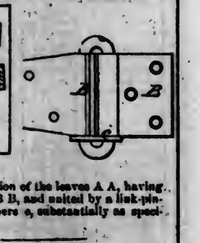
158,641. MANUFACTURE OF PAPER-PULP. J. F. Jones, Marcellus Falls, N. Y. [Filed Nov. 20, 1874.]

1. The process of making paper or board direct from the grasses, weeds, and the like, by grinding in the stock-grinder, and running the stock into paper direct, without boiling or chemical disintegration, as herein specified.

2. The pulp or stock for the manufacture of paper, &c., composed of grasses, weeds, and the like, ground fine in the stock-grinder, without boiling or other chemical process in its preparation.

158,642. PLOW-BEAMS. Cornelius Kingsley, Chicago, Ill. [Filed Apr. 14, 1874.]

Brief.—The cast-metal plow-beam is strengthened by flanged edges, and the several attachments and supports for other parts are cast solid with it.



1. The combinations of the beam A and extensions B and C with the bracket G, all cast in one piece, substantially as and for the purposes specified.

2. The combination of the beam A, extensions B and C, brackets F and G, and clevis H, substantially as and for the purposes specified.

158,643. HINGES. David W. Long, Parkersburg, W. Va., assignor of one-half his right to W. N. Chancellor, same place. [Filed Oct. 17, 1874.]

Brief.—The hinge is of sheet metal, and the two leaves are connected together by a link-pintle. The metal of the leaf, after forming the pintle-eye, is turned at right angle to the same, thus affording an additional attachment upon the edge of the door or gate. A washer is used on the head of the link at each end.

The combination of the leaves A A, having arms or wings B B, and united by a link-pintle, C, and washers *c*, substantially as specified.

158,644. SPOOL-MACHINES. G. H. Lyman, Providence, R. I., assignor to D. T. Lyman, same place. [Filed Aug. 20, 1872.]

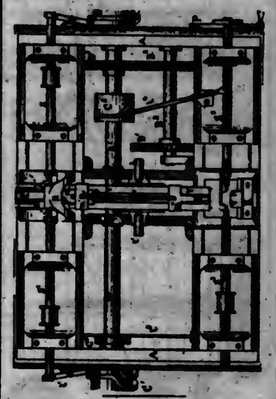
Brief.—The blanks to form spools are placed in a conducting-trough, by which they are presented to the different tools consecutively, for the purpose of performing the various operations necessary to complete the spools.

1. The block-holder H, with clutch *h*, constructed and operated substantially as described.

2. In combination with lever P and clutch *h*, the spring *o*, substantially as and for the purposes herein shown and set forth.

3. In combination with the reciprocating stamping cross-pieces *t*, provided with centers and dies, and arranged one on each side of the conductor, as specified, the levers *v v' v''*, toggle-joint *e*, arm *a*, and cam C, substantially as shown and set forth.

4. In combination with the bent lever F for operating the knife-carriage, jointed at its bend or elbow as described, the spring *o* applied to said lever at said jointed bend or elbow, substantially as and for the purposes set forth.



5. The combination of a spindle, S', having center *i*, lever *h*, cam C', spindle S'', provided with center *r* and ball *a*, with carriage K, cam *s'*, lever P, and spring S', substantially as and for the purposes described.

6. The conductor Y, substantially as described, for the purposes set forth.

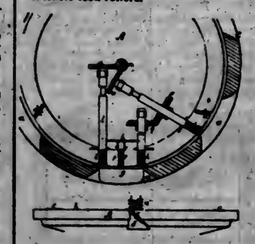
7. The combination of sleeves *m*, fingers *f*, rod *r* provided with shoulders, carriage *v*, sliding pawls *p*, stationary pawls *n*, and springs *s*, substantially as described, and for the purposes specified.

8. In combination with the conductor, the carriage *p*, railway *y*, and inclined planes *x*, substantially as described, and for the purposes specified.

9. A conductor or trough, Y, extending in a right line or continuously from end to end of the machine, in combination with the mechanism for boring and beveling and for turning the blanks contained in and passing through said conductor, substantially as herein shown and set forth.

158,645. RAILWAY-RAIL-JOINT FASTENINGS. P. McCarty, Fairfield, Iowa. [Filed Nov. 2, 1874.]

A railway-rail-joint coupling, consisting of the combined chair and fish-bar B, constructed in one piece, as described, and recessed at *f*, elastic cushion *g*, washer *h*, and fish-bar *l*, arranged to operate as and for the purposes specified.



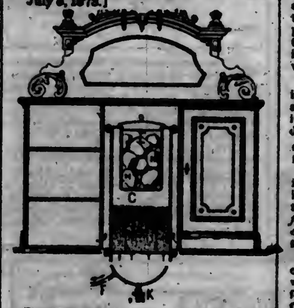
158,646. WATER-CLOSET VALVES. Edwin Mills, Somerville, Mass. [Filed Aug. 17, 1874.]

Brief.—A valve made with a hollow projection to receive an air-pipe that extends above the water-level in the main tank, and admits air into the supplementary tank beneath the main tank, thereby causing the water to flow into the closet-bowl.

In a water-closet valve, the hollow boss or projection B, with the tank opening upward to receive the air-pipe, substantially as described.

158,647. MACHINES FOR MAKING EXCELSIOR. Jas. G. Moore, Lisbon, N. H. [Filed Oct. 14, 1874.]

Brief.—A slide is arranged radially in the wheel, and provided with a series of vertical cutters, and moved lengthwise while passing between two guide-cams, causing the cutters to cut in lines parallel to the block of wood, which is held in one of a series of recesses in a circular frame, and fed to the cutters by suitable feed-rollers.



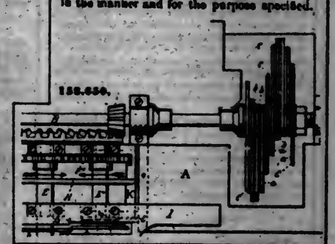
1. In the excelsior-machine, the guide-cams *g h*, applied to the stationary frame C, as described, and to operate, as set forth, with one or more slides, *s*, provided with scoring-cutters, and applied to a rotary wheel, A, carrying a set of plane-irons, the frame O having feed-rollers, and all being to operate as explained.

2. In the excelsior-machine, the combination of the shafts *l m*, bevel-gears *p q*, spur-gears *n o*, and screw *n'* with shaft B and feed-rollers *f k l*, all being arranged as shown and described.

158,648. COMPOUNDS FOR UNHAIRING HIDES AND SKINS. Henry Mower, Canton, assignor of one-half his right to M. Blodgett, of Sandy Creek, N. Y. [Filed Apr. 17, 1874.]

The combination of lye from wood-ashes or potash and lime which has been treated by the gas generated by sulphuric acid, sulphuret of iron, and water, substantially in the manner and for the purposes herein set forth.

158,649. WATER COOLERS AND FILTERS. A. M. Peterson, Philadelphia, Pa. [Filed July 8, 1873.]



The filter and cooler A, composed of the chambers G D, the sieve E, and the ice-vessel H, substantially as and for the purpose shown and described.

158,650. MACHINES FOR COMBING AND CUTTING GRASS AND BRISTLES. Joseph Pickering, Philadelphia, Pa., assignor of one-half his right to Jos. M. Pickering, same place. [Filed June 4, 1874.]

Brief.—The pickers and combers are arranged spirally upon their shaft, and their edges and points are beveled, so that the bristles, in being combed, are automatically fed to the centers, which cover the tines to graduate it as to length.

1. The teeth *c*, having bevels *e* on their front ends and corresponding bevels *d'* on their front edges, in combination with the shaft H, on which they are spirally arranged for the double purpose of combing the grass or bristles and feeding it forward toward the cutters D and D', substantially in the manner, and for the purpose above described.

2. The slotted hinged guard I in combination with the cutters D and D', substantially in the manner and for the purpose specified.

158,651. WATER-PROOF PADS FOR COPYING-PRESSES. Chas. Rowland, New York, N. Y., and Jos. G. Rowland, Quincy, Ill. [Filed Nov. 24, 1874.]

As a new article of manufacture, a letter-press sheet, coated on both sides with asphalt varnish, and finished with shellac, substantially as specified and shown.

158,652. VOTING APPARATUS. Henry W. Spratt, 4 Lee Road, Blackheath, England. [Filed Aug. 10, 1874.]

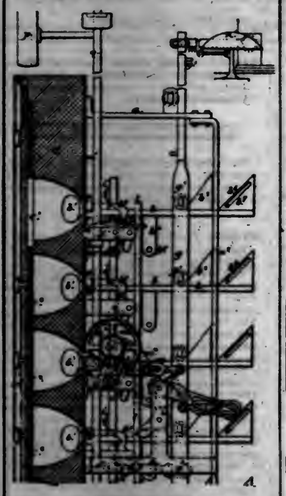
Brief.—The apparatus is arranged within and opposite to the entrance of a chamber, in which is a turnstile. The voting-knobs are in recesses covered by doors sliding in a frame, which is only long enough to allow access to one knob at a time. The drawing of a knob locks all the other knobs, registers a vote for the candidate to whom the particular knob is assigned, indicates to the voter that his vote or votes are registered, registers the vote or votes on a public index, rings a bell, and actuates the entire locking apparatus, which may be set to lock for a single vote, or for any given number of votes. The turning of the stile by the exit of the voter, through a projection upon the top of the stile, lifts a bar to unlock the whole mechanism, and puts it in a condition to register the votes of the next voter.

1. The arrangement, in connection with the indicators or recording-instruments *d*, of the sliding bars *b*, with their knobs or handles *b'* in recesses provided with sliding doors *c'*, as described, so as to prevent access to more than one handle or knob at a time, as herein set forth.

2. The sliding bars *b*, formed or provided with inclines *b''*, stops or projections *b'*, and projecting parts *b''*, carrying-fingers *b'*, in combination with the locking-pieces *e*, tumbler-levers *f*, and their springs *f'*, the whole arranged and operating together substantially as described, for the purposes specified.

3. The combination, with the sliding bars *b*, of the sliding frame *g* and its anti-friction wheels *g'*, raised, by the inclines *b''*, during the forward movements of the bars *b*, the said frame being arranged, in combination with the other parts, as described, so as by its upward and return movements to actuate the public index or recording-machine *r*, ring the bell *u'*, and return the bar *b*, by which it has been raised, to its normal position, as herein set forth.

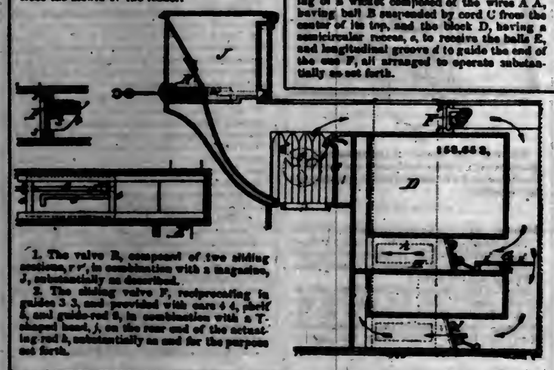
4. The combination, with the sliding bars *b*, of the vertical sliding bar *i*, provided with catches *i'*, and the sliding bar *g*, whereby when one bar is drawn out all the others are locked until the bar drawn out is released, whereupon the unlocking is effected, during its return, by the action upon the lever *h* of the pin *g''* of the sliding frame *g*, as above described.



5. The combination, with the tumbler-levers *f*, locking-pieces *e'* and sliding bars *b*, of the locking-bar *l*, arranged to be moved by the crank-pin *f''*, actuated as hereinbefore described.

scribed, for locking the whole of the sliding bars *b* when the voter has given the number of votes to which he is entitled.

6. In combination with the sliding frame *g* and locking-bar *h*, the slotted arm *k*, stud *j*, slotted lever *j'*, spindle *j*, pawl *j*, ratchet *j*, toothed wheel *j*, pinion *j'*, spindle *j'*, crank or cam *j*, and pin *j*, all arranged and operating together substantially as and for the purposes herein described and set forth.



7. The combination, with the sliding bars *b* and sliding frame *g*, of the slotted arm *m*, pin *m'*, arm *m*, pawl *m'*, ratchet *m'*, and index-wheel *m'*, arranged to indicate to the voter the number of votes he has given, and also of suitable connections, (not shown,) actuated by the projections on the turnstiles, which will allow the wheel *m'* to return to zero as he leaves the voting-chamber, all substantially as herein described.

8. The combination, with the locking-pieces *r* and sliding bars *b*, of the unlocking-bar *q*, arranged to be actuated by an arm or connective (not shown) carried by, or connected with, the turnstile, so as to unlock the sliding bars *b* as the voter leaves the voting-chamber, substantially as described.

156,652. MAGAZINE COOKING-STOVES. W. B. Treadwell, Albany, N. Y. [Filed Nov. 21, 1874.]

Brief.—The damper in the magazine is extensible, and may wholly or only partially close the mouth of the feeder.

1. The valve B, composed of two sliding sections, *r r'*, in combination with a magazine, J, substantially as described.

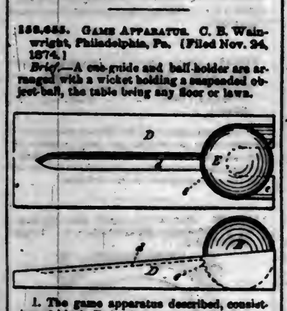
2. The sliding valve F, reciprocating in guides 3 3, and provided with cam 4 4, plate 5, and guide-rod 6, in combination with a T-shaped head, *j*, on the rear end of the actuating-rod *h*, substantially as and for the purpose set forth.

3. In combination with the ovens D *D'* and the flues *b P P*, and the descending flue *d*, the L-shaped partitions and valves *l l* and passages *h h'*, leading into the outlet-flue, all arranged in the manner described.

4. In combination with the flues *b P P d*, surrounding the ovens D *D'*, the pivoted valve G, operating in the manner as and for the purpose set forth.

156,654. BURIAL-CASES. G. Van Winkle, Kalamazoo, Mich. [Filed Dec. 5, 1874.]

Brief.—The rotating lid has large circular openings at each end, which turn upon cylindrical pivots rigidly secured to the inside of the outer case. A strip of flexible rubber is secured to the inner receptacle near its upper edge, and prevents escape of gases.

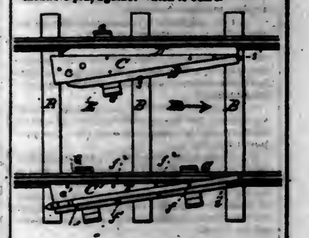


1. In a burial-case, the combination, with the outer case, A, and the inner receptacle, C, rigidly connected by means of screws *s* and cylindrical blocks *b*, of the lid B, rotating on the said blocks, substantially as specified.

2. The combination, with the rotating hollow lid B, of the rubber strip *e*, held in position upon the upper edges of case C by clamp-strips *d*, substantially as specified, and for the purpose set forth.

156,655. GAME APPARATUS. C. B. Wainwright, Philadelphia, Pa. [Filed Nov. 24, 1874.]

Brief.—A cob-guide and ball-holder are arranged with a wicket holding a suspended object-ball, the table being any floor or lawn.



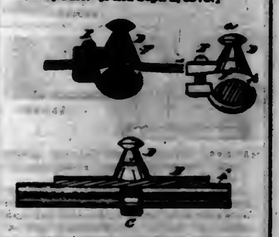
1. The game apparatus described, consisting of block D, having a semicircular recess, *c*, for holding a ball, and longitudinal groove *d* for guiding the cue F, and the ball B, suspended by means of the cord C, attached to any convenient device, substantially in the manner and for the purpose above specified.

2. The game apparatus described, consisting of a wicket composed of the wires A A, having ball B suspended by cord C from the center of its top, and the block D, having a semicircular recess, *c*, to receive the balls E, and longitudinal groove *d* to guide the end of the cue F, all arranged to operate substantially as set forth.

156,656. CAR-REPLACERS. R. D. Watson, Findlay, Ohio. [Filed Oct. 24, 1874.]

Brief.—The inner and outer inclined blocks are provided with rigid steadying-plates on the under side, which have upturned ends. The outer block has an adjustable rail, the lower end of which is provided with a hinged dog. Said rail moves on a pivot in the block, and is secured at the desired angle by a detachable pin, against which it bears.

1. The combination, with the detachable block C', of the hinged dog I and rail F, substantially as specified.



2. The combination, with the pivoted rail F, of block C', the studs *f' f'*, and the detachable pin *i*, substantially as and for the purpose set forth.

3. The hooked plates E G, rigidly secured to the under side of the block C, (said block having track-flanges D D,) and the block C', in combination with the rails A A, as and for the purpose set forth.

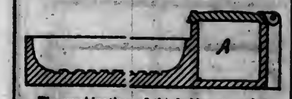
156,657. ROLLS FOR WELDING FLUE-IRONS. Wm. M. Watson, Tonica, Ill. [Filed Apr. 12, 1873.]

The roll C, provided with the eccentric groove A and collar *g*, in combination with the plain roll E, for the purpose of welding a double skin on the mold-board or share, substantially as set forth.

156,658. CURTAIN-FASTENINGS. John B. Weller, Bellbrook, and Finley G. Hopkins, Xenia, Ohio. [Filed Sept. 2, 1873.]

A carriage-curtain and roll clamp, consisting of the plate B, having an outer button, *c*, and a concave inner surface, and the plate C, having a concave inner surface and a shouldered connection, all combined substantially as and for the purpose specified.

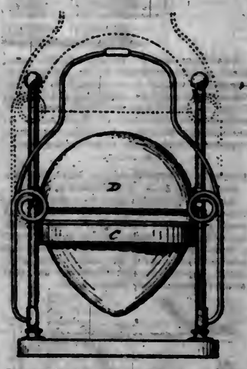
156,639. QUILTING-FRAMES. Thomas N. Wheeler, Blue Earth City, Minn. [Filed June 2, 1874.]



Brief.—The quilting-frame is convertible into a clothes-frame.

The combination, with the frame A B C D, of the rollers E, tension-bar G, cords *f*, pulleys *e*, and pins A, all substantially as and for the purposes herein set forth.

156,640. DEVICES FOR HOLDING AND MIXING STOVE-POLISH. Joseph C. Wightman, Boston, Mass. [Filed Oct. 26, 1874.]



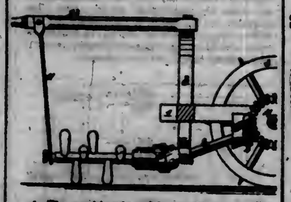
Brief.—The blacking, when not in use, is kept in a box or holder, to which is fastened permanently a mixing-dish having the interior roughened for grating the blacking.

The combination of the holder A and the mixing-dish B, the latter having an interior roughened surface, substantially as herein described.

156,641. COVERED TABLE-WARES. Horace C. Wilcox, West Meriden, Conn., assignor to the Meriden Britannia Company, same place. [Filed Aug. 28, 1874.]

Brief.—The dish is provided with vertical guides, and the cover with corresponding frictional slides, whereby the cover may be held suspended at any point of elevation desired.

In combination with a dish, C, provided with one or more vertical guides, the cover D, provided with corresponding frictional slide, whereby the said cover may be held at any point of elevation between its two extremes, substantially as described.



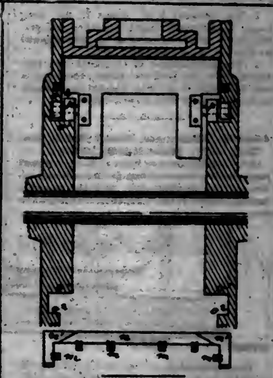
156,609.

The dogs *b b*, pivoted or hinged in the upper end of the slots in the sides of the bar-head, each of which has an angularly-slotted extension, *c*, in combination with the lever E, having its fulcrum between the extended ends of said dogs, and the pins *a a*, to operate in the angular slot *a*, substantially as and for the purpose described.

156,643. REVOLVING CULTIVATORS. N. S. Wood, Boone County, Mo. [Filed July 16, 1874.]

Brief.—The rotating shafts carrying the hoes are driven by the bearing-wheels through connecting-shafts having universal joints. A single handle, pivoted to an arched part of the frame, serves to move the rotating shafts freely by means of adjustable rods.

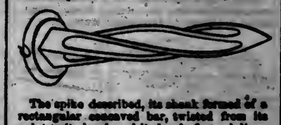
1. The combination of frames I I, connected by yoke 2, shafts 3 3, universally-jointed bee-shafts 9 9, pivoted lever or handle 13, and adjustable rods 11 11, as and for the purpose described.



2. In combination with the driving-wheels, frames, and arched connecting-bar, the geared shafts 3 3, universally jointed to the rotary shafts 5 5, as and for the purpose described.

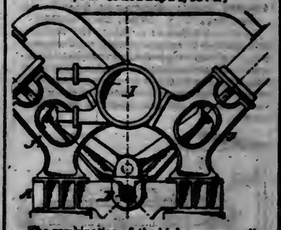
156,644. ROTARY ENGINES. Orwin Adams, Battle Creek, Mich. [Filed June 11, 1874.]

Brief.—The outer roller bears on the outer cam, the inside roller on the inside cam, which allows each roller to continue rotating in one direction.



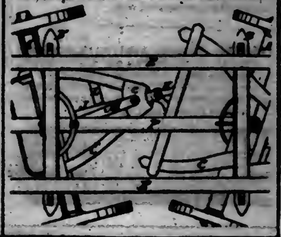
1. The stationary cams *o'* and *o*, the surface of *o'* projecting beyond the surface of *o*, in combination with the rollers *p* and *q*, turning on the same pin, substantially as specified.

2. The movable packing of a rectangular piston, consisting of the combination of the packing-pieces *o o' o'*, the adjoining ends of each piece being beveled to form close contact, and the springs *n*, substantially as and for the purpose specified.



156,645. SPIKES. Joseph J. Adgate, Steubenville, N. Y., assignee of three-fourths his right to J. Maitland, J. H. Shoenberger, and C. Wheeler, Reading, Pa. [Filed Dec. 12, 1874.]

Brief.—Spike is formed from a rectangular bar of iron, and is twisted throughout its length. It is concave on all four sides to within a short distance of the head, where it is plain. Head is beveled, so that a claw can be readily inserted underneath it.



The spike described, its shank formed of a rectangular concaved bar, twisted from its point to its head, and its head of equal diameter centrally in axial line with the shank, and beveled from top to bottom, all substantially as and for the purposes herein set forth.

156,646. COMPOUND ENGINES. S. Archbold, Chester, Pa. [Filed Sept. 1, 1874.]

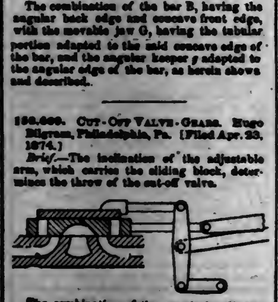
The combination of the high-pressure cylinder G and its frames J, the low-pressure cylinder H and its frames J', and the condenser I, secured to the said frames, with the beam A and propeller-shaft D, all being arranged as set forth.

156,647. BOTTOM-CHAIRS. Jacob Reuter, Jr., Seymour, Ind. [Filed Dec. 7, 1874.]

1. The bolsters B B', frame E, and long reach F, connected rigidly together and pivoted to the front and rear axles, all combined as and for the purpose described.

2. The combination of the front and rear bevels with the long and sliding reaches F J and the strap M, to limit the curve on which the vehicle may turn, as set forth.

156,669. WRENCHES. Otis T. Bedell, New York, N. Y. [Filed May 20, 1874.]



Brief.—The concave front of the bar allows space for the free working of the tubular portion of the movable jaw, and the opposite bearing-edges present reduced frictional surfaces.

The combination of the bar B, having the angular back edge and concave front edge, with the movable jaw C, having the tubular portion adapted to the said concave edge of the bar, and the angular keeper g adapted to the angular edge of the bar, as herein shown and described.

156,670. CUT-OFF VALVE-GEARS. Hugo Bilgram, Philadelphia, Pa. [Filed Apr. 23, 1874.]

Brief.—The inclination of the adjustable arm, which carries the sliding block, determines the throw of the cut-off valve.

The combination of the angularly-adjustable slide and rod E, slide S, and link L, operated by an eccentric, with a rod conveying motion to the cut-off valve of a steam-engine, substantially as shown.

156,671. BUREAU-BEDSTEADS. Chas. Broda, New York, N. Y. [Filed Apr. 10, 1874.]

Brief.—A bedstead in which the bed-bottom consists of canvas resting on transverse slats, which are supported by springs on transverse rods connecting flexible side supports or rails, and the whole is so arranged that the entire bed-bottom can be wound upon a shaft in a case, and the case closed to resemble a bureau.

The axle F, flexible supports I I, cross-bars O O, springs P P, slats Q, and canvas R S, in combination with the slats R R, head-rest U, Ed D E, and foot-rest L, substantially as and for the purpose set forth.

156,672. FIRE-ROLLERS FOR PLANING-MACHINES. C. N. Brown and H. W. Meyer, Dayton, Ohio. [Filed Nov. 30, 1874.]

Brief.—A series of disks of elastic material are firmly placed upon a shaft, and covered by a series of metallic rings.

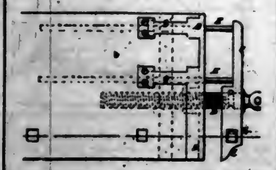
The combination of the shaft A, elastic packing-disks B, and outer metallic covering-rings C, substantially as herein shown and described, for the purpose specified.

156,673. ELECTRIC FUSES. C. A. Browne and Isaac S. Browne, North Adams, Mass. [Filed Aug. 22, 1874.]

Brief.—Furnished ready to receive priming when about to be used.

156,673.

The tube A, having wires a a in a packing, C, and provided with open-ended chamber D for the priming.



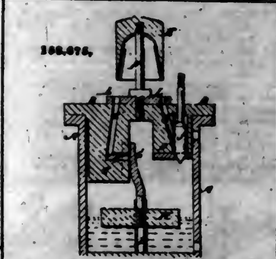
156,674. TOOTH-BRUSHES. Chas. Bulkley, Philadelphia, Pa. [Filed Sept. 3, 1874.]

Brief.—The handle of a tooth-brush is provided with a tooth-pick, which can be forced out of its shield when desired. Above this device is a hinged arm that holds a thread taut, so that it can be used to remove substances from between the teeth.

An improved tooth-brush with its metallic attachments a b d e f and the cord t, substantially as set forth, in the manner above described.

156,675. BENCH-VISES. C. Burton, New Baltimore, Ohio. [Filed Oct. 28, 1874.]

Brief.—The movable jaw of the vise is provided with two arms, which pass through the stationary jaw, and eyebolts attached to arms upon the rear of said jaw, for maintaining at all times the parallelism of the jaws. The movable jaw is slotted for the reception of a spring-dog, by means of which, in connection with a similar dog in the work-bench, work of any desired length may be clamped.



The angle-plate or stationary jaw B, provided with arms b and eyebolts F, the horizontal movable jaw C, carrying the adjustable dog G, and provided with a swiveled screw, D, and the guide-rods E, arranged parallel to the screw, all constructed, combined, and operating in connection with a bench, as shown and described.

156,676. WATER AND STEAM INDICATORS FOR BOILERS. William L. Carman, Belvidere, Neb. [Filed July 20, 1874.]

Brief.—Upon the rising of water in the chamber, the float rises, carrying with it the vertically-sliding valve, and closing the whistle-port. A weighted valve is also employed to let off undue pressure of steam. A perforated washer registers with the ports of the steam and low-water alarm whistle, the perforations being of different sizes, to indicate by a different note undue pressure of steam and low water.

156,676.

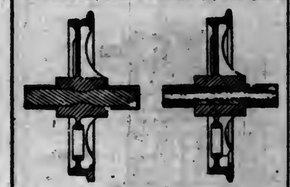
1. The combination of the cylinder or case A, the cover B, having a projection, C, formed upon its lower part, and provided with a port, c', the slide O, and the float H, working vertically on guide-pins I, substantially as herein shown and described.

2. The combination of the thick washer L, having different-sized holes formed through it, with the cover B, the ports c' d', and the whistle E, substantially as herein shown and described.

156,676. APPARATUS FOR RAISING WATER BY PNEUMATIC PRESSURE. Robt. A. Cheesbrough, New York, N. Y. [Filed Nov. 10, 1874.]

Brief.—One or more stationary water-receivers are placed in the well, and connected by pipe with a compressed-air reservoir, which is kept filled with compressed air by means of the air-compression pump driven by the windwheel, and an air cock or valve is used for alternately admitting and shutting off the compressed air to and from said receiver, for the discharge and replenishment of water.

In an apparatus for raising water by pneumatic pressure obtained by an air pump or compressor worked by a windmill, the combination of the valve for supplying and shutting off the air to and from the water receiver or receivers with the shaft of the windmill by connecting mechanism, the whole constructed to operate substantially as herein described.



156,677. WATER-CLOSETS. Robt. C. Clark, New York, N. Y. [Filed Dec. 5, 1874.]

Brief.—The combination with the seat of a water-closet of a spring-catch, which is actuated by the door of the closet; said seat being hinged and subjected to the action of a spring or weight in such a manner that whenever the door of the closet is opened or closed, the spring-catch releases the seat, which is immediately thrown open.

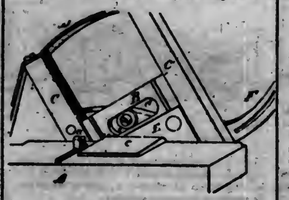
The combination of a spring-catch, a, with the hinged seat C of a water-closet, subjected to the action of a weight or spring, and with a tappet, d, secured to the door F of the closet, and serving to actuate the spring-catch whenever the door is opened or closed, substantially in the manner herein shown and described.

156,678. CAR-WHEELS. Wm. J. Cochran, Baltimore, Md. [Filed Dec. 12, 1874.]

A car-wheel having a journal at each side covered with sleeves of anti-friction or hard metal, substantially as described.

156,679. MACHINES FOR ROUNDING AND BACKING BOOKS. John E. Coffin, Portland, Me. [Filed Oct. 24, 1874.]

Brief.—Books received on a falling shelf in front jaw, and rounded and delivered from same aperture automatically.



156,680. BANDAGE-WINDERS. Alfred M. Cone, Corry, Pa., assignor to himself and L. D. Parsons, same place. [Filed Dec. 12, 1874.]

Brief.—A small rod is secured parallel to a lower arm of the roller, and, with said roller, serves to feed the cloth uniformly as well as smoothly.

A machine for winding bandages, constructed substantially as shown and described—that is, having a spindle, G, arm B, rod I, screw C, and crank H, in combination with a suitable frame, as specified.

156,681. MACHINES FOR TAPERING SPOKES. Phillip Coon, Canton, N. Y. [Filed Dec. 10, 1874.]

Brief.—The spokes are placed upon a stationary bed, and retained in the desired position by suitable stops, while the superfluous material is removed by a reciprocating cutter.

In a machine for tapering or finishing the ends of spokes, the combination of the bed or table A with the inclined guide-arms C C', slotted cams or gate H carrying knife E, roller d, and hand-lever F, the whole constructed to operate as and for the purpose set forth.

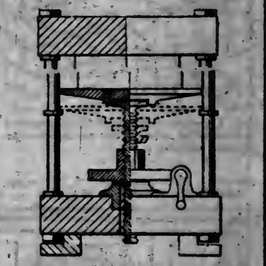
156,682. LASTING BOOTS AND SHOES. Geo. W. Copeland, Malden, Mass. [Filed Jan. 6, 1875.]

Brief.—The lasting-tacks are clinched or upset within the body of the sole by means of a metal plate inserted between the outer and inner surfaces.

1. The improvement in the manufacture of boots and shoes, consisting in clinching the ends of the lasting-tacks within the body of the inner sole in an incision formed from, and open at the lower side or edge of, the same, substantially as and for the purpose specified.

2. As a means for puncturing the sole and clinching the lasting-tack within the body of the sole, a combined cutter and anvil, operating substantially as and for the purpose shown.

3. The method of securing together the welt or upper, or the welt and upper and inner sole, by tacks clinched within the body of said sole upon a metal tool or anvil inserted from the outer surface of said sole beneath each tack before the same is driven, substantially as and for the purpose set forth.



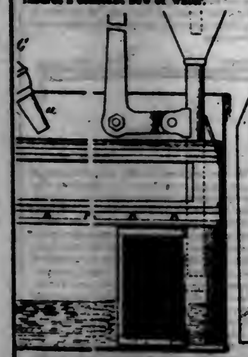
156,683. BALE-TIES. Marcus D. Copeland, Providence, R. I., assignor to Mrs. Susan A. Copeland, same place. [Filed Dec. 4, 1874.]

1. The combination of the bale-band, having elliptic slots at the ends, with the bolt, as and for the purpose set forth.

2. A tie-bolt with neck under the head, for the purpose fully specified.

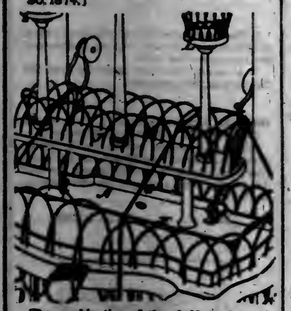
156,684. SCREW-PRESSES. J. J. Crawford, Nashua, N. H. [Filed July 15, 1874.]

Brief.—The collars secured to the guide-posts are to arrest the platen on its downward movement, and automatically release the platen, if the turning of the screw-nut be continued.



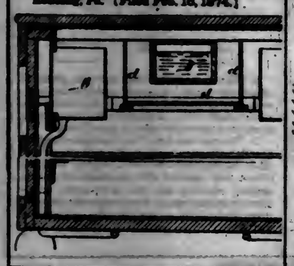
1. The screw-shaft D and movable platen B of a screw-press, connected together and constructed substantially as set forth, so that the screw-shaft will be automatically released and cease to operate the platen, as set forth.

2. The combination of the platen, having the parallel ribs on its under side, with the screw-shaft having a square head adapted to fit between said parallel ribs, substantially as described, whereby the said screw-shaft, in its downward movement, is automatically released from the platen, as and for the purpose described.



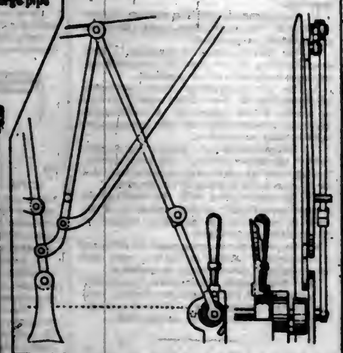
158,646. DISH-WASHERS. W. N. Cosgrove, Faribault, Minn. (Filed Oct. 10, 1874.)

Brief.—The water, thrown upon the dishes by means of a force-pump and flexible hose, is drawn again from the dish-holding tank; a wire screen, with coiled board bottom, protecting the pump and preventing sediment from clogging up the same, whereby the same water may be used over and over again free from all impurities, while the bulbous reservoir between the pump and discharge-pipe insures a constant flow of water.



A dish-washer, constructed as described, and consisting essentially of the tank A, a force-pump provided with the bulb or reservoir F, the strainer I, having the solid board J, and the pipe B with its handle G and nozzle c, substantially as herein set forth.

158,666. WINDOW-CONSERVATORIES. John T. Crawford, Pontiac, Mich. (Filed Apr. 30, 1874.)



The combination of the shelf A, elevated shelf J, baskets I, and cord N, all arranged and operating substantially as and for the purposes described.

158,667. REFRIGERATORS. S. H. Crump, Reading, Pa. (Filed Feb. 16, 1874.)

The partitions *d*, arranged between the ice-boxes B B and the water-cooler D, and below the hinged top E of the refrigerator, as specified.

158,668. TOP-JOINTS FOR VEHICLES. Thos. F. Darcy, New York, N. Y. (Filed Dec. 5, 1874.)

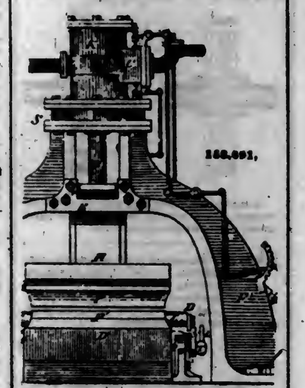
1. The braces of a vehicle-top to fold toward the bow-pivots, and mounted at the lower end on a revolving shaft, having a spring or springs set so as to raise the top, and a lever-handle and stop-catch for lowering and fastening the top, all combined substantially as specified.

2. The combination of stud I on one of the bows with a brace, A', to fold as set forth.

158,669. IRON COLUMNS. Garret B. Davids, Baltimore, Md., assignor to himself and T. Desmond, same place. (Filed Feb. 16, 1872.)

1. A channel-bar, having the straight central portion and inclined pocket with the thickened edges formed entirely by rolling, substantially as shown and described.

2. A column formed of two of the herein-described rolled channel-bars, joined back to back by a single line of rivets or bolts, as herein shown and described.



158,670. PITMAN-CONNECTIONS. Lewis H. Davis, West Chester, Pa. (Filed Jan. 2, 1875.)

Brief.—The turn-bolt has a cam-head located in an eye formed in an extension of the bearing-block, so that by turning the bolt the cam thereon will press the box against the wrist-pin, thereby maintaining the parts in proper relation. The bolt is made adjustable to any desired position by the engagement of its handle by the ratchet-surface on plate L.

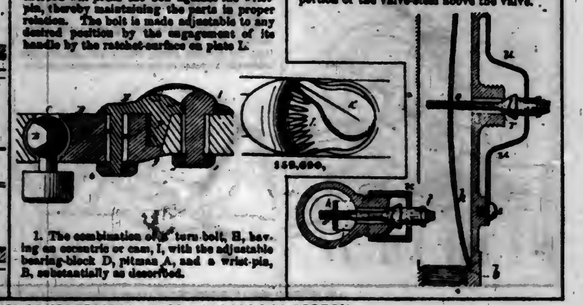
1. The combination of the turn-bolt H, having an eccentric or cam, I, with the adjustable bearing-block D, pitman A, and a wrist-pin, B, substantially as described.

2. The combination of the turn-bolt H, provided with an eccentric or cam, I, and handle or arm K, with the bearing-block D, plate E, with its ratchet or locking-surface L, the pitman A, and a wrist-pin, B, substantially as described.

3. The adjustable bearing-block D, having a slot, *a*, and flange F, in combination with the turn-bolt H, provided with an eccentric or cam, I, pitman A, and wrist-pin B, substantially as described.

158,671.

158,672. STONE-CUTTING MACHINES. Louis Deterre, San Francisco, Cal. (Filed Sept. 7, 1874.)



Brief.—A steam-hammer, of oblong form, has, detachable along it beneath, a chisel-formed tool, which falls in the same plane with an inverted similar tool on an anvil. A table with rollers on it, and a cam-lever for raising one end, the other end being hinged, is adapted to adjust the stone between the tools.

1. The adjustable table B B, provided with rollers r r r, dependent in its movements on the eccentrics N F', socked and lever-arm attachments T L, respectively, and ratchet-wheel *t* with catch *p*, in combination with the hammer S, fitted with the knives P P', substantially as and for the purposes herein set forth and specified.

2. The combination of the knives P P', fitted, respectively, to the hammer and anvil blocks H and D, with the adjustable table B B, and attachments thereto, herein described, substantially as and for the purposes herein set forth and specified.

158,673. AUTOMATIC VALVES FOR STEAM-RADIATORS. John Elder, Jr., New York, N. Y. (Filed May 6, 1874.)

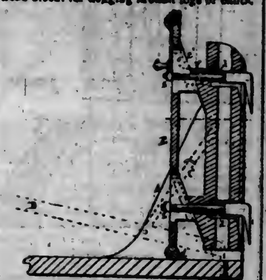
Brief.—The spring is held in the tube by a block at one end thereof, and a groove cut on the interior at its other end. The valve, resting externally, is held between said spring, to which it is attached by a prolongation of its stem, and an external guard surrounding the portion of the valve-stem above the valve.

158,674. TOY WIND-WHEELS. William G. Fischer, Brooklyn, assignor to A. Weidmann & Co., New York, N. Y. (Filed Aug. 12, 1874.)

Brief.—Like the wheels of artificial fire-works, but arranged to move oppositely by wind-power.

The chromatic toy herein described, composed of the colored feather-wheel C and the perforated feather-wheel D, both hung on the same spindle, and arranged to turn simultaneously in opposite directions, substantially as specified.

158,675. BIRD-CAGE ATTACHMENTS. Geo. Fliedner, Portland, Oreg. (Filed Oct. 3, 1874.)



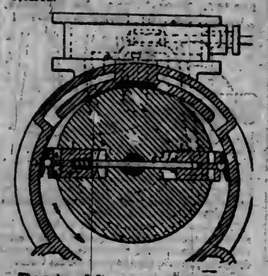
Brief.—A receptacle attached to the outside of the cage, for holding cake, sugar, &c.

1. The tube *a*, made with the inward shoulder *b*, near one end, and the block *c*, having a recess at one side and secured by the cap *f*, in combination with the spring *h*, supported by such shoulder *b* and recess, and the air-valve having a screw-stem that is introduced from outside the tube *a*, and passes through the spring, as and for the purposes set forth.

2. The guard *e*, surrounding the stem of the valve, and made with an opening of less diameter than the valve, in combination with the tube *a*, adjustable air-valve *i*, and spring *h*, as and for the purposes set forth.

158,676. SAW-MILL DOGS. Wm. M. Ferry, Grand Haven, Mich. (Filed June 17, 1874.)

Brief.—The dogs are restricted and secured at different distances from the faces of a head-block, for dogging around logs or masts.



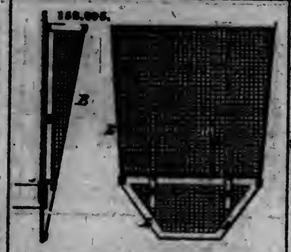
1. The dog-bar B, dogs G, springs *f*, roller *d*, plate E, and a lever, D, when the parts are constructed and combined to operate substantially as shown and described.

2. In combination with the plate E and dogs G the pendulum-stop *g*, substantially as and for the purposes set forth.

3. The slotted plate E and its diagonally-grooved blocks E' in combination with the cheek-pieces F, dog-bar B, dogs G, spring *f*, roller *d*, stop *g*, and a lever, D, constructed and operating substantially as herein shown and described.

158,677. ROTARY ENGINES. Ernest Frank, Baltimore, Md. (Filed Mar. 6, 1874.)

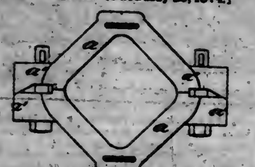
Brief.—Segmental blocks coincide with the faces of the cylinder, and are attached to the piston-heads, which are mounted on variable rods, and adjusted by springs, whereby an even bearing on all parts of the cylinder is secured.



The valves I I', constructed with their respective parts, as described, and mounted upon a common rod, *d*, of variable length, in combination with the adjustable faces *k*, having area coincident with the interior of the cylinder, substantially as specified.

158,678. CLEANERS FOR DRAWING-ROLLS. Benj. F. Gambrill and James L. Sheridan, Baltimore, Md. (Filed Nov. 21, 1874.)

Brief.—The cleaner is a bar with wbeveled cloth-covered edge, inserted through a slot in the cover or top board, and resting by gravity upon and between two of the rolls of the frame.



The self-adjusting clearing-board G, having beveled edges or projections *b*, in combination with the rollers C C and the slotted cover D, all substantially as and for the purposes herein set forth.

158,679.

The receptacle B, constructed of the frame E and wire body, and open at the side adjoining the cage and secured thereto, substantially as described.

158,680. MOLDS FOR CASTING INGOTS. David Foster and William Lockwood, Sheffield, England. (Filed May 20, 1874.)

In an open-topped mold divided longitudinally for casting steel ingots, and having lugs *a'* *a'*, the combination of the bolts *b* and the spring *c* arranged upon the bolts, for permitting the lateral expansion of the mold-sections, substantially as and for the purpose described.

158,681. SAWING-MACHINES. John Gerhardt, Montreal, Canada, assignor to himself and James Rutchinson, same place. (Filed Sept. 15, 1874.)

Brief.—The lumber to be sawn is fed to the saws by vertical feed-rolls and prevented from pinching the saws by a series of wedge-shaped disks.

1. The laterally and vertically adjustable hook-plates E E', and hooked check-plates C', combined with the saws and the saw-frame, substantially as specified.

2. The adjusting-screw G', and straining-peg F', combined with the hooked plates E and E', substantially as specified.

3. The combination of saw-guide V and guide W with the same vertically-adjustable beam *x*, having the eccentric pin *y*, and the superposed spring *y'*, as and for the purpose set forth.

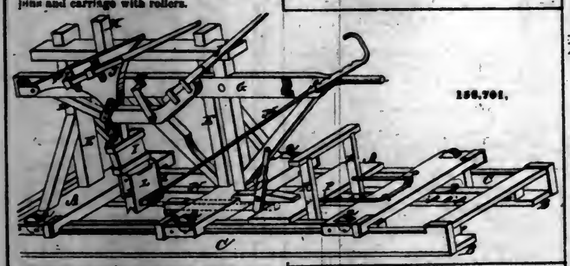
4. The spreading-disks A arranged to slide on their shafts between an adjustable collar, K, and a spring, *i*, and the shafts arranged to slide laterally against a spring, *w*, arranged, in the relation described, to the collar K, substantially as specified.

5. The upper spreading-disks A arranged on a vertically-adjustable shaft, substantially as specified.

6. The lower guide *p*, spreading-disks *i*, and the slip rollers arranged adjustably to the saws on the shifting-frame *r*, substantially as described.

158,682. LAMP-BURNERS. John Gleason, Brooklyn, N. Y. (Filed Dec. 29, 1874.)

Brief.—A double-walled body, outer wall finely perforated, inner wall having one perforation, and a collar at either end, to be interposed between the burner and the collar of the lamp.



1. The safety extension-collar, formed of the double-walled body A, having its outer wall finely perforated and a single hole in its inner wall, and provided at its ends with collars *a'* *a'* to adapt it to be interposed between the burner and collar of a lamp, substantially as herein shown and described.

2. The combination of an intermediate collar, C, with the lower end of the extension-collar A a^1 a^2, substantially as herein shown and described.

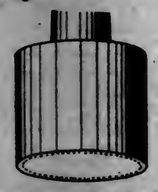
156,701. DITCHING-MACHINES. H. H. Gray, Middleville, Minn. [Filed Dec. 16, 1874.]

Brief.—A ditching-machine, with a spade having a toothed edge longer in center than at sides, is operated by a swing-derrick, having vertical beam, toggle-joint, and levers. A grappler is hinged to rear side of the spade, and operated by a notched rod, a follower, and lever. The machine slides on a track with pins and carriage with rollers.

156,701.

1. The spade K, having its lower edge toothed and made longer in the center than at the sides, substantially as and for the purposes herein set forth.

2. The combination of the toothed spade K, provided with side flanges *d d*, and the grappler L, hinged between the upper ends of said flanges, substantially as and for the purposes herein set forth.



3. The combination of the swinging derrick G with vertical beam H, sliding head I with spade K, toggle-joints *b b*, and levers J J', all constructed and arranged to operate substantially as and for the purposes herein set forth.

4. The combination of the track B C D with pins *i i*, carriage A with wheels or rollers *a a*, lever-frame E, and bail F, all as and for the purposes herein set forth.

5. The follower N and lever O, in combination with the hinged grappler L on the flanged spade K, for the purposes herein set forth.

156,702. SHOES AND DIES FOR STAMPING-MILLS. Wm. Hainsworth, Pittsburg, Pa., assignor to Pittsburg Steel-Casting Company, same place. [Filed Dec. 19, 1874.]

Brief.—The core of the hammer-head is made of cast-steel or other hard metal. Its outer head is of wrought-iron, or other tough metal. The head may be shrunk about the core, or the core may be cast inside the head. Object: To prevent the head from breaking or splintering.

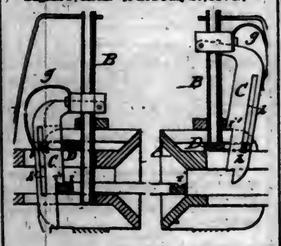
In the manufacture of shoes and dies for stamping-mills, the combination of a wrought-iron or other tough fibrous shell with a hard-metal body, substantially as set forth.

156,703. SAW-MILLS. Herman D. Hall, Denver, Colo. [Filed Dec. 19, 1874.]

Brief.—The shaft which moves the cog-carriage is provided with a number of friction-wheels of different sizes, and over this shaft, but placed at an angle thereto, is a short shaft carrying a corresponding set of friction-wheels. A horizontal movement of either of the shafts will bring two of these friction-wheels into contact, but only two can be in contact at the same time.

1. In a mechanism for feeding the log-carriage for saw-mills, the combination of the driving-shaft A and the movable shaft E, arranged in different vertical planes, and each provided with a series of wheels of different diameters, substantially as and for the purposes herein set forth.

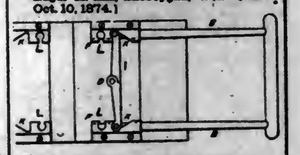
2. The combination of the driving-shaft A, with wheels C^1 C^2 C^3 C^4, rubber springs *d*, and the shaft E, with wheels D^1 D^2 D^3 D^4, pivoted box *f*, and sliding box *h*, all constructed and arranged to operate substantially as and for the purposes herein set forth.



156,704. ROCK-DRILLS. Jos. Hanrahan, Ottawa, Canada. [Filed Dec. 18, 1874.]

1. A rock-drill having a cruciform bit, and either or both of the radial wings C and D beveled unequally on opposite sides, as shown, to throw the two cutting-edges out of a radial line, substantially as set forth.

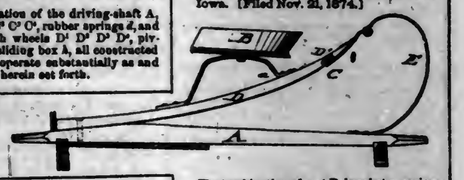
2. A rock-drill having either or both of its radial wings beveled unequally on opposite sides, and its through cutting-edge A recessed centrally, as and for the purpose set forth.



156,705. CAR-COUPLINGS. J. Hardey, East Saginaw, Mich. [Filed July 26, 1874.]

1. The draw-head A, coupling-pin B, pivoted elbow-lever C, carried by said pin and having a vertical slot, *h'*, and spring *g*, to operate with the pin-supporting plate D, pin *h*, and coupling-link E, all combined as and for the purpose herein set forth.

2. The coupling-link E, having end notches *i*, in combination with projecting front shoulder *i'* of lever C, for holding link in horizontal position for coupling with adjoining draw-head, as set forth.

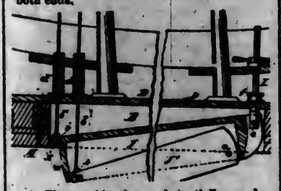


156,706. HANDLES FOR CHILDREN'S CARRIAGES AND SLEIGHS. Geo. B. Hawks and Edgar A. Hill, Sheboygan, Wis. [Filed Oct. 10, 1874.]

1. The handle X of a child's carriage, consisting of the side pieces B B, suitably connected at their front ends, and connected at a short distance from their rear ends by means of the jointed rod D, all combined substantially as and for the purposes described.

2. The combination of the handle X, legs F F or G G, and body of the carriage or sleigh, substantially as and for the purposes set forth.

156,707. SPRING-SEAT SUPPORTS. Frank A. Hawley and Amos Pearsall, McGregor, Iowa. [Filed Nov. 21, 1874.]

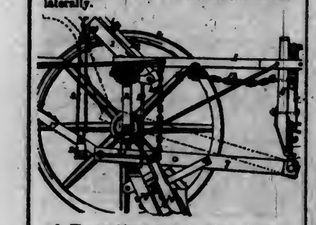


156,707.

The combination of seat B, bracket *a*, spring C D, and C-spring E with the perch A, as and for the purpose specified.

156,708. CENTER-BOARD WHERRIES. Charles Hemje, New York, N. Y. [Filed Nov. 30, 1874.]

Brief.—Keel, keelson, and ribs or frame-timbers bolted together; center-board well entirely within keel and keelson, closed at top by a rider, into which masts may be stepped, and which binds the parts; also, center-board composed of a plurality of parts pivoted together, adapted to be operated from either or both ends.



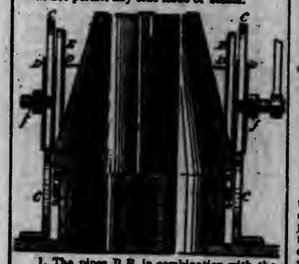
1. The combination, substantially as described, of the frames G G and rider D, with the combined keel and keelson A B, whereby great strength is preserved, while a full-sized center-board may be used without interfering with the position of the masts, and whereby the ordinary floor-boards are dispensed with, substantially as and for the purpose specified.

2. In combination with a center-board, composed of two or more sections, J J', pivoted together at or near their front ends, the rigid forward hoisting device and independent after hoisting cords or chains *b b'*, substantially as and for the purpose described.

156,709. CULTIVATORS. R. S. Higgins, Fairfield, Ill. [Filed Aug. 19, 1874.]

Brief.—The plow-beams are attached to swinging standards, having pivoted center-braces and equalizing draft, which allow independent forward and back movement to the plows. Pivoted handles allow this movement when the plows are hung up. Bars adjustable in width, with elbow-levers and stirrups, provide for moving the plow-beams laterally.

1. The combination of the pivoted oblique braces 12, pendants 6, main frame 1, beams 7, and single-trees 11, substantially as and for the purposes set forth.



2. The L-shaped bars 27, constructed and operating as described, in combination with the plow-beams 7, loops 31, transverse bar 24, and nuts 25 26, substantially as and for the purposes set forth.

3. The nuts 25 26 and screw-protecting sleeves 28, in combination with the L-shaped bars 27 and transverse bar 24, for adjusting the plow-beams as to their distance asunder.

4. The combination of the hooks 18 and pivoted bails 19 with the pivoted handles 17, beams 7, and draft apparatus 6 13, by means of which the plow-beams are supported while out of use, without affecting the application of the draft to the main frame.

156,710. VARIABLE EXHAUSTS FOR LOCOMOTIVE AND OTHER ENGINES. Edwin A. Hill, East Cambridge, Mass. [Filed Jan. 4, 1875.]

Brief.—On the outer sides of the nozzles are placed expansible plates, to admit of expansion when said nozzles become heated. The working sections are provided with cutting-edges, which work against the fixed sections, for the purpose of removing any gummy substance which may accumulate. The side sections are provided with flanges, so that when the nozzles are expanded the column of escaping steam will be kept unbroken, and will not permit any side issue of steam.

1. The pipes B B, in combination with the sections A A of the nozzles, and the expansible sections A" A" and center section, A', substantially as and for the purpose specified.

2. The combination of the base-pipe B with section A, having cutting-edges *a'''*, and fixed sections A' A", substantially as and for the purpose specified.

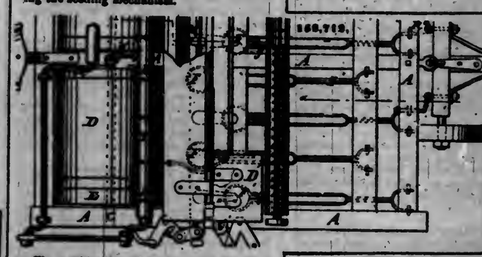
3. The sectional exhaust-nozzles A A, in combination with the center section, A', and end sections, A" A", provided with flanges or overhanging edges *a' a''*, substantially as and for the purpose specified.

4. The combination of the sections A A of the nozzles, having projecting studs *e e*, with the vertically-sliding cross-heads D D, provided with oblique converging grooves *d d*, and having arm F, slotted at *f'*, and secured by bolt *f*, substantially as and for the purpose specified.

5. The sections A A and pipes B B, combined to operate with and upon each other by means of cutting-edges *a'* and *b*, substantially as and for the purposes set forth.

156,711. CORN-SHELLERS. Lora B. Holt, Worcester, Mass. [Filed July 24, 1874.]

Brief.—The stationary shelling-disk has a peculiar arrangement of ribs and corrugations.

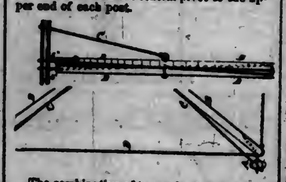


1. In a disk corn-sheller, the presser-plate provided with the curvilinear projection *w*, commencing at a point on the right side of the hub of the shaft and extending to a point situated at or about one-third of the distance from the shaft to the extreme left of the casing.

2. In a disk corn-sheller, the presser-plate provided with the projections *w* and *x*, as and for the purposes described, whereby the corn is caused to pass around the casing at a greater radial distance and the end of the ear is ground.

3. In a disk corn-sheller, the presser-plate provided with corrugations *z*, arranged between the projections *w* and *x*, as and for the purposes described.

156,712. COMBINED LAND-ROLLERS AND SEEDING-MACHINES. James H. Holland, Aurora, Mo. [Filed July 3, 1874.]



Brief.—To the outside of the roller are removably attached skeleton-wheels, and secured upon the same axle, so that when they rotate they carry the axle with them, operating the seeding mechanism.

The combination of the detachable wheels E and roller D with the shaft C and frame A, in the manner set forth.

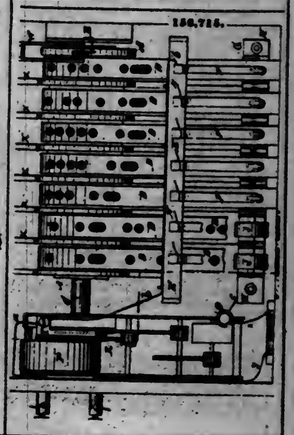
156,713. MOSQUITO-BAR FRAMES. Wm. F. Howe, Galveston, Tex. [Filed Sept. 26, 1874.]

Brief.—The canopy-frame is composed of the bars, pivoted together and crossing each other diagonally, and a cord passing around the notched ends of the bars. It is connected to the supporting-posts by pins, and a brace-cord extends from the central pivot to the upper end of each post.

The combination of two rods, A A, two centrally-pivoted diagonal bars, B B, a circumjacent cord, D, and cords C C, extending from central pivot to the rods, as and for the purpose described.

156,714. PACKING CIGARS. S. Jacoby, New York, N. Y. [Filed Dec. 17, 1874.]

Brief.—The tips are made to point in alternate opposite directions, and back of the line of the butt-ends, whereby the evaporation of the moisture of the cigars is uniform.



A package of cigars having the cigars arranged so that their tips alternately point in opposite directions, and recede from the line of the butts, in the manner and for the object herein specified.

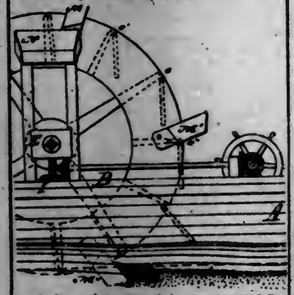
156,715. TELEGRAPHIC SIGNAL APPARATUS. Joseph W. Eaton, Richmond, Va. [Filed Sept. 28, 1874.]

1. The combination of the perforated non-conducting tapes D, with a grooved drum, A, placed upon one and the same shaft with the mainspring of a clock-gearing, so constructed and arranged that the withdrawal of the tapes winds up the spring, and the reaction of the spring, when the tapes are released, winds up to turn the tapes for the transmission of the signals, substantially as described.

2. The perforated non-conducting tapes D, in combination with the insulated spring-seated wheels G, the insulated wheels J, and the wires N, connecting the wheels J of one tape with the contact-wheels G of the next, substantially as and for the purpose described.

3. The combination, with the stud *d*, of the loose wheel E, the spring-seated insulated catch S, and the wire *c*, for the purpose of opposing the motion of the clock-gearing when the spring is wound up, and shunting the circuit from the operating parts until the tape, which has been drawn out, is released, substantially as described.

156,715.

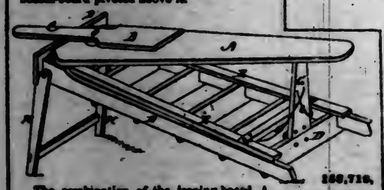


156,716. GRAIN-DRILLS. Jacob King, Indianapolis, Ind., assignor of one-half his right to Jos. K. English and Ewald Over, same place. [Filed Apr. 20, 1874.]

The case B, provided with a detachable top flange, consisting of the sections C *c* and C *c'*, adapted to interlock with the top of the case, substantially as and for the purpose specified.

156,717. DREDGING. Geo. Kuhn, St. Louis, Mo. [Filed Oct. 24, 1874.]

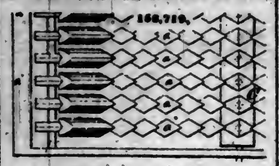
Brief.—A current-wheel provided with feathering-buckets and elevators, arranged adjustably on standards, to discharge the sand, &c., into a barge, to which the wheel is attached by suitable frame-work.



1. The combination of the current-wheel C, provided with the feathering-buckets *a a'*, &c., and the elevators M M', &c., arranged as described, the barge A, and the frame B, substantially as shown and described.

2. The combination of the wheel C, provided with the feathering-buckets *a a'*, &c., and the elevators M M', &c., the standards F F', upon B, barge A, and frame B, substantially as described and shown.

156,718. CORRUGATED IRONING-BOARDS AND STEP-LADDERS. Israel L. Landis, Lancaster, Pa. [Filed Dec. 19, 1874.]



Brief.—To a frame containing a step-ladder are pivoted legs and braces, which support a detachable ironing-board, which has a bosom-board pivoted above it.

The combination of the ironing-board A, provided with the pivoted bosom and sleeve board B C, and pieces *d*, with pins *i*, the ladder D, hook frame E, legs H H, brace G, and castings I with arm *m*, all constructed and substantially as and for the purposes herein set forth.

156,719. GRATES. John B. Lardin, Pittsburg, Pa. [Filed Dec. 8, 1874.]

Brief.—The short bars serve as continuations of the main bars, preventing coal from falling into the space below.

156,719.

1. In combination with the grate-frame A and the longitudinally-reciprocating grate-bars *a*, the supplementary transverse bars or bridges B supporting the bars *a* at their ends, said grate-bars and bridges being correspondingly grooved, or recessed and ridged, substantially as and for the purpose described.

2. In combination with the longitudinally-vibrating grate-bars *a*, the simple lever C connected to each separately, and having an independent fulcrum, *d*, below, substantially as shown and described.

156,720. MANUFACTURE OF SOAP. Charles Lehmann, New York, N. Y. [Filed Nov. 28, 1874.]

The within-described process of manufacturing soap by melting the fat in a separate vessel, then heating a strong lye of from 30° to 36° Baumé to the boiling-point in another vessel, and mixing the molten fat and the boiling lye in a third vessel, whereby a perfect saponification is effected without any waste of lye, substantially in the manner set forth.

156,721. OIL-CANS. Ferdinand Lehr, New York, N. Y. [Filed Dec. 9, 1874.]

Brief.—Pressure on the elastic bottom of the chamber causes an adjustable spring-valve to close the communication between the air in the chamber and the drip-pipe. The discharge-tube within the pipe has its ejected volume of oil contracted by a contained wire looped on its outer end.

156,721.

1. The valve *d*, provided with a stem, which bears on the elastic bottom of an oiler, A, in combination with the vent-hole and discharge-pipe B, constructed and operating substantially as shown and described.

2. In combination with an oiler having an elastic bottom, a drip-pipe, C, and vent-opening *c*, valve *d*, adjusting-screw *f*, and discharge-pipe B, constructed to operate substantially as described.

3. A wire or rod, *g*, constructed with an enlarged or looped end, and of a length about equal to the discharge-pipe, and arranged within such pipe, for reducing the size of the discharge-passage, in combination with each other and with an oiler having an elastic wall, for ejecting oil through the discharge-pipe by compression of air within the oiler, substantially as herein shown and described.

156,722. BAG-FASTENERS. Jas. Marshall, Laporte City, Iowa. [Filed Dec. 12, 1874.]

A bag-fastening composed of a fastening-string attached to the bag, provided with a rigid or elastic disk, C, and metal or other button D, as described, the string being applied around the bag and secured between the disk and button, substantially in the manner and for the purpose described.

156,723. HORSE HAY-RAKES. Peter Mast, Waterville, Ohio. [Filed Nov. 7, 1874.]

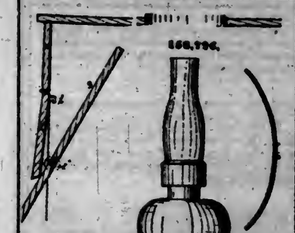
Brief.—An independent dumping-lever is interposed between the setting-lever and rake-head.

The combination of the setting-lever C, notched arc C', and arms *b a* with the shifting-lever D D' and connecting-bar *d*, substantially as and for the purpose specified.

156,724. CAR-COUPLINGS. David McCurdy, Ottawa, Ohio. [Filed Oct. 1, 1874.]

1. In combination with the draw-bar of a railway-car, the grooved stud B, substantially as and for the purposes set forth.

2. In combination with a draw-head having the mouth *b*, the false mouth-piece C, having the flaring mouth *m*, and pivoted within the draw-bar by the pin *k*, for the purpose set forth.



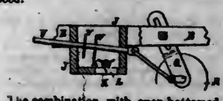
156,725. METAL PLOW-BEAMS. Malcolm McDowell, Ravenswood, Ill. [Filed Oct. 1, 1874.]

Brief.—A metal plow-beam of form fully described in the claim.

A metal beam for plows of the cross-section of an inverted T, tapering toward the clevis end of the beam, both in the base and web, and also tapering toward the land-side or rear end, the base diminishing and the web increasing in width until they form a plate of uniform thickness, with dimensions of area equal to that of the mid cross-section, substantially as shown and described.

156,726. REFLECTORS AND SHADE-PROTECTORS. Marmaduke H. Mendenhall, Wabash, Ind. [Filed Aug. 4, 1874.]

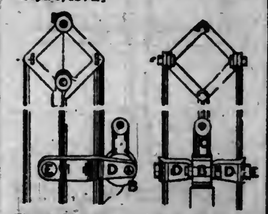
Brief.—The pivoted deflector is adjustable vertically, to vary the field of reflected light, and it also revolves partially on a horizontal axis to vary the angle of reflection.



156,726.

1. The box A, open or cut away at one side, and the deflector *g*, pivoted in notches thereof and adapted to be clamped in any adjustment by means of screws *h*, said parts being combined as shown and described.

2. The box A, provided with two sets of notches, *i* and *i'*, and the hinged piece *l*, and the deflector *g*, combined as shown and described.



156,727. COTTON-SEED PLANTERS. Benj. F. Miller and Wm. J. Reeves, Gatesville, Tex., assignors of one-half their right to James M. Morris and Edward A. Jones. [Filed Jan. 5, 1874.]

Brief.—Within an opening in the bottom of the hopper rotates a distributer, above which is reciprocated an agitator for stirring up the seed.

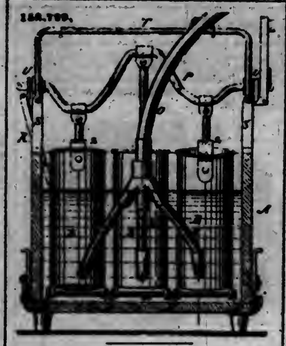
The combination, with open-bottomed hopper J, of the sliding stirrer U V, and rotary distributer K L, as and for the purpose specified.

156,728. INGOT-MOLDS. Thomas P. Moorwood, Sheffield, Great Britain. [Filed Sept. 3, 1874.]

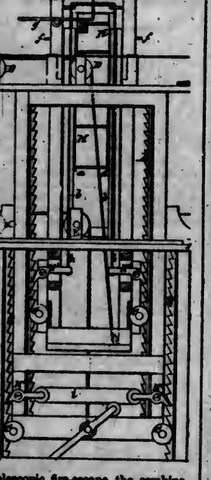
The combination, in a mold for casting ingots, of two sections hinged together, and separable at the corners, a strap, D, hinged to projections F E on one of the sections, and an eccentric, B, carried by the strap, and arranged to bear against the corner of the other section, all as set forth.

156,729. HAND FIRE-ENGINES. Henry Neumeyer, Millerstown, Pa. [Filed June 27, 1874.]

Brief.—Within a tank, and hinged to its bottom, are two or more vibrating force-pumps, whose discharge-pipes connect with a single hose. The discharge-valves are in chambers within the cylinders, the inclined sides of which form the valve-seats, the valves falling by their own gravity. The bar for the foot-rest slides under the tank, and is locked in place by cam-levers.



1. An engine for extinguishing fires and for other purposes, composed of the tank A, vibrating cylinder-pumps B, crank-shaft P, pipes N, hose O, and driving-cranks R, combined and arranged substantially as described.

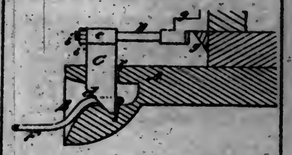


2. The foot-piece, composed of the slides V V, connecting-bar V', and cam-levers *s s*, in combination with a fire-engine, substantially as and for the purposes described.

3. The chambers J, in combination with the cylinders B, as and for the purposes described.

156,730. FIRE-ESCAPE LADDERS. Abraham Oberndorf, Jr., and Ernest Frank, Baltimore, Md. [Filed May 2, 1874.]

Brief.—A telescopic fire-escape in which each section is raised by an independent rope and drum, the drums being attached to the same shaft, and thrown in and out of gear by levers. The sections are retained at any desired height by pawls, which engage with ratchet-bars.

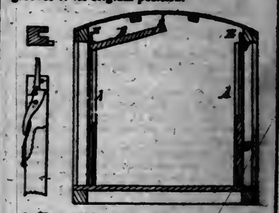


1. In a telescopic fire-escape, the combination of the friction-wheels, ratchet-tramways, and guide-blocks with the corner posts of the stories, for reducing the friction, substantially as described.

2. In a telescopic fire-escape, the combination of the horizontal swinging bars *i i* and the vertical rods *h h* with the detents H', for withdrawing the same from the ratchet-tramways, substantially as described.

3. In combination with the pulleys D and E and the ropes D' and E', a windlass consisting of separate independent barrels, corresponding in number to the number of movable stories, which rest upon a central core or shaft, or revolve with the same by means of a clutch-wheel and spline, as may be desired.

156,734.

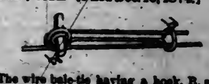


156,731. CAR-COUPLINGS. Geo. T. Perkins, St. Elmo, Ill. [Filed Dec. 14, 1874.]

The combination of the bevel adjustable gravity-pin C, having the eye *c*, the horizontal threaded rod D, passing through said eye, and holding the nut *d'*, and the uncoupling-rod E, all constructed to operate as described.

156,732. FREIGHT-CAR DOORS. G. W. Phelon, Chicago, Ill. [Filed Dec. 15, 1874.]

Brief.—Vertically-sliding door provided with transoms, which rest in spring-catches at top of groove, permitting door to be swung to under side of roof and there fastened. By removing the hook and pressing on the spring-catch, the door is permitted to descend in the grooves to its original position.

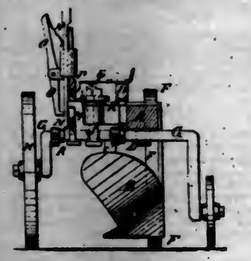


1. The combination, in a freight-car, of the grooved metallic pieces A and pivoted dogs E, as and for the purpose set forth.

2. The door B, provided with the metallic end pieces C, and pins or transoms D, as and for the purpose set forth.

3. The combination, in a freight-car, of the sliding door B, provided with end pieces and transoms, with the grooved metallic pieces A, substantially as and for the purpose specified.

156,733. BALE-TIES. John W. Pillo, Humboldt, Tenn. [Filed Dec. 10, 1874.]



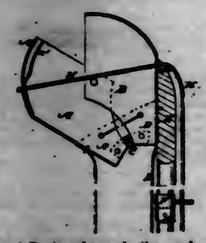
The wire bale-tie having a hook, B, and a single or double coil, C, formed upon the same strand, in combination with the tie end, passed round the base of the coil, and a clamping locking-pin, E, driven through said coil above the bent tie end, substantially as and for the purpose set forth.

156,734. SCREW-PROPELLERS. R. B. Porter, Havana, Cuba. [Filed Oct. 31, 1874.]

A screw-propeller constructed of three or more curved and twisted blades attached at one or both ends to the shaft, and provided with projecting interior and exterior auxiliary blades or wings, substantially in the manner and for the purpose set forth.

168,725. WHEEL-PLOWS. Peterson Prawl and Francis H. Wemple, Waverly, Ill. [Filed Oct. 31, 1874.]

Brief.—From a horizontal arm, rigid upon the plow-beam, a vertical swiveled arm descends to and is pivoted on the arched axle, having a lifting-wheel upon its long crank. A lever rigid upon the axle turns down the small wheel and raises the plow. The same lever has also a device for raising the other wheel to run on level land. Both bearing wheels run in furrows.



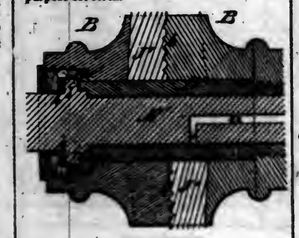
1. The loose arm J, pivoted on axle G, and swiveled to rigid arm K, as and for the purpose described.

2. The combination of the arm M, lever N, lever-socket O, lever-pawl P, and notched bar Q, with the axle G, the arms J K, and the plow-beam A, substantially as herein shown and described.

3. The arrangement of the transporting-wheels F H, in connection with the plow-beam A and plow B, to enable both of said wheels to run in furrows, substantially as herein shown and described.

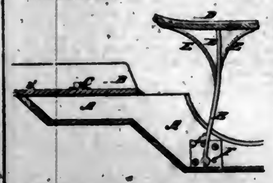
168,726. FRUIT-PICKERS. Benj. F. Price, Mount Sterling, Ill., assignor to himself and A. A. Hill, same place. [Filed Dec. 12, 1874.]

Brief.—The jaws are mounted upon the end of a staff. The edges are concave. One is single and the other double, the single blade, in cutting off the fruit, passing between the double blades, which are worked by a cord and pulley, the cord extending to the lower end of the staff. A flexible tube conveys the fruit to the ground.



The jaws A B, pivotal to each other, made the one with a double concave edge and the other with a single concave edge, and provided with rubber springs C, in combination with the flexible tube D, the staff E, and cord H, substantially as herein shown and described.

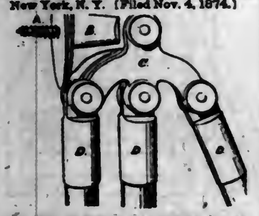
168,727. NUTS FOR VEHICLE-WHEELS. A. N. Price, Jamestown, N. Y. [Filed Oct. 24, 1874.]



1. The journal A, having the oil-passages *a a'*, and collar *f*, in combination with the nut G, pipe-box D, cap C, and screw-plug *g*, substantially as and for the purpose set forth.

2. The pipe-box D, having an annular flange, *a*, on its lower end, provided with notches *c*, in combination with the bolt-sections B B', pins *i i*, nut G, and cap C, substantially as and for the purpose set forth.

3. The hub-section E, provided with the tenons *n* and mortises *n'*, having projections *b* A, in combination with the similarly-formed hub-section B', the tenons of which break joints with those in the opposite hub-section E, and spokes J, substantially as and for the purpose set forth.



168,728. SEATS FOR EXTENSION-CARRIAGES. James V. Randall, Newtown, Pa. [Filed Nov. 30, 1874.]

1. The combination, with the carriage-body A, of the seat B, having slots *b'* and the stationary clamping-bolts C, whereby said seat may be held and adjusted over the rear of the body, as shown and described.

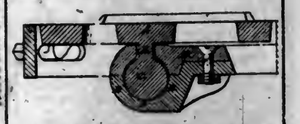
2. The elastic seat D, the elastic branched standards E, provided with gudgeons *e'* at their lower ends, and the sockets F, provided with stops *f'*, in combination with a carriage-body, A, provided with an adjustable seat, B, substantially as shown and described.

168,729. TOWEL-RACKS. Jos. A. Reynolds, New York, N. Y. [Filed Nov. 4, 1874.]

A towel-rack consisting of the screw-bracket A B, the plates C, and the sockets D, the latter being jointed on the plates, while the plates are jointed to the bracket, in the manner and for the uses set forth.

168,730. GRAIN-SCOURERS. D. M. Richardson, Detroit, Mich. [Filed Dec. 11, 1874.]

1. In a vault-cleaning apparatus, the combination of the vessel D, flexible pipes from the vault to the upper part of the tank, and from the upper part of the tank to the air-pump, and an air-pump, whereby vessel and pump are independently movable about the vault.



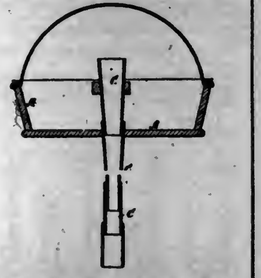
2. The tank D, the air-pump, and the odorizer H, the several parts being connected by the flexible pipes F, G, and G', whereby the noisome air is drawn from the tank, passed through the air-pump, and deodorized, substantially as described and shown.

3. The process described, wherein the noisome air drawn from a vault, in the act of cleaning it, is taken into a tank, thence into an air-pump, and discharged through a deodorizer containing chlorine or chlorides, substantially as described.

The spider A, provided with the ratchet-faced segments *a* and the V-shaped and ratchet-faced spars *a'*, arranged as described, and for the purposes set forth.

168,731. GRATES. A. Richmond, Brooklyn, Conn. [Filed Dec. 23, 1874.]

Brief.—The securing cap-piece prevents displacement of the grate. The openings in the socket and securing cap-piece allow the passage of the stem of the ball attachment when the grate is tilted.



1. A ball-and-socket joint for the grate of any range, furnace, or stove, formed by a ball attachment upon the under side of the grate, and a resting-socket on the arms, permanently attached to the stove in any suitable manner, and a securing cap-piece or cover, all as and for the purposes shown.

2. In a ball-and-socket-joint grate-support, the combination of the socket provided with opening *d*, and the securing-cap provided with corresponding opening *e*, all as and for the purposes set forth.

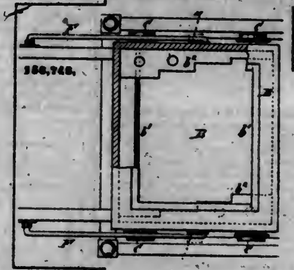
168,732. HAND POTATO-PLANTERS. J. Sawyer, Tremont, Ill. [Filed May 23, 1874.]

Brief.—Passing into the hopper from the under side is a sectional seed-tube, decreasing in size from top to bottom, to allow the hopper to be lowered thereon for filling.

A hand potato-planter having the holder A, provided with tube C C, made in two sections, and jointed at the bottom of said holder, as and for the purpose described.

168,733. MACHINES FOR CLEANING PRIVY-VAULTS. Samuel R. Schorf, Jersey City, N. J. [Filed Nov. 26, 1874.]

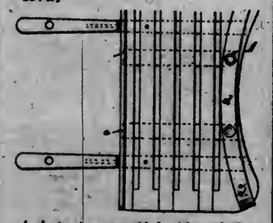
Brief.—The contents of the vault are drawn into the vacuum caused in the tank by the pump. The foul vapors pass from the tank into the pump, by which they are expelled into the deodorizer. All the parts are independently movable, and are separably attached by flexible pipes.



168,734.

The combination of the spindle B, for traversing the slide-rest of the lathe, the bearing D of the spindle, and the hand-wheel E, secured to the spindle B, with a nut, G, adapted to the said bearing and to the hub of the wheel, all substantially as set forth.

168,735. WASHING-MACHINES. John B. Shrawder, Fairview Village, Pa. [Filed Nov. 12, 1874.]



The slotted presser-foot bar A, provided with the spring-lever C and key *c*, in combination with the presser-foot B, having the small bar *a*, substantially as and for the purpose set forth.

A reciprocating wash-box, E E', having end ribs *b' b'* and side rubbers *b' b'*, the latter reversely notched, and all rigidly attached to the box, as and for the purpose described.

168,736. STREET-CAR PLATFORMS. John B. Slawson, New York, N. Y. [Filed Dec. 16, 1874.]

1. A street-car, provided with a platform for the exit and entrance of passengers, in which the rear side is carved toward the entrance-door, in the manner and for the purposes set forth.

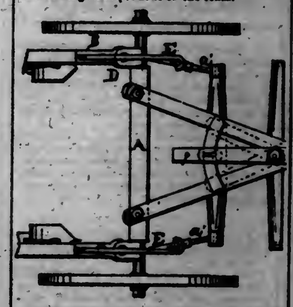
2. In combination with the entrance-platform of a street-car, a protecting-rail, *d*, carved inwardly toward the entrance-door, substantially as and for the purpose set forth.

168,737. LOCKING DEVICES FOR SLIDE-RESTS. Milton J. Skinner, Camden, N. J. [Filed Nov. 11, 1874.]

Brief.—The nut G is provided with conical recesses at each end, adapted to a cone on the bearing, and one on the hub of the hand-wheel, for traversing the slide-rest. When screwed against the hub of the hand-wheel it locks it, and holds the slide-rest in position. When turned in an opposite direction and against the bearing, it is prevented from interfering with the action of the hand-wheel.

168,738. BOOK-RACKS. David J. Stein, New York, N. Y. [Filed Oct. 1, 1874.]

Brief.—The two heads are provided with extension-slides, acted on by a spring in such a manner that the slides may be made to move beyond the shelf, so as to lengthen the same.

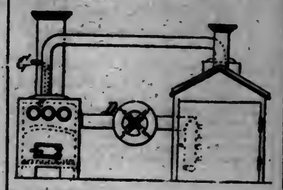


An extensible book-shelf, constructed as herein shown and described, consisting of the frame A, heads or clamps B, slides C, and spring D, said heads and slides being adapted to be moved outwardly beyond the shelf to lengthen the same, substantially as and for the purposes specified.

168,739.

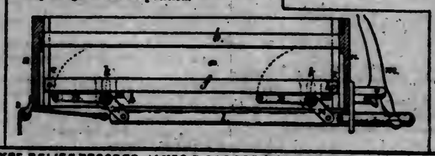
168,740. WHEEL-CULTIVATORS. Joseph Stofford, Galesburg, Ill. [Filed Aug. 21, 1874.]

Brief.—A walking-cultivator with elevated axle and pivoted tongue, enabling the operator to change the course of the plows and the carriage independent of the team.



1. In a walking straddle-row cultivator, the combination of the pivoted pole C, rigid axle A, wheels B, and plow-beams D D, so that the operator may control the direction of the machine by the plow-handles, and permit of the tongue vibrating freely, substantially as and for the purpose specified.

2. The suspending-rods E E, secured to the forward ends of the plow-beams, and projecting forward of the axle, and operating in combination with the brace-rods *a' a'*, substantially as and for the purpose specified.



168,741. LUMBER-DRIERS. H. S. Taylor, Wilmington, Del. [Filed July 20, 1874.]

Brief.—Steam may be introduced from any convenient source.

168,742. GRATES. Jos. D. Slichter, Reading, Pa., assignor of one-half his right to Louisa Bradford, same place. [Filed Oct. 3, 1874.]

Brief.—The arms are operated, to raise and lower movable grate-bars, by rotating the sleeves, to which they are attached, and which fit loosely on the shaft that carries them. The sleeves are moved by means of the projections. Two latches bear against the projections to keep the grate-bars in position.

168,743. GRAIN-CRADLES. John W. Settle, Glasgow, Ky. [Filed Oct. 3, 1874.]

Brief.—The socket for the fingers is provided with an eye for the brace, and a rivet-pin for the cross-bar, all made in one piece.

The means for holding together in relative position the fingers A, cross-bar E, and braces F, consisting of the finger-socket D, having the projecting soft-metal nipple *d* and perforated lug *d'*, as shown and described.

168,744. DEVICES FOR ATTACHING PRESSER-FEET TO THEIR BARS. John J. Schneider, Taylor County, Iowa. [Filed Dec. 15, 1874.]

Brief.—The small bar is the presser-foot is inserted in the slot in the bar, and the key on the spring-lever catches over the under side of the shank of the foot, and holds it in place.

168,745. GRAIN-CRADLES. John W. Settle, Glasgow, Ky. [Filed Oct. 3, 1874.]

Brief.—The socket for the fingers is provided with an eye for the brace, and a rivet-pin for the cross-bar, all made in one piece.

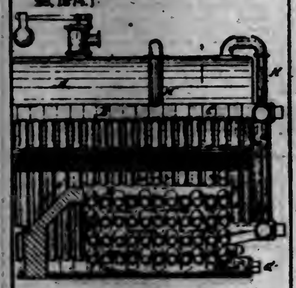
The means for holding together in relative position the fingers A, cross-bar E, and braces F, consisting of the finger-socket D, having the projecting soft-metal nipple *d* and perforated lug *d'*, as shown and described.

168,746. COMPOUND FABRICS. G. V. Shepard, Troy, N. Y. [Filed Jan. 2, 1875.]

Brief.—The woven backing prevents the knit fabric stretching out of shape, and adapts it to various uses.

A knitted fabric, A, in combination with, and fastened to, a woven, felted, or other backing, B, as described, and for the purpose set forth.

168,747.



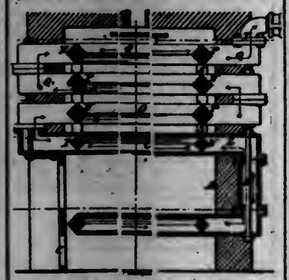
The combination of the spindle B, for traversing the slide-rest of the lathe, the bearing D of the spindle, and the hand-wheel E, secured to the spindle B, with a nut, G, adapted to the said bearing and to the hub of the wheel, all substantially as set forth.

168,748.

DEPARTMENT OF JUSTICE LIBRARY.

The combination of the hot-air chamber C, arranged directly above the furnace, the pipe G, communicating with said chamber and with a steam-generator, and the pipe D, provided with a fan-blower, and connected with a receiver or separate drying-chamber, for conveying the commingled and intermixed hot air and steam into the latter, substantially as and for the purpose described.

158,754. SECTIONAL STEAM-BOILERS. John F. Taylor, Charleston, S. C. [Filed Oct. 28, 1874.]

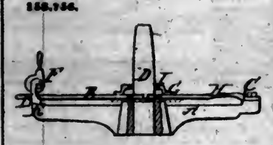


1. The combination, with a cylinder and sectional boiler, of the pipes H, which feed the water from the top of the sectional boiler to the bottom of the cylinder-boiler through the steam-space, and the pipes K, having downwardly-opening valves I, substantially as and for the purpose described.

2. The cylinder-boiler A, in combination with the pipes H and K, the valves I, and the sectional cast-iron boiler B, constructed, as described, of the tubes C, arranged as shown, the rods C', and the diaphragms D, substantially as and for the purpose described.

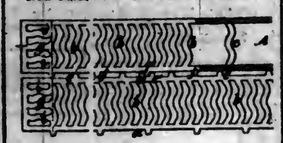
158,755. BOILERS FOR WATER-HEATERS. Wm. Taylor, St. Louis, Mo. [Filed Nov. 16, 1874.]

Brief.—The larger pipes are contracted horizontally, to allow the more ready passage of smoke and ashes. The transverse pipes extend into and rest in the masonry, and support the sections.



In a boiler, the combination of sections composed each of longitudinal pipes O, having smaller horizontal than vertical diameter, and transverse supporting-pipes N P of angular cross-section, with alternate rear and front connection between contiguous sections, substantially as and for the purpose set forth.

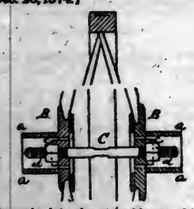
158,756. SAW-GUMMERS. S. Lee Tibbals, Conkin, Miss. [Filed Oct. 3, 1874.]



Brief.—A clamping-bar, B, provided with a guide, I, for the punch D, for clamping the saw down upon the die, whereon it is released by means of the spring portion H of said bar.

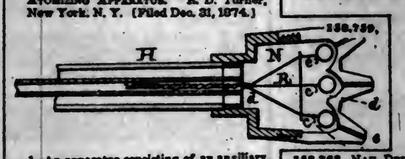
The presser-bar B, having guide I and elastic portion H, combined with bed A, having die and punch D, as and for the purpose specified.

158,756.



158,757. FURNACE GRATE-BARS. C. Toope, New York, N. Y. [Filed Dec. 17, 1874.]

1. The combination, in a grate-bar for furnaces, of the side flanges, *a a*, the upper series of corrugated traverses, *b b*, and the lower series of corrugated traverses, *c d*, for steadying and strengthening the side flanges, substantially as described, and for the purpose specified.

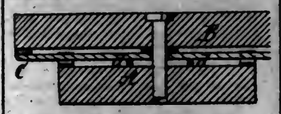


2. The combination, in a furnace grate-bar of the side flanges, *a a*, corrugated traverses *b b*, and the inclined front end, *g*, connected with the first traverse *b* by means of the longitudinal ribs *f*, substantially as described, and for the purpose specified.

158,758. WHEELS FOR HARVESTERS, &c. Benj. G. Turner, Fremont, Nebr. [Filed Dec. 26, 1874.]

In a wheel having a double set of inclined spokes and double hubs, the central screw-rod C, in combination with the inner rings or bearings, *e e*, and screw-nuts *d d*, to draw in each set of spokes of the wheel equally and simultaneously toward the middle of its axis, substantially as and for the purpose set forth.

158,759. HYDROCARBON-FURNACES AND ATOMIZING APPARATUS. R. D. Turner, New York, N. Y. [Filed Dec. 31, 1874.]

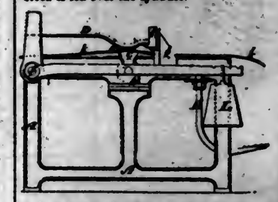


1. An apparatus consisting of an auxiliary device, E, having stem S and branches *c'*, in combination with tubes *c* H, perforated core *d*, and head M, having cavity N, recesses *n'*, and ejecting-openings *o'*, for the purpose of atomizing petroleum and other liquid hydrocarbons, and in atomic conditions mixing them and their vapors with steam before and at the point of combustion, substantially as described and shown.

2. The perforated core *d*, in combination with tubes *c* H and head M, substantially as described.

3. In combination with a boiler, A, cylinder and shell D D', pipes G G' K L, with their steam-jackets, the atomizing apparatus, consisting of tubes *c* E, core *d*, head M, and auxiliary device E, substantially as and for purposes described and shown.

158,760. RAILWAY-CAR TRUCKS. J. Turner, Grosse Isle, Mich. [Filed Oct. 21, 1874.]



Brief.—A lever extending from the center to the extremities of the transom, and resting upon a fulcrum upon each side of the king-bolt.

The combination of the lever C and fulcrums *d* with the bolster A and transom B of a railway-car, substantially as and for the purpose set forth.

158,761. LEATHER-DRESSING MACHINES. John K. Tullis, Glasgow, North Britain. [Filed Jan. 2, 1874.]

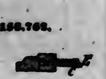
Brief.—The hide or sheet of leather is pressed down upon the scraping-cylinder by a series of independent springs, which readily yield for any inequality of thickness as the stock is fed over the cylinder.

1. A leather-dressing machine in which are combined a cutting or scraping cylinder, C, and a series of independent springs, D, arranged to bear directly upon the hide, substantially as and for the purpose specified.

2. The combination, substantially as described, of cushions *m* with the springs D and cylinder.

3. The combination of the guide-bars *n*, the cylinder, and the springs D.

4. The combination of the adjustable bar O with the springs D and cylinder, for the purpose specified.

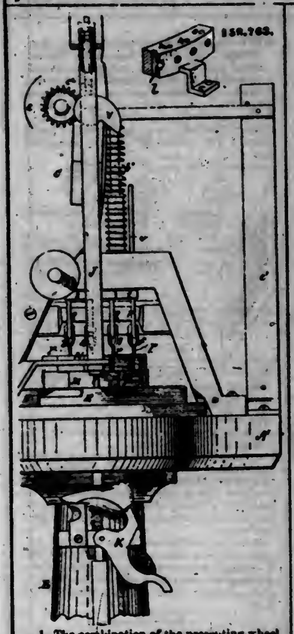


158,762. WEATHER-STRIPS. Wm. T. Valentine, Albany, N. Y. [Filed Dec. 24, 1874.]

Brief.—The weather-strip is composed of felt, overlaid on one side with cambric or muslin, and having the outer edge beveled.

1. A packing for weather-strips, composed of felt C, combined with a cambric or muslin covering, substantially as described.

2. The beveled edge E on the packing C of weather-strips, substantially as described.



158,763.

158,764. NAIL-DRIVING MACHINES. Walter S. Watson, Boston, Mass. [Filed Jan. 7, 1875.]

Brief.—Mechanism to receive nails of different sizes, and to select from the nails so received those of a required size, and present them to drivers, which drive them into the sole of a jacked boot or shoe. There is a receiving and presenting wheel having two sets of nail-pockets to receive two sizes of nails, and operated by independent feed mechanisms, to bring either set of pockets under the plungers that drive the nails. The plungers are of different lengths to correspond with the two sizes of nails, and the proper plunger is brought into play by the same lever that operates the feed, to bring under said plunger those pockets containing nails of the size for which the plunger is adapted.

158,763.

1. The combination of the presenting-wheel F and two or more guides or chutes, for directing two loose nails at a time to such wheel.

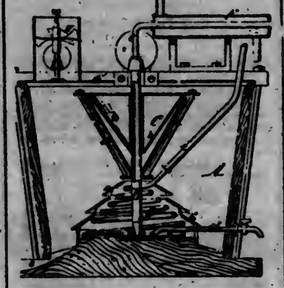
2. The combination, in a machine for presenting and dividing two sizes of loose or separate nails, of a wheel or its equivalent for receiving and presenting nails, one or more pairs or sets of guides or tubes to direct such nails to the wheel, and a driver to drive the nails from the wheel into the sole of a boot or shoe, all being arranged and operating substantially as set forth.

3. The combination of the wheel F or its substitute, one or more pairs or sets of guide tubes or chutes, A, and the ratchet-wheels M N, and dogs O P or their mechanical equivalents, operated by the yoke U or other proper agent, the whole being arranged so as to instantly throw one set of plungers out of action, and bring into action the opposite, whereby the size of nail is changed, substantially as shown and set forth.

4. The combination of the pocketed wheel F, driver I, and dually-arranged nail-guides and plungers with a jack for supporting a boot or shoe, substantially as set forth.

5. The combination, with the rotating pocketed wheel F and dually-arranged nail-guides and plungers, of a driver actuated in such manner as to execute two descents to one descent of the plungers, substantially as set forth.

6. The combination, with the wheel F, of the two ratchets M and N and the dogs O P, the latter operating alternately upon the wheels, and being actuated or shifted by the arm *p'* and intermediate mechanism, or the substantial equivalent thereof, essentially as and for the purpose described.



7. The detailed mechanism herein explained for shifting the position of the arm *h'*, consisting of the forestel wedge *l'*, bent lever *n'*, and arm *p'*, the two latter being carried by the shaft *o'*, and the whole operating substantially as set forth.

8. The combination of one or more pairs of guide tubes or chutes with a series of nail-receiving pockets in a presenting-wheel, under such an arrangement that two pockets are provided for each pair of guide-tubes, substantially as set forth.

9. The combination of a nail receiving and presenting wheel, provided with two series of receiving and presenting receptacles, with feed mechanisms for presenting the nails of either series, substantially as set forth.

158,764. CENTRIFUGAL EVAPORATORS. C. Wendel and W. Florich, New York, N. Y. [Filed Dec. 5, 1874.]

Brief.—The fluid is introduced into the drum through a hollow shaft, and is sprayed through the perforated felt-lined wall, falling down upon protectors, which shield it from contact with the heating-coil. By a perforated exhaust-pipe, which sprays steam against the drum, evaporation is accelerated. The same pipe conveys steam to heat the liquor in its induction-pipe. The fan-blower exhausts the air from the inclosing-vessel, promoting rarefaction.

1. The conical drum C, mounted on a hollow shaft, B, in combination with the vessel A and coil D, substantially as set forth.

2. The combination of the heater F with the conical drum C, hollow shaft B, vessel A, coil D, and pipe *e*, substantially as shown and described.

3. The perforated tail-pipe *e* of the coil D, in combination with the conical drum C, vessel A, and coil D, substantially as described.

4. The protector E, in combination with the conical drum C, vessel A, and coil D, substantially as described.

5. The exhaust-fan H, in combination with the closed vessel A, drum C, and steam-coil D, substantially as set forth.

158,765. LUBRICATING-BOXES. Joseph Whitaker, Woonsocket, R. I. [Filed Nov. 27, 1874.]

Brief.—A recess is formed in the concave face of the movable tube, by which the draft is increased and the oil delivered freely therefrom.

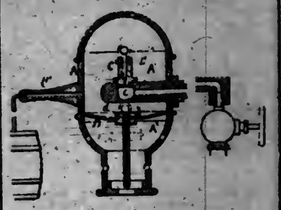
1. The recess *e*, arranged in the concave head of the independent oil-elevating tube, substantially as and for the purposes described.

2. An independent oil-elevating tube having a recess or recesses, *e*, in combination with the spring and oil-reservoir, substantially as and for the purposes described.

3. The journal-box having the orifices O at or near its ends, substantially as described, for the purposes set forth.

4. The independent journal-box B, contained within the outside case, and provided with the beveled edges *n n*, substantially as and for the purposes set forth.

158,766. WAGON-BOLSTERS. L. F. Whitman, Macomb, Ill. [Filed May 18, 1874.]

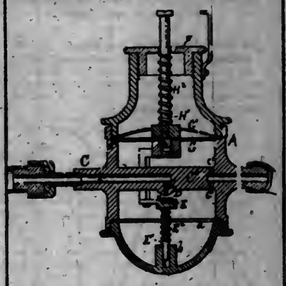


1. The bolster A, having tapering ends, the forked pivoted stakes B, and the pivoted braces C, having notched feet *d*, and the bolts *d'*, all combined substantially as specified.

2. The combination, with the bolster and pivoted bed stake B, of the brace C, pivoted to move at right angles with the plane of rotation of the end stake, the pivot-pins of the end stake and brace being at right angles with each other, substantially as specified.

158,767. GAS-REGULATORS. Frederic W. Wiesebrock, Brooklyn, N. Y., assignor to Henry W. Shepard and Robert Seaman, New York city. [Filed Oct. 15, 1874.]

Brief.—For charging beer or other liquid with carbonic-acid gas.

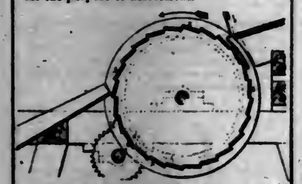


1. A shell or case, A, provided with air-openings, diaphragm D, valve E, and pipe C, having an opening or valve-seat, *c*, the same being combined and arranged as shown, whereby the valve is automatically opened and closed by the adverse pressure of the atmosphere and gas acting directly on the diaphragm, and entirely irrespective of the varying degree of pressure which the gas-supply vessel may contain, substantially as described.

2. In combination with a suitable shell or case having air-openings and lateral openings for the inlet and egress of gas, an elastic diaphragm, D, valve-rod F, yoke E', and valve E, the latter being arranged as shown, whereby the discharge-opening *c* of the inlet-pipe shall be automatically opened and closed by said valve through the adverse pressure of the atmosphere and gas acting on the elastic diaphragm, substantially as described.

158,768. GAS-GOVERNORS. Frederic W. Wiesebrock, Brooklyn, N. Y., assignor to Henry W. Shepard and Robert Seaman, New York city. [Filed Dec. 28, 1874.]

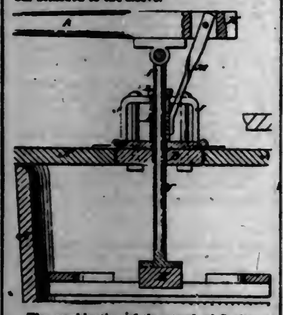
Brief.—Gas is fed to the shell when a partial vacuum is produced, whatever be the amount of pressure in the gas-containing vessel. The diaphragm is adjusted by means of the screw-cap.



1. In connection with a suitable shell, the pipe O and cone-shaped nozzle D, the channels *o' d*, each of which being connected as shown, in combination with the valve E, washer 4, stem E', and spring E'.

2. The plunger H, having a rod H', spring F', screw-cap F, diaphragm C, and valve F, the latter being connected to the plunger by any suitable gearing, the whole being combined and arranged to operate substantially as described.

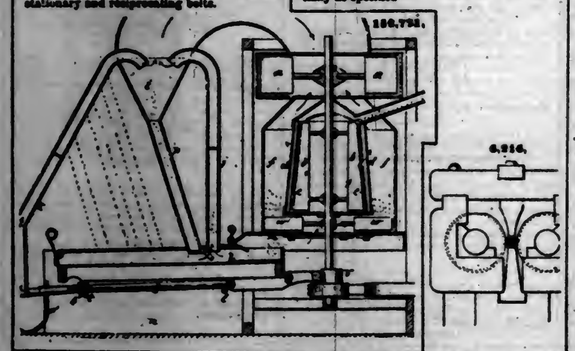
166,769. FEEDING COAL, &c., FROM A HOPPER. John B. Wilford, Reading, Pa., assignor to Hezekiah Bradford, same place. [Filed Nov. 16, 1874.]



Brief.—Under the outlet of a hopper revolves, by a pinion, a hollow cylindrical bucket-wheel, which, according to its position with the hopper, receives from it an adjustable amount of material, and drops it into a trough for the purpose of assortment.

The apparatus for feeding coal or other material from a hopper or receptacle, consisting of a cylinder with plates or buckets for lifting the material over the top of such cylinder near the mouth of the hopper, substantially as set forth.

166,770. WASHING-MACHINES. Horace G. Williams, Hamilton, Iowa. [Filed June 13, 1874.]



Brief.—The shaft of the presser slides in a sleeve fixed in a standard, and is operated by a lever attached to the shaft, and a fulcrum-bar attached to the sleeve.

The combination of the standard J, sleeve L, guide-arm I, and fulcrum-bar M with the lever K and vertical shaft H, attached to the presser, all constructed and arranged substantially as and for the purpose described.

166,771. MIDDLINGS-PURIFIERS. Jos. W. Wilson, Warsaw, Ill. [Filed June 6, 1874.]

Brief.—Devices, as claimed, for separating and removing the light impurities from the middlings while passing through the vertical stationary and reciprocating bolts.

166,772.

1. The combination of suction-fan a, fan b having brushes c, stationary bottomless bolt d, and circumjacent chamber f, all constructed and arranged to operate substantially in the manner described.

2. The air-trunks h f and spout p, in combination with chambers i g S, suction-fan a, and horizontal bolt A, as and for the purpose specified.

3. The combination of horizontal bolt A, rods l, eccentric U, springs o', loops t, and check-nuts b', substantially as and for the purpose specified.

REISSUES.

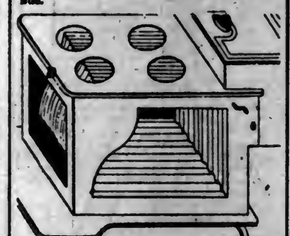
4,915. MACHINE-CLUTCHES. Albt. B. Benn, New Haven, Conn. Patent No. 149,166, dated Mar. 3, 1874. [Filed Dec. 26, 1874.]

Brief.—By the rotation of the bar in one direction it engages the pulley, and by the rotation of the bar in the opposite direction it disengages the pulley and frees it from the shaft.

1. In combination with a shaft and pulley loose thereon, and the sleeve D, in connection with said shaft so as to revolve therewith, but free for longitudinal movement, the bolt or bar I, in connection with the pulley and with the sleeve, so that a longitudinal movement of said sleeve will impart a rotative movement to said bolt or bar, and thereby cause the said bolt to engage the pulley with, or disengage it from, the shaft, according to the direction of the movement of said sleeve, substantially as described.

2. A clutch-pulley constructed with a T-shaped groove or flange, L, combined with a bolt, I, and a nut, d', in said groove, and means, substantially such as described for imparting a rotative movement to said bolt, to engage or disengage said pulley.

4,916. MACHINE FOR ROLLING METAL. Leopold Thomas, Hoboken, N. J., assignor to the American Hot-Rolled-Shafting Company, New York city. Patent No. 120,626, dated Nov. 14, 1871. [Filed Nov. 19, 1874.]



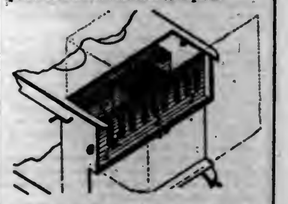
An improvement in a rolling-mill for rolling bars, shafts, or other articles lying parallel to the axes of the rolls, comprising a pair of rolls rotating in the same direction and a guide for confining the article to be rolled in proper position, the flattened or recessed surfaces on one or both rolls to facilitate the introduction of the article to be rolled, substantially as specified.

166,772.

4,916.

4,917. RESERVOIR COOKING-STOVES. G. G. Wolfe, Troy, N. Y. Patent No. 76,292, dated Mar. 31, 1868; reissue No. 5,442, dated June 10, 1873. [Filed Jan. 28, 1874.]

Brief.—The reservoir is cut away in such manner as to fit over a portion of the top of the stove, covering the rear flues, and is provided with a short pipe, which, when in place, forms a continuation of the rear ascending flue.



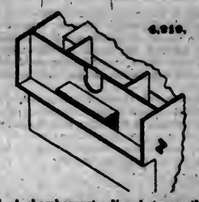
1. A water-reservoir, constructed to embrace the rear end and upper side of a cooking-stove, substantially as and for the purpose specified.

2. In combination with the rear end and upper side of a cooking-stove, a water-reservoir, constructed to embrace the same, and provided with a pipe or flue, which inclosee the upper end, and forms a continuation of the exit-flue, substantially as and for the purpose shown.

3. In combination with the rear end and upper side of a cooking-stove, a water-reservoir, which embraces the same, and forms a covering for the upper ends of the vertical flues, substantially as and for the purpose set forth.

4,918. RESERVOIR COOKING-STOVES. G. G. Wolfe, Troy, N. Y. Patent No. 76,292, dated Mar. 31, 1868; reissue No. 5,442, dated June 10, 1873. [Filed Jan. 28, 1874.]

Brief.—Dampered apertures through the back plate of the stove permit the products of combustion from each rear flue to strike against the side of the reservoir, which is placed in contact with said back plate.



1. In combination with a cooking-stove having rear vertical flues, and with a water-reservoir located in rear of the same, dampered openings formed in and through the back plate of said stove by means of which, when desired, communication for the heated escaping products of combustion is effected between the descending flue or flues and said reservoir.

2. In combination with a cooking-stove having rear descending and ascending flues, and with a water-reservoir located in rear of the same, dampered openings is and through the rear wall of said flues by means of which communication for the heated gases of combustion can be opened and closed between the said descending and ascending flues and the said reservoir.

4,919. RESERVOIR COOKING-STOVES. G. G. Wolfe, Troy, N. Y. Patent No. 76,292, dated Mar. 31, 1868; reissue No. 5,442, dated June 10, 1873. [Filed Jan. 28, 1874.]

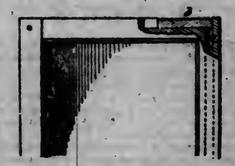
Brief.—A chamber between the back plate of the stove and the front side of the reservoir receives the products of combustion from the rear ascending flue, and returns them to the same flue when the damper is properly manipulated.

4,919.

1. A chamber extending between the rear casing of the ascending flue of a cooking-stove and the front side of a water-reservoir attached thereto, and communicating at its lower side with said ascending flue, and its upper side with the exit-flue, in combination with a damper by means of which the upper part of the said ascending flue may be caused to communicate directly with or be separated from said exit-flue, substantially as and for the purpose specified.

2. A chamber situated between the rear side of the descending and ascending flues of a cooking-stove and the front side of a water-reservoir attached thereto, partially divided by a central horizontal flue-strip, and communicating at its lower side with the ascending flue, and at its upper side with the exit-flue, substantially as and for the purpose shown.

3. In combination with a chamber situated between the rear side of the vertical flues of a cooking-stove and the front side of a water-reservoir attached thereto, partially divided by a horizontal flue-strip, and communicating through a suitable opening at its lower side with the center or ascending flue, and through a similar opening at its upper side with the exit-flue, a damper for closing the upper portion of said ascending flue, substantially as and for the purpose set forth.

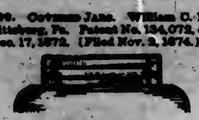


4,920. MANUFACTURE OF LIQUID CARBONIC ACID. H. Beine, Groningen, Netherlands. Patent No. 152,960, dated June 23, 1874. [Filed Nov. 16, 1874.]

Brief.—Distills the carbonic acid from bicarbonate of soda, &c., in a retort at about 400° centigrade, and conducts the gas into a receiver kept at about 0° centigrade. The gas liquefies by its own pressure. Describes apparatus for the purpose, and suggests the various uses to which the acid may be applied. Describes a mode of making bicarbonate of soda by mixing ammonia, common salt, and excess of CO_2, and heating in a retort. Result is sodic bicarbonate and ammonium chloride.

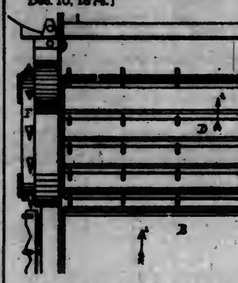
The within-described process for manufacturing carbonic-acid gas and liquefied carbonic-acid gas of any desired tension and temperature, by heating bicarbonate of soda or other bicarbonates in a closed vessel or retort, and conducting the escaping gases through a pipe into a refrigerated reservoir, substantially as hereinbefore described.

4,921. SLATE-FRAMES. Saml. B. Bushfield, Baltimore, Md. Patent No. 99,641, dated Feb. 15, 1870. [Filed Dec. 10, 1874.]



Brief.—A slide-bar in one of the frame-pieces is arranged to close the pencil-chamber in the adjoining frame-piece. The bar is also roughened to form a sharpener.

1. In a slate-frame, a sliding bar in combination with and arranged at right angles to the recess e, substantially as set forth.



2. The corrugated pencil-sharpening slide-bar b, in combination with a slate-frame, as set forth.

4,922. GUTTERS FOR EAVES. William C. King, Pittsburg, Pa. Patent No. 134,072, dated Dec. 17, 1872. [Filed Nov. 2, 1874.]

A vessel having a flanged cover, and provided with a pliant and yielding band, which is much wider than it is thick, and arranged between the vessel and flange of the cover, the greater portion of the width of the band projecting outward and beyond the outer wall of the vessel, and bearing elastically with its edge against the flange of the cover, said projecting portion readily yielding downwardly and upwardly to the pressure and pull of the hand upon the cover, all for the purpose of forming an easy separating-joint, and at the same time excluding dust and destructive agents without the necessity of hermetically sealing the vessel, substantially as described.

4,923. HARVESTERS. Chas. W. Marsh and William W. Marsh, Sycamore, Ill. Patent No. 41,060, dated Jan. 5, 1864. [Filed Dec. 10, 1874.]

1. The combination of the sickle C, provided with the rivs or projections b, with the endless band B and toothed apron D, substantially as and for the purpose specified.

2. The toothed belt F, in combination with the toothed apron D and endless band B, as and for the purpose specified.

3. A grain-elevating mechanism having its front part arranged to operate on or near to the cutting line, substantially as and for the purpose specified.

4,924. HARVESTERS. Chas. W. Marsh and William W. Marsh, Sycamore, Ill. Patent No. 41,060, dated Jan. 5, 1864. [Filed Dec. 10, 1874.]

1. The folding binders' table or tables, constructed and operating substantially as indicated, so as temporarily to diminish the width of the machine, for the purpose set forth.

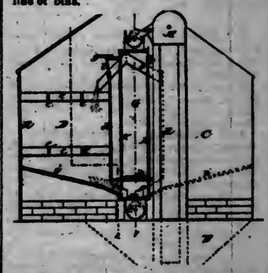
2. In combination with an elevated binders' table or tables, the folding or removable binders' stand, constructed and operating substantially as indicated, to vary the width of the machine, for the purpose set forth.

4,925. BALANCED SLIDE-VALVES. Washington Obenchain, Logansport, Ind. Patent No. 146,701, dated Jan. 20, 1874. [Filed Oct. 26, 1874.]

4,926.

1. A valve for steam and other engines, the exhaust aperture of which is contracted as specified, whereby it is made of a width equal to or less than that of the exhaust-port in its seat, for the purpose set forth.

2. The partially-balanced valve D, having outwardly-projecting lips or surfaces of such length as to cause them to cut off the steam at the desired points, and inwardly-projecting lips or surfaces of such length as to cause the distance between their inner edges to be less than the width of the exhaust-port in the valve-seat, in order that they may retain the steam in the cylinder until the piston has reached a point where it is desirable to allow it to be exhausted therefrom, the construction of the valve being substantially such as is herein described.



3. The combination, with a steam-valve and valve-chest, of the balance-cylinder E, closed at top, the balance-ring F, the flange f, forming a part of said balance-ring, and the air recess or groove f' on the inner edge of said ring, communicating with the balance-chamber f', between the balance-cylinder and the valve-chest wall, substantially as specified.

4,926. TREATMENT OF GRAIN FOR THE MANUFACTURE OF STARCH, SPIRITS, &c. Wm. Adamson and C. F. A. Simcain, Philadelphia, Pa., assignors to William Adamson. Patent No. 147,353, dated Feb. 10, 1874. [Filed Aug. 26, 1874.]

The mode described of preparing farinaceous substances for conversion into starch or alcohol, namely, subjecting said substances, prior to such conversion, to the action of heated hydrocarbon, as set forth.

4,927. GRAIN-ELEVATORS. Henry I. Chase, Philander F. Chase, and Edwin D. Chase, Peoria, Ill. Patent No. 136,604, dated May 20, 1873. [Filed Jan. 6, 1875.]

Brief.—The grain-bins extend beyond the elevating-house, and are arranged in rows and low, in order to avoid the enormous pressure of accumulated grain. Between the grain-bins is an open passage, within which the conveyers have independent foundations, and extend from the elevator to the rear of the line of bins.

1. The system described of receiving, conveying, storing, and shipping grain in rows of bins C D, of one story in height, arranged on either side of an upper and lower line of conveyers, E' E', one line for receiving and distributing grain, the other for discharging the same, constructed to operate substantially as and for the purposes set forth.

2. The system described of a combination of elevator-houses, G G, in one line, of not more than two stories in height, from each of which runs back at a right angle a double line of store-bins, having an upper and lower line of conveyers E' E' built on independent foundations, substantially as and for the purposes set forth.

3. The construction and combination of the bins C D, walls d d, stays e e e, floor f, spouts f f, passages g g, conveyers E' E', posts h h, spout h, platforms g h, and elevator A, substantially as set forth.

6,908. GRAIN-ELEVATORS. Henry L. Chase, Philander F. Chase, and Edwin D. Chase, Peoria, Ill. Patent No. 160,894, dated May 20, 1875. [Filed Jan. 6, 1875.]

Brief.—The continuous spiral grain-conveyor has its journals arranged within journal-boxes suspended from the upper part of the conveyor. Said boxes are adjustable.

1. The continuous spiral grain conveyor, having the journals of its shaft arranged in journal-boxes suspended from the top of a conveyor-trough by means of brace-rods, so as to allow a free passage of the grain along the bottom of the trough, substantially as set forth.

2. The combination of the adjustable keys D D, journal-boxes B B, and spiral grain-conveyor shaft, substantially as and for the purpose set forth.

3. The combination of the cross-braces C C, adjustable suspension-rod b b, journal-boxes B B, screw-nuts c c, adjustable keys D D, journals a a of conveyor-shaft, and conveyor-trough, substantially as set forth.

4. The conveyor-trough having a polished sheet-metal lining, and provided with the door E, in combination with the continuous spiral grain-conveyor A, substantially as set forth.

6,909. CARRIAGE-STEPS. Geo. A. Keene, Lynn, Mass., assignor, by mesne assignments, to the Rubber-Step Manufacturing Company. Patent No. 66,764, dated June 11, 1867. [Filed Nov. 27, 1874.]

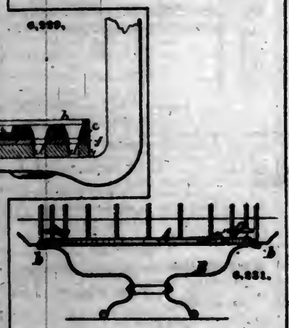
1. A plating of india-rubber, in combination with and firmly attached to the step of a carriage, substantially as and for the purpose described.

2. In combination with a bracket or arm projecting from the carriage, a metallic plate, pivoted on its upper surface with india-rubber, substantially as described.

3. In combination with a plate, firmly attached to the step-bracket or arm of a carriage, an upwardly-presenting resilient rubber plating, firmly attached to said plate, substantially as described.

4. In combination with a plate, firmly attached to the step-bracket or arm of a carriage, a wearing-surface of upwardly-presenting resilient projections, firmly attached to said plate, substantially as described.

5. In combination with a metallic plate, a rubber surface, firmly affixed thereto, to be applied to a step, substantially as and for the purpose described.



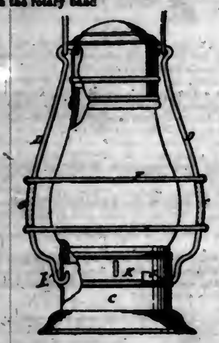
6. A plating of resilient material, with alternating elevations and depressions, attached to and forming the wearing-part of a carriage-step, substantially as described.

7. As a tread for steps, a plating of resilient material, vulcanized to a plate, and covering the upper surface of the same, substantially as described.

8. The combination of a series of upwardly-presenting resilient projections, forming a wearing-surface, a metallic plate, the upper surface of which is below the upper surface of said projections, and a step to which said plate is firmly affixed, substantially as and for the purpose described.

9. In combination with a step, a series of upwardly-presenting vulcanized india-rubber projections, firmly affixed thereto by a metallic plate, substantially as described.

6,909.



6,931.

1. The combination, with the circular dome of a bird cage and its detachable circular stand, of a circular metallic mat, said mat serving to collect impurities, and to cover the central depression in the stand created by its pedestal, substantially as described.

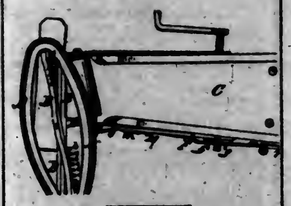
2. As a new article of manufacture, a cage-mat constructed of sheet metal, with a raised rim and a laterally-projecting flange, substantially as described, for the purpose specified.

6,929. LANTERNS. Jos. Klotz, West Meriden, Conn., assignor to himself and F. J. Clark. Patent No. 146,079, dated Dec. 30, 1873. [Filed Aug. 15, 1874.]

Brief.—The stamps or guards are adjusted within the slots in the base by the inclines upon the rotary band

The combination, with base C, having vertical slot l, of the rotary band K, having inclines J, for the purpose of locking and unlocking clamp D, in the manner described.

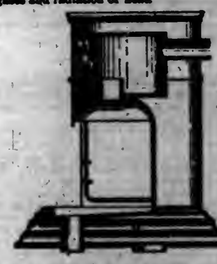
6,931. METALLIC MATS FOR BIRD-CAGES. O. Lindemann, Edgewater, N. Y. Patent No. 122,472, dated Jan. 2, 1872. [Filed Oct. 7, 1874.]



6,930. STRAW-CUTTERS. John K. O'Neil, Canton, Ohio. Patent No. 120,314, dated Oct. 24, 1871. [Filed Oct. 24, 1874.]

Brief.—The cutter-wheel and the adjacent end of the feed-box are correspondingly inclined, both vertically and laterally, to the end of the main portion of the feed-box, to cut the stalks in a double oblique direction. Chisel-edged commiuuting-cutters are located upon a cross-arm in advance of the knife, and shred the ends of the stalks as they are presented by the feeding mechanism.

1. The severing-knives B B, arranged in a doubly-oblique position, substantially as specified, in combination with the feeding-box C, for the purpose of cutting the stalks and straw in doubly-oblique directions, substantially as herein specified.



2. The chisel-edged commiuutting cutters b attached, substantially as described, to the lower side of the cutter-wheel A, in combination with the severing-knives B B, for the purpose of cutting the straw or stalks transversely previous to their being operated upon by the severing-knives, substantially as herein specified.

3. The pin-disk D, reciprocating ratch-bars F H, ratchet-wheels G I, and retracting-springs, constructed and operating substantially as described, in combination with severing-knives B B and commiuutting cutters b b, in the manner and for the purpose specified.

6,932. FIRE-PLACE HEATERS. William L. Phillips, Normal, Ill. Patent No. 146,472, dated Jan. 13, 1874. [Filed Jan. 28, 1874.]

Brief.—The smoke entering the drum is mingled with air drawn from the room through the open front, so as to moderate its heat, and obviate excessive heating of the drum, and prevent "burning" of the air in the air-chamber thereby. The drum is enlarged for the same object, and to allow full expansion of gases and radiation of heat.

An open front fire-box, in combination with a reverberatory chamber situated above the dome of the said fire-box and a jacket inclosing both of said instrumentalities, substantially as and for the purpose described.

6,934. MANUFACTURE OF ARTIFICIAL STONE. Jos L. Rowland, New York, N. Y. Patent No. 137,322, dated Apr. 1, 1873. [Filed Jan. 8, 1875.]

1. The apparatus, substantially as described, for mingling carbonic-acid gas with vapors of fluids in a chamber containing the material to be indurated, as set forth.

2. The combination, with an indurating or curing chamber, G, of a carbonic-acid-gas generator and a vapor or steam generator, substantially as described.

3. The combination of a gas and vapor mixing pipe or passage, gas-generator, vapor-generator, and indurating or curing chamber, substantially as described.

4. Introducing into the curing-chamber steam and carbonic acid gas, the latter being subjected to a cooling process during its passage from the furnace to the curing-chamber, substantially as described.

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 7.—NO. 3. TUESDAY, JANUARY 19, 1875. PRICE { $6,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1875 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, DISTRICT OF MASSACHUSETTS.

WILLIAM B. LAWRENCE, COMPLAINANT, *vs.* RICHARD H. DANA, JR., *et al.*, RESPONDENTS.

[*In equity.—May term*, 1869—*to wit, September* 20, 1869.]

The owner of the copyright of a book having agreed with the author of certain notes and additions to the same, embraced in two editions of the same prepared by him, that she would make no use of such notes and additions in subsequent editions of the work, but the author might use the same as he pleased; it was thereupon decreed that he should have the exclusive benefit of the copyright for the same.

Where the editor of subsequent editions makes notes and additions which can be clearly separated and distinguished from the notes and additions in the previous ones, he is entitled to use them and have a monopoly of them.

But if they cannot be thus separated and distinguished from the former notes, he cannot use them without violating the copyright for the former notes.

The editor of a subsequent edition cannot borrow from citations introduced into the previous ones by another editor without infringing the copyright for them, though they are not accompanied by the extracts previously presented with the citations; nor can he borrow citations of authorities, although without remarks or comments, even when prefixed or appended to notes not otherwise objectionable.

Equity suits on copyrights are usually referred to a master to examine into the charge of infringement, and upon the nature and extent of it.

Even when the infringement has been established on the principal hearing, it will still be referred to a master for the same purposes.

An injunction will be ordered in the latter case only when the infringements are few and their nature can be conveniently ascertained.

Where notes are partly original and partly copied, the latter may be published if they can be distinguished and separated, otherwise the publication must be restrained.

OPINION OF THE COURT.

CLIFFORD and LOWELL, *Judges:*

CLIFFORD, *J.:*

Complainant alleges in substance and effect that Catharine Wheaton, deceased, widow of the late Henry Wheaton, in the year 1853, then in full life, requested him to prepare a new edition of Wheaton's Elements of International Law, and that he, in pursuance of that request, prepared such notes for that purpose as seemed to him fit, and also an appendix and introductory remarks, with a full and careful memoir of the life of the deceased author; that, so far as the edition contained matters not previously published in this country, it was duly copyrighted by the said Catharine as proprietor thereof; that the same was subsequently published by the firm of Little, Brown & Co., and that all the profits arising out of the contract with the publishers were enjoyed by the said Catharine as the complainant intended they should be when he undertook to prepare the edition; that he afterward, in pursuance of a similar request from the same source, prepared other annotations of the same work, which were also copyrighted by the same person, and that they were published in 1863 by the same publishers; that he is advised and believes that the transactions as recited, in respect to those two editions, operated to convey to the said Catharine no other beneficial interest in the said annotations and additions to the work than the right to use the same in those editions; that in fact it was always understood and agreed by and between them that the beneficial interest in the same, except as aforesaid, belonged to the complainant, and that the copyrights were taken out and held in trust by the said Catharine in accordance with that understanding and agreement. Prior to that period the author, as the complainant alleges, had caused four several editions of the work to be published, two at Philadelphia, one at London, and one in 1848 at Leipzig, in two volumes, by F. A. Brockhaus, in the French language; that in the edition of 1848 the author inserted and published, both in the text and notes, many new matters never before published by him in the English language; that the author died in 1848; that the French edition was reprinted by the said Brockhaus in 1853, and that the complainant in 1860 ascertained that the said Brockhaus had published another edition of the work in French, without the knowledge or consent of the representatives of the author, and that he contemplated publishing further editions of the same without paying anything to those representatives for copyright; that in view of these circumstances, and at the request of the

said Catharine, he commenced negotiations with the said Brockhaus upon the subject; and he alleges that the result was, that the parties came to an agreement that the complainant should revise and translate his annotations and adapt the same for a work to be sold in Europe, making such additions thereto as should render the work as complete as possible down to the time of publication; that the representatives of the deceased author should give up all claim on the said Brockhaus in respect to the editions published and to be published; and that in consideration thereof the said Brockhaus agreed to pay to the said Catharine, if the complainant so directed, the sum of six thousand francs, together with the sum of four hundred and fifty dollars, to be paid to the complainant to defray in part the expenses to be incurred in preparing the translations; that the complainant, before the agreement was completed, stated to the said Catharine or her agent, Martha B. Wheaton, that he would do no more work on any book over which he did not possess exclusive control; that he would only undertake the work required of him in the proposed arrangement on the condition that the entire copyright should be assigned to him; that the said Catharine, manifesting a great desire to retain the legal title to the copyrights of the book, requested him to confer with Professor Parsons in her behalf, in order that some arrangement might be made which should substantially secure to the complainant what he desired, and be at the same time acceptable to the said Catharine; and the complainant alleges that he assented to that proposition, that he had one or more interviews with Mr. Parsons, and made an agreement with him as to the title to the copyrights and other matters, as expressed in the memorandum set forth in the bill of complaint, as follows:

MEMORANDUM.

Mr. Lawrence will write to Mr. Brockhaus in terms to bring to Mrs. Wheaton the right to draw on Mr. Brockhaus at once for 6,000 francs. He will also endeavor to get from Mr. Brockhaus as much as he can toward the actual expense of having the translation into French made here, and so much of that expense as he fails to get from Brockhaus Mrs. Wheaton will pay from the proceeds of the draft on Brockhaus. Mrs. Wheaton will, on the payment of her draft on Brockhaus, agree formally to make no use of Mr. Lawrence's notes in a new edition without his written consent, and Mrs. Wheaton will give to Mr. Lawrence the right to make any use he wishes to of his own notes.

That the said Parsons, for the purpose of being more certain that the memorandum would be approved by the said Catharine, wrote on the same sheet of paper to the respondent, Martha B. Wheaton, that he and the complainant had come to a perfectly amicable result, as expressed generally in the memorandum, and suggested to her that she should make a copy of the same for herself, if the result was satisfactory; and the complainant also alleges that the said Martha afterward, in behalf of her mother and herself, and to signify their approval of the result, signed the said memorandum, and wrote the date, "June 14, 1863," thereon, and caused the same to be delivered to the complainant. Additions were subsequently made to the agreement, and the terms of it were in some respects varied, as appears by the correspondence between the parties; but the complainant alleges that he is advised and believes that the amendments to the same do not vary any such parts of the same as relate to the copyrights in this country; and he also alleges that the consideration of the agreement of the said Brockhaus to pay said amount to the said Catharine was the promise of the complainant to furnish new and additional notes for the future editions of the work, as was well known and understood by the parties; that he, the complainant, wrote to said Brockhaus, as agreed; that the letter was approved by the other parties, and was by the said Martha and Catharine sent to the said Brockhaus, and that the said Catharine, on the 17th of June, 1863, drew a bill of exchange on him for the amount specified in the memorandum; and that the same, in consequence of said letter and of the promises and undertakings of the complainant, was duly honored and paid.

Theory of the complainant is, and he accordingly alleges, that there was not, on the first day of January, 1865, any valid subsisting copyrights of the editions published, respectively, in 1836 and 1846; that the copyrights of the editions published in 1855 and 1863 secured the exclusive right to the same only so far as those editions differed from the aforesaid antecedent editions; that it was a part of the agreement made through the agency of the said Parsons, that the said Catharine should execute and deliver to the complainant a formal instrument, securing to him all his rights in the premises, of such a nature as to admit of being recorded, as required by the acts of Congress relating to copyrights; and he avers that the other respondents had full notice and knowledge of the agreement, and that he, in a court of equity, by virtue of that agreement, is taken and deemed to be the owner and proprietor of the last-mentioned copyrights, in and as to all matters contributed by him as aforesaid; and that, by reason thereof, the respondents are bound not to make any use of any such matters so contributed by him to either of the said editions of the said work. Based upon these and other allegations, as more fully set forth in the record, the claim of the complainant is, that he is in equity the exclusive owner and proprietor of the copyrights for all the matters which he contributed to those two editions; and he charges that the said firm of Little, Brown & Co. procured and induced the said Martha, in her own behalf and that of her mother, to consent and agree that the said publishing firm of Little, Brown & Co. should publish an edition of that work, and procure the same to be edited and notes to be prepared for the same by some person other than the complainant; that thereupon the said firm procured and employed Richard H. Dana, Jr., one of the respondents, to edit the proposed edition, and to prepare the notes as aforesaid; and the complainant further shows that the respondents, without his consent, have caused the proposed edition to be printed, published, and publicly sold. Reference is also made to certain alleged pretences set up by the respondents; and the complainant prays for an account and for an injunction, and that the respondents may be decreed to surrender and deliver up all copies of the book on hand, and to make and deliver to the complainant a good and sufficient deed of the copyrights of 1855 and 1863, in accordance with his equitable title.

Questions of intrinsic importance and of great difficulty are presented for decision in respect to the title of the complainant, and as they are in their nature preliminary, they will be first considered. Briefly stated, his claim of title, considered broadly, is to the additions to and emendations of the text of two editions as published under his supervision, to the memoir of the author as contained in those editions, to the annotations prepared by him and published in those editions, and to the arrangement of the same, and the mode in which they are therein combined and connected with the text, and to the indices as published in those editions. He rests his claim upon the following grounds, as substantially stated in the bill of complaint: First, upon a contract or agreement between Catharine Wheaton and himself, that she should make no use of his notes aforesaid in any new edition of the work without his written consent; and that she would convey to him, by a formal instrument, the right to make any use he might see fit to make of his own notes. Secondly, upon the ground that, in the consideration of a court of equity, he is taken and deemed to be the owner and proprietor of the copyrights in and as to all the matters contributed by him and published in those two editions. Evidently both claims, as presented, have respect to the agreement as expressed in the memorandum of June 14, 1863, and the subsequent correspondence upon that subject, as the first is founded in covenant or contract, and the second in an equitable title to the copyright, as derived from the original arrangement and by virtue of the agreement expressed in that written paper. Confirmation of that proposition is not needed, as the language employed in the stating part of the bill of complaint is too plain for controversy; but if it were not so every vestige of ambiguity is removed by the principal prayers of the bill of complaint, which are for an injunction and an account, and for a good and sufficient deed conveying the legal title to the copyrights.

The respondents contend that the complainant is not entitled to any relief for several reasons.

1. Because the memorandum, as they contend, is not a perfected contract, but merely a note or memorandum of the stipulations of a proposed agreement as to the true understanding and definite terms of which the parties never actually agreed, and on which their minds never in fact met.

2. Because, the parties having failed to agree as to the true understanding of the memorandum and the terms of the formal agreement which it contemplated, the complainant relinquished and abandoned the whole subject-matter of the instrument, and so notified the respondents.

3. They also contend that the agreement cannot be enforced, because the same was procured by fraudulent misrepresentations and concealments of the complainant.

4. That the agreement cannot be enforced because the memorandum is without consideration.

5. Because the basis of the memorandum and the negotiations which led to it were the supposed legal copyrights held by the said Catharine; and they insist that those copyrights are void, and consequently that the agreement is inoperative, inasmuch as the parties entered into the same through mutual mistake.

6. Because the memorandum containing the agreement does not transfer nor assign any copyright to the complainant, or provide for or contemplate any such transfer or assignment.

I. Search is made in vain for any support to the first proposition of the defense, as applied to the terms or execution of the memorandum.

Interviews took place between the complainant and Professor Parsons, and they conferred together upon the subject-matter embraced in that memorandum, as suggested by the said Catharine; and the proofs show that they came to a perfectly amicable result, that the memorandum was drawn by the latter and delivered to the complainant, to be transmitted to the said Martha B. for her examination, and that she afterward, on behalf of her mother and herself, and to signify their approval, signed the memorandum and wrote the date thereon, and caused the same to be delivered to the complainant. Expressed in intelligible terms as the memorandum is, the construction and effect of the language are questions of law which cannot be controlled or influenced by the opinion of any witness, not even by that of the person employed to prepare the draft for the consideration of the parties. He may not at the time have regarded it as a contract, but they were at liberty to adopt it as such; and if they did so, and it was duly and understandingly executed as such, their rights under it must be ascertained from the language employed, as applied, in view of the surrounding circumstances, to the subject-matter of the negotiation.

They subsequently differed, as the correspondence shows, as to the proper terms of the formal agreement for which the memorandum provides; but it was not denied, throughout that period, that the said Catharine had agreed "to make no use of Mr. Lawrence's notes in a new edition without his written consent," nor that she had also agreed to give him "the right to make any use he wishes to of his own notes." Attempt was made, it is true, to ingraft the qualification into the latter branch of the stipulation, that the complainant should not publish in the United States a new edition of the notes and other matter of his own composition, "which he had added to the said two editions of said book, until the last edition is sold;" but it is clear to a demonstration that the agreement, as expressed in the memorandum, contains no such qualification. Properly considered, it is equally clear also that there is nothing in the correspondence to sustain the theory of the respondents as presented in their first proposition. "On reflection," said the complainant in his letter to Mr. Parsons, dated June 14, 1863, "the suggestion you made yesterday offers many advantages over my proposed plan . . . as it settles at once and forever all questions in regard to the book." Influenced by those considerations, as he represents, he wrote a second letter of that date as a substitute, if preferred by the other party, for the one previously prepared to be forwarded to Mr. Brockhaus, and submitted it to the approval of Mr. Parsons, as the friend of the said Catharine; but he expressly stated therein that, in sending it, he did not wish to recede from the former arrangement. On the contrary, he stated in the inclosed letter that, having made an arrangement with the said Catharine, which gave him the entire control over his notes as published in English, and any claim she might have to the editions published by his correspondent, he had advised her to the effect that she might draw for the whole six thousand francs. He proposed in that letter to Mr. Parsons, that the said Catharine might retain the copyright to the text, and to relinquish all claim for the expenses of the stipulated translation; but he did not propose to vary the agreement, as expressed in the memorandum, as to his own notes, and he also made claim to the right, if any, that the said Catharine had to the text and notes of the foreign editions.

Full consultation took place between Mr. Parsons and the said Martha, as the agent of the said Catharine; and Mr. Parsons, under date of June 16, 1863, wrote to the complainant that—

1. Mrs. Wheaton will send your last letter to Mr. Brockhaus, and returns you your former letter. 2. Mrs. Wheaton will draw at once on Mr. Brockhaus, at twenty days, for 6,000 francs. 3. When Mrs. Wheaton learns that the bill is paid, she will execute instruments satisfactory to you, which shall in the first place bind her not to use your notes without your written consent, and in the next place give you all her claims and interests in respect to the whole book, text and notes, for continental Europe in future.

Inadvertently Mr. Parsons omitted to restate the second clause of the agreement as expressed in the memorandum, that Mrs. Wheaton would give to the complainant the right to make any use he wished of his own notes; but, his attention having been called to the omission by the complainant on the following day, he replied, on the 19th of the same month, that the complainant was certainly right in his construction of their arrangement, that the complainant under it could make any use he saw fit of the matter which he had contributed. Appended to that letter is a note in the nature of a postscript, dated four days later, in which the writer suggests that Mrs. Wheaton was bound by her contract with Little, Brown & Co., as the publishers of the then current edition of the work, and that she could not convey to him anything covered by her copyright in any way detrimental to that edition; but he proposed no alterations of the agreement, and confirmed the same by his two letters, and none was made or proposed by the parties. Prior to the 31st of August, 1863, the complainant received intelligence that the bill of exchange drawn by the said Catharine had been duly honored, and on that day he wrote to Mr. Parsons, requesting him to cause the agreement of June 14, 1863, to be carried into effect. Delay ensued before any response was received to that request; but when it came, October 17, 1863, it brought with it a draft for the formal agreement, as stipulated in the memorandum. As originally prepared, the draft contained three several stipulations. First, that the said Catharine should retain unimpaired the full legal exclusive copyright in the text of the book. Second, that she should in all ways respect the rights of the complainant to all the notes and other matter of his own composition which he had added to the book in the same manner and to the same extent as if he had a full legal copyright of the same. Third, that she thereby transferred and assigned to him thereafter the whole title, text and notes, to the editions published in continental Europe.

Besides these several stipulations, there was interlined in pencil at the close of the second stipulation the words following, to wit:

But the said W. B. Lawrence shall not publish a new edition thereof until the last edition is sold.

Beyond doubt the draft was prepared without the words in pencil, and the explanations of Mr. Parsons upon the subject are that he probably exhibited the paper after it was drafted to the said Martha B., or to the respondent, Charles C. Little, and that he made the interpolation at their suggestion. Dissatisfied with the draft as prepared, the complainant returned it to Mr. Parsons. His objections were twofold, as expressed in the letter

returning the paper. First, because it made no reference to the "*Historie du Droit des Gens;*" but, chiefly, on account of the stipulation that he should not publish a new edition until the last edition was sold, which he declared to be wholly inadmissible, as it would lead to new embarrassments. Alterations were subsequently made in the form of the draft, obviating the first objection, and limiting the restriction constituting the second and principal one, so that the complainant might publish a new edition before the last was sold anywhere except in the United States; but he declined to adopt it, insisting that the agreement as expressed in the memorandum contained no such stipulation. Determined not to involve himself in new complications, the complainant returned the last draft as amended to Mr. Parsons, stating to him at the same time that he had concluded, on reflection, to decline accepting any paper from Mrs. Wheaton. He had previously given him to understand that no such arrangement could be accepted, and more than intimated that if Mrs. Wheaton did not accede to his views in that behalf, matters must rest as they were in the original agreement. Contention, however, arose by some means between the parties in respect to what was quite unimportant, and what was not probably thought of by them or by Mr. Parsons when the memorandum was framed and executed.

Stipulations for the protection of the contract with the publishers of the prior editions were unnecessary, as their remaining interests, if any, were vested, and, being antecedent to the negotiations between these parties, could not be impaired by the agreement contained in the memorandum, for the reason, as clearly stated by the complainant, that Mrs. Wheaton could not convey what she did not own.

Viewed in any light, the correspondence shows nothing more than that the parties disagreed as to the extent of the obligation imposed by the memorandum, which is a question of construction; but it was never even suggested that it did not contain a complete valid agreement. Conclusive proof that neither Mr. Parsons nor Mrs. Wheaton entertained any such views during that period is found in the drafts for the formal instrument as prepared by the former, executed by the latter, and forwarded to the complainant for his acceptance. Both were prepared and signed, as therein recited, "*in execution of an agreement heretofore made by and between*" Mrs. Wheaton and the complainant, which is plenary evidence that up to that time the agreement expressed in the memorandum as to the notes was regarded as complete and obligatory.

II. Abandonment is the next defense to be considered; but the proposition must be examined in view of the conclusion announced, that the stipulations contained in the memorandum, as to the notes contributed by the complainant, are a perfected agreement, and not a mere proposal, as suggested by the respondents. Mere proposals may in general be withdrawn at any time before they are accepted by the party to whom they are made; and ordinary contracts, executory on both sides, may in certain cases be regarded as forfeited, as where the reciprocal stipulations are dependent, and where a party seeking to enforce performance has himself omitted to do something which he was required to perform as a condition precedent to his right of action. Cases may arise also where a party is estopped to set up a particular contract, as where he has subsequently agreed in due form of law and for a valuable consideration to relinquish its benefits or not to enforce its provisions, or where he has, by his representations and conduct, designedly caused the other party to believe that the contract had been discharged or that it would not be enforced, and has intentionally induced that party to act on that belief, to his pecuniary prejudice; if the belief so induced is unfounded, the party in fault in such a case is estopped to allege or prove the falsity of his representations as evidenced by his words and conduct. (*Pickard* vs. *Sears*, 6 Ad. and Ell., 474; *Freeman* vs. *Cooke*, 2 Exch., 654; *Van Rensselaer* vs. *Kearney*, 11 How., 326; *Hawes* vs. *Marchant*, 1 Curt., 144; *Moore* vs. *Crofton*, 3 Jones & La T., 446.)

Argument to show that the case is not one of forfeiture is unnecessary, as the proposition finds no support whatever in the evidence. Contracts executed on one side and unperformed on the other stand upon a very different principle from those where nothing has been done by either, so far as respects the party who has fulfilled his obligation and paid the stipulated consideration. Rights and obligations secured or imposed under such circumstances have become vested and absolute; and if the delinquent party seeks to avoid the obligation imposed on him, he must allege and prove a new contract, for a valuable consideration, amounting to a valid release, or that the other party is estopped to enforce the obligation by virtue of some operative binding agreement to relinquish the benefits from the same, or not to enforce the stipulation; or he must allege and prove that he has been deceived and designedly misled by the admissions and representations of the other party, as before explained. (*Foster* vs. *Dawber*, 6 Exch., 854; *Edwards* vs. *Chapman*, 1 Mees. & Wels., 231; *Wildes* vs. *Fessenden*, 4 Met., 12; 1 Smith Lea. Cas., 5th Am. ed., 462; *Bank of Virginia* vs. *Groves*, 12 How., 51.) None of the elements of estoppel exist in this branch of the case, as the complainant did not agree that he would discharge the memorandum or that he would not enforce its provisions. Nothing approximating to such an agreement is exhibited in the record, nor do the respondents in fact set up any such defense. What they do set up is that the complainant relinquished and abandoned any agreement in the premises, and so notified the respondents, by which it is understood they refer to the letter of the complainant, addressed to Mr. Parsons, of the 2d of November, 1863, in which he says—

> On reflection, I have determined to decline accepting any paper whatever from Mrs. Wheaton, and therefore return the inclosed,

meaning the amended draft for the formal agreement. Disconnected from the circumstances and the other correspondence, it might be possible to misunderstand the meaning of the writer of that letter; but it must be construed in view of what preceded it, and of the subject-matter to which it related. Since the 31st of August preceding the date of that letter, the complainant had been more or less engaged in efforts to procure the formal agreement in respect to the notes as stipulated in the memorandum; but all his efforts proved fruitless. Only eight days before, he prepared the draft of the letter exhibited in the record as one intended for the same correspondent, in which he stated to the effect that his sole object in asking for the formal agreement was to prevent any further litigation, saying that he was satisfied that without it he could restrain any attempt to use these notes by Mrs. Wheaton, or any one else, in a future edition, adding, at the same time, that if she "does not sign the paper as now suggested," meaning one of the drafts for the formal agreement, without any restriction as to the use of the notes, then "matters can rest as they are." Although never sent to his correspondent, the exhibit may well be referred to as tending to show the real intent of the complainant at the time it was written.

Weighed in view of the antecedent correspondence and the surrounding circumstances, it certainly would be a perversion of the language of the complainant to regard what he wrote on that occasion either as an agreement to relinquish or not to enforce that stipulation; and, even when separately considered, the language falls far short of what is necessary to justify any such conclusion. He made no admission by that statement inconsistent with the claim he now sets up; nor did he say anything to induce the said Catharine, or any one of the respondents, so to act that either she or they will be injured if the agreement expressed in the memorandum is held valid and enforced. (*Howard* vs. *Hudson*, 2 El. & Bl., 10; *Audenried* vs. *Betteley*, 5 Allen, 385; *Pierrepont* vs. *Barnard*, 2 Seld., 291; *Rich* vs. *Atwater*, 16 Conn., 416; *Plumer* vs. *Lord*, 9 Allen, 458.) Expressions of a doubtful character are not sufficient to support such a defence as against a contract fully executed on the part of the complainant; but the meaning of the language employed must be clearly such that a man of ordinary prudence would take the representation to be true, and believe that it was meant that he should act upon it; and it must also appear

that he did act upon it as true, so that he will be pecuniarily injured if it be allowed to be disproved. (*Rich* vs. *Atwater*, 16 Conn., 415; *Mowry* vs. *Sheldon*, 2 R. I., 379; *Flagg* vs. *Mann*, 2 Sum., 516; *Langdon* vs. *Doud*, 10 Allen, 435; *Moore* vs. *Crofton*, 3 Jones & La T., 446.)

Estoppels are allowed to shut out the truth only when it is necessary to protect a party setting up such a claim or defense against an injury or liability to which he is exposed without his own fault, and by reason of having trusted to the statements designedly made by the other party to expose him to such injury or liability, and which were of such a character that a man of ordinary prudence would take the representations to be true, and believe it was meant that he should act upon them as presenting the true state of the case. They must be proved, and will not be extended by implication beyond the plain import of the deceptive act, admission, agreement, or representation. When the request was made by the complainant for the formal agreement he doubtless expected that it would include the "Histoire," as well as the notes specified in the memorandum, and perhaps the memoir of the author and the indices; but the better opinion is, that, when he wrote the letter of June 14, 1863, he surrendered all claim to everything mentioned in the antecedent negotiations, except the claim to the notes as already secured, including, of course, the arrangement of the same, and the mode in which they are therein combined and connected with the text. All claim to the copyright of the text was abandoned by the complainant at a very early period of the negotiations, and it does not appear that it was ever after renewed.

Abundant evidence exists in the record to show that Mrs. Wheaton, as well as Mr. Parsons and Miss Wheaton, was willing to concede the claim of the complainant as to the history; but inasmuch as it was not included in the memorandum, the conclusion of the court is, that the complainant, when he elected to stand upon the original agreement, relinquished that claim. He had previously described it as a matter of little or no value; and when he gave notice that he had determined not to accept any paper whatever from Mrs. Wheaton, it must be understood that he was content with what was secured to him in the memorandum. His right to the notes is therein plainly expressed, and there is no evidence in the record which shows that Mrs. Wheaton, or any one of the respondents was ever misled by the language of the letter giving that notice. Conclusive evidence to the contrary is found in the several answers of the respondents, and their subsequent conduct confirms that conclusion.

III. Grant that the memorandum was regarded by the parties thereto as a contract, still the respondents contend that it cannot be enforced, because, as they allege, it was procured by the fraudulent misrepresentations and concealments of the complainant. They submit that general proposition, and under it they make the following specific accusations: First, that when the negotiation as to the notes was commenced there was not, in fact, any understanding between the complainant and Mr. Brockhaus that the former should perform for the latter any editorial labor, either of revision or of translation. Second, that the foreign publisher was ready at that time to pay the six thousand francs to Mrs. Wheaton, without requiring any such labor from the complainant. Third, that the said publisher had not then made a final proposal to the complainant to pay anything to any one in that behalf, as appears by his letters addressed to the complainant. Fourth, that the complainant concealed the contents of those letters from Mrs. Wheaton, and those acting in her behalf. Fifth, that he falsely represented to her and those acting for her that the said publisher would not pay the sum specified, except upon his undertaking to revise his annotations, and make such additions to the same as would adapt them to a new addition to be sold in Europe, and the general charge is that she was induced to assent to the memorandum by reason of those false representations.

Accusations of fraud amount to nothing as a defense to a contract otherwise legal and binding, unless they are satisfactorily proved; and the burden of proof to establish such a defense is upon the party who makes such a charge. (*Attwood* vs. *Small*, 6 Cl. and Fin., 447; 1 Story, Eq. Jur., § 200; *Park* vs. *Johnson*, 4 Allen, 266; *Jennings* vs. *Broughton*, 5 De G., M. and G., 132; *Campbell* vs. *Fleming*, 1 Ad. and Ell., 41.) Apart from the inferences attempted to be drawn from the correspondence between the complainant and the foreign publisher, it is scarcely pretended that those accusations find any substantial support in the record; and the court is of the opinion that the several letters, when properly construed and considered in their proper connection, show that every one of the specific suggestions of fraud is unfounded. Correspondence between the complainant and the foreign publisher, in relation to a new edition of the work for the foreign market, commenced more than three years before the date of the memorandum; and in the first letter written by the complainant he stated that he did not expect any compensation for his services, but that he should desire to obtain what he could for the widow of the author; and it is a mistake to suppose that the negotiation as to the notes commenced before there was any understanding upon that subject between those parties. Enough certainly had been learned to satisfy any reasonable person that the arrangement could be made if desired, and that was sufficient to justify the complainant in ascertaining what would be conceded as to the notes. Equally unfounded also is the charge that Mr. Brockhaus was ready at that time, or at any time before or afterward, to pay the six thousand francs without any stipulation from the complainant to revise the notes and superintend their publication. His letter of the 29th of April, 1863, is a complete refutation of both those charges, and shows to a demonstration that the services to be rendered by the complainant really constituted the chief inducement to the arrangement. Convinced that the "rich emendations" made to the work by the complainant would, if adapted to his proposed new edition, be of great value, he was desirous to secure his services to accomplish that object, and, in order to do that, he was willing to pay the described amount. By his letter of June 12, 1860, Mr. Brockhaus called for a definite proposal; and the complainant, in his letter of August 25, 1862, complied with that request, and made the proposal, which, with slight modifications, was subsequently accepted; but, whether before or after the commencement of the negotiations as to the notes, is wholly immaterial. The charge that the letter of the 29th of April, 1863, or any of the others, was concealed from Mrs. Wheaton or those acting in her behalf, is disproved by the correspondence from which the inference is attempted to be drawn. Taken as a whole, the correspondence satisfies the court that the foreign publisher never did agree to pay the six thousand francs, except upon the undertaking of the complainant to revise his annotations, and to adapt the same to the proposed new edition for the foreign market, and that the respondents have failed to prove that the complainant was guilty of any fraudulent misrepresentations or concealment.

IV. Extended argument to show that the fourth proposition of the respondents cannot be sustained, is unnecessary, as it finds no support in the evidence. Founded as the proposition is upon the theory that the foreign publisher was willing to pay the money for antecedent obligations, or as a gratuity to the family of the author, it is sufficient answer to it to refer to what is said in response to the preceding proposition without entering into details.

V. Next proposition of the respondents is that the copyrights of the editions of 1855 and 1863 are void, and consequently that the agreement expressed in the memorandum is inoperative, inasmuch as the parties entered into the same through mutual mistake. They insist that the copyrights are void for several reasons, which will be separately considered: First, because no written assignment of copyright, or of the inchoate right of the complainant thereto, as the author, was ever made to Mrs. Wheaton." Second, because the "notice of copyright inserted in the several copies published of said editions" is defective, "in the omission to give notice in said editions of the copyright secured in the" original edition of the work. Third, because, upon the facts alleged and proved by the complainant, the copy-

rights of the editions in question were not taken out by the proper person, nor in the proper district.

Copyright may be granted under the copyright act to the author of any book falling within the classes described in the first section of the act, if the author is a citizen of the United States or permanently resident therein; and the first section also provides that such author shall have "the sole right and liberty of printing, reprinting, publishing, and vending such book," for the term of twenty-eight years from the time of recording the title of the same as therein required. Executors, administrators, and legal assigns of the author are also included in the purview of the section; but the fourth section provides that no person shall be entitled to the benefit of the act unless he shall, before publication, deposit a printed copy of the title of such book in the clerk's office of the district court of the district where the author or proprietor shall reside; and the provision is that the clerk of such court shall record such printed copy forthwith in a book to be kept for that purpose, and in the form therein prescribed. (4 Stat. at Large, 437.) Where the author continues to be the owner he is entitled to a copy of the title; but if he has parted with the ownership, the requirement is that the clerk of such district shall give a copy of the t tle under the seal of the court to the proprietor. (Ibid., 437.) Proprietors of any such book, though not authors, are also recognized as entitled to the benefits of the act in another provision of the fourth section, in which they are required within three months from the publication of said book to deliver, or cause to be delivered, a copy of the same to the clerk of said district. Legal proprietors, though not authors, may also recover of persons who print or publish any manuscript, the property of which is in them, without their consent, all damages occasioned by such injury. (*Stevens* vs. *Gladding*, 17 How., 447. See also 4 Stat. at Large, 437, 439, §§ 6, 15.)

Left in moderate circumstances, Mrs Wheaton very properly desired to obtain something from the literary publications of her late husband, and with that view she sought the advice of the complainant, as the intimate friend of the author and of his family. Consultations accordingly took place between them upon the subject. Suggestion was first made that his reports of the decisions of the Supreme Court might be republished; but their attention was soon directed to a new edition of the Elements of International Law, as affording more promise of profit beyond mere remuneration. Editorial labors were necessary to such an undertaking, and the complainant tendered his services, and the same were gladly accepted by Mrs. Wheaton and her children.

Pursuant to that arrangement, the complainant edited in succession the two editions in question—that is, he made some additions to and emendations of the text, prepared the notes, composed the memoir, and made the indices. Alterations were made in the arrangement as first concluded; but it is unnecessary to enter into details, as the proofs are clear that the complainant acted throughout that entire period with the distinct understanding that his services in editing those editions were to be gratuitous and without any charge. Speaking of the first annotated edition, the agreement was distinct that the contributions were to be furnished without charge, and the edition of 1863 was prepared with the same explicit understanding between the parties. Although the services were gratuitous, the contributions of the complainant became the property of the proprietor of the book, as the work was done just as effectually as they would if the complainant had been paid daily an agreed price for his labor. He gave the contributions to the proprietor for those two editions of the work, and the title to the same vested in the proprietor, as the work was done, to the extent of the gift, and subject to the trust in favor of the donor, as necessarily implied by the terms of the arrangement. (*Sweet* vs. *Benning*, 16 C. B., 480; *Mayhew* vs. *Maxcell*, 1 Johns. & H., 312.) Delivery was made as the work was done, and the proprietor of the book needed no other muniment of title than what was acquired when the agreement was executed. (*Sweet* vs. *Cater*, 11 Sim., 572; *Simms* vs. *Marryat*, 7 Eng. L. & Eq., 337; *Woods* vs. *Russell*, 5 Barn & Ald., 942; *Atkinson* vs. *Bell*, 8 Barn. & Cress., 277.) Vested as the title and property of the contributions were in Mrs. Wheaton, she would not acquire anything by an assignment from the contributor, as he had neither the immediate title to the contributions nor any inchoate right of copyright in those editions. He could not assign anything, because he owned nothing *in præsenti*, as the title to his contributions and the inchoate right of copyright for those editions had become vested in Mrs. Wheaton as proprietor of the book. (*Clarke* vs. *Spence*, 4 Ad. & Ell., 448; *Laidler* vs. *Burlinson*, 2 Mees. & Wels., 602.) Guided by these views, the court is of the opinion that none of the authorities cited by the respondents to show that a written assignment from the complainant to Mrs. Wheaton was necessary have any proper application to the question under consideration, because the complainant never acquired any right to demand a copyright in his contributions to those two editions, but the contributions as they were made and composed, or put in form, became vested in the proprietor. (*Shepherd* et al. vs. *Conquest*, 17 C. B., 443. 444; Chitty on Con. (10th Am. ed.,) 401; *Tonson* vs. *Walker*, 3 Swanst., 672.) Certain remarks are found in the opinion of the court in the case of *Pierpont* vs. *Fowle*, 2 W. & M. 46, apparently inconsistent with the views here expressed; but the decision of the court in that case is a sufficient answer to those remarks. Contrary views, it is sometimes supposed, are also expressed in the case of *Atwill* vs. *Ferrett*, 2 Blatch., 46; but the learned judge admits that an equitable title may vest in one person to the labors of another where the relations of the parties are such that the former is entitled to an assignment of the production, which is the precise point involved in the case before the court; and many other authorities than those cited in that case sustain the same principle. (*Sweet* vs. *Shaw*, 3 Jurist, 217; *Colburn* vs. *Duncomb*, 9 Sim., 155; *Little* vs. *Gould*, 2 Blatch., 362; *Sweet* vs. *Cater*, 11 Sim., 572; *Mawman* vs. *Tegg*, 2 Russ., 385; *Nicol* vs. *Stockdale*, 3 Swanst., 687; *Cary* vs. *Longman*, 3 Esp., R., 273.)

Second defect in the copyright, as alleged in argument by the respondent, "consists in the omission to give notice in said editions of the copyright secured in the original edition." Persons desirous of securing a copyright must comply with the conditions of the copyright act, and if they fail to do so they are not entitled to the benefit of its provisions. Authorities to support that proposition are not necessary, as those conditions are prescribed by an act of Congress. Deposit must be made before publication, if the subject-matter is a book, of a copy of such book in the clerk's office of the district court, as before explained; and the applicant must give information of copyright being secured, by causing to be inserted, in the several copies of each and every edition published during the term secured, on the title-page or the page succeeding, the following words, viz: "Entered according to act of Congress in the year , by A. B., in the clerk's office of the district court of ," (as the case may be) Beyond doubt, the omission to comply with those requirements renders the copyright invalid, as the act provides that no person shall be entitled to the benefit of the act unless he fulfils those conditions; but the important inquiry arises, what are those conditions? (*Wheaton* vs. *Peters*, 8 Pet., 591; *Ewer* vs. *Coxe*, 4 Wash., 487.) Full compliance with the conditions prescribed in the fourth section of the act is conceded; but the theory of the respondents is that the fifth section of the act requires that the same notice *in totidem verbis* must be inserted in the several copies of each and every edition published during the term secured, so that the second and every subsequent edition shall correctly specify the date of the original entry. They cite no authorities which support the proposition, and they assign no reasons in support of it, except that the act makes no provision for a change of the date in the successive notices to be given, and that the omission to give notice of the original copyright in subsequent editions tends to mislead the public. Acts of Congress are to be construed by the rules of the common law, and the construction should be such as will carry into effect the true intent and meaning of the legislature; but the province of construction can never extend beyond the language employed as applied to the subject-matter and the surrounding circumstances. (*Rice* vs. *Railroad*, 1 Black, 359; *Binney* vs. *Canal Co.*, 8 Pet., 201.) Change of date in the notice required in case of successive editions of the same book, it may be conceded, is not contemplated by the fifth section of the copyright act; but the meaning of the provision is that a new notice in the same prescribed form shall be given in every improved edition published during the term. Compliance with that requirement, when the original edition is published, is a full protection for that edition throughout the term; but it is no protection to a second edition with notes, nor to any succeeding edition with improvements, because the requirement is that the "information of copyright secured" shall be "inserted in the several copies of each and every edition." Neglect to comply with that condition in a second edition will not vitiate the copyright of the original edition if it was regularly secured, nor will a valid copyright of a second edition cure material defects in the copyright of the original edition. Copyrights of the editions of a work other than the original edition are granted for additions to, emendations of, or improvements in the work, and every copyright should bear date of the day when it was secured. Authors or proprietors of a book for which a copyright is secured are required by the second section of the act of the 3d of March, 1865, "within one month of the date of publication" to transmit, free of postage or other expense, a printed copy of the book to the library of Congress at Washington, for the use of said library; and the fourth section provides that, in the construction of that act the word "book" shall be construed to mean every volume and part of a volume, together with all maps, prints, or other engravings belonging thereto, and shall include a copy of any second or subsequent edition which shall be published with any additions; but the proviso enacts that the author or proprietor shall not be required to deliver to the said library any copy of the second or any subsequent edition of any book, unless the same shall contain additions as aforesaid, nor of any book not the subject of copyright. (13 Statutes at Large, 540.) Prior to the passage of that act, the courts had decided that the "information of copyright being secured," if duly entered in the first volume of a work of several volumes, was sufficient; but all the residue of the provision is merely in affirmance of the true intent and meaning of the copyright act. (*Dwight* vs. *Appleton*, 1 N. Y. Leg. Obs., 198.) Subsequent editions without alterations or additions should have the same entry, because they find their only protection in the original copyright; but second or subsequent editions with notes or other improvements are new books within the meaning of the copyright acts, and the authors or proprietors of the same are required to "deposit a printed copy of such book," and "give information of copyright being secured," as if no prior edition of the work had ever been published; and the term of the copyright as to the notes or improvements is computed from the time of recording the title thereof, and not from the time of recording the title of the original work. Copyrights, like letters patent, afford no protection to what was not in existence at the time when they were granted. Improvements in an invention not made when the original letters patent were issued are not protected by the letters patent, nor are the improvements in a book not made or composed when the printed copy of the book was deposited and the title thereof recorded as required in the fourth section of the copyright act. Protection is afforded by virtue of a copyright of a book, if duly granted, to all the matter which the book contained when the printed copy of the same was deposited in the office of the clerk of the district court, as required by the fourth section of the copyright act; but new matter made or composed afterward requires a new copyright, and if none is taken out, the matter becomes public property, just as the original book would have become if a copyright for it had never been secured. Publishers may be in the habit of inserting more than one notice in new editions, but there is no act of Congress prescribing any such condition. Whenever a renewal is obtained under the second section of the copyright act, the requirement is that the title of the work so secured shall be a second time recorded, and that the applicant must comply with all the other regulations in regard to original copyrights; but there is nothing in any act of Congress to show that each successive edition must specify the date of the original copyright, as contended by the respondents. Tendency to mislead the public cannot be successfully predicated of a copyright in due form of law, where it appears that the party who secured it complied with all the conditions prescribed in the copyright act, which is all that need be remarked in reply to the suggestion of the respondents upon that subject.

Special examination of the third objection made by the respondents to the copyrights in question is unnecessary, as it is clear that if the property and title of the matter contributed by the complainant vested in Mrs. Wheaton as the work was done, she was the proper person to take out the copyright; and it is not controverted that, if she was the proper person, she took it out in the proper district.

Based as the objections to the validity of the copyrights are upon an assumed construction of the fifth section of the copyright act, the court thought it right to examine the several questions presented upon their merits; but it would be a sufficient answer to the entire proposition to say that no such defence is set up in the answer. (*Foster* vs. *Goddard*, 1 Black, 518.) Other answers are made by the complainant to the proposition; but the court having come to the conclusion that it is founded in a misconstruction of the copyright act do not find it necessary to give the other suggestions much consideration. Stated in brief words, the conclusions of the court are that the copyrights are valid, and that the agreement set forth in the memorandum is binding.

VI. Unexecuted, however, as the agreement is, it does not transfer nor assign the copyrights in question to the complainant. Both parties agree to that proposition; but the respondents err in supposing that the agreement does not provide for nor contemplate any such transfer or assignment, as is plainly shown by the very terms of the memorandum. Copyright of a book, when taken out in due form, secures to the author or proprietor the sole right and liberty of printing, reprinting, publishing, and vending such book during the term for which it is granted; but it secures nothing more; and the agreement was that Mrs Wheaton, who held the legal title of the copyrights, should make no use of the notes in a new edition without the written consent of the complainant, and that she would give him the right to make any use of the same he might see fit, which was in all respects equivalent to a contract to transfer and assign to him the legal title to the copyrights. Equity would have compelled the execution of the formal instrument therein stipulated if the right to demand it had not been waived by the complainant. His claim as now presented is twofold, and in the judgment of the court it may be sustained upon both grounds. (Curtis on C., 315; *Mawman* vs. *Tegg*, 2 Russ., 385; *Sweet* vs. *Shaw*, 3 Jurist, 217; *Colburn* vs. *Duncombe*, 9 Sim., 155.) The legal title to the copyrights is in Mrs. Wheaton or her legal representative, and the complainant claims in the first place that the same is held in trust for him as the equitable owner of the notes by virtue of the original arrangement under which the same were prepared. Secondly, the complainant claims that the negative as well as the affirmative promise contained in the agreement in regard to the use of the notes was binding upon Mrs. Wheaton, and that both are obligatory upon her legal representative, and all others having notice of the existence of those covenants. (*Barfield* vs. *Kelly*, 4 Russ., 355.)

Two principal objections are taken by the respondents to the claim of the complainant that he is the equitable owner of the notes under the original arrangement. First, they deny that the proofs in the case warrant any such finding, especially as the theory is denied in the answer. Second, they contend that Mrs. Wheaton, if such was the agreement, could not legally copyright the notes, as it would show that she was but a mere licensee, and that the copyrights in that state of the case would be void on that account.

First, conclusive proof to show what was the original

understanding between the parties is found in the correspondence upon the subject. Unaided by any one, the complainant prepared the notes, but with the express understanding that he would do so without any charge, and that the property of the same, so far as respected the new edition, should vest in the proprietor of the book, and that she should take out the copyright and remain, as she was, the sole and exclusive owner of the entire book. Liberal, however, as the agreement was toward the proprietor of the book, yet it did not include anything except that edition; and when the second annotated edition was prepared under a similar arrangement, as conceded by both parties, the agreement was not extended beyond that publication. Confirmation of those propositions is unnecessary, as they are not controverted by the respondents. They deny that it was agreed between the parties that the notes should ever afterward become the property of the complainant, but they do not allege nor offer any proof tending to show that his agreement with Mrs. Wheaton extended beyond the annotated editions. Tested by these indubitable facts, the rights of the parties are plain and easy to be understood. As the proprietor of the book, Mrs. Wheaton, by virtue of that arrangement, became the absolute owner of the notes as they were prepared, so far as respects the editions in question; and she also acquired therewith the right to copyright the same for the protection of the property; but she did not acquire thereby any right or title, legal or equitable, to use the notes in a third edition of the annotated work without the consent of the complainant. Proof to support any such right or title is entirely wanting in the record, and no such right or title is set up in the answer. (*Sweet* vs. *Cater*, 11 Sim., 572.) Such omission confirms the view that no such right or title was intended to be conveyed, and the subsequent conduct of the parties in executing the memorandum tends strongly to the same conclusion.

Second, suppose the facts to be so, then the respondents contend that the copyrights are void, because, as they insist, the applicant for the same was a mere licensee of the author of the notes; but the court is of a different opinion for the reasons already given, as well as for others yet to be mentioned. Literary property, even when secured by copyright, differs in many aspects from property in personal chattles, and the tenure of the property is governed by somewhat different rules; but the difference in the nature and tenure of the property is much greater before copyright is taken out, and while the right to that protection for the same remains entirely inchoate. Title to the notes or improvements prepared for a new edition of a book previously copyrighted may, in certain cases, be acquired by the proprietor of a book from an employee, by virtue of the contract of employment, without any written assignment; and, when so acquired, the tenure of the property depends upon the terms of the contract, but it cannot be held to be a mere license where, as in this case, the contract was that the proprietor of the book should take the exclusive right to the contributions for two successive editions, together with the right to copyright the same for the protection of the property, as the inchoate right of copyright unquestionably passed to the proprietor of the book by the same arrangement (*Agawam Co.* vs. *Jordan*, 7 Wall., 603; *Fletcher* vs. *Morey*, 2 Story, 564.) Such inchoate right is incapable of any other limitation than that prescribed by the copyright act, so that the proprietor of the book necessarily took out the copyright in the usual form. Beyond controversy, she took it out by the consent of the complainant; and it is equally clear, in the judgment of the court, that she took it out for the protection of her own property in the notes, and in trust for the complainant when her property in the notes should cease. (*Maxman* vs. *Tegg*, 2 Russ., 385; *Little* vs. *Gould*, 2 Blatch., 365.) Arrangements of the kind, it is believed, are frequently made between the proprietors of books and editors employed to prepare notes or other improvements to successive editions; and it is not perceived that there is any legal difficulty in upholding such a contract where, as in this case, it violates the rights of no one, and is entirely consistent with the public right. (*Fletcher* et al. vs. *Morey*, 2 Story, 566.) Entered into as it was in good faith, and with a full knowledge of all the facts, it was not void; and neither the representative of the proprietor of the book, nor any other person having notice of the same is at liberty to repudiate it, as it appears that it was knowingly acted upon in a way that the complainant would suffer serious pecuniary injury to allow it to be disproved. (*Farina* vs. *Silverlock*, 39 Eng. L. & Eq., 516; *Ecolt* vs. *Bannister*, 17 C. B. (N. S.) 708; *Sherman* vs. *Champlain Co.*, 31 Vt., 175; *Cairncross* vs. *Lorimer*, 3 Law Times, 130.)

Covenant is the second ground of claim as set forth in the bill of complainant, and it is undoubtedly true, as contended by the respondents, that the theory of the claim as presented in allegation and in proof is that the legal title to the copyrights vested in the proprietor of the book. The respondents in argument deny that proposition, and insist that the copyrights are void; but the objections they make to their validity have already been examined and overruled, and the reasons assigned for the conclusions need not be repeated. Expressed as the promises are, both the negative and affirmative, in plain and unambiguous language, they require neither construction nor explanation; and it is clear that they are binding upon the legal representative of the proprietor of the book, and all others having notice of the rights of the complainant. (*Colby* vs. *Duncombe*, 9 Sim., 155.) Mrs. Wheaton died March 5, 1866, leaving two children; but it is alleged and conceded that the respondent, Martha B. Wheaton, is the administratrix of her estate, and so far as respects the book in question her sole heir. Controlled by these reasons, the court is of the opinion that the complainant, in the view of a court of equity, is the equitable owner of the notes, including the arrangement of the same, and the mode in which they are therein combined and connected with the text, and of the copyrights taken out by the proprietor of the book for the protection of the property, including the equitable ownership of the complainant. (*Fletcher* vs. *Morey*, 2 Story, 564; *Parker* vs. *Muggridge*, 2 Story, 342; *Clark* vs. *Southwick*, 1 Curt., 299; *Rerick* vs. *Kern*, 14 S. & R., 271; *Simms* vs. *Marryat*, 7 Eng. L. & Eq., 337; Curt. on C., 315; *Mayhew* vs. *Maxwell*, 1 Johns. & Heni., 315.)

Brief examination will next be made of the special defence set up by the respondents who published the edition of the work which is the subject of complaint, and also by the respondent who edited the same, that they cannot be adjudged liable to any decree, because they had no notice of the alleged trust or agreement. Plenary proof is exhibited in the record that the senior partner of the publishing firm had full knowledge of all the circumstances attending the preparation of the notes and the publication of the two annotated editions, and also full knowledge of the memorandum at the time it was executed, and of all the subsequent negotiations in respect to the formal agreement. Reference need only be made to the correspondence in the record, and to his own answer and deposition in the case in support of that proposition; and the circumstances as disclosed in the correspondence show to the entire satisfaction of the court that the other members of the firm knew, or might have known, what the claim of the complainant was to the notes long before the contract for publishing the edition in question was executed, and all the facts and circumstances connected with the claim, as fully as they were known to their senior partner. Proof beyond what already appears is certainly unnecessary to show that the proprietor of the book and the respondent, Martha B. Wheaton, were repeatedly apprised of the claim of the complainant in terms which could not be misunderstood. Their friend and legal adviser knew all that had transpired, and, in view of the circumstances, and the acknowledged intimacy of the respondent, who edited the edition, the conclusion of the court is, without hesitation, that he knew enough of the claim of the complainant to put him upon inquiry. His answer tends strongly to support that proposition, and the same inference is fully justified by his deposition. He admits that the proprietor of the book, when the agreement that he should edit the edition in question was made between them, expressed the wish that he should not make any use of the notes prepared by the complainant; and in his cross-

examination he states to the effect that the respondent, Martha B. Wheaton, proposed to read to him all that had passed between her mother and herself, Mr. Parsons, and Mr. Lawrence, but that he declined to hear it, wishing to confine himself as much as possible to the position of an editor. Some of the remarks made by the same respondent, in the interview which took place between him and the complainant, and his conduct in refusing to read the letter of the complainant when it was handed to him for that purpose, tend strongly in the same direction. Nothing is better settled than the rule that whatever puts a party upon inquiry is sufficient notice in equity.

Ordinary prudence is required of every person dealing with trust property, and if he fails to investigate when put upon inquiry he is chargeable with all the knowledge it is reasonable to suppose he would have acquired if he had performed his duty. (*Hill* vs. *Simpson*, 7 Ves. Jr., 170; *Kennedy* vs. *Greene*, 3 Myl. & K., 722; Com. Dig., Chan., 4 C., 2; *Smith* vs. *Low*, 1 Atk., 489; 3 Sug. on V. and P. (10th ed.,) 471; *Jones* vs. *Smith* 1 Hare, 43; *Booth* vs. *Varnum*, 9 Conn., 236; *Pitney* vs. *Leonard*, 1 Paige, Ch. R., 461; *Carr* vs. *Hilton*, 1 Curtis, 390.)

Constructive notice is held sufficient, upon the ground that when a party is about to perform an act by which he has reason to believe that the rights of a third person may be effected, an inquiry as to the facts is a moral duty, and diligence an act of justice. Hence, says Judge Duer, in the case of *Pringle* vs. *Phillips*, 5 Sand., S. C. R., 157, he proceeds at his peril when he omits to inquire, and is then chargeable with all the knowledge of the facts that by a proper inquiry he might have ascertained. (*Hawley* vs. *Cramer*, 4 Cow., 717; *Williamson* vs. *Brown*, 20 Law Rep., 397; *Fulton Bank* vs. *Canal Co*, 4 Paige, Ch. R., 127; *Bank of Alex.* vs. *Seton*, 1 Pet., 309.) Inquiry is a moral duty whenever the circumstances are such that a person of ordinary prudence would refuse to act; but if a party under those circumstances shuts his eyes to the means of knowledge which he knows is at hand, he then forfeits every pretence of defence, as such conduct is equivalent to actual notice of all the facts he might have ascertained by a performance of his duty. (*May* vs. *Chapman*, 16 Mees. & Wels., 355.)

Grant that the several conclusions announced by the court are correct, still the respondents insist that the complainant is not entitled to a decree, because they contend that they have not infringed the equitable right of the complainant to the exclusive use of the notes in question, nor violated the terms of the agreement as expressed in the memorandum.

Before proceeding to examine the question of infringement, it will be necessary to reproduce, as concisely as possible, some of the principal issues upon the subject as presented in the pleadings.

Statement of the complainant is that, prior to the last edition annotated by him, there was no book of international law in which all the authorities bearing upon the different questions discussed or referred to in the original work of the author, or in his antecedent annotations, were collected and presented in a convenient form for reference. Such authorities as he represents consisted of judicial decisions, diplomatic discussions by distinguished diplomatists, and dissertations, treatises, and lectures of learned publicists and writers upon the law of nations; that he undertook to collect and present, and by a considerable amount of labor and intellectual exertion did collect and present, in his notes and in a convenient form, with reference to each question so discussed, the discussions and opinions as aforesaid, translating such as were in any foreign language, and giving them in full where they seemed sufficiently important to be so presented, and in other cases referring to them giving the name of the book and the page where the passage could be found; that many of the authorities so collected, and particularly those relating to diplomatic discussions and negotiations, and those showing the way in which cases involving principles of international law have arisen between different nations and been determined, are to be found in newspapers, gazettes, legislative debates, the series of books such as the Annual Register and others named or referred to in the bill of complaint, not treatises on international law; that there is no book which can serve as an index or digest to assist an author in any material respect in collecting such authorities; that the number of books and papers of that nature examined by him in searching for the authorities and matters cited by him is so great that it is only possible to make such collection by devoting much attention to the subject for many years, and by making and preserving memoranda of such matters bearing upon the subject as from time to time they come to the knowledge of a person giving a large share of his attention to such matters, and reading all such books as relate to the subject, and availing himself of much intercourse with persons conversant with such matters. Corresponding statement of the respondent is that the plan of work he adopted was to take the text of the author of the book with his notes and annotate the same with original notes of his own, in the same manner as if they had never before been annotated; that it was no part of his plan to revise, reduce, or alter the complainant's notes, even in such manner as the law of copyright would have permitted if the complainant had had a copyright therein; but that his course was after reading a topic in the text, if he thought it required annotation, to examine all the works to which he had access bearing upon the topic, and, among others, but not more or differently than others, the contributions of the complainant. When he had made all the examination he thought necessary, the allegation is that he then gave the subject the best reflection he could, and subsequently wrote out a new and original note in every instance, in manuscript throughout, in his own hand or that of an amanuensis, and without other reference to, or assistance from, any notes of the complainant than as above stated.

The complainant also alleges that in preparing the text of his edition he exercised a considerable amount of skill and judgment in the arrangement of his annotations, and in combining and connecting them with the text, and that he prepared a complete index to the same; and he charges that the respondents, in their book, have copied, conformed to, and pirated the said annotated book and the annotations of the same which he prepared; and that they have used and availed themselves of the said book and annotations and the said labors of the complainant. Responsive to the charge that his notes are in a great part taken and copied from those of the complainant, and that he has pirated and unduly used the contributions of the complainant, the respondent totally denies the same and every part thereof. Evidence to show that the notes in the two annotated editions of Wheaton's Elements of International Law, as prepared by the complainant, involved great research and labor beyond what appears in those two works, is unnecessary, especially as the allegations in the bill of complaint to that effect are not directly denied in the answer; and it is equally obvious and clear that the results of the research and labor there exhibited could not well have been accomplished by any person other than one of great learning, reading, and experience in such studies and investigations. Such a comprehensive collection of authorities, explanations, and well-considered suggestions is nowhere, in the judgment of the court, to be found in our language, unless it be in the text and notes of the author of the original work. Uncontradicted as these propositions are, it would be an act of supererogation to add anything further in their support. Much, also, has been accomplished by the last editor of the work in the same direction, and in the collection and presentation of similar matters wholly distinct and separate from what was antecedently collected and presented by the complainant. But the review and comparison of the merits of the respective books are not matters within the province of the court, except so far as the same become necessary in order to decide the issues involved in the pleadings. Stripped of all mere form, the charge against the respondent is that he has infringed the rights of the complainant; and that question is the only one of much importance which remains to be considered. Apart from the testimony of the parties themselves, and the comparison of the books, the evidence in the case consists mainly of the testimony of the two experts, and the result of the respective comparisons made by them, of the notes and citations of authorities contained in one of the books with those of a corresponding character contained in the other, together with the opinion of each expert witness, whether the several notes and citations so examined and compared are or are not of the same character. Though admissible in all such cases, the opinions of experts are nevertheless in their nature secondary evidence; but the comparisons made by them in this case have very much facilitated the investigations made by the court. Considerable aid has been derived from that source, and from the testimony of the parties; but the court has found it necessary to re-examine the comparisons made by the witnesses, and to make others for themselves, in order to come to a satisfactory conclusion. Regarded as a basis to enable the court to compare one book with the other, the results given by the experts as exhibited in their depositions, have proved to be of great service to the court in estimating the weight to be given to their respective opinions. Complicated as the facts are, the examination of the case has imposed much labor upon the judges; but the investigation has been made with care, and continued from time to time until both are satisfied that the court is prepared to render a just decision. Like other controversies of a similar character, the issue upon the merits presents two questions, one of fact and the other of law. Stated in brief terms, the question of fact is, What use did the respondents who edited the edition in question make of the complainant's notes? And the question of law presented, inasmuch as it is conceded that he used the same to some extent, is, Was that use allowable, or was it of a character and to such an extent that it infringed the complainant's rights? Direct evidence upon the subject is unattainable, as the respondent states that he cannot remember nor undertake to give the authors from whom he derived any particular class of citations. Difficult though it be to make proof, still the complainant is not entitled to any decree unless he proves infringement, as alleged, to the satisfaction of the court, as the burden in that issue is always upon the party making the charge. Except that the burden is upon the complainant, the same difficulty is experienced by the respondents in their efforts to prove the affirmative allegations of the answer, and consequently both parties are obliged to rely chiefly upon a comparison of the contents of the respective books, as the best evidence which either party is able to produce. Examination of the notes contained in the respective books will show that the description given of them by one of the respondents' witnesses is quite accurate. He states to the effect that they are either statements of historical events, accounts of legislative debates, narratives of diplomatic discussions, negotiations, or correspondence, abstracts of cases in the courts or judicial tribunals of different countries, or summaries

of other text-writers or essayists on international law, and other kindred topics, accompanied with references to the books and documents where the matters are to be found. Such authorities and references of the kind mentioned are very numerous in the edition containing the notes of the complainant, and he contends that the respondent has made a much larger use of such notes, references, and authorities, including those collected and presented by him to illustrate particular topics of international law, than the law of copyright or the agreement between him and Mrs. Wheaton, as expressed in the memorandum, will permit. Numerous instances are given where the same topics are illustrated in the two works by reference to the same historical facts or diplomatic negotiations, and where the views expressed are supported by the citation of the same books, pamphlets, debates, and newspapers; and the complainant contends that these coincidences occur in instances so numerous that it is past belief that they could be accidental; and he insists that the just inferences to be drawn from these coincidences, when taken in connection with the admission of the respondent that he did make some use of the complainant's book for the purposes of reference, fully sustain the burden of proof on his part, and justify the conclusion that, in each particular instance in which the citations and authorities are the same, they were in fact taken from his book, unless the respondent can explain these coincidences, or show that the citations and authorities were derived from some other quarter. Weighted as required by the rules of circumstantial evidence, the complainant contends that these coincidences of fact, as exhibited in the two books, are not only consistent with the charge of infringement, but that they, taken as a whole, are absolutely inconsistent with any other theory, which is the test usually applied in cases where proof is required beyond any reasonable doubt. Great latitude is justly allowed by the law to the reception of indirect or circumstantial evidence, the aid of which is constantly required in the administration of justice; and whenever the necessity for a resort to such evidence arises either from the nature of the inquiry or the failure of direct proof, objections to testimony on the ground of irrelevancy, even in common-law suits, are not favored, for the reason that the force and effect of circumstantial facts usually and almost necessarily depend upon their connection with each other. Circumstances altogether inconclusive, if separately considered, may, by their number and joint operation, especially if corroborated by moral coincidences, be sufficient to constitute full and conclusive proof. (*Castle et al. vs. Ballard*, 23 How., 167; 1 Stark Ev., 58, 562.)

Instances quite numerous are also given where clerical and typographical errors and peculiarities, including special translations, are reproduced in the edition prepared by the respondent; and the court is reminded in argument that cases have arisen where the strongest proof of copying consisted "in the coincidence of errors." (Jeremy, Eq. Juriad., 322.) Where the question is whether the defendant, in preparing his book, had before him and copied or imitated the book of the plaintiff, it is manifest, says Mr. Curtis, that this kind of evidence is the strongest proof, short of direct evidence, of which the fact is capable. (Curtis on C., 235; *Murray* vs. *Bogue*, 1 Drewry, 367; *Spiers* vs. *Brown*, 6 W. R., 353.) Other authorities may be cited where the presumptions arising from the identity of inaccuracies is carried much further, and where it is held that when a considerable number of passages are proved to have been copied by the copying of the blunders in them, other passages which are the same with passages in the original book must be presumed *prima facie* to be likewise copied, though no blunders occur in them. (*Mawman* vs. *Tegg*, 2 Russ., 394; *Longman* vs. *Winchester*, 16 Ves. Jr., 269.)

Coincidence of citation is also invoked by the complainant as evidence of copying; and the instances given as examples are many where the authorities are cited in the same way—that is, by volume and page, or by chapter and section, as the case may be, and from the same edition of the work, and from the same place.

Identity in the plan and arrangement of the notes, and in the mode of combining and connecting the same with the text, is also invoked by the complainant, as strongly supporting the charge of infringement; and it is quite apparent, on a comparison of the two books, that the instances of identity in that respect are numerous and pervading. Copyright may justly be claimed by an author of a book who has taken existing materials from sources common to all writers, and arranged and combined them in a new form, and given them an application unknown before, for the reason that in so doing he has exercised skill and discretion in making the selections, arrangement, and combination, and having presented something that is new and useful, he is entitled to the exclusive enjoyment of his improvement, as provided in the copyright act. (*Gray* vs. *Russell*, 1 Story, 11; *Lewis* vs. *Fullarton*, 2 Beav., 6; *Greene* vs. *Bishop*, 1 Cliff., 199; *Emerson* vs. *Davies*, 3 Story, 768; *Story* vs. *Holcombe*, 4 McLean, 309.) Books "made and composed" in that manner are the proper subjects of copyright; and the author of such a book has as much right in his plan, arrangement, and combination of the materials collected and presented, as he has in his thoughts, sentiments, reflections, and opinions, or in the modes in which they are therein expressed and illustrated; but he cannot prevent others from using the old material for a different purpose. All he acquires by virtue of the copyright is "the sole right and liberty of printing, reprinting, publishing, and vending such book" for the period prescribed by law. Others may use the old materials for a different purpose, but they cannot copy and use his improvement, which includes his plan, arrangement, and combination of the materials, as well as the materials themselves, of which the book is made and composed. (*Emerson* vs. *Davies*, 3 Story, 768; Curtis on C., 180; *Gray* vs. *Russell*, 1 Story, 17.)

Many other facts and circumstances are adduced by the complainant in support of the charge of infringement; but the classes mentioned will be sufficient for the present investigation, as it is not the purpose of the court to enter into the details of the evidence. Infringement in any and every form, as alleged in the bill of complaint, is denied in the answer; and the respondent, in addition to such denials, has presented in proof and in argument very elaborate and minute explanations of all the principal facts and instances adduced by the complainant in support of the charge of infringement. Separate examinations at this time of each one of the explanations so given would be impracticable, and any partial review of them in the opinion would necessarily be unsatisfactory, as it would afford ground for inference that the residue had been overlooked, or that they had not been duly considered. Suffice it to say, that they have all been read, studied, and made the subject of careful comparison with the facts and circumstances adduced by the complainant; but the conclusion of the court is that they are not of a character, speaking generally, to rebut the particular proofs of the complainant, to which it was intended they should be applied. But the respondent contends that, even if it be true that matters of fact, citations, and authorities have been borrowed to a considerable extent, he had a right to take them, as the use he made of them was substantially new, and different from that made by the complainant in the two prior annotated editions of the work, because they were used by him in illustrations of new and original propositions. Secondly, he contends that the complainant is not entitled to any decree on account of any use he has made of the matters of fact, citations, and authorities exhibited in those editions, because, as he insists, the use he so made amounts to no more than a fair and original abridgment of the former editions. The doctrine of new and different use in the law of copyright applies more particularly to the old materials, and not to the materials of a work like that of the last annotated edition of the complainant, where the materials collected are much abridged, and sometimes paraphrased and newly arranged, and combined with the text of the original work. Beyond all doubt he might take the old materials as found in the sources from which the matters of fact, citations, and authorities of the complainant were drawn, and use them as he pleased in illustration of new and original propositions, or for any other purpose not substantially the same as that to which they are applied in the annotated editions edited by the complainant; but he could not borrow the materials as therein collected and furnished, nor could he rightfully use the plan and arrangement, or the mode by which they are combined with the text, beyond the extent falling within the definition of fair use, which rule is only applicable to the materials, and not to the plan, arrangement, and mode of operation. Proper attention to the nature of the charge in the bill of complaint will show that the doctrine of new and different use is wholly inapplicable to the matter in issue between the parties, because the charge is that the respondent has borrowed the matters of fact, citations, and authorities collected and presented in the notes of the complainant, and not that he has made the same use of the old materials. On the contrary, the charge is that he has not consulted the old materials at all, but that he has borrowed the matters of fact, citations, and authorities exhibited in his book from the matters of fact, citations, and authorities as collected, arranged, and combined with the text in those two annotated editions. Even supposing the rule to be otherwise, and that a second writer may take bodily the matters of fact, citations, and authorities collected, arranged, and combined, as in the two annotated editions before the court, if the use he makes of the materials is substantially new and different, still the concession will not benefit the respondent, as his edition of the work, except the new materials collected and presented, occupies the same field and was designed for the same class of readers, and was "made and composed" for the same general purpose. Unsupported by the evidence, as the theory of fact involved in the proposition is, it is quite clear that it cannot furnish any defence for the respondent, even if the principle is correct. Argument to show that an author may have a copyright in his notes to an older work, though the materials collected are not new, is unnecessary, as the proposition is elementary, if it appear that they have never before been collected and embodied. (*Gray* vs. *Russell*, 1 Story, 11.)

The respondent's second proposition deserves more consideration, as it presents a defense applicable to the main issue involved in the pleadings. Concisely stated, the proposition is that, even conceding that he borrowed materials from the prior annotated editions to a considerable extent, still the quantity so taken and used did not amount to more than a fair and original abridgment of the former annotated editions. Third persons cannot make any use of a patented invention without the consent or license of the patentee, because he acquires, by virtue of his letters patent issued under the patent act, the full and exclusive right and liberty of making and using his invention, as well as of vending it to others to be used, for the term allowed by law; but the right secured to the author or proprietor of a book is only "the sole right and liberty of printing, reprinting, publishing, and vending such book," which, as construed by the courts, means the exclusive right to multiply copies for the benefit of the author or his assigns. (*Stephens* vs. *Cady*, 14 How., 336; *Reade* vs. *Lacy*, 1 Johns. and Hem., 526; *Millar* vs. *Taylor*, 4 Burr., 2311; *Stowe* vs. *Thomas*, 3 Am. L. Reg., 228.) Courts have sometimes supposed that the same rule of decision should be applied to a copyright as to a patent for a machine, and consequently that an abridgment of an original work made and condensed by another person without the consent of the author of the original work ought to be regarded as an infringement; but the language of the respective acts of Congress making provision for the protection of such rights is different; and the opposite doctrine has been too long established to be considered at the present time as open to controversy. (*Story* vs. *Holcombe*, 4 McLean, 309.) Whatever might be thought if the question was an open one, it is too late to agitate it at the present time, as the rule is settled that the publication of an unauthorized but *bona fide* abridgment or digest of a published literary copyright, in a certain class of cases at least, is no infringement on the original. (Phillips on C., 171; Newbery's case, Lloft R., 775; *Dodsley* vs. *Kinnersley*, Ambler, 403; *Whittingham* vs. *Wooler*, 2 Swanst., 428; *Giles* vs. *Wilcox*, 2 Atk., 141.)

Strong doubts are expressed by Mr. Curtis, whether the definition of an allowable abridgment, as given in the earlier classes, can be sustained, except as applied to such works as histories, or works composed of translations, and others of like kind; but it was decided in this court, in the case of *Folsom* vs. *Marsh*, 2 Story, 105, that an abridgment in which there is a substantial condensation of the materials of the original work, and which required intellectual labor and judgment to make the same, does not constitute an infringement of the copyright of the original author; and the court, as now constituted, is inclined to adopt that rule in cases where it also appears that the abridgment was made *bona fide* as such, and that it is not of a character to supersede the copyrighted publication. Unless it be denied that a legal copyright secures to the author "the sole right and liberty of printing, reprinting, publishing, and vending the book" copyrighted, it cannot be held that an abridgement, or digest of any kind, of the contents of the copyrighted publication, which is of a character to supersede the original work, is not an infringement of the franchise secured by the copyright. What constitutes a fair and *bona fide* abridgment in the sense of the law is, or may be, under particular circumstances, one of the most difficult questions which can well arise for judicial consideration; but it is well settled that a mere selection or different arrangement of parts of the original work into a smaller compass will not be held to be such an abridgment. (*Campbell* vs. *Scott*, 11 Sim., 38 and note; *Gyles* vs. *Wilcox*, 2 Atk., 141; *Folsom* vs. *Marsh*, 2 Story, 107.) Substantially the same views are expressed in the case of *Tinsley* vs. *Lacy*, 1 Hem. and Miller, 753; and the vice-chancellor in that case, in speaking of the authorities by which fair abridgments have been sustained, goes on to say that the courts have gone far enough in that direction, and adds that it is difficult to acquiesce in the reason sometimes given, that the compiler of an abridgment is a benefactor to mankind, by assisting in the diffusion of knowledge. Viewed in the light of these principles, it is quite clear that the book of the respondent, even if it could be regarded as an abridgment of the prior editions, must still be held to be an infringement of the same; but the court is of the opinion that it is not an abridgement of those editions, in any sense known to the law of copyright. Instead of being an abridgment of the prior editions, it is precisely what it purports to be, a reprint of the text of the author, with notes by a new editor; and the proofs are full to the point that he was employed to edit a new edition of the work, to supersede the antecedent editions annotated by the complainant. Instructed as he was to make no use of the complainant's notes, his principal defense still is that he complied with those instructions, and that he did not make any use of the notes in his edition beyond what is allowable as fair quotations from the published work of a prior author treating upon the same subject. Copying is not confined to literal repetition, but includes also the various modes in which the matter of any publication may be adopted, imitated, or transferred, with more or less colorable alterations to disguise the source from which the material was derived; nor is it necessary that the whole or even the larger portion of a work should be taken, in order to constitute an invasion of a copyright. Some use may be made by a subsequent writer of the contents of a book or treatise antecedently made, composed, and copyrighted by another person, in making and composing a new book upon the same subject, whether the contents of the antecedent book or treatise were wholly original, or were partly original, and partly made up of selections from other authors. Copyright differs in this respect from patent right, which admits of no use of the patented thing without the consent or license of the patentee. Persons making, using, or vending to others to be used, the patented article are guilty of infringing the letters patent, even though they may have subsequently invented the same thing without any knowledge of the existence of the letters patent; but the recomposition of the same book without copying, though not likely to occur, would not be an infringement. Coincidence, if perfect, is sufficient to prove the infringement of a patent, as the charge is that the defendant, if it be a machine, has made machines in the similitude of the patented machine, and with the same mode of operation. Copying is essential to constitute an infringement of copyright, but identity of contents, arrangement, and combination, is strong evidence that the second book was borrowed from the first, as it is highly improbable that two authors would express their thoughts and sentiments in the same language throughout a book or treatise of any considerable size, or adopt the same arrangement or combination in their publication. (*Reade* vs. *Lacy*, 1 Johns. and Hem., 526.) Great difficulty attends every attempt to define in definite terms the privilege allowed by law to a subsequent writer to use without consent or license the contents of a book or treatise antecedently made, composed, and copyrighted by another author; or to mark the boundaries of the privilege of such subsequent writer to borrow the materials in a book like the annotated editions of the complainant, where the materials have been selected from such a variety of sources, and where the materials so selected are changed and combined with certain chosen passages of the text of the original work, and in a manner showing the exercise of discretion, skill, learning, experience, and judgment. Decided cases are referred to where the principal criterion of determination is held to be the intent with which the person acted who is charged with infringement. Remarks to that effect are to be found in the opinion of the court in the case of *Carey* vs. *Kearsley*, 4 Esp. R., 170, and the decision in the case of *Spiers* vs. *Brown*, 6 W. R., 353, refusing the application for an injunction, turned to some extent upon the same consideration; but the vice-chancellor (now chancellor) refused to apply that doctrine in the subsequent case of *Scott* vs. *Stanford*, Law Rep., 3 Eq., 722, and explained the grounds of his ruling in the former case, which show that he would not sanction that rule in any case unless it appeared that the defendant had bestowed such mental labor upon what he had taken as to produce an original result. Evidence of innocent intention may have a bearing upon the question of "fair use," and where it appeared that the amount taken was small, it would doubtless have some probative force in a court of equity in determining whether an application for an injunction should be granted or refused; but it cannot be admitted that it is a legal defense where it appears that the party setting it up has invaded a copyright. (*Cary* vs. *Faden*, 5 Ves., 23; *Reade* vs. *Lacy*, 1 Johns. and Hem., 526; *Bramwell* vs. *Halcomb*, 3 Myl. and Cr., 738.) Few judges have devised safer rules upon the subject than Judge Story. He held that, to constitute an invasion of copyright, it was not necessary that the whole of a work should be copied, nor even a large portion of it, in form or substance; that if so much is taken that the value of the original is sensibly diminished, or the labors of the original author are substantially to an injurious extent appropriated by another, that is sufficient in point of law to constitute an infringement; that, in deciding questions of this sort, courts must "look to the nature and objects of the selections made, the quantity and value of the materials used, and the degree in which the use may prejudice the sale or diminish the profits, or supersede the objects of the original work." (*Folsom* vs. *Marsh*, 2 Story, 116.) Mere honest intention on the part of the appropriator will not suffice, said Vice-Chancellor Wood, as the court can only look at the result, and not at the intention in the man's mind at the time of doing the act complained of, and he must be presumed to intend all that the publication of his work effects. (*Scott* vs. *Stanford*, Law Rep., 3 Eq., 723; *Hodges* vs. *Welsh*, 2 Irish. Eq. R., 266.) Twenty years before that decision was made Mr. Curtis, in his valuable work on the law of copyright, expressed the same views, and this court entertains no doubt they are correct. (Curtis on C., 240.) Recent decisions afford more ample protection to copyright than those of an earlier date, and they also restrict the privilege of the subsequent writer or compiler in respect to the use of the matter protected by the copyright within narrower limits. Express decision in *Kelley* vs. *Morris*, Law Rep., 1 Eq., 697, is, that in the case of a map, guide-book or directory, or the like, where there are certain common objects of information which must, if described correctly, be described in the same words, a subsequent compiler is bound to do for himself what which was done by the first compiler; that he is not entitled to take one word of the information published without independently working out the matter for himself so as to arrive at the same result from the same common sources of information, and that the only use he can make of a previous publication of that kind is to verify his own calculations and results when obtained. Rights secured by copyright are property within the meaning of the law of copyright, and whoever invades that property beyond the privilege conceded to subsequent authors commits a tort, and is liable to an action. None of these rules of decision are inconsistent with the privilege of a subsequent writer to make what is called a fair use of a prior publication; but their effect undoubtedly is to limit that privilege so that it shall not be exercised to an extent to work substantial injury to the property which is under the legal protection of copyright. Reviewers may make extracts sufficient to show the merits or demerits of the work, but they cannot so exercise the privilege as to supersede the original book. Sufficient may be taken to give a correct view of the whole, but the privilege of making extracts is limited to those objects, and cannot be exercised to such an extent that the review shall become a substitute for the book reviewed. (*Story* vs. *Holcombe*, 4 McLean, 309.) Examined as a question of strict law, apart from exceptional cases, the privilege of fair use accorded to a subsequent writer must be such, and such only, as will not cause substantial injury to the proprietor of the first publication; but cases frequently arise in which, though there is some injury, yet equity will not interpose by injunction to prevent the further use, as where the amount copied is small and of little value, if there is no proof of bad motive, or where there is a well-founded doubt as to the legal title, or where there has been long acquiescence in the infringement, or culpable laches and negligence in seeking redress, especially if it appear that the delay has misled the respondent. (*Sweet* vs. *Cater*, 11 Sim., 580; *Tinsley* vs. *Lacy*, 1 H. and M., 752; *Spiers* vs. *Brown*, 6 W. R., 353; *Strahan* vs. *Graham*, 15 W. R., 487; *Bramwell* vs. *Halcomb*, 3 Myl. and Cr., 738; *Reade* vs. *Lacy*, 1 Johns. and Hem., 527; *Jarrold* vs. *Houlston*, 3 Kay and Johns., 717; *Lewis* vs. *Fullarton*, 2 Beav., 6; *Bell* vs. *Whitehead*, 17 L. T., 141; Curtis on C., 396; *Saunders* vs. *Smith*, 3 Myl. and Cr., 711.)

Guided by the rules of law, as already explained, the court, after having examined the whole case with care, is of the opinion that many of the notes presented in the edition edited by the respondent, whose case is under consideration, do infringe the corresponding notes in the two editions edited and annotated by the complainant, and that the respondent borrowed very largely the arrangement of the antecedent edition, as well as the mode in which the notes in that edition are combined and connected with the text. Judge Story held, in the case of *Emerson* vs. *Davies*, (3 Story, 768) that every author had a copyright in the plan, arrangement, and combination of his materials, and in his mode of illustrating his subject, if it be new and original; and it was also held, in *Greene* vs. *Bishop*, (1 Cliff., 199,) that there may be a valid copyright in the plan of a book, as connected with the arrangement and combination of the materials; and no doubt is entertained that both those decisions were correct; but it is a mistake to suppose that a subsequent writer can be held to have infringed a book where he has not borrowed any of the materials of which the book is composed. New materials are certainly the proper objects of copyright; and old materials, when subsequently collected, arranged, and combined in a new and original form, are equally so; and in either case the plan, arrangement, and combination of the materials are as fully protected by the copyright as the materials embodied in the plan, arrangement, and combination. Damages may be recovered in either of the supposed cases for the infringement of the property protected by the copyright;

but the property in the latter case consists chiefly, if not entirely, in the plan, arrangement, and combination of the materials collected and presented in the book, as any other person may collect from the original sources the same materials, and arrange and combine them in any other manner not substantially the same as that of the antecedent author. (*Barfield* vs. *Nicholson*, 2 Sim. and Stu., 6.)

Detailed specification of the instances of infringement, as shown by a comparison of the two books, would be impracticable, and will not be attempted; as the settled practice in equity is, where the works are voluminous and of a complex character, containing, as in this case, much original matter mixed with common property, the cause will, at some stage of the case, be referred to a master to state the facts, together with his opinion, for the consideration of the court. Much the better course is to make the references before the final hearing; but the parties in this case waived any reference at that stage of the cause, and elected to proceed to final hearing without any such report. Cases arise where the court, under such circumstances, would not order a reference, but would proceed to compare the books and ascertain the details of the infringement; but the case before the court is far too complex to admit of that course of action. (Curtis on C., 325; *Mawman* vs. *Tegg*, 2 Russ., 400; 2 Story Eq. Jurisp., § 941.) Details have been examined, as far as practicable, consistent with the claims of other official duties, but the judges are of the opinion that they should be further examined, and the results classified, before the court proceeds to determine the extent of the infringement, as the danger of injustice cannot well be avoided in any other way. New matter of value has been collected and presented by the respondent, and he has added much that is valuable in his references to events which have occurred since the publication of the last preceding annotated edition. Whatever may have been the rule in the earlier history of equity jurisprudence, it is now settled law in this court that a book may in one part of it infringe the copyright of another, while in other parts it may be entirely original and the proper object of a copyright; and in such a case it was held, in *Greene* vs. *Bishop*, (1 Cliff., 201,) that remedy will not be extended beyond the injury. Preceding that decision, the same rule had been adopted in *Story* vs. *Halcombe*, (4 McLean, 315,) in which the opinion was given by the late Mr. Justice McLean. Modern practice in the chancery courts of England is the same, as appears in the case of *Jarrold* vs. *Houlston*, (3 Kay and Johns., 724,) in which the opinion was given by Vice-Chancellor Wood, since promoted to the office of Chancellor. (*Kelly* vs. *Morris*, Law Rep., 1 Eq., 701; *Carnan* vs. *Bowles*, 2 Bro. Ch. R., 80; Curtis on C., 325.) Suggestion is made that it will be impossible to separate that which is original from that which is borrowed, and to some extent the suggestion may be of weight; but the court is of the opinion that the difficulties in that behalf, when the matters pass under the searching examination of a master, will be much less than is apprehended by the parties. Should the difficulty in any instance or class prove to be insurmountable, then the rule in equity is, that if the parts which have been copied cannot be separated from those which are original without destroying the use of the original matter, he who made the improper use of that which did not belong to him must suffer the consequences of so doing. If a second writer mixes the literary matter of another, which is under the protection of a copyright, with his own, without the license or consent of the proprietor, he must nevertheless be restrained from publishing what does not belong to him; and if the parts of the work cannot be separated, so that the injunction prevents also the publication of his own literary production so mixed with that of another, he has only himself to blame. (*Mawman* vs. *Tegg*, 2 Russ., 390; *Lewis* vs. *Fullarton*, 2 Beav., 11.) Extended application of that rule, it is believed, will not be required, in view of the proofs exhibited in the record, and of the facilities afforded by the comparison of the notes in the respective editions to separate what is original from that which has been copied.

Attention is called by the respondent to the fact that some of the notes in the edition edited by him are entirely original; that in others the material copied is much condensed, or the notes reduced to a mere reproduction of the authorities cited in the prior edition, and that other notes have been enlarged and improved by the addition of new matter, and, in view of those circumstances, he contends that the edition edited by him should be regarded as a new and original work; but the decisive answer to the first and last suggestion is, that no man is entitled to avail himself of the previous labors of another for the purpose of conveying to the public the same information, even though he may append additional information to that already published. (*Scott* vs. *Stanford*, Law Rep., 3 Eq., 734; 2 Story, Eq. Jurisp., § 940; 2 Kent. Com., 380 and 383; *Cary* vs. *Faden*, 5 Ves., 25 and note; *Wheaton* vs. *Peters*, 8 Pet., 591; *Bramwell* vs. *Halcomb*, 3 Myl. and Cr., 737.)

Additional remarks in respect to the alleged fact that the contents of the notes copied were condensed is unnecessary, as it is quite clear, as before explained, that the change made in that behalf is not of a character to afford the respondent any defence.

Supported by these reasons, the conclusions of the court are as follows:

1. That the complainant in a court of equity is the equitable owner of the notes in the two annotated editions described in the pleadings as arranged, and the mode in which they are combined and connected with the text.

2. That the title to the entire text, together with the title to the memoir and indices, is in the proprietor of the book, and not in the complainant, as alleged in the bill of complaint.

3. That there are notes in the edition edited by the respondent of substantial importance in point of number and the value of the materials which do infringe the equitable rights of the complainant, as explained and defined by the court.

4. That all the respondents had notice of the claim of the complainant, as explained and defined by the court.

5. That there are notes in that edition of substantial importance in point of number and the value of the materials which do not infringe any rights of the complainant.

6. That the notes in that edition consisting wholly of citations found in the corresponding notes of the complainant do infringe his rights, as explained and defined by the court, though many of them are unaccompanied by the extracts collected and presented in the next preceding edition.

7. That notes consisting of authorities or collections of authorities, copied in like manner as described in the preceding proposition, and without remarks or comments, do also infringe the complainant's rights, though they are found inserted in, or prefixed or appended to, notes otherwise not objectionable.

8. That notes of which the whole or some substantial and material part is condensed from the corresponding notes in the preceding edition, or from the extracts therein printed and published, without any marks of original labor, or of any such labor except the study of the note copied and adopted, do also infringe the complainant's rights, as explained and defined.

9. That notes wholly original do not infringe.

10. That notes partly original and partly copied from the preceding edition do not infringe, except for the matter copied, if it be practicable to ascertain and define the separate proportions and make the separation of the same; but if not, still the respondent, at the proper stage of the case, must be restrained from using the part copied.

11. That the cause must be referred to a master to examine the pleadings and proofs and report the extent of the infringement as adjudged by the court in this investigation, and also to examine and ascertain what, if any, other instances of the alleged infringements within the principles here explained are proved; and if any, to classify the same, and report the details, together with the reasons for his conclusions, for the consideration of the court.

12. That all other matters in the cause will be reserved until the coming in of the master's report.

13. That the cause is referred to Henry W. Paine as master, for his examination and report in the premises, in conformity to the opinion and directions of the court.

Equity suits for the infringement of a copyright are usually referred to a master before the final hearing, to ascertain whether the charge is proved, and, if so, for a final report as to the nature and extent of the infringement; and in such cases the general rule is, that the complainant, if he prevails in the suit, is entitled, if at all, to an injunction at the time the decretal order is entered, to restrain the respondent from any further violation of his rights, as the whole case is then before the court. Even when the case is heard before any such reference and report, if the charges of infringement are few and of a character that the extent of the infringement can be conveniently determined by the court, without sending the case to a master, the court, if the case be one where an injunction is the proper remedy, will order it at the same time that the decision is announced upon the merits. But where the cause comes to a final hearing without any such report, the court, if the charges of infringement are numerous and of a character to require extended examination before the extent of the infringement can be ascertained, will ordinarily send the case to a master for further examination and report in respect to all matters not previously adjudged by the court; and the general rule in such cases is, that the injunction will not be granted until the nature and extent of the infringement are fully ascertained and determined, as its effects and operation might work great injustice. Obviously the present case falls within the latter rule, and, therefore, an injunction will not be ordered until the court shall have acted finally upon the report of the master.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Any person may oppose either extension.

Hearings upon the respective applications are appointed for the days named in each case.

Arguments must be filed ten days before the day of hearing.

439.—Whole number, **31,443.**—**Folly-Machines.**—Granted to CHARLES H. DENISON, February 19, 1861. Application filed November 19, 1874. Testimony closes January 19, 1875. Hearing February 3, 1875.

441.—Whole number, **31,445.**—**Limekilns.**—Granted to RICHARD DONALDSON, February 19, 1861, and reissued May 19, 1863. Application filed November 18, 1874. Testimony closes January 19, 1875. Hearing February 3, 1875.

498.—Whole number, **31,502.**—**Machines for Breaking Coal.**—Granted to R. A. WILDER, February 19, 1861. Application filed November 18, 1874. Testimony closes January 19, 1875. Hearing February 3, 1875.

507.—Whole number, **31,511.**—**Lamps.**—Granted to CHAS. W. CAHOON, February 19, 1861, and reissued August 9, 1864. Application filed November 14, 1874. Testimony closes January 19, 1875. Hearing February 3, 1875.

521.—Whole number, **31,525.**—**Machines for the Manufacture of Hoe-Blanks.**—Granted to NATHAN BRAND, February 26, 1861, and reissued in two divisions, numbered 1,481 and 1,482, May 26, 1863. Application filed October 3, 1874. Testimony closes January 26, 1875. Hearing February 10, 1875.

529.—Whole number, **31,533.**—**Weighing Apparatus.**—Granted to AUGUSTUS B. DAVIS, February 26, 1861. Application filed November 27, 1874. Testimony closes January 26, 1875. Hearing February 10, 1875.

530.—Whole number, **31,534.**—**Scale-Beams.**—Granted to AUGUSTUS B. DAVIS, February 26, 1861. Application filed November 27, 1874. Testimony closes January 26, 1875. Hearing February 10, 1875.

542.—Whole number, **31,546.**—**Polishing Iron Bars and Rods.**—Granted to BERNARD LAUTH, February 26, 1861. Application filed November 3, 1874. Testimony closes January 26, 1875. Hearing February 10, 1875.

563.—Whole number, **31,566.**—**Drying Tunnels.**—Granted to FRANCIS H. SMITH, February 26, 1861; reissued June 30, 1868, July 11, 1871, and March 26, 1872. Application filed November 27, 1874. Testimony closes January 26, 1875. Hearing February 10, 1875.

574.—Whole number, **31,578.**—**Machines for Folding Paper.**—Granted to WILLIAM H. MILLIKEN and JOHN MILLIKEN, February 26, 1861, and reissued in two divisions, numbered 3,785 and 3,786, January 4, 1870. Application filed October 26, 1874. Testimony closes January 26, 1875. Hearing February 10, 1875.

575.—Whole number, **31,579.**—**Corn-Planters.**—Granted to FRANCIS B. PRESTON, February 26, 1861. Application filed November 27, 1874. Testimony closes January 26, 1875. Hearing February 10, 1875.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date January 19, 1875.]

8,008.—Advertising-Desk.—GARRETT E. CARHART, Washington, D. C. Application filed November 25, 1874. Term of patent 3½ years.

8,009.—Cooking-Ranges.—LUTHER W. HARWOOD, Troy, N. Y., assignor to Fuller, Warren & Co., same place. Application filed January 2, 1875. Term of patent 7 years.

8,010.—Street Lantern and Post.—RICHARD B. HEWITT, Philadelphia, Pa. Application filed December 18, 1874. Term of patent 3½ years.

8,011.—Inkstand-Base.—JAMES H. JOHNSON, Newark, N. J., assignor to JOHNSON MANUFACTURING COMPANY, same place. Application filed December 1, 1874. Term of patent 3½ years.

8,012.—Parlor Cooking-Stoves.—NICHOLAS S. VEDDER and FRANCIS RITCHIE, Troy, N. Y., assignors to NICHOLAS S. VEDDER, same place.—Case A. Application filed December 30, 1874. Term of patent 3½ years.

8,013 to **8,017**, inclusive.—**Center-Piece.**—SAMUEL KELLETT, San Francisco, Cal.—Nos. –, 2, 3, 4, 5. Applications filed January 2, 1875. Term of patents 14 years.

8,018.—Casing of Soda-Water Apparatus.—FRANK H. SHEPHARD and EMIL SCHWAB, Lowell, assignors to JAMES W. TUFTS, Madford, Mass. Application filed January 6, 1875. Term of patent 14 years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Certificate bearing date January 19, 1875.]

2,171.—Shirts.—MARKEWITZ & PRICE, New York, N. Y. Application filed December 11, 1874.

"the representation of an oval medallion, and the words 'Columbia Dress Shirt.'"

2,172.—Perfume.—MILLER BROTHERS, New York, N. Y. Application filed December 24, 1874.

"'Amaranth Bouquet.'"

2,173.—Carpet-Warp.—HENRY E. VOGELL, New York, N. Y. Application filed December 30, 1874.

"the figure or design of a four-sided pyramidal-shaped weight. Upon one face or side of the weight is the word 'Standard.'"

2,174.—Coffees.—BARKLEY & HASSON, Baltimore, Md. Application filed January 14, 1875.

"'CAW-PHY.'"

2,175.—Coffees.—BARKLEY & HASSON, Baltimore, Md. Application filed January 14, 1875.

"a picture, in broad oval, of a plantation scene, with negroes gathering and carrying coffee to an open shed above which a palm-tree spreads its leaves, and the words 'Plantation Ground Coffee.'"

2,176.—Pumps.—W. & B. DOUGLAS, Middletown, Conn. Application filed January 12, 1875.

"'THE AQUARIUS.'"

2,177.—Pumps.—W. & B. DOUGLAS, Middletown, Conn. Application filed January 12, 1875.

"'THE PENDULUM.'"

2,178.—Pumps.—W. & B. DOUGLAS, Middletown, Conn. Application filed January 12, 1875.

"'THE SWAN.'"

2,179.—Perfumery, Soap, &c.—EDDY BROTHERS, New York, N. Y. Application filed December 28, 1874.

"'Royal Dagmar.'"

2,180.—Paints.—HAINEMANN & STEINER, New York, N. Y. Application filed November 30, 1874.

"a figure of justice."

2,181.—Fire-Kindlers and Prepared Fuel.—JOSEPH D. HUSBANDS, Jr., St. Louis, Mo. Application filed January 14, 1875.

"'Boss.'"

2,182.—Table-Sauce.—LEWIS & CO., Chicago, Ill. Application filed January 12, 1875.

"'Warwickshire Sauce.'"

2,183.—Cigars.—J. FRANK MILES, Boston, Mass. Application filed January 8, 1875.

"'CHARLES SUMNER.'"

2,184.—Pile-Cure.—MONTGOMERY & CO., Philadelphia, Pa. Application filed January 12, 1874.

"'Spohr's New Pile-Cure.'"

INDEX OF INVENTIONS PATENTED JANUARY 19, 1875.

	Class No.	No. of Patent
Acid, apparatus for concentrating and evaporating sulphuric, Fauré and Kessler	35	158,924
Alarm apparatus, electro-magnetic fire, M. G. Farmer, (reissue)	50	6,244
Alarm, burglar, A. C. Taylor	24	158,813
Alarm, electro-magnetic burglar, R. J. Brittain	50	158,897
Auger, cotton, A. O. Schultz	41	158,905
Auger, earth, Davis and Mills	51	158,919
Baby tender, E. Post	143	158,977
Bag holder, U. E. Lemon	57	158,849
Bale tie, Flinn and Wier	7	158,836
Bales, hay, straw, and other, L. Dodge, (reissue)	7	6,243
Barrel, R. W. Baylor	40	158,777
Barrels, coating for oil, M. W. Quick	40	158,978
Bath attachment, T. D. Woolsey	8	158,877
Bath, electro-therapeutic, Becker and Hoffman	50	158,890
Bedstead, invalid, Cosby and McGovern	62	158,913
Bedstead, toilet stand, Schwarts and Wood	62	158,966

	Class No.	No. of Patent.
Bee hive, A. B. Bowen	9	158,826
Blader, temporary, Guichetean and Perin	15	158,839
Blacking, water proof liquid, E. Clark	92	158 907
Blanket or lap robe, horse, G. V. Shepard	72	158,990
Boiler for heating purposes, E. and W. B. Mayer	147	158,854
Bolt bearing, king, G. J. Orr	31	158 971
Boom, sheer, W. B. Culbertson	13	158,917
Boot and shoe crimping machine, Farnsworth and Barrett	16	158,789
Boot and shoe crimping machinery, L. H. Farnsworth	16	158,788
Boot and shoe heels, machine for forming rands for, T. Bullock	16	158,901
Boot and shoe soles, die for flanging, F. D. Ballou	16	158,882
Boot jack, H. N. Conklin	16	158,911
Boring machine, Z C. Phillips	173	158 809
Bread slicer, W. A. Brown	88	158 827
Brick laying machine, C. Franke	4	158,838
Bridle, W. S. Mitchell	72	158 857
Brush, C. A. Hussey	22	158,943
Buckle, T. L Wiswell	23	158,909
Burner, Argand gas, T. Clough	64	158,832
Butter worker, J. Thompson	45	159,000
Butter worker, Yaw and Mitchell	45	158,820
Calculator, mechanical, H. B. Martin	42	158,853
Calf weaner, W. Sutton	144	158,814
Can and measure, fluid, G. W. Aldrich	132	158,773
Cane juice, apparatus for treating, F. Randon	155	158,979
Canvas stretcher, Wight and Gardner	54	159 012
Car brake, air and steam, J. M. Connel	122	158,912
Car coupling, C. Billmeyer	122	158 892
Car coupling, A. Coulter	122	158,915
Car coupling, W. O Gunckel	122	158,935
Car coupling, J. J. Lahaye	122	158,948
Car coupling, S. Ott	122	158 973
Car coupling, Petree and Heaslee	122	158 975
Car heater, T. W. Tyler	154	159 002
Car wheel, J. Leland	122	158,848
Carpet stretcher, G. H. Ford	62	158,926
Carriage axle, Spicer and Insull	31	158,993
Carriage jump seat, J. R. Patten	31	158,864
Carriages, axle for children's, H. W. Warner	31	158 815
Cartridge, lubricating, J. V. Meigs	31	158,960
Ceiling, metallic, H. Adler	4	158 881
Chair, rocking, C. Streit	62	158,869
Chimney cap, A. B. Hussey	4	158,942
Chopper, meat, D. Peters, (reissue)	25	6,236
Chopper, meat, D. Peters, (reissue)	25	6 237
Cloth cutting machine, A. Warth, (reissue)	38	6,238
Cloth, &c, plate for guiding a hand knife in cutting, J. Lacmann	38	158,801
Coal box, J. Forster	154	158,837
Coal box, J. L. Holliday	154	158,797
Comb, M. Dittenhoeffer	161	158 922
Cooler, milk, Hadcock and Pierce	45	158,840
Corks, apparatus for branding and counting, N. W. Mitchell	42	158,963
Corn sheller, J. N. Wolfe	59	158 816
Cultivator teeth, coupling joint for, E. Children	43	158,906
Cutting apparatus, meat, J. A. Morrell	25	158 804
Cutting apparatus, meat, J. A. Morrell	25	158,805
Damper, H. A. White	154	158,875
Dental engine hand piece, J. W. Gilbert	46	158,932
Dental plugger, J. W. Baxter	46	158,888
Dental plugger, pneumatic, G. W. Nichols	46	158,863
Dentist's chair, G. W. Archer	46	158,880
Digger, potato, L. A. Bruckett	114	158,896
Door hanger, Herald and Ramsey	84	158,796
Drill, countersink and planer, combined, W. McCrosson	100	158,958
Egg carrier, Barnett and Garrett	116	158,824
Egg carrier, A. H. Bryant	116	158,928
Electroplating, rack for, H. E Osborn	113	158 972
Elevating packages, sling for, G. D. Stevens	79	158 996
Elevator, hydraulic, Lane and Smith	118	158,951
Engine bed plate, steam, J. D. Richardson	150	158,960
Engine, oscillating, G. W. Heald	150	158,938
Engine, road, R. R. Doan	94	158,923
Equalizer, spring, J. W. Marks	31	158,956
Fare box, T. Keech	42	158,946
Fare box, R. M. Robinson	42	158,981
Fare box, R. M. Robinson	42	158,982
Faucet, W. C. Bussey	167	158,829
Faucet, filtering, G. W. Wilson	167	159,008
Fence, farm, I. E. Hogue	53	158,941
Fertilizers, preparation of, B. Ackerman	96	158,772
Fire arm, M. Sellen	55	158,968
Fire arm, breech loading J. Broughton	18	158,899
Fire arm, revolving, W. Mason	123	158,957
Fire arm, revolving, D. B Wesson	123	158,874
Fire kindler, J. D. Husbands, Jr., (reissue)	61	6,246
Forms, machine for cutting irregular, G. A. Haley	172	158,793
Fountain sprinkler, C. A. Buttles	167	158,903
Fracture apparatus, arm, D. Bissell	156	158,893
Fracture apparatus, arm, D. Bissell	156	158,894
Fracture box for legs, D. Bissell	156	158,967
Friction drum, J. S. Mundy	87	158,967
Fruit jars, wire fastener for, C. Wright	58	159,010
Furnace, hot air, J. A. Lawson	154	158 954
Furnace, hydrocarbon, C. M. Gearing	149	158,931
Furnace, reverberating, J. Nicholson, Jr	149	158,862
Gage and square, carpenter's sliding, Iske and Baumgartner	97	158,843
Game apparatus, D. R. Da Costa	143	158,918
Game apparatus, F. W. Smith	143	158,991
Gas carbureting machine, T. J. Martin	27	158,802
Gas flames, apparatus for lighting, extinguishing, and regulating, L. Baumeister	64	158,887
Gas lighting apparatus, electro-magnetic, E. E. Bean	64	158,889
Glue cup, H. Meyer	29	158,991
Gridiron, J. H. Mitchell	88	158,838
Gun cleaner, W. H. Manair	55	158,851
Hair cutter's gage, A. G. Wilkins	161	159,004
Hame attachment, Myers and Spicer	72	158 860
Harness tree, W. P. Wolfington	72	158,817
Harvester, T. P. Benton	74	158 825
Harvester, G. H. Clark	74	158,908
Harvester, clover, C. R. Hardy	75	158,795
Harvester guards, die for swaging, J. H. Sieberling	74	158,810
Harvester, hemp, W. F. Cochrane	74	158 909
Heater, car, T. W. Tyler	154	159 002
Hinge, gate, S. L. Selden	24	158,987
Hog trap, P. Lane	144	158,950
Hogs, watering tank for, G. A. Carter	167	158,905
Hoisting apparatus, Opperman and Black	79	158,970
Hoisting apparatus, Plantz and Sternberger	79	158,976
Horse blanket or lap robe, G. V. Shepard	72	158,990
Horse detacher, P. Arnold	31	158,774
Horse power, T. G. Palmer	159	158,806
Horse power, mounted, F. D. Coy	159	158,784
Horseshoe machine, F. Supple	60	158,871
Horseshoe machine, J. Williams	60	159,005
Indicator, station, J. W. Bryan	121	158,900
Indicator, station, F. G. Johnson	121	158,798
Insulating compound, I. Smith	50	158,868
Iron beam, compound, W. S. Sampson	4	158 983
Ironing board, A. Iske	91	158,844
Kindling material, W. S. Tisdale	61	159 001
Knife, shoe, A. L. Butterworth	16	158 830
Ladder, fire escape, D. Sanford	30	158,984
Lamp chimney, Wright and Kenney	90	159,011
Latch, locking, E. Skinner	93	158,811
Leather tapering machine, J. and G. W. Settle	92	158,989
Lightning rod, S. R. Wilmot	50	158,007
Lock for drawers, R. W. Whitney	93	158,876
Loom picking mechanism, Bean and Farnham	95	158,775
Lubricating device for marine propellers, F. G. Fowler	87	158,791
Matches, machine for cutting splints for, W. B. Nielsen	174	158,968
Metal coating composition, E. J. W. Burras	35	158 902
Meter and motor, liquid and gas, J. A. Stenberg	64	158,995
Mill, fulling, S. Hussey	76	158,842
Monument, M. A. Richardson	54	158 866
Mortising tool, G. Erlin	173	158,835
Mower, lawn, S. A. Hand	75	158,794
Mowing machine, W. F. Cochrane	74	158 910
Musical instruments, insulator for, W. B Miller	112	158,856
Nut lock washer, J. Miller, Jr	14	158 962
Ore crushing machine, S. R. Krom	3	158 800
Oven, baker's, Crumbie and Donald	6	158,916
Packing, piston, J. Bole	151	158 895
Paper bag machine, C. H. Kellogg	109	158,945
Paper box machine, F. Gates, (reissue)	109	6,245
Paper cutting machine, S. W. Soule	109	158,812
Paper pulp, mechanism for molding, J. C. and L. Coburn	108	158,782
Pegs, mechanism for compressing points on, B. F. Sturtevant	16	158,998
Photographic plate holder, Taber and Boyd	111	158,872
Pipes, joint for wrought iron, G. Lander	163	158,953
Pipes, tin lining metallic, J. Ferguson	163	158,790
Pitman connection, L. Mangus	67	158,852
Planters, wheel scraper for, J. C. Barlow	133	158,825
Plow, gang, G. Moore	114	158,859
Pocket book, C. Lieb	146	158,955
Press, baling, L. Dodge, (reissue)	7	6,242
Press, cotton, T. J. M. Jewell	7	158,845
Press, hay and cotton, W. C. Banks	7	158,864
Printer's shooting stick, J. H. Frey	117	158,792
Prisons, construction of, A. B. Mullett	4	158,966
Propellers, lubricating device for marine, F. G. Fowler	87	158,791
Pump cylinders, lining for, J. W. Douglas	118	158,786
Purifier, middlings, G. T. Smith	57	158,992
Reflector, W. R. Gardner	90	158,929
Rein holder, B. R. Hamilton	72	158,936
Rein holder, check, Wood and Drago	72	158,818
Rings, die for making hollow, S. Cottle	23	158,914
Sad iron holder, M. E. Hildreth	91	158,841
Sash fastener, J. Christie	24	158,780
Sash holder, F. R. Glascock	24	158,933
Sash opening and closing mechanism, G. A. Lincoln	24	158,850
Satchel, knitting, C. McFadden	38	158,959
Saw, hand, H. Disston	131	158,921
Saw sharpener, gin, Miselt and Revell	131	158,964
Scraper, road, W. T. Nichols	51	158,861
Screw driver, W. F. Patterson	29	158,807
Sewing machine, D. Williamson	134	159,006
Sewing machine cutting attachment, W. A. Springer	134	158,813
Sewing machine needles, machine for grooving, S. C. Kingman	104	158,947
Sewing machine operating mechanism, B. C. Young	134	158,821
Sewing machine ruffler, G. W. Darby	134	158,834

	Class No.	No. of Patent.
Sewing machine, wax thread, F. D. Ballou	134	158,883
Shafting, safety box for revolving, M. R. Jones	67	158,799
Sheet metal, machine for trimming and beading, J. De Butt	136	158,920
Shingles, machine for dressing, S. M. King	173	158,946
Shirt bosom, A. Small	38	158,867
Shoe knife, A. L. Buterworth	16	158,830
Shoe sole tips, device for forming, J. J. Henry	16	158,939
Shoe uppers, form for fitting, W. J. B. Mills, (reissue)	16	6,235
Show cases, corner for, M. Anderson	54	158,823
Shutter fastener, J. Christie	24	158,779
Sifter, coal, J. S. Pearce	154	158,808
Signal, switch, J. A. T. Bird	120	158,776
Sled brake, J. York	31	158,879
Spark arrester, J. H. Carr	94	158,904
Spark arrester, Summers and Fay	94	158,870
Spring, door, J. E. Cottom	24	158,933
Soles to uppers, fastening for uniting, B. F. Sturtevant	16	158,999
Stage scenery, guide for, C. Higbee	143	158,940
Stair rod securer, T. W. Gardner	24	158 930
Stove, base burning, S. H. La Rue	154	158,847
Stove polish, J. and A. P. Yates	154	158,878
Telegraph apparatus, T. A. Edison	50	158,787
Telegraph for cities, electro-magnetic fire alarm, Channing and Farmer, (reissue)	50	6,239
Telegraph for cities, electro-magnetic fire alarm, Channing and Farmer, (reissue)	50	6,240
Telegraph for cities, electro-magnetic fire alarm, Channing and Farmer, (reissue)	50	6,241
Telegraphic apparatus and circuit, M. Gally	50	158,928
Telegraphic apparatus automatic, M. Gally	50	158,927
Thill coupling, N. P. Ingalls	31	158,944
Toe calks, machine for making, L. S. Wright	60	158,819
Toy, automatic, R. J. Clay	143	158,781
Toy confectionery, machine for making, J. Goucher	88	158,934
Toy gun, Wiedemann and Lindsey	143	159,003
Trap, animal, H. C. Burk	143	158,778
Umbrella, U. G. Steinmetz	165	158,994
Uterine supporter, Bennett and Parsons	156	158,891
Vegetable slicer, E. Moneuse	59	158,803
Vehicle axle, J. McCurdy	31	158,855
Vehicle seat, V. E. Davis	31	158,785
Vehicle seat and body, E. W. Anderson	31	158,822
Vehicle side spring, D. M. Lane	31	158,949
Vehicle wheel, J. B. Fink	31	158,925
Vehicle wheel hub, H. A. Payne	31	158,974
Vent clearer for washbowls, &c., J. S. Hawley	91	158,937
Warming and ventilating apparatus, A. B. Mullett	147	158,965
Wash bowls, &c., vent clearer for, J. S. Hawley	91	158,937
Washing machine, J. F. Bassett	91	158,886
Washing machine, J. C. Chase	91	158,831
Washing machine, M. Commerce	91	158,783
Washing machine, Niermann and Schiester	91	158,969
Water closet, E. O. Brinckerhoff	8	158,896
Water wheels, case for turbine, E. R. Stilwell	168	158,997
Watering tank for hogs, G. A. Carter	167	158 905
Wells, making artesian and other, C. Pontes	51	158,865
Wood, machine for embossing, U. A. Lanteigne	54	158,952

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED JANUARY 19, 1875.

	Patent No.
Ackerman, B., Preparation of fertilizers	158,772
Adler, H., Metallic ceiling	158,881
Aldrich, G. W., Fluid can and measure	158,773
American Fire Kindler Company, assignee, (reissue)	6,246
Anderson, E. W., Vehicle seat and body	158,822
Anderson, M., Corner for show cases	158,823
Archer, G. W., Dentist's chair	158,880
Arnold, P., Horse detacher	158,774
Bachman, S. C., assignee	158,958
Bakewell, A. C., & Co., assignees	158,792
Baldwin, F. A. R., assignee	158,847
Ballou, F. D., Die for flanging boot and shoe soles	158,882
Ballou, F. D., Wax thread sewing machine	158,883
Banks, W. C., Hay and cotton press	158,884
Barlow, J. C., Wheel scraper for planters	158,885
Barnett, E., and W. H. Garett, Egg carrier	158,824
Barrett and Farnsworth	158,789
Bassett, J. F., Washing machine	158,886
Baumeister, L., Apparatus for lighting, extinguishing, and regulating gas flames	158,887
Baumgartner and Iske	158,843
Baxter, J. W., Dental plugger	158,888
Baxter, W. H., assignee	158,877
Baylor, R. W., Barrel	158,777
Bean, B. F., and C. H. Farnham, Loom picking mechanism	158,775
Bean, E. E., Electro magnetic gas lighting apparatus	158,889
Becker, J., and W. D. Hoffman, Electro therapeutic bath	158,890
Bennett, G., and F. E. Parsons, Uterine supporter	158,891
Bentley, O., assignee	158,819
Benton, T. P., Harvester	158,825
Billmeyer, C., Car coupling	158,892
Bird, J. A. T., Switch signal	158,776
Bissell, D., Arm fracture apparatus	158,893

	Patent No.
Bissell, D., Fracture box for legs	158,894
Black and Opperman	158,970
Bole, J., Piston packing	158,895
Bond, W. H., assignee	158,773
Bowen, A. B., Bee hive	158,826
Boyd and Taber	158,872
Brewer, G. G., assignee	158,902
Brinckerhoff, E. O., Water closet	158,896
Brittain, R. J., Electro magnetic burglar alarm	158,897
Brockett, L. A., Potato digger	158,898
Broughton, J., Breech loading fire-arm	158,899
Brown, W. A., Bread slicer	158,827
Bryan, J. W., Station indicator	158,900
Bryant, A. H., Egg carrier	158 828
Bullock, T., Machine for forming boot and shoe heel rands	158,901
Burger, T. W., assignee	158,845
Burk, H C., Animal trap	158,778
Burras, E. J. W., Metal coating composition	158,902
Bussey, W. C., Faucet	158,829
Buterworth, A. L., Shoe knife	158,830
Buttles, C. A., Fountain sprinkler	158,903
Carnegie, T. M., assignee	158,953
Carr, J. H., Spark arrester	158,904
Carter, G. A., Watering tank for hogs	158,905
Channing, W. F., and M. G. Farmer, Electro magnetic fire alarm telegraph for cities, (reissue)	6,239
Channing, W. F., and M. G. Farmer, Electro magnetic fire alarm telegraph for cities, (reissue)	6,240
Channing, W. F., and M. G. Farmer, Electro magnetic fire alarm telegraph for cities, (reissue)	6 241
Chapman, G. A., assignee	158,869
Chase, J. C., Washing machine	158,831
Children, E., Coupling joint for cultivator teeth	158,906
Christie, J., Shutter fastener	158,779
Christie, J., Sash fastener	158,780
Clark, E., Water proof liquid blacking	158,907
Clark, G. H., Harvester	158,908
Clay, R. J., Automatic toy	158,781
Cline, Seiberling & Co., assignees	158,810
Clough, T., Argand gas burner	158 832
Coburn, J. C. and L., Mechanism for molding paper pulp	158,782
Cochrane, W. F., Hemp harvester	158,909
Cochrane, W. F., Mowing machine	158,910
Colt, S., assignee	158,963
Colt's Patent Fire Arms Manufacturing Company, assignee	158,957
Commerce, M., Washing machine	158,783
Conklin, H. N., Boot jack	158,911
Connel, J. M., Air and steam car brake	158 912
Cosby, O. G., and G. W. McGovern, Invalid bedstead	158,913
Cottle, S., Die for making hollow rings	158,914
Cottom, J. B., Door spring	158,833
Coulter, A., Car coupling	158,915
Coy, F. D., Mounted horse power	158,784
Crumber, A., and D. Donald, Bakers' oven	158,916
Culbertson, W. C., Sheer boom	158,917
Da Costa, D. R., Game apparatus	158,918
Darby, G. W., Sewing machine ruffler	158,834
Davis, J. R., and J. R. Mills, Earth auger	158,919
Davis, V. E., Vehicle seat	158,785
De Butt, J., Machine for trimming and beading sheet metal	158 920
Disston, H., Hand saw	158,921
Dittenhoefer, M., Comb	158 922
Doan, R. R., Road engine	158,923
Dodge, L., Baling press, (reissue)	6,242
Dodge, L., Hay, straw, and other bales, (reissue)	6,243
Donald and Crumbie	158,916
Douglas, J. W., Lining pump cylinders	158,786
Duvey, J. F., assignee	158,993
Drago and Wood	158,818
Edison, T. A., Telegraph apparatus	158,787
Erlin, G., Mortising tool	158,835
Farmer and Channing, (reissue)	6,239, 6 240, 6,241
Farmer, M. G., Electro magnetic fire alarm apparatus, (reissue)	6,244
Farnham and Bean	158,775
Farnsworth, L. H., Boot and shoe crimping machinery	158,788
Farnsworth, L. H., and T. Barrett, Boot and shoe crimping machine	158,789
Fauré, M. J. F. R., and J. L. Kessler, Apparatus for concentrating and evaporating sulphuric acid	158,924
Fay and Sanumera	158,870
Ferguson, J., Tin lining metallic pipes	158,790
Fink, J. B., Vehicle wheel	158,925
Flinn, E., and R G. Wier, Bale tie	158,836
Fürtscheim, M., assignee	158,867
Folsom, J. S., assignee	158,788, 158,789
Ford, G. H., Carpet stretcher	158,926
Forster, J., Coal box	158,837
Fowler, F. G., Lubricating device for marine propellers	158,791
Franke, C., Brick laying machine	158,838
Frey, J. H. Printer's shooting stick	158,792
Gally, M., Automatic telegraphic apparatus	158,927
Gally, M., Telegraphic apparatus and circuit	158,928
Gardinier, E., assignee	158,845
Gardner, T. W., Stair rod securer	158,930
Gardner, W. R., Reflector	158,929
Gardner and Wright	159,012
Garrett and Barnett	158,824
Gates, F., Paper box machine, (reissue)	6,245
Gearing, C. M., Hydrocarbon furnace	158,931
Gilbert, J. W., Dental engine hand piece	158,932

	Patent No.
Glascock, F. R., Sash holder	158,933
Godshall, W. S., assignee	158,925
Goucher, J., Machine for making toy confectionery	158,934
Grubb, J. W., assignee	158,847
Guichetean, P., and A. Perin, Temporary binder	158,839
Gunckel, W. O., Car coupling	158,935
Hadcock, O. P., and F. W. Pierce, Milk cooler	158,840
Haley, G. A., Machine for cutting irregular forms	158,793
Hamilton, B. R., Rein holder	158,936
Hand, S. A., Lawn mower	158,794
Hardy, C. R., Clover harvester	158,795
Hawes, L. P., assignee	158,832
Hawley, J. S., Vent clearers for wash bowls, &c	158,937
Heald, G. W., Oscillating engine	158,938
Helfins, W., assignee	159 001
Henry, J. J., Device for forming shoe sole tips	158,939
Henslee and Petree	158 975
Herald, J., and E. S. Rumsey, Door hanger	158,796
Higtee, C., Guide for stage scenery	158 940
Hildreth, M. E., Sad iron holder	158 841
Hoffman and Becker	158,890
Hogue, L. E., Farm fence	158,941
Holliday, J. L., Coal box	158,797
Homan, W. and W. C., assignees	159 008
Husbands, J. D., Jr., Fire kindler, (reissue)	6,246
Hussey, A. B., Chimney cap	158,942
Hussey, C. A., Brush	158,943
Hussey, S., Fulling mill	158,842
Iden, H., assignee	158,832
Ingalls, N. P., Thill coupling	158,944
Insull and Spicer	158,993
Iske, A., Ironing board	158,844
Iske, A., and J. Baumgartner, Carpenter's sliding gage and square	158,843
Jewell, T. J. M., Cotton press	158 845
Johnson, F. G., Station indicator	158,798
Jones, M. R., Safety box for revolving shafting	158,799
Keech, T., Fare box	158 846
Kellogg, C. H., Paper bag machine	158,945
Kenney and Wright	159,011
Kessler and Fauré	158,924
King, S. M., Machine for dressing shingles	158,946
Kingman, S. C., Machine for grooving sewing machines needles	158,947
Krom, S. E., Ore crushing machine	158,800
Laemann, J., Plate for guiding hand knives in cutting cloth, &c	158,801
Labaye, J. J., Car coupling	158,948
Lane and Bodley, assignees	158 951
Lane, D. M., Vehicle side spring	158,949
Lane, P., Hog trap	158,950
Lane, P. P., and S. R. Smith, Hydraulic elevator	158,951
Lantrigne, U. A., Machine for embossing wood	158,952
La Rue, S. H., Base burning stove	158,847
Lauder, G., Joint for wrought iron pipes	158,953
Lawson, J. A., Hot air furnace	158,954
Leland, J., Car wheel	158,849
Lemon, U. E., Bag holder	158 949
Lieb, C., Pocket book	158 955

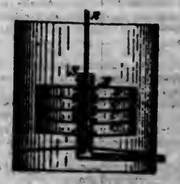
TITLES, DRAWINGS, AND CLAIMS

OF

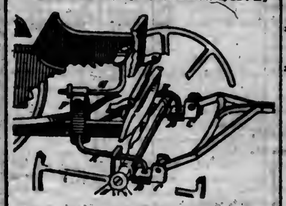
PATENTS GRANTED JANUARY 19, 1875.



158,772. PREPARATION OF FERTILIZERS. B. Ackerman, New York, N. Y. [Filed Dec. 14, 1874.]

The within-described banded manure, composed of the excrementary matters A and straw or litter D, confined in an approximately-rectangular form by the bands C, so as to prevent the ventilating-grooves a, substantially as and for the purposes herein specified.

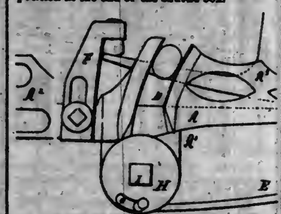
158,773. FLUID GAUGE AND MEASURER. G. W. Aldrich, Syracuse, N. Y., assignor of one-half his right to Wm. H. Bond, same place. [Filed June 17, 1874.]



Brief.—A series of measuring-chambers of determinate size are arranged one above the other about a central supply-tube, and have at top and bottom openings into said tube. The chambers being full, a piston fitting the tube is raised, so as to uncover successively the openings, and allow the liquid to flow from one or more of the chambers, according to the height to which the piston is raised. The necessary air-supply is admitted through the hollow piston-rod.

1. The measuring-chambers C C C, when combined with the supply-tube S and the piston-head H, substantially in the manner described.

2. The hollow piston-rod R, when used in combination with the piston-head H, and the measuring-chambers C C C, and the supply-tube S, substantially in the manner set forth.



158,774. HORSE-DETACHERS. P. Arnold, Elizabethtown, Ky. [Filed Dec. 4, 1874.]

In a device for detaching horses from vehicles, the combination of the spring-clevis F H, treadle G, and pins E with the couplings C D of the tongue or shafts, substantially as and for the purposes specified.

158,775. PICKING MECHANISMS FOR LOOMS. Benjamin F. Bean and Chas. H. Farnham, Manchester, N. H. [Filed Nov. 16, 1874.]

Brief.—To check the back movement of the picking-stick, the bed on which the rocker rests is provided with an elastic stop, against which the toe of the rocker is arranged to strike, and the bed has side flanges and a curved guiding-way, in which works a projection on the toe. An adjustable spring under the bed, and attached to the rear end of the rocker, serves to return the stick to its position at the end of the shuttle-box.

1. The combination, with the rocker and its bed, of an elastic stop, adapted to operate in connection with the rocker, substantially as and for the purposes set forth.

2. The rocker and its guiding projection located near its forward end, combined with the bed, having a curved guiding-way and side flanges, substantially as described.

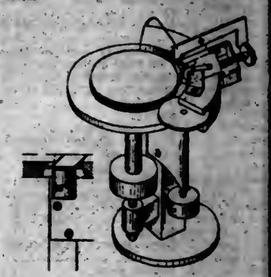
3. The combination, with the rocker, constructed as described, its strap, and the frame or bed, having side flanges, of the long adjustable spring E, extending horizontally along under the bed or frame, and terminating at or near the back end of the rocker, as set forth.

4. The combination of the bolt I, square next to its head, the slotted washer, having pins b', the cam C, and the hanger A', provided with projections for adjusting the force of spring E, as set forth.

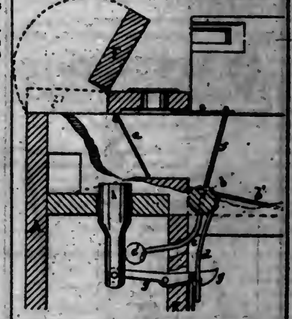
5. In combination, the flanged bed or frame, having curved guiding-way, the arm F, and check, and the rocker with its guiding projection, all substantially as described.

158,776. SWITCH-SIGNALS. Jas. A. T. Bird, Chicago, Ill. [Filed Apr. 10, 1874.]

The rotary posts I, F, J, and J', each provided with a shouldered collar and with a pulley or rag-wheel, both rigidly attached thereto, the signal-boards mounted on the said posts, and operating in connection with the said shoulders, the ropes or chains arranged over the said pulleys or wheels, and connected to the bell-cranks, and the switch-rails, also



connected to the said bell-cranks, all combined and operating together, in connection with adjustable extensions on the train, substantially as and for the purposes specified.

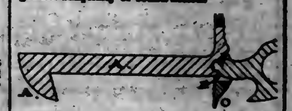


158,777. BUTTER-PATCHING MACHINES. H. Bornhardt, New Haven, Conn. [Filed July 14, 1874.]

1. A barrel-cylinder composed of straight staves A A, said staves being united by metal rings B B, or their equivalents, substantially as described.

2. As a new article of manufacture, a barrel constructed, as described, and provided with a head formed in two sections, D D', and fastened by a key, F, substantially as set forth.

158,778. ANIMAL-TRAPS. Hiram C. Burk, Zoar Station, Ohio. [Filed Sept. 24, 1874.]



1. The combination, with the loop a, axle b, and weight c', of the arms f and d, trigger g, and actuating-treadle h, as and for the purposes specified.

2. The combination, with the loop a, arms f, and treadle b', of the axle b, arms d, trigger g, and weight g', as and for the purposes specified.

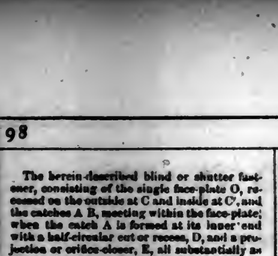
158,779. SHUTTER-FASTENERS. J. Christie, New Orleans, La. [Filed June 6, 1874.]

Brief.—Simple face-plate, fewer pieces, and greater simplicity of construction.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

The herein-described blind or shutter fastener, consisting of the single face-plate O, recessed on the outside at C and inside at C', and the catches A B, meeting within the face-plate, when the catch A is formed at its inner end with a half-circular cut or recess, D, and a projection or orifice-closer, E, all substantially as shown, for the purpose set forth.

158,780. FASTENING FOR THE MEETING-RAILS OF SASHES. J. Christie, New Orleans, La. (Filed June 6, 1874.)



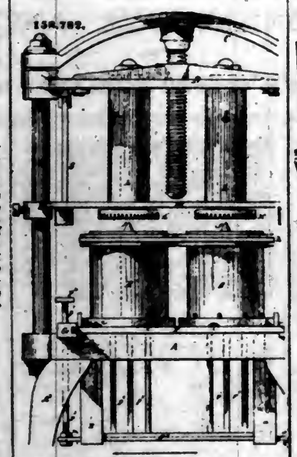
Brief.—A hooked arm having a weighted knob is hinged to fastening-plates, which are attached conversely to the meeting-rail of the upper sash. A slotted clasp is hinged to a screw-shank inserted in the meeting-rail of the lower sash, and with this clasp the hooked arm engages, its weighted knob preventing the striking of the glass, and also serving to hold it on an incline outward, to prevent interference with the free movement of the sashes.

The combination of the weighted hooked arm C, hinged to plates A B, with the slotted clasp E, hinged to screw-shank F, all substantially as described and shown, for the purpose set forth.

158,781. AUTOMATIC TOYS. Robt. J. Clay, Boston, Mass. (Filed June 10, 1874.)

Brief.—Represents a toy figure which appears to drive a sewing-machine, but is driven by mechanism inside the machine instead.

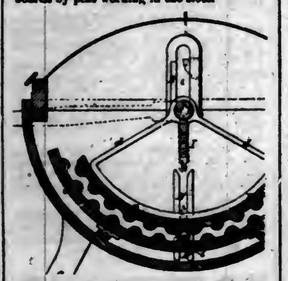
1. The automatic toy, substantially as described, consisting of the seated figure or doll A, the rock-shaft c, and one or more pedals, b b, the sewing-machine frame D, and the vibratory needle-arm or lever E, all applied together and to the table or case B, and provided with mechanism for operating them, essentially as explained.



2. The combination of the stop-rod c' and the automatic toy, consisting of the seated doll or figure A, the rock-shaft c, one or more pedals, b b, the sewing-machine frame D, vibratory needle-arm or lever E, and the clock mechanism H, all being arranged and applied substantially as specified.

158,782. MECHANISMS FOR MOLDING PAPER-PULP. Jehiel C. Coburn and Leonard Coburn, Worcester, Mass.; said Jehiel C. Coburn assignor to said Leonard Coburn. (Filed Dec. 10, 1873.)

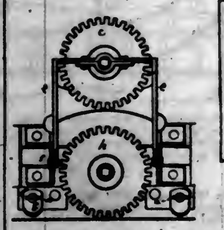
1. The combination, with the bed A, plates D, matrix-chambers E, and dies K, of the oscillating-plate F', rods F' F', guide-plate M, and spring-latches S, substantially as and for purposes set forth.



2. The combination, with the internal cylinder I, of the grooved cone J, and conical point or cap f, to end for the purpose stated.

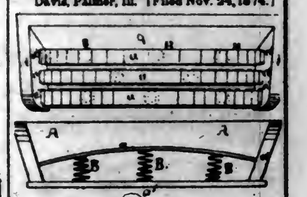
158,782.

158,783. WASHING-MACHINES. Mathias Commeroe, Jersey City, N. J. (Filed Aug. 26, 1874.)



Brief.—The wash-boards are caused to oscillate in opposite directions by means of the slotted levers, which are pivoted on the inner sides of the tub, and connected with the wash-boards by pins working in the slots.

The combination, with the oscillating wash-boards C D, of the pivots c, slotted levers H, pins b b, and springs I, substantially as and for the purpose herein set forth.

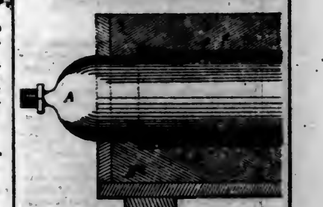


158,784. MOUNTED HORSE-POWERS. Franklin D. Coy, Marseilles, Ill., assignor to H. A. Pitts' Sons Manufacturing Company. (Filed July 2, 1874.)

Brief.—The frame, suspended from the rear, is held in place during the operation of the machine by fastening devices.

In a mounted horse-power, the buttons g g and set-screws c' c', in combination with the hangers p and wheels c and h, all constructed and arranged as and for the purpose set forth.

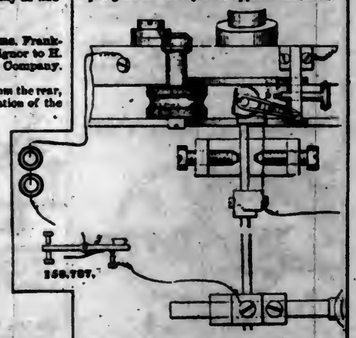
158,785. VEHICLE-SEATS. Valentine E. Davis, Palmer, Ill. (Filed Nov. 24, 1874.)



1. Strips a, supported by springs B, and constructed and combined to operate in mortises a', as and for the purpose set forth.

2. Frame A, mortised at a' in combination with strips a, springs B, and bottom A', as and for the purpose set forth.

158,786. LINING PUMP-CYLINDERS. Joseph W. Douglas, Middletown, Conn., assignor to W. and B. Douglas, same place. (Filed July 13, 1874.)



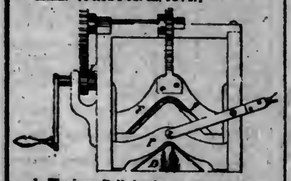
Brief.—A tinned sleeve is placed around the soft-metal lining, to prevent fusing the same when the molten metal is poured.

The combination of the metal sleeve F, the lining-cylinder A, and the iron cylinder, as described.

158,787. TELEGRAPH APPARATUS. Thomas A. Edison, Newark, N. J. (Filed Aug. 13, 1874.)

Brief.—"Electromotograph" in which the mechanical action of an armature is obtained by electro-chemical decomposition. A pivoted stylus, included in a circuit, is carried in one direction by the friction of a moving fillet of chemically-prepared paper. When the current passes the friction is lessened by the decomposition effected thereby, and a retractile spring moves the stylus in opposite direction.

158,787.



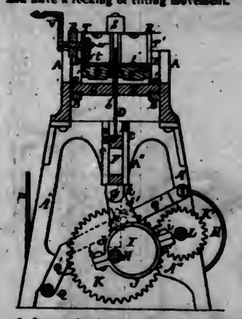
1. A moving surface in contact with a yielding vibrator, through which pulsations of electricity are passed when such surfaces in contact are of such a character that the friction will be varied by the electrical condition, substantially as set forth.

2. A vibrator, in combination with means for adjusting the pressure of the vibrator on the moving surface, and of the yielding force that moves the vibrator in the opposite direction to that derived from the moving surface, substantially as set forth.

3. The combination of a yielding vibrator, operated substantially as set forth, with a secondary circuit actuated by such vibrator, substantially as specified.

4. A telegraph instrument with a vibrator that is controlled by electro-chemical decomposition.

158,788. MACHINERY FOR CRIMPING BOOTS AND SHOES. Luther H. Farnsworth, Hudson, assignor to John S. Folsom, Boston, Mass. (Filed Feb. 12, 1874.)



1. The jaws D D, having convex elastic inner faces, in combination with the angular rods b and screws d, substantially as described, for the purpose specified.

2. In a crimping-machine, the vertically-sliding forms P P, located on each side of the presser F, provided with corrugated bottoms, and operated simultaneously by the bifurcated lever R R', substantially as described, for the purpose specified.

3. In a crimping-machine, the combination of the laterally-adjustable jaws D, corrugated forms P P', and presser F, all arranged and operating substantially as described.

158,789. BOOT AND SHOE CRIMPING MACHINES. Luther H. Farnsworth, Hudson, and Thomas Barrett, Boston, assignors to J. S. Folsom, Boston, Mass. (Filed Aug. 22, 1874.)

Brief.—The bed-plate, inclined from the ends inward to an angle, is slotted longitudinally, the leather to be crimped laid upon the plate over the slot, and, by means of a "former" resting upon a vertically-sliding holder, the leather is forced up between jaws or clamps, which are held within an adjustable frame directly above the bed-plate. The jaws or clamps are provided with an elastic binder, and have a rocking or tilting movement.

1. In a crimping-machine, an adjustable bed-plate and frame, the former having a central longitudinal slot, and both inclined from the ends downward to an angle, and having together a lateral and longitudinal or universal rocking or tilting movement, substantially as specified.

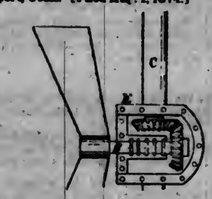
2. In a crimping-machine, an adjustable frame having a permanent clamp and jaw, T, and formed to receive and allow the lateral adjustment of a clamp and jaw, T, both the clamp and jaws being inclined from the ends downward to an angle, and formed to hold adjustable rubber or other elastic or yielding binders, substantially as described.

3. The bars or rods G, provided with springs q and nuts S, and supported as shown, so as to be raised and lowered at the ends of a crimping-machine frame, in combination with an adjustable frame, E, having clamps and jaws T T', all constructed and operating substantially as and for the purposes herein set forth.

4. The frame F, provided with an adjustable former, in combination with slotted bed-plate C, clamps and jaws T T', and adjustable frame E, all substantially as and for the purposes described.

5. In combination with a vertical sliding frame, F, adjustable connecting arms or rods J', eccentrics I, and shaft H, all arranged and operating substantially as specified.

6. In a crimping-machine, the segmental face cams K on shaft H, in combination with friction-rollers g, rods or bars G, and frame E, all constructed and operating substantially as and for the purposes described.



7. In combination with the movable frame E, having clamps and jaws T T', the rods G and foot-treadle Q, all substantially as and for the purpose set forth.

8. In combination, the sliding frame F, connecting arms or rods J', eccentrics I, shaft H, cog-wheels K K', shaft L, wheel M, chuck N, yoke m, rod O, and handle P, all arranged and operating substantially as and for the purposes specified.

158,790. TIN-LINING METALLIC PIPES. Jas. Ferguson, Bridgewater, Mass. (Filed Nov. 21, 1874.)

The process of coating or covering the external portions of metallic pipes, cocks, &c., which are to be tinned or zinced internally by immersing them in a molten bath of tin or zinc, with a mixture of salt and whiting to prevent the molten tin or zinc from adhering to the outer portions of such pipes or other metallic articles, as set forth.

158,791. LUBRICATING DEVICES FOR MARINE PROPELLERS. Frank G. Fowler, Bridgeport, Conn. (Filed Aug. 1, 1874.)

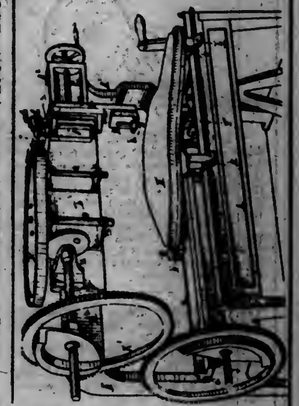
1. The mode of lubricating a submerged propeller-shaft and gearing attached thereto, by providing the same with a close case, and connecting it with a funnel, through which the case is filled with mercury and tar, oil, or similar compounds, which expel the sea-water from the case, and from contact with the gears and bearings, and lubricate the same, substantially as set forth.

2. The mode of expelling sea-water from and around propeller-shafts and gearing attached thereto, by introducing within a case or sleeve that surrounds such parts, mercury, fresh water, and oil, lard, or tar, the latter either separate or combined, substantially as shown.

3. The combination of the step-box H, and shaft G, and sleeve C, attached rigidly to the case E, whereby the friction on engine-shaft is greatly lessened, and the case with which the boat may be turned greatly enhanced, as shown and described.

158,792. PRINTERS' SHOOTING-STICKS. Jas. H. Frey, Cleveland, Ohio, assignor to Allan C. Bakewell & Co., Pittsburg, Pa. (Filed Nov. 3, 1874.)

Brief.—A shooting-stick with sleeve-handle broader than driving end, and a square end between driving-shoulders, to drive down quoins.



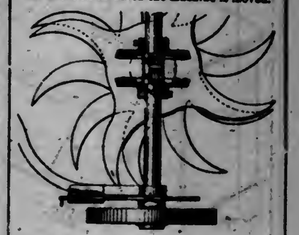
1. In combination with a shooting-stick having a driving head, H, a handle, I', consisting of a sheath or sleeve of a material that will not deface the type, and provided with enlarged portions c' c' and flattened surfaces d', substantially as and for the purpose specified.

2. A shooting-stick tapered from side to side, and having right-angled shoulders upon the opposite sides, having a square-faced projection suitable for driving down quoin or furniture, substantially as specified.

158,793. MACHINES FOR CUTTING IRREGULAR FORMS. Geo A. Haley, Chicago, Ill. (Filed Oct. 2, 1874.)

Brief.—The table which carries the material revolves, and the molding is cut by a tool, which is kept at right angles to its work by a system of irregular gears.

1. The tool-holder M, as described and shown, oscillating on an upright spindle, y, and operated by a grooved cam, P, so as to be always at right angles with the cut, as and for the purpose set forth.

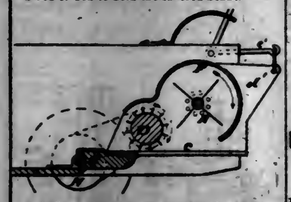


2. The combination of the table E, supporting the cam-plate H, and reciprocating upon the ways a of the guard-wheels b on the corners of said table, and flanges a' of the frame A, as set forth.

3. The combination, with the table E, of the stirrup F, stop c, shaft G, gear I, shafts J J', eccentric oval gears K K', shaft M, and bevel-gears O O', for communicating an irregular rotary movement to the upper cam-plate P, mounted on the cross-head L, substantially as described.

4. The combination, with the adjustable cross-head L and cam-plate P, of the rock-shaft Q, gored segment R, and arm R', the tool-holder M, head M', feed-screw t, shaft f, and pinion l, as and for the purposes set forth.

158,794. LAWN-MOWERS. S. Ashton Head, Philadelphia, Pa. (Filed Nov. 28, 1874.)

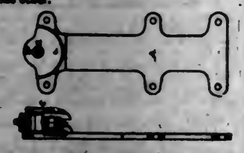


Brief.—Arrangement of devices whereby the cutting mechanism is operated continuously in the same direction, irrespective of the direction in which the machine is moved.

The combination, in a lawn mower, of a driving-axle, bevel-gears loose thereon, and having fair-but-teeth set in respectively reverse directions, spring-pawls to engage with the ratchet-and bevel-gears, a bevel-pinion and rotating cutter, and a stationary cutter, substantially as set forth.

158,795. CLOVER-HARVESTER. Clinton R. Hardy, Lexington, Ind. [Filed July 13, 1874.]

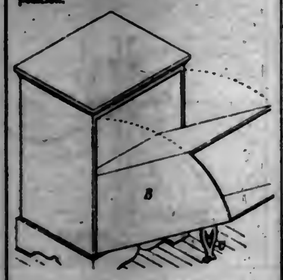
Brief.—A vertically-adjustable cutting or plaiting apparatus, moving concentric with the supporting-axle, is used in connection with a tool or box to hold the severed heads.



1. In a clover-harvester, the frame composed of the cross-bar C and side frames, *d d'*, for bearing the operative mechanism, consisting of the rod D and teeth *e e*, hinged on a line joining the centers of the ground-wheels B B, and operated by the lever *c c'*, substantially as shown and specified.

2. The fan E and housing F, in combination with the rod D, teeth *e e*, pulleys G H I J, and ground-wheels B B, constructed to operate together substantially as shown, and for the purposes set forth.

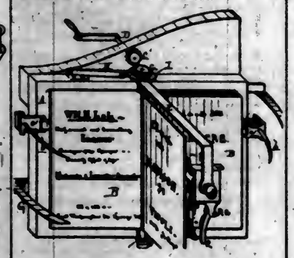
158,796. DOOR-HANGERS. John Herald and Edward S. Bunnay, Binghamton, N. Y. [Filed Nov. 7, 1874.]



Brief.—Simplicity of construction being attained by casting the two parts complete, a pin on one passing entirely through the roller, and taking its bearing in a hollowed recess of the other.

The hanger-plate A and roller-pin B, of one piece, in combination with the cap-piece C, having a hollowed recess for the end bearing of the pin, and the roller D, constructed substantially as herein described, for the purpose set forth.

158,797. COAL-BOXES. James L. Holliday, Wheeling, W. Va., assignor of one-half his right to J. A. Holliday, same place. [Filed Dec. 24, 1874.]



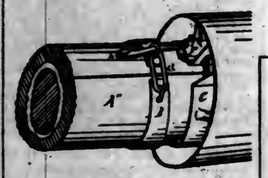
Brief.—When the hinged receptacle is tilted, the supporting-leg drops into a perpendicular position.

The combination of the case A, the coal-compartment B, and the movable leg C with such hinge, and with the hinges D D and the hinge fastening the movable leg to the front of the coal-compartment, substantially as and for the purpose hereinbefore set forth.

158,798. STATION-INDICATORS. F. G. Johnson, Chicago, Ill. [Filed Nov. 10, 1874.]

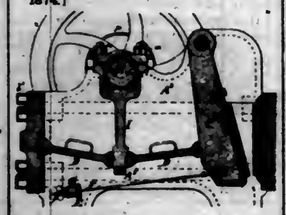
Brief.—The indicating-leaves are arranged in book form, and each provided with a yield ing tag, which is grasped by the leaf-turning mechanism, pivoted at *d* to the lower end of the vibrating arm. One leaf at a time may be taken off either book, according to the direction in which shaft C is rotated.

1. The combination, with the bracket A, having rods *b*, of the book B, provided with tags *a*, connected to the leaves of the same by rubber straps, each having an eye to slip over said rods, as set forth.



2. The combination, with the bracket A, of the shafts C D, and arm E, adapted to be vibrated as described, and having attached to its extremity a locking and leaf-turning device, substantially as set forth.

3. The combination, with the locking and leaf-turning mechanism fastened to the arm E, vibrated as shown, of the segment G, as and for the purpose set forth.



158,799. SAFETY-RODS FOR REVOLVING SHAFTING. Marquis R. Jones, Darien, Wis. [Filed June 26, 1874.]

Brief.—Cylindrical casing is placed around universal joints in revolving shafting, to cover the joint when the shaft runs at any angle.

In combination with the boxing A'', the cylinder B', rim C, arms *c*, flat *a*, pin *b*, and lugs D, substantially as and for the purpose specified and described.

158,800. ORE-CRUSHING MACHINES. S. B. Krom, New York, N. Y. [Filed Mar. 26, 1874.]

1. The hollow washers *b'*, on the tie-bolts B, in combination with the stout framing A A' A^2, and with the parts C D D I H, as specified.

2. The breaking-cups *m*, in combination with the crank H, link I, toggles D D, and crushing-jaw C, as specified.

3. In a crushing-machine having a vibrating jaw, C, and operating shaft H, the fly-wheel P, connected to the said shaft by a friction-coupling, *p*, as and for the purposes specified.

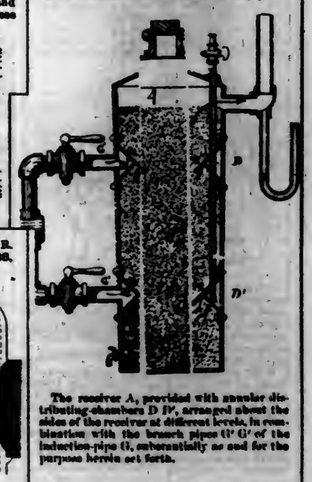
4. The exchangeable toggles D D, having the supporting-heads *d d*, in combination with the crushing-jaw C and link I, as specified.

5. The crushing-machine described, operating by a vibrating jaw, C, crank H, link I, and toggles D, and having the friction-coupling *p* to the fly-wheel P, so combined and arranged that the breaking of either set or the slipping of the friction-coupling will relieve the machine from overstrain, as herein specified.

6. The combination of the sectional framing A^1 A^2 and longitudinal tie-bolts B with the ore-crushing jaw C, when the tie-bolts are arranged parallel to, and directly in the line of, the strain, as herein specified.

158,801. PLATES FOR GUIDING A HAND-KNIFE IN CUTTING CLOTH, &c. Jacob Lachmann, Philadelphia, Pa. [Filed Oct. 16, 1874.]

Brief.—The roughened and hardened edges sharpen the knife as it is drawn over them in cutting.



A pattern-plate for guiding a hand-knife in cutting out layers of leather, cloth, or other fabric, when the boundary edges of said plates are of steel roughened and hardened, substantially as and for the purposes set forth

---

158,802. GAS-CARBURETING MACHINES. Thos. J. Martin, Philadelphia, Pa., assignor of two-thirds his right to D. W. Stuart, same place, and W. B. Prall, Washington, D. C. [Filed Dec. 4, 1874.]

Brief.—The carbureting-receiver is nearly filled with porous absorbent material, and hydrocarbon fluid is supplied till it rises to the lower end of a vent and indicator pipe.

The receiver A, provided with annular distributing-chambers D D', arranged about the sides of the receiver at different levels, in combination with the branch pipes G' G'' of the induction-pipe G, substantially as and for the purpose herein set forth.

158,803. VEGETABLE-SLICERS. B. Monsees, New York, N. Y. [Filed May 27, 1874.]

Brief.—The machine may be secured to the edge of a table or bench. The vegetable is pressed upon the upper surface of a disk with cutters by a follower within a cylinder. This disk and its operating pinion are held between the points of two antagonizing screw-bolts, and may be adjusted by the movement of a nut above and below them, and the revolution of the screws.

The horizontal revolving cutter-disk contained between the screws *n* and *o*, in combination with the frame *c d*, bent arm 3, and gear-wheels, as set forth.

158,804. MEAT-CUTTING APPARATUS. Jas. A. Morrell, New York, N. Y. [Filed Dec. 26, 1874.]

Brief.—A cogged wheel attached beneath the revolving tub and a horizontal series of inclined circular saws are operated at appropriate speeds by gearings from a single wheel; the inclined position of each circular knife causing it to operate upon a varying line of surface on the block or sub-bottom, an abutment springing from a fixed central shaft serving to arrest the meat and throw it back to the cutters.

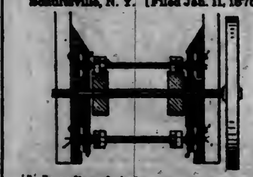
1. The circular cutters K, set obliquely on the shaft, substantially as set forth.

2. In combination, the oblique circular cutters K and the revolving bottom C.

3. In combination with the oblique circular cutters K, the revolving bottom C and the stationary guide L, substantially as set forth.

158,805. MEAT-CUTTING APPARATUS. Jas. A. Morrell, New York, N. Y. [Filed Oct. 30, 1874.]

Brief.—Within a tub a fixed perpendicular central shaft, with a cogged wheel at top, even with top of tub; a crank outside of periphery of tub, carrying a shaft connected to a sleeve around the central shaft; also, a system of gearing meshing with the large wheel, and by sleeves upon a descending shaft revolving a series of circular knives on their own axes, close to the inner periphery, while they traverse its whole circle.



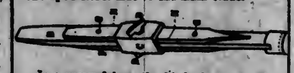
1. In combination with the vertical sides of the tub, the knives K, having a double rotation, revolving on their own vertical axis, and with it around a central vertical axis, substantially as set forth.

2. In combination with the stationary central wheel, D, carrying the intermediate double wheel G G', pinion H, vertical rotating shaft I, and knives K, substantially as set forth.

3. In combination with the crank-arm E, slotted at H', and adjustable knives and shaft swinging in said slot, the spring M, for maintaining the knives in relation to the tub, substantially as set forth.

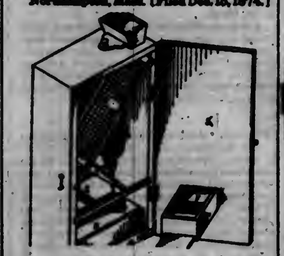
4. In combination, the crank-arm E, slotted at H', cam F, swinging sleeve F, knife-shaft I, and adjusting set-screw and spring, substantially as set forth.

158,806. HORSE-POWERS. T. G. Palmer, Schuylerville, N. Y. [Filed Jan. 11, 1875.]



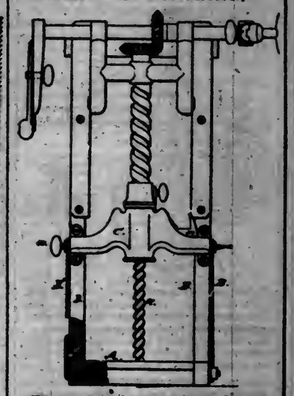
1. In endless-chain horse-powers, two sets of wheels or rollers, *c c'*, operating on each end of spindles or rods for carrying the endless chain, substantially as and for the purpose specified.

2. Spindles attached to the ends of the legs or center of the links for the extra set of wheels, as specified.



158,807. SCREW-DRIVERS. W. F. Patterson, Boston, Mass. [Filed Nov. 2, 1874.]

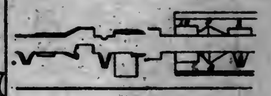
Brief.—The blade of a screw-driver is provided with a fixed clamp projecting upon both sides thereof, in which are detachably secured two auxiliary adjustable and reversible blades, one upon either side of the main blade.



In a screw-driver, the blade B, having the fixed clamp C projecting upon both sides thereof, and provided with the screws D D, in combination with the detachable and reversible blades E F, having the indentations G G and gage-marks H H, constructed to operate substantially as and for the purpose specified.

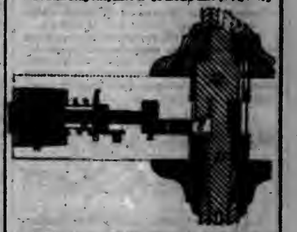
158,808. COAL-SIFTERS. James S. Pearce, Northampton, Mass. [Filed Dec. 15, 1874.]

In a coal-sifter, constructed substantially as described, the drawer F, combined to operate with the door K, screens D E, and drawer H, substantially in the manner and for the purpose specified.



158,809. BORING-MACHINES. T. C. Phillips, Pittsburg, Pa. [Filed June 9, 1873.]

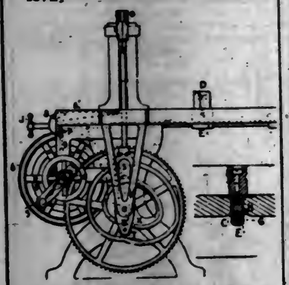
The bearing C, provided with projections T and thumb-screw *w*, in combination with the curved arms B', furnished with notches A on their inner faces, and uprights B, hinged to the base A, substantially as herein described, and for the purpose set forth.



158,810. DIES FOR SWAGING HARVESTER-GUARDS. Jas. H. Solbering, Doylestown, (near Chippewa P. O.) Ohio, assignor to Chas. Solbering & Co., same place. [Filed Mar. 21, 1874.]

Brief.—The bar is submitted to the action of the dies, commencing with groove 1, and passing successively between the others in their order. After the blank is partly formed in die-blocks A B, the end is bent back and the point formed in die-blocks U D, and the guard completed.

The improved series of dies herein described for making harvester-guards, substantially as set forth.



158,811. LOCKING-LATCHES. H. Skinner, Grand Rapids, Mich. [Filed June 1, 1874.]

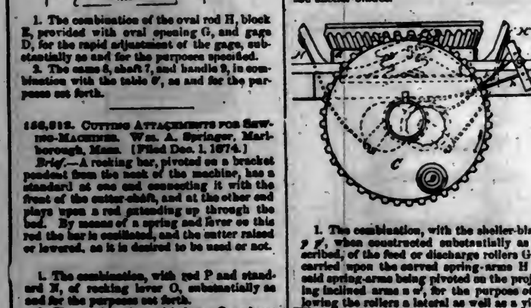
1. The cams *s s'* upon the hub D, engaging with and operating upon the projections *n* and *n'* on the bar E, for the purpose of withdrawing the bolt A, substantially as described.

2. The slotted sleeve O, having ring R, provided with projecting pegs 1 and 2, in combination with the bolt A, provided with flanges for the purpose of locking the door from the outside, as shown and described.

156,812. PAPER-CUTTING MACHINES. Samuel W. Soule, New York, N. Y. [Filed Mar. 3, 1874.]

1. The combination, with the oval rod H, block E, provided with oval opening G, and gage D, for the rapid adjustment of the gage, substantially as and for the purposes specified.

2. The cams f, shaft 7, and handle 9, in combination with the table 6', as and for the purpose set forth.



156,813. CUTTING ATTACHMENTS FOR SEWING-MACHINES. Wm. A. Springer, Marlborough, Mass. [Filed Dec. 1, 1874.]

Brief.—A rocking bar, pivoted on a bracket pendent from the neck of the machine, has a standard at one end connecting it with the front of the cutter-shaft, and at the other end plays upon a rod extending up through the bed. By means of a spring and lever on this rod the bar is confined, and the cutter raised or lowered, as it is desired to be used or not.

1. The combination, with rod P and standard N, of rocking lever O, substantially as and for the purposes set forth.

2. The combination, with lever O and rod P, of piece a, lever d, and spring g, substantially as and for the purposes set forth.

3. The combination, with shaft H, rod P, standard N, and nook-piece C, of bearing-pieces L and M, rocking lever O, hinged bearing b, adjustable piece c, lever d, and spring g, substantially as and for the purposes set forth.

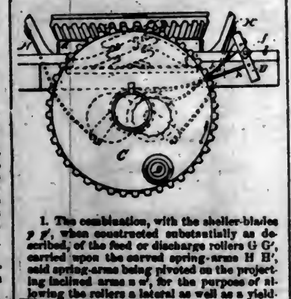
156,814. CALF-WEANERS. W. Sexton, Macon County, Ill. [Filed Apr. 11, 1874.]

Brief.—The curved prongs furnish the means of attachment to the animal's nostrils, and by their adjustability adapt the device either to weaning or to preventing cows from sucking themselves, according as their position is advanced or retreating.

1. The curved prongs C C' in combination with frame A, carrying square D B, as and for the purpose set forth.

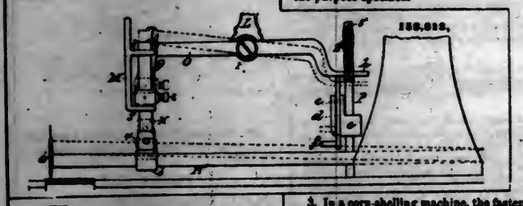
2. The curved prongs C C' provided with hooks and adjustable in frame A, substantially as described.

156,815. AXLES FOR CHILDREN'S CARRIAGES. Henry W. Warner, Greenfield, Mass. [Filed Dec. 11, 1874.]



156,815.

The axle for children's carriages, consisting of the rod A and the seat-blocks B, secured thereon, whereby the blocks are secured to the axle without making holes through the latter, substantially as set forth.



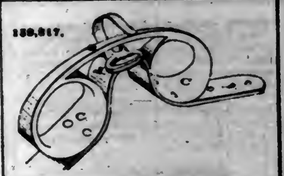
156,816. CORN-SHELLERS. John N. Wolfe, Lancaster, Ohio. [Filed Dec. 12, 1874.]

Brief.—Bearings of withdrawing-rollers for cob carried upon pivoted spring-arms; driving-wheel formed with eccentric on its inner face; a ring playing thereon operates, through an arm, a vibrating lever and a spring-pawl; a ratchet-wheel on the axis of one of the withdrawing-rollers, to secure correspondence between their action and that of wheel carrying the sheller-blades.

1. The combination, with the sheller-blades p p', when constructed substantially as described, of the feed or discharge rollers G G', carried upon the curved spring-arms H H', said spring-arms being pivoted on the projecting inclined arms a a', for the purpose of allowing the rollers a lateral as well as a yielding spring motion, to adjust them to any size of cob, substantially as set forth.

2. In a corn-shelling machine, the driving bevel-gear wheel C, having formed upon its face an eccentric, in combination with the ring f and arm h, vibrating arm or rocking shaft E, pawl j, and ratchet-wheel F, the whole constructed to operate substantially as and for the purpose specified.

156,816.



3. In a corn-shelling machine, the fastening-plates b b', formed with the inclined bracket-supports a a' for the spring-arms H H', and bearing-ring e for bevel-wheel B, substantially as set forth.

4. The combination, with the beveled gear-wheel B, carrying the spring-arms e e' and sheller-blades p p', of the driving gear-wheel C, provided with the eccentric c, arm h, rocking shaft E, pawl j, having guide-plates l l', and ratchet-wheel F, and discharge or feed rollers G G', substantially as set forth.

156,817. HARNESS-TREES. W. F. Wolfington, Louisville, Ky. [Filed July 2, 1874.]

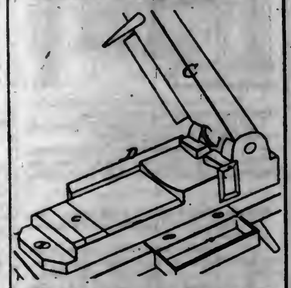
Brief.—The terrets are cast with a bridge connecting their tops. Beneath this is another, conforming to the outline of a horse's back, and either cast concurrently, or wrought and riveted to the bottom of the terrets. Projections of wrought metal, forming a continuation of the lower bridge, or separately riveted, are provided for the attachment of the jockey-flaps.

A harness-tree having line-loops C C, connected together by bridges A and B, and provided with projecting pieces D D, substantially as and for the purpose set forth.

156,817.

156,818. CHECK-REIN HOLDERS. John W. Wood and Edward A. Drago, Valparaiso, Ind. [Filed Apr. 4, 1874.]

Brief.—A spring-cylinder with strap attached, the said strap having a hook to receive the check-rein, and a retaining-loop upon the frame of the cylinder, to attach it to the check hook of a harness-saddle.



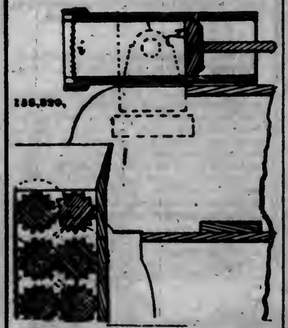
1. The main case A, provided with removable side, in combination with a spring cylinder-case, B, provided with a square-ended post, C, and the rim g coiled round the bolts e for setting the cylinder B, as and for the purpose set forth.

2. The attachment A', consisting of the looped leather J e, loops e f f, and bolt h, in combination with the case A, substantially as described.

3. The hook H, as described, in combination with the strap d, elongated pivot-stop G, and fulcrum F, as and for the purpose set forth.

4. The cylinder B, provided with the loop or bar E and elongated ears D, in combination with the strap d, as described.

156,819. MACHINES FOR MAKING TOE-CALKS. Luther S. Wright, Groton, assignor of one-half his right to Orlando Bentley, Marathon, N. Y. [Filed Mar. 7, 1874.]



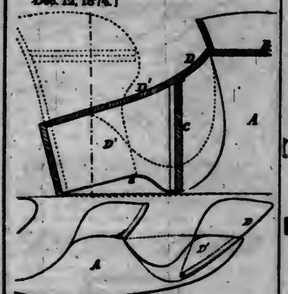
1. The transversely-concave die-bed, and the combination therewith of the gage b, as set forth.

156,820. BUTTER-WORKERS. Benoni Yaw and James J. Mitchell, (administrator of Robert H. Mitchell, deceased,) New Concord, Ohio. [Filed June 22, 1874.]

Brief.—A cylinder, open at one end and having a woven-wire disk fixed in the other, is transiionel centrally. When the open end is upward the butter is put in; when turned to the horizon a piston presses the butter through the interstices of the disking. Falling into a vertical cylinder having fluted rolls revolving in pairs, it is delivered therefrom into any desired receptacle.

1. The combination, in a butter-working machine, of a horizontally-operating plunger, B, and a pivoted box, C, provided with a wire-cloth sleve, f, at one end, through which the butter is pressed by the plunger, substantially as herein set forth.

2. The combination of the frame A B, slide C with plunger D, operated by the rack e and gearing b E c, the pivoted box G with sleve f, and the box H with rollers l, all constructed substantially as and for the purposes herein set forth.



156,820.

156,821. SEWING-MACHINE OPERATING MECHANISMS. Barker C. Young, Boston, Mass. [Filed Sept. 1, 1874.]

Brief.—The operator is enabled to start, vary the speed, or check the driving mechanism of a sewing-machine by means of a treadle connected to a shaft carrying a belt-pulley at one end and a friction-wheel at the other.

The combination of hanger E, attached to the under side of a sewing-machine table, and having ears c c, and shoe E', shaft G', swinging arm G, sleeve-bearing G', shaft b, wheel F, treadle H, rod h, and spring f, substantially as and for the purpose set forth.

156,822. VEHICLE SEATS AND BODIES. B. W. Anderson, Washington, D. C. [Filed Dec. 12, 1874.]

1. A rising and folding seat-back having a rigid extension below the plane of the seat, to operate substantially as set forth.

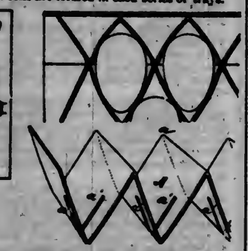
2. The combination, with a vehicle, of a seat or seat-back to slide and fold by successive movements, and provided with a rigid extension below the plane of the seat and suitable connecting devices, substantially as specified.

3. The combination, with the boot or body of a vehicle, cut away to form entrances through its wall, of a rising and folding seat having side standards, to operate, when folded, to close said entrances, substantially as specified.

4. The combination, with a vehicle boot or extension in rear of the front seat, of a rising and folding seat or seat-back having a back panel extending below the plane of the seat, to operate, when folded, to close said boot or extension and form a covering thereto, substantially as specified.

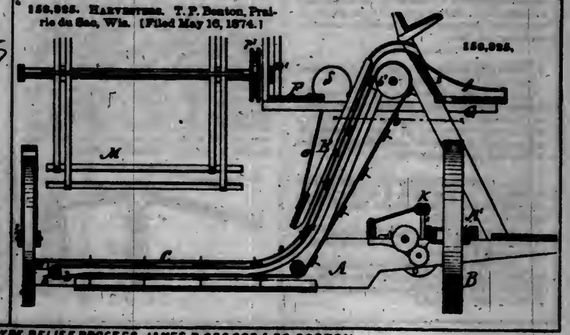
5. A rising and folding vehicle-seat or seat-back having a stiff extension below the plane of the seat, adapted for sliding connection with a part fixed to the vehicle, and to operate substantially as specified.

156,823. CORNERS FOR SHOW-CASES. M. Anderson, Chicago, Ill. [Filed Nov. 21, 1874.]



Brief.—The metal corners are provided with side flanges, and the under face of the plate has protuberances for catching and holding the screws.

As a new article of manufacture, a metal corner for show-cases having the side flanges C, and provided upon its under face with the protuberances c, for catching and holding the screws, substantially as and for the purpose set forth.



156,824. EGG-CARRIERS. Ephraim Barnett and Wm. H. Garrett, New Concord, Ohio. [Filed Aug. 1, 1874.]

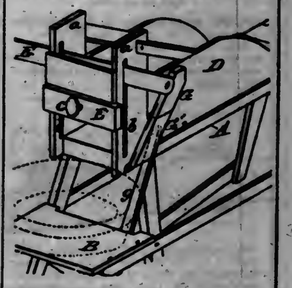
Brief.—The carrier is composed of sheets of corrugated pasteboard, having slots cut through the lower angles of the corrugation half their height, and dividing-strips having angular converging slots, whereby alternate half-cells are formed in each series of trays.

In an egg-carrier, the sheets A, having the slots a' cut through the lower angles of the corrugations to the extent of half the height of the corrugations, in combination with the dividing-strips B, having angular slots b converging toward the top, as described, whereby alternate half-cells are formed, in the manner described and shown.

156,825. HARVESTERS. T. P. Benton, Prairie du Sac, Wis. [Filed May 16, 1874.]

156,825.

156,826. BEE-HIVES. Asto B. Bowen, West Randolph, Vt. [Filed Apr. 13, 1874.]



Brief.—A tapering pin or rod passes through the hive, to be withdrawn when air inlets are desired.

The process of forming communicating passages through the combs by means of a removable tapering peg arranged for the reception of the natural deposit of wax around it, substantially as described.

156,827. BREAD-SLICERS. Wm. A. Brown, Eureka, Ill. [Filed Oct. 24, 1874.]

Brief.—The bread, forced along a trough against a gage for regulating the thickness of the slice, is cut by a guided vibrating knife, having its fulcrum in one of two jointed arms, the other jointed arm being connected to the rod of a treadle, so that both foot and hand may be employed in slicing the bread.

1. The hand-trough I, arranged above the delivery end of the elevator, as and for the purpose set forth.

2. The rod M, journaled to the front end of the arms P P, pivoted to the rear end of the machine, in combination with the shaft Q, having pinions p p, racks v, latching-lever Q', and perforated segment R, substantially as and for the purpose set forth.

3. Wheels B B', applied in pivoted frames A' A', in combination with the draft-frame A, the chains i i, pulleys j j, and a winding and unwinding rod, J, arranged as described.

1. In a bread-slicer, the combination, with a trough, D, and a knife, K, of the slotted guides *a a*, gage F, and jointed arms G G', substantially as described.

2. The treadle G' and rod *g*, combined with jointed arms G G', slotted guides *a a*, and a vibrating knife, K, substantially as described.

156,892. EGG-CARRIERS. Abner H. Bryant, Chicago, Ill. (Filed June 21, 1873.)

Brief.—The egg-carrier is composed of strips of pasteboard, provided with alternate slits on opposite sides, interlocking at right angles, forming bottomless rectangular pockets.

The combination of the longitudinal strip A and transverse strip B, constructed of flexible material, each provided with alternate reversed slots, as described, for interweaving said strips together edgewise and forming rectangular bottomless pockets, as set forth.

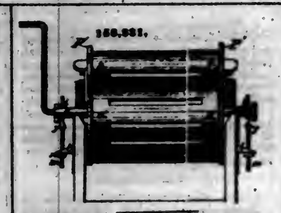
156,893. FAUCETS. Wm. G. Bussey, San Francisco, Cal. (Filed Dec. 8, 1874.)

The clasp consisting of the curved jaws *a a*, united by the circular spring *f*, said jaws being operated by the screw-rod A and nut I, substantially as and for the purpose described.

156,894. SHOE-KNIVES. A. L. Butterworth, Franklin, N. H. (Filed July 26, 1874.)

Brief.—By means of the nut working in the transverse slot, the blade becomes endwise adjustable, and adapted for the depth of cut required.

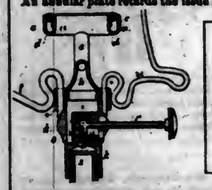
The combination, with the threaded knife-shank *b*, of the recessed handle A, having the transverse slot *a*, the ferrule-guard *c*, at the mouth of the blade-recess, and the rotating operating-nut C, seated in said slot, and engaging with said threaded knife-shank, to adjust the protrusion of the blade, substantially as specified.



156,895. WASHING-MACHINES. J. C. Chase, Rutland, Ohio. (Filed Nov. 28, 1874.)

Brief.—These rollers, with partially-grooved surfaces, having them smooth at the ends, are journaled in end plates, on which are legs and bottoms connected by elastic bands. A mirror with a set-screw connects the bracket of the end plates to the tub.

1. In a washing-machine, the combination of rollers *a b c*, end plates F F', the legs *p*, and bottoms K K', with elastic bands *o*, substantially as set forth.



2. The mirror *p*, brace *i*, and nut *n*, in combination with the leg I and projecting arms *f*, substantially as described.

3. The rollers *a b c*, with corrugations extending near to their ends, and terminating in the smooth friction-rings *a'*, substantially as set forth and described.

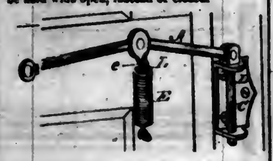
156,896. ARGAND GAS-BURNERS. Theodore Clough, New York, N. Y., assignor to himself, A. T. Welch, H. Iden, and L. P. Haven, same place. (Filed June 10, 1874.)

Brief.—A ring of aluminum clamped into the burner has rabbets to remove the metal of the burner from the flame. The whole burner proper is detachable from the base. The shade-holders revert against the base. An annular plate retards the issue of the gas.

1. The perforated ring of aluminum *b*, having recessed or flanged edges, over which the edges of the hollow metal ring *a* are turned, as set forth.

2. The argand gas-burner ring *a b*, arms *c*, and cylindrical chamber *h*, in combination with the cylindrical body *k*, into which the chamber *h* is introduced, as and for the purposes set forth.

3. The deflector-plate *o*, in combination with the hollow burner-ring *a*, and leaving an annular opening of uniform width between the plate and burner-ring, through which the gas passes with uniformity up to the flame, as specified.



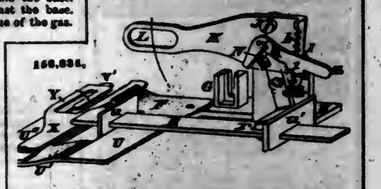
4. The cylindrical valve *s*, with gas-passage ways introduced within the body *r* of the burner and operated by the eccentric *t* within a mortise in the cylinder, and the stem *r* passing through each body and eccentric, in combination with the gas-burner, substantially as set forth.

5. The wire arms *l* or *o* of the shade or chimney-holder, having double or 3 beads at the lower ends, in combination with the flange *q*, having vertical holes for receiving the ends of the wires, and against the outer surfaces of which flange the bent wire presses, as set forth.

6. The cylindrical valve *s*, helical spring *s*, and eccentric *t*, in combination with the body *k* and gas-burner, substantially as specified.

156,897. DOOR-SPRINGS. Jas. B. Cottom, Dayton, Ohio. (Filed Dec. 10, 1874.)

Brief.—The jointed rods, forming a toggle-lever, have at their joint a reversible hook, and are connected at one end direct to the door, and at the other, by means of a reversible pin working in a reversible bracket, to the jamb or door-frame. A spiral spring in vertical position, with looped ends, is hooked into the reversible hook, and catches over studs at suitable distances on the door. A reversible device adapts it to right or left hand door. The tension of the spring is adjustable on the studs. By placing of the spring in opposite positions—that is, above instead of below the toggle-joint—the door may be held wide open, instead of closed.

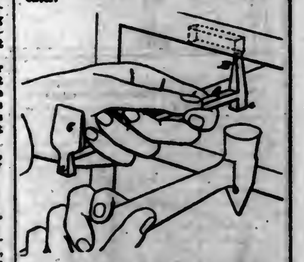


1. The reversible door-spring, consisting of the jointed rods A and B, reversible pin C, and spring E, constructed and operating substantially as described.

2. In combination with the jointed rods A and B, the reversible hook L and reversible pin C, with its bracket D, all constructed to operate as and for the purposes set forth.

156,898. RUFFLERS FOR SEWING-MACHINES. George W. Darby, Hamilton, Ohio. (Filed July 27, 1874.)

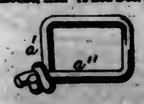
Brief.—The bar to which the rufflers-blade is attached slides in slotted guides turned up from the presser-foot frame, and midway between the guides in the leg or casket that receives the presser-bar, and from the end of the frame, and projecting under the ruffler-blade and foot portion, there is a holder. The devices of the second classes move the ruffler-blade, and determine the size of the gather. The holder W is adapted to fold a strip to be ruffled, and attached to an underlying piece.



1. The frame consisting of the parts F H U *a*, post I, and central supporting-leg G, when constructed and arranged substantially as described, for the purposes specified.

2. The slotted lever K, having the rack *k* and lever F, provided with its stud, in combination with bent lever Z, arranged and operating conjointly, in the manner as I for the purposes described.

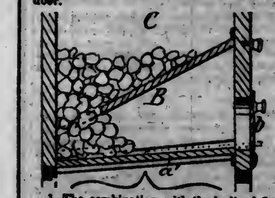
3. The slotted holder-arm U, in combination with the holder W and spring Y, substantially as set forth.



156,899. MORTISING-TOOLS. Gustavo Brin, San Francisco, Cal. (Filed Dec. 10, 1874.)

Brief.—The tool is designed for cutting mortises into which the bolts of drawer-locks enter.

A mortising-tool consisting of the shank A, with its small chisel B and transverse bit or chisel C, with their heads *c*, substantially as and for the purpose above described.

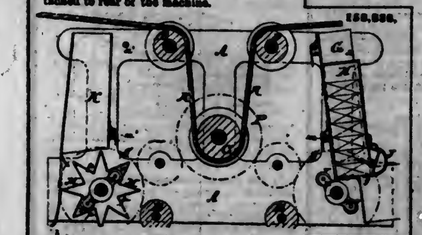


156,900. BALE-TIES. E. Flinn and R. G. Wier, Mobile, Ala. (Filed Dec. 29, 1874.)

The bale-tie link described, the same consisting of a single piece of stiff wire, A, bent into the form of a parallelogram, and the two ends of the wire secured together at one corner by coiling the projecting end of the wire at the shorter side *a'* of the link around the projecting end of the wire at the longer side *a''* of the same, for the purposes specified.

156,837. COAL-BOXES. John Forster, New York, N. Y. (Filed Dec. 26, 1874.)

Brief.—A box divided into two chambers by an inclined diaphragm, having at its lower edge an aperture for the delivery of coal into a passage in the lower chamber leading to the door.



1. The combination, with the inclined floor *a'* of a coal-box, of the walls F and E, forming passage P, substantially as and for the purpose specified.

2. The inclined diaphragm B, having an aperture, *c*, in combination with the sliding door *b* and walls E F, substantially as and for the purpose described.

156,838. BRICK-LAYING MACHINES. Chas. Franks, New York, N. Y. (Filed July 29, 1874.)

Brief.—Boxes for holding the bricks are attached to one end of the machine, said boxes having valved bottoms, which are acted upon by arms attached to the axis of the carriage, which causes the valves to move back and allow the bricks to fall in place. A box containing the mortar is attached to the other end of the machine. The mortar is admitted to the wall by a drum or wheel having V-shaped cavities, and spread by a trowel attached to rear of the machine.

1. A machine for laying bricks, provided with a box at one end containing bricks, acted upon by arms attached to a revolving shaft situated below said box, and a mortar or cement box at its other end, in combination with a wheel arranged with recesses or cavities attached to a revolving shaft situated below said mortar-box, the whole being arranged and operating substantially in the manner and for the purpose hereinbefore described and specified.

2. In brick-laying machines, a box, G, divided by partition-plates *c* into suitable compartments to receive the bricks, and provided, near the bottom, with projecting side flanges *w* and self-acting valves or hinged plates J, the whole being arranged and operating substantially as set forth.

3. In combination with a brick-box, G, arranged in the manner and for the purposes set forth, the self-acting hinged valve J, provided with a projecting piece, *p*, and diagonal plate *z*, operating substantially as described.

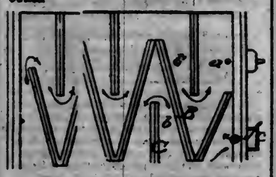
4. In combination with a box, G, the movable house H, in the manner and for the purpose substantially as described.

5. The mortar-box K, in combination with a wheel, M, and a plate, I, arranged and operating together substantially as described.

6. In combination with the side frames A of a brick-laying machine, the plates W W, projecting downward and embracing the brick wall, arranged and operating substantially in the manner and for the purpose described.

7. In brick-laying machines, the grooved pulley C and guide-pulleys D D, in combination with a rope, R, attached to both extreme ends of the wall, substantially as and for the purpose specified.

156,839. TEMPORARY BINDERS. Ferdinand Guichoteau and Alex. Paris, New York, N. Y. (Filed Oct. 2, 1874.)



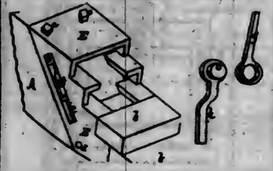
Brief.—A wire swiveled at one end of book-back passes through fold of sheet, and slips under ledge on other end. The wires are bent into loops or buckles.

The rod *b*, having the elastic folds *i i*, substantially as shown and described.

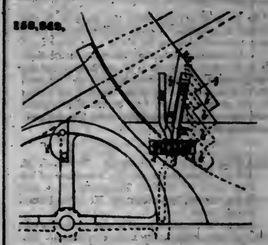
156,840. MILK-COOLERS. Oscar P. Hadcock and Frank W. Pierce, Copenhagen, N. Y. (Filed Dec. 10, 1874.)

Brief.—The milk introduced between and at one end of the pans follows a serpentine passage to the other end, or back again to an outlet.

The continuous zigzag partition B, attached to one end of the pan A, having inlet and outlet passage *c a*, in combination with the partitions C C, attached to the sides of the pan, and extending into the angles in the zigzag partition B, substantially as described, and for the purpose set forth.



156,841. HAT-BRUSH HOLDERS. Mary B. Hildreth, Mount Pleasant, Iowa. (Filed June 27, 1874.)

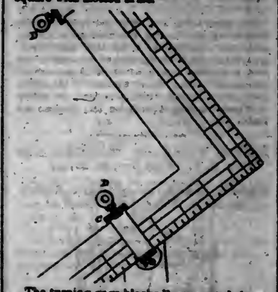


The cylindrical holder-block B, constructed entire, and longitudinally channeled underneath in the form of a groove-recess, having its upper or interior portion *b* enlarged to slip endwise over the enlarged portion of the handle of an ordinary rod-iron, and the lower portion or neck *b'* contracted to allow the passage of the handle-stem *a'*, and to prevent the escape of said enlarged portion of the handle, as specified.

156,842. FULLING-MILLS. Sylvanus Hussey, Gowanda, N. Y. (Filed Aug. 3, 1874.)

Brief.—Provides beater with a metal socket-frame, so that the toes can be removed as they wear away. By means of adjustable catch *f* in slot *a*, dog *g*, and eccentric lever A, (the two latter being hinged to the side frames,) the beater is raised and held in a fixed position while the material operated upon is being removed.

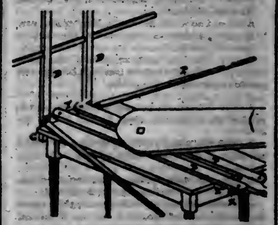
156,843. GAGES. Isaac Lane, Lancaster, Pa. (Filed Sept. 26, 1874.)



1. The combination of the dog *g*, eccentric lever A, the slot *e* in the side of the casket-face E, and the adjustable catch *f* therein, operating as and for the purpose specified.

2. In a tailing-mill, the metal casket or toe-holder E and toes *b b*, in combination with the beater A, as and for the purpose specified.

156,844. CARPENTERS' SLIDING GAGES AND SQUARES. A. Imhe and J. Baumgartner, Lancaster, Pa. (Filed Sept. 26, 1874.)



Brief.—For scribing, by the exposed angle of the square, the "tread" and "riser" of a stairway. An improvement on the old form of a continuous slotted straight-edge and try-square with slotted arms.

The turning gage-blocks B, connected, by a pivot, *a*, with a sliding loop, C, having a set or binding screw, D, in combination with an ordinary metallic square, substantially as shown, for the purpose specified.

156,845. IRONING-BOARDS. A. Imhe, Lancaster, Pa. (Filed Apr. 20, 1874.)

Brief.—Between two slides, which are constructed so as to be applied to the top of an ordinary table, is arranged a sliding block, to the top of which is secured a self-board, and adapted to be turned thereon, while to the end of each slides are hinged a number of clothes-racks, in such a manner as to admit of the same being folded down compactly upon the top of the ironing-board.

1. The combination of the foundation-bars B and the end pieces K and F, the latter having catch I, with the adjustable self-board C, having the locking-curve H, the whole being adapted for ready attachment to and removal from any ordinary table, substantially as described.

2. In combination with the bars B B, the board A, adapted to slide longitudinally, and also to revolve upon its pivot h, as described.

3. In combination with the foundation-bars B B, the turning-plate D D, perforated for the reception of rods E, and hinged to the said bars B, together with side driers F on pivots in the cross-piece F, the whole constructed and operated in the manner and for the purpose set forth.

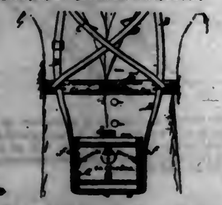
156,846. COTTON-PRESSES. Tryon J. M. Jewell, New York, N. Y., assignor of his right to T. W. Burger, Plainfield, N. J., and R. Gardinier, Brooklyn, N. Y. (Filed June 16, 1874.)

Brief.—An arched head-block carries a vertical screw, actuated by toothed sectors. The toggle-joints are pivoted to the lower corners of the central arch, and arranged to sustain the platen against tilting from unequal pressure.

The combination of the centrally-arched head-block B, carrying the vertical screw D, with the toggle-joints I, having their lower arms made solid, and arranged to sustain the platen against tilting otherwise from uneven resistance during its downward movement, pivoted to the lower corners of the arch in the said head-block, and provided with the sectors which gear into and are worked by the aforesaid screw D, the whole arranged for operation substantially as and for the purpose set forth.

156,847. BALE-BURNING STOVES. Silas H. La Rue, Philadelphia, assignor of one-half his right to C. M. Bunk, J. W. Grubb, and F. A. R. Baldwin, Allentown, Pa. (Filed Nov. 16, 1873.)

Brief.—The elevated deflecting-plate prevents the coal from falling through the annular air-inlet which surrounds the axis of the grate, and air is admitted to the interior of the burning fuel. Clinkers can be pushed through the central opening of the grate.



1. The fire-pot H, having projecting lugs b, supported upon the ring K, as herein described.

2. The vibrating grate M, having a central opening, E, in combination with an elevated imperforate deflecting-plate, S, of larger diameter than the said opening, and arranged relatively to each other, as herein described.

3. The deflecting-plate S, covering the opening E, and having the fire-brick cap W, as and for the purpose herein described.

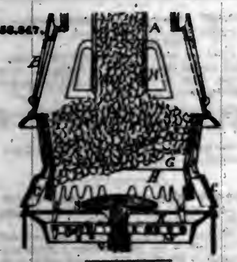
4. The combination of the grate M with the central deflecting-plate S, the ring K, a fire-pot, H, having its discharge-end elevated above the grate, as herein described, and the illuminating-doors O, all operating in conjunction, as herein described.

156,848. FARE-BOXES. Theo. Kozak, New York, N. Y. (Filed Nov. 30, 1874.)

The combination, with the receptacle carried by the conductor for the receipt of fare or fare-checks, of the means by which said receptacle is locked about and inextricably secured to the body of the carrier, substantially in the manner and for the purposes described.

156,849. BALE-BURNING STOVES. Silas H. La Rue, Philadelphia, assignor of one-half his right to C. M. Bunk, J. W. Grubb, and F. A. R. Baldwin, Allentown, Pa. (Filed Nov. 16, 1873.)

Brief.—The elevated deflecting-plate prevents the coal from falling through the annular air-inlet which surrounds the axis of the grate, and air is admitted to the interior of the burning fuel. Clinkers can be pushed through the central opening of the grate.



1. The fire-pot H, having projecting lugs b, supported upon the ring K, as herein described.

2. The vibrating grate M, having a central opening, E, in combination with an elevated imperforate deflecting-plate, S, of larger diameter than the said opening, and arranged relatively to each other, as herein described.

3. The deflecting-plate S, covering the opening E, and having the fire-brick cap W, as and for the purpose herein described.

4. The combination of the grate M with the central deflecting-plate S, the ring K, a fire-pot, H, having its discharge-end elevated above the grate, as herein described, and the illuminating-doors O, all operating in conjunction, as herein described.

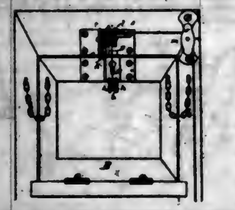
156,847.

156,848. CAR-WHEELS. Jas. Leland, Cambridgeport, Mass. (Filed Dec. 19, 1874.)

1. A railway-carriage wheel composed of a wrought-iron body, A, and of a cast-steel rim, B, founded upon the periphery of said body, and with flanges *a a* to project and lap on its opposite sides, and extend entirely around such body, all combined substantially as specified and represented.

2. The railway-carriage wheel composed of a wrought-iron body, A, and of a cast-steel rim, B, founded upon the periphery of the said body, and with flanges *a a* to extend around and on opposite sides of the body, and also having the cast-steel of the rim extended from either or both of the flanges into or through the body, all combined substantially as set forth.

156,849. RAG-HOLDERS. Uriah B. Lemon, Franklin, Mich. (Filed Sept. 29, 1874.)



Brief.—The mouth of the bag is placed over the D-shaped iron bar, and held securely thereon by drawing said bar into the grooved semicircular bar.

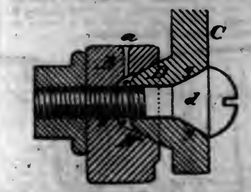
The D shaped iron bar *b* and grooved semicircular bar *c*, with bar *c*, mortised and grooved standard A, and lever *f*, combined and arranged to operate substantially in the manner as and for the purpose specified.

156,850. SASH OPENING AND CLOSING MECHANISMS. Geo. A. Lincoln, East Somerville, Mass. (Filed Dec. 19, 1874.)

Brief.—The combination with an arm of a series of guide-wheels projected from a door-frame with a bolt, and its case provided with another arm and guide-wheel applied to a sash, all being operated with two cords.

1. The combination of the arm E, its guide-wheels *c*, *d*, *e*, *f*, and *g*, and bolt-catch with the bolt C, and its case *b*, provided with the arm G and guide-wheel *i*, all being substantially as described, and to operate with cords, as and for the purpose set forth.

2. The combination and arrangement of the pair of guide-wheels *n n*, applied to the door-frame, with the arm E and its guide-wheels, and with the bolt and case provided with the wheel and arm, and applied to the sash, all being arranged as specified.

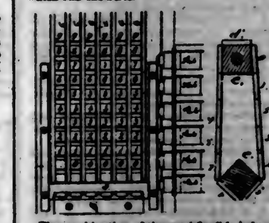


156,851. GUN-CLEANERS. Wm. H. Manstr, Wakefield, Mass. (Filed Dec. 19, 1874.)

Brief.—The arms of the sleeve are spread by forcing down the shank, and the rubber is thereby expanded to fit the bore of the gun. The parts are locked, either before or after expansion, by turning the shank so as to bring a stop or stud thereon into a lateral notch in the end of the slot in the sleeve.

The gun-cleaner, substantially as described, composed of the shank A and its stud *f*, the expansive wiper D, and the sleeve B slotted and provided with the notches, all being combined and arranged in manner, and to operate essentially as set forth.

156,852. PITMAN-CONNECTIONS. Levi Mangus, North Liberty, Ind. (Filed Nov. 20, 1873.)



1. The pitman-connection, consisting of the cockle-bar A, having on one end the eye B, with conical recess D' and perforations *a b*, the pitman C, having conical pivot D, and conical recess *g*, and the pivot-screw E, with conical head *d* and nut F, all constructed and arranged as shown and described.

2. The pitman-head C, having on one side the conical projecting bearing D, and centrally opposite the same on the other side, the conical-bearing recess *g* terminating in a perforation through said conical projecting bearing, as specified.

156,853. MECHANICAL CALCULATORS. H. B. Martin, San Francisco, Cal. (Filed June 10, 1873.)

Brief.—The calculations are inscribed upon the semi-flexible belts, and different calculations are brought into view by graduated racks driving pinions fixed to the shafts over which run the belts.

The combination of the semi-flexible belts *d* with the square or angular rollers *e* and the sliding racks *c*, as and for the purposes set forth.

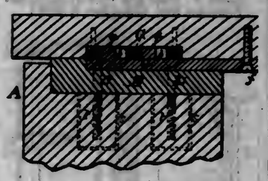
156,854. BOILERS FOR HEATING PURPOSES. Hiram Mayer and William B. Mayer, Freeport, Ill. (Filed Nov. 6, 1874.)

Brief.—The parts forming the lower portion of the flues are connected together, and may be removed bodily from the heater, and the heater itself is removable from the tank.

1. The heater B, placed within and surrounded by the tub or boiler A, and supported above the bottom thereof, as described, in combination with the flue or flues C, passing through the heater, and communicating with the boiler at different points or sides thereof, as set forth.

2. The plates D D', connected to and made removable, together with the rings *d*, in combination with the heater-shell B, and forming, in connection with said shell, the walls of the smoke and air ducts, as described.

156,855. AXLES FOR VEHICLES. John McCurdy, Smicksburg, Pa. (Filed Mar. 19, 1874.)

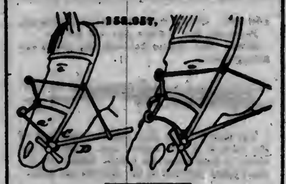


Brief.—The spindles are made easily removable in case of injury.

The combination of the spindle B, provided with the hub-band C and screw D, the axle-tree A, with threaded eave in its end, and the set-screw *a*, all substantially as and for the purposes set forth.

156,856. INSULATORS FOR MUSICAL INSTRUMENTS. William R. Miller, Baltimore, Md. (Filed Dec. 17, 1874.)

Brief.—To prevent dispersion of the sound-waves through the legs of the instrument.



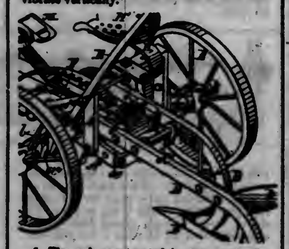
The combination and arrangement of the plate C, insulator B, and leg A, substantially as shown and described, so that the screws D D pass through the plate and insulator and into the leg, thereby relieving the insulator from any strain, as set forth.

156,857. BRIDLES. W. S. Mitchell, Washington, D. C. (Filed Jan. 7, 1875.)

1. The combination, with a bridle-bit, of a stiff bar or lever, having its fulcrum arranged on the animal's nose, for operation in connection with the check-rein F or driving-rein D, substantially as shown and described.

2. The combination of the draw-line *c* and bridge-piece *d* with the reins D and bit C, all arranged for operation substantially as set forth.

156,857.



156,858. GRIDIRONS. James H. Mitchell, San Francisco, Cal. (Filed Aug. 7, 1874.)

As a new article of manufacture, a rectangular gridiron constructed as described, having one removable side, and with the opposite sides, *a b*, provided with recesses for holding the bars *c c*, which bars are cut short enough to allow a play or end motion in the recesses, to prevent buckling or warping when heated, as above set forth.

156,859. GANG-PLOWS. Elgin Moore, Moline, Ill. (Filed Oct. 20, 1874.)

Brief.—An arch is made upon each section of the axle, one overlapping the other, and pivoted together near the bottom. One section remains in vertical position, having the seat and rack-bar. The other, by a rigid lever having a brake-arm, is made a crank to raise the plows by the team till released automatically; also, devices to permit the tongue to vibrate vertically.

1. The axle constructed in two parts, the bent or arched inner ends of which overlap and are pivoted to each other, the fixed portion A carrying the ratchet-bar, and the movable portion A' carrying the plow-beams and mechanism for raising, lowering, and adjusting the plows, substantially as and for the purpose set forth.

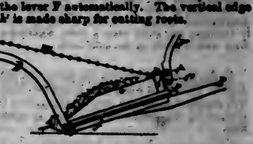
2. The hand-lever E, constructed as described, with a foot on its lower end, and arranged to operate with the lugs *b* on the hub of the supporting-wheel, and with the ratchet-bar F, sectional axle A A', and plow-beams D D, substantially as described, and for the purpose specified.

3. The rack-bar F, constructed as described, with a diverging arm, *f*, arranged to operate with the hand-lever E, lugs *b*, sectional axle A' A, and plow-beams D D, substantially as and for the purpose specified.

4. The bars G G' G², arranged to operate with the sectional axle A A' and plow-beams D D, substantially as described, and for the purpose specified.

5. The combination of the tongue I, pivoted plate *d*, and fixed plate J, the tongue secured to the plate *d*, so as to oscillate vertically and made adjustable laterally, substantially as and for the purpose set forth.

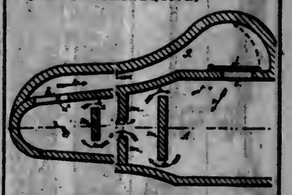
156,860. HAME ATTACHMENTS. James H. Myers and Saml. Spicer, Goodrich, Mich. (Filed May 20, 1874.)



1. The hame-clip D, slotted and perforated, and pivoted to the hame A, substantially as described.

2. A trace-iron, E, curved and adjustably connected to a pivoted clip, D, said clip being provided with the pole-strap loop *c*, all substantially as described, and for the purpose set forth.

156,861. HEAD-SCRAPERS. W. T. Nichols, Chicago, Ill. (Filed Dec. 29, 1874.)



Brief.—The chain which regulates the angle of inclination of the scraper is connected to the latter by a lever, F, which, when depressed, shortens the chain, and causes the scraper-blade to enter the earth, but when thrown up allows the scraper to ride with its blade free. The reversal of the scraper resets the lever F automatically. The vertical edge *h'* is made sharp for cutting roots.

1. The lever F, in combination with the chain *m*, whereby the gathered load of earth may be allowed to depress the rear of the scraper, and throw the working-blade *d* out of the ground, substantially as described.

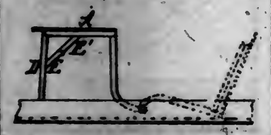
2. A root-cutter, *h*, in combination with the scraping-blade *d*, substantially as and for the purpose described.

156,862. REVERBERATING FURNACES. John Nicholson, Jr., Pittsburg, Pa., assignor to Ragot De Montbrueux Gun Company, same place. (Filed Mar. 24, 1874.)

A heating or melting furnace, provided with a heating-chamber, having alternate ridges *m*, thereby causing the heat to travel in a zigzag course from either the front or rear end of the working-chamber at the will of the operator, substantially as herein described, and for the purpose set forth.

156,863. PNEUMATIC DENTAL PLUGGERS. Gorton W. Nichols, Chicago, Ill. (Filed Aug. 14, 1874.)

Brief.—The point-receiving shank is made of the same piece as the case itself, within which the double-faced hammer works.



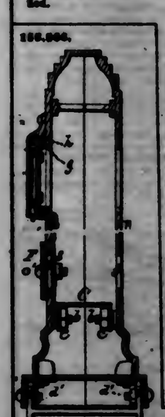
156,863.

The combination of the point-receiving chuck with the hollow instrument-handle *a a a* and double-faced hammer *g*, substantially as and for the purpose set forth.

156,666. JUMP-SEATS FOR CARRIAGES. J. B. Patten, Amesbury, Mass. [Filed Dec. 21, 1874.]

Brief.—Easily folded and turned forward out of the way in getting in.

1. The combination of the front legs pivoted to the carriage-body, the two ends of toggles B B', the seat, and the rear legs, D D', pivoted to the said seat, as set forth.



2. The combination of the two ends of toggle B B', bar F, seat A, and the rear legs, D D', pivoted to the seat, substantially as set forth.

156,667. MAKING ARTESIAN AND OTHER WELLS. Charles Paxton, Omaha, Nebr. [Filed Nov. 23, 1874.]

Brief.—Artesian-well lining of hydraulic cement, either throughout the whole extent of the bore, or only in such parts thereof as may by their caving in require it, which, when it becomes set, shall form a tube, whereby a false wall is given to the said bore.

In the boring of wells in the earth, the process of lining the walls with a cement which will readily harden and prevent the caving in thereof, by the means substantially as specified.

156,668.

156,668.

156,668. MOUSETRAPS. M. A. Richardson, Bridgeport, Conn. [Filed Oct. 31, 1874.]

1. In a measurement or tomb-marker, the vertical sectional parts A B, having broad flanges a upon their edges, for the purpose of rendering considerable the discrepancy in size of the two sections, substantially as described, and for the purpose set forth.

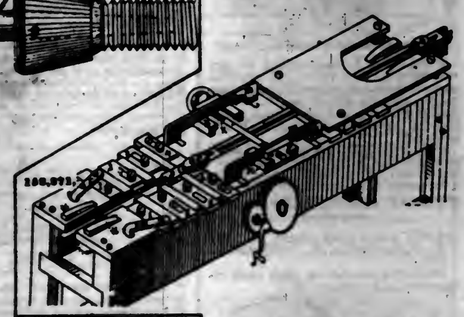
2. The combination, with the portrait-frame C, of the fixed wear-head H, having recess *e*, and the hinged lid I, having flange A, substantially as and for the purpose specified.

3. The combination, with the tabled F, of the springs S and screw-bolts *s'*, substantially as specified.

4. The combination, with the sections A B, of the screw-threaded projections *c* and U-shaped link C, substantially as specified.

156,669. SHIRT-BOSOMS. Addison Small, Portland, Me. [Filed Apr. 23, 1874.]

Brief.—The spaces between the plaits are strengthened.

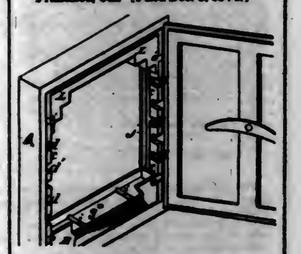


The double-linen shirt-bosom, composed of the parts A B C D, folded and applied, relatively to each other, as herein described, the same being stitched in the manner set forth.

156,670. INSULATING COMPOUNDS. Isaac Smith, New York, N. Y., assignor of one-half his right to George A. Chapman, same place. [Filed Jan. 16, 1874.]

156,671.

The insulating material herein described, the same being a homogeneous mixture of shellac, asbestos, coal-tar, oak-black, and paraffine, in the proportions substantially as set forth.



In a horseshoe-bending machine, the adjustable former C, compressing bar S, stationary plates 2 2 3 3 4 4, slides 1 1, levers F F, and slides E, combined and arranged to operate substantially as and for the purpose specified.

156,671. HORSESHOE-MACHINES. Francis Suppin, Boston, Mass., assignor to Jos. F. Suppin and Bernard F. Suppin, same place. [Filed Dec. 16, 1874.]

Brief.—A series of slides provided with friction-rollers, between which the blank is carried by the former, which is adjustably attached to a rock-bar that is operated by a pinion. The forward end of said bar is serrated, and strikes against two slides, E, forces them inward, and causes the heel-bending rollers to be thrown around the former, and complete the bending operation.

The combination, with the smoke-flue B, of the inner wire-cloth cone A, attached by its base to the wall of said flue, point upward, and the close cone-shaped extinguishing-cap A', surmounting the apex of said cone A, as specified.

156,672. PHOTOGRAPHIC-PLATE HOLDERS. Isaiah W. Taber and Thos. H. Boyd, San Francisco, Cal. [Filed Dec. 3, 1874.]

The photographic-plate-holder frame A, provided with notches *d* on the inner edges of its side rails, in combination with the tray or receptacle E, with its lugs O, and connected corner-pieces L, with their lugs O', substantially as and for the purpose above described.

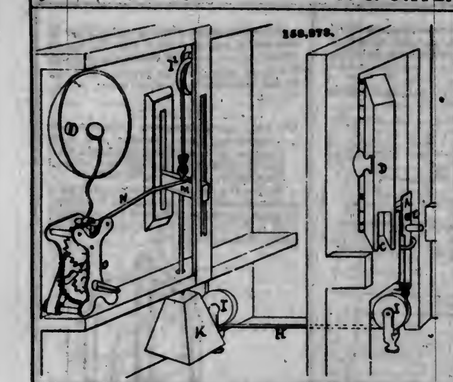
156,673. ROCKING-CHAIRS. Charles Strait, Cincinnati, Ohio. [Filed Sept. 28, 1874.]

Brief.—Hinged leaves upon the ends of the spring swivel upon bolts in the rockers. The spring passes between elastic bearings, and is secured centrally by bolts to the platform.

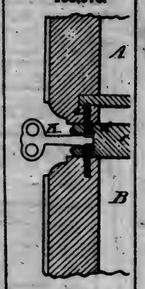
1. The platform A and rocker-frame B, in combination with the brace or braces C, which are centrally connected to the platform, and hinged leaves *a a*, substantially as specified.

2. The platform A and rocker-frame B, in combination with the elastic bearings D D and brace or braces C, substantially as specified.

156,674. SPARE-ARRESTERS. J. Summers and O. W. Fay, Muncie, Ind. [Filed June 13, 1874.]



Brief.—A closed cap is placed on the cone to collect carbonic-acid gas, which extinguishes the sparks as they are projected into it.



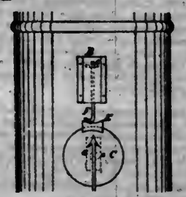
156,675. SURREY-ATTACHMENT. A. C. Taylor, Cutchen, Ohio. [Filed June 20, 1874.]

The combination of the door D, provided with a slot, C, the bolt A, projection E, pattern I I' F, cord H, weight K, cross-bar M, and lever N, all operating together as described.

156,676.

156,676.

156,674. REVOLVING FIRE-ARMS. Daniel B. Wesson, Springfield, Mass. [Filed July 30, 1874.]

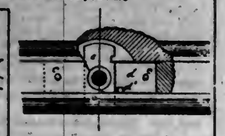


1. The combination of the detent K, held in place by a spring-rod, *n*, spring *o'*, and extractor-stem I, substantially as set forth.

2. A finger-piece, H, pivoted about midway its length, a part of which projects below the surface of that part of the frame to which it is attached, so that it may readily be operated by the pressure of the finger to disengage it from the idler, and also provided with an incline, *f'*, to ride up upon a projection on the lower part of the barrel, in combination with an idler for operating the extractor.

3. The combination of the hollow extractor-stem I, spring-rod *n*, and spring *o'*, substantially as described.

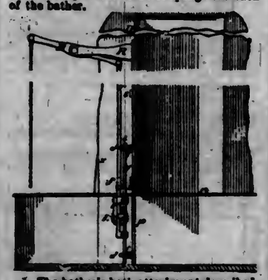
156,675. DAMPERS. H. A. White, Hamilton, Canada. [Filed June 16, 1874.]



Brief.—The box holds one end of a spring, and protects it against too great heat. To the free end of the spring is attached a saddle, which embraces and bears upon the periphery of the disk rigidly affixed to the damper-spindle. The pressure of the spring upon the disk maintains the damper in any adjusted position.

1. The spring-box B, open or closed, fitted to the stove-pipe A, in combination with the spring F, saddle E, and spindle-plate C, substantially as specified.

2. The circular area-edged disk C, attached to the spindle of the damper, in combination with the saddle E and spring F, all operating substantially as and for the purpose specified.



156,676. LOCKS FOR DRAWERS. Reul W. Whitney, Cleveland, Ohio, assignor to Wilcox Sewing-Machine Company, same place. [Filed Nov. 2, 1874.]

The hereinbefore-described lock, consisting of the plate *d*, having the bolt *e* pivoted thereto, as shown, and placed in the cross-bar C, to be turned by a key, K, for locking the drawers A and B, as specified.

156,677. BATH ATTACHMENTS. Thomas D. Woolsey, San Francisco, Cal., assignor of one-half his right to Wm. H. Baxter, same place. [Filed Nov. 2, 1874.]

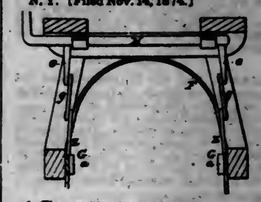
Brief.—A brush or sponge is fitted to a traveling frame, which, by a system of guide-rods, lever-beam, and springs for its adjustment, is made, by the pulling up and down of a connecting-rod, to scrub or sponge the back of the bather.

1. The bather's bath attachment described, consisting of the sliding frame F, with brush attachment L, guide-rods *g g'*, springs *t t'* on the retaining-pins *d d'*, connecting-rods *r' r*, with lever B on the hinge-bracket E, and slide-plate P, with slide-brackets *s s'* on the shutter D, substantially as and for the purposes herein set forth and specified.

2. The sliding frame F, provided with the brush L, in combination with the guide-rods *g g'*, springs and retaining-pins *t t'* and *d d'*, respectively, substantially as and for the purposes herein set forth and specified.

3. The roller-brush L fitted to the sliding frame F, and provided with the sheave *a*, which is actuated by running on the guide-rod *g*, as described, substantially as and for the purposes herein set forth and specified.

4. The guide-rods *g g'* fitted loosely to the retaining-pins *d d'*, in combination with the slide-frame F, provided with the eye-pieces *s s'* and the springs *t t'*, substantially as and for the purposes herein set forth and specified.



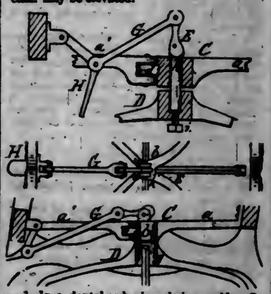
5. The springs *t t'* fitted to the retaining-pins *d d'*, in combination with the eyes *b b'* of the guide-rods *g g'*, and sliding plate P, substantially as and for the purposes herein set forth and specified.

156,678. STOVE-POLISHES. J. Yates and A. P. Yates, Rockford, Ill. [Filed Nov. 21, 1874.]

Brief.—Plumbago, benzine, asphaltam, gasoline, and liquor of iron.

A stove-polish composed of the ingredients herein specified, and in the proportions substantially as set forth.

156,679. SLED-BRAKES. John York, Lacon, N. Y. [Filed Nov. 14, 1874.]

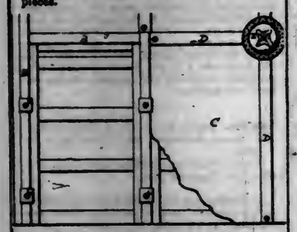


1. The combination, with the lever-brake Z, pivoted to the runners, of the rock-shaft H, having crank-arms *c* and the connecting-links *g*, substantially as specified.

2. The metallic brake guard-strip G, secured to the inside of the runner, and having the brace-arms F extending upward and inward, and secured to the standard and bolsters, all combined substantially as specified.

156,680. DENTISTS' CHAIRS. G. W. Archer, Rochester, N. Y. [Filed Mar. 23, 1874.]

Brief.—The spider is constructed with two stiff arms and two pivoted arms, so that it can be adjusted to different-sized chairs. The chair is provided with an independent support, having an elevating-cam, by which the chair may be elevated.

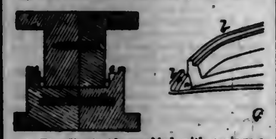


1. In a dental or barber chair, a spider, C, constructed with two stiff arms, *a a*, attached to the rear rail, and two pivoted arms, *a' a'*, connecting with the front rail, the whole combined, as shown, that the spider may be expanded or contracted horizontally to adapt itself to different-sized chairs, as herein shown and described.

2. The combination, with the brace or bottom of a dental or a barber chair, of the independent support D, spider C, and elevating-cam E, by which the chair may be elevated upon the support, and turned upon the same as a pivot, as described.

3. The combination, with the spider C and support D, of the spindle I, cam E, connecting-rod G, and treadle H, operating in the manner and for the purpose specified.

156,861. METALLIC CEILINGS. Henry Adler, Pittsburg, Pa. [Filed May 20, 1874.]



Brief.—A sheet-iron ceiling consisting of panels secured in position by concealed fastenings, cap-pieces, and ornamental corner-pieces.

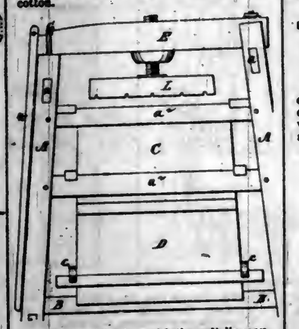
1. In combination with the panels C, the cap-pieces D, and corner-pieces E, substantially as and for the purpose specified.
2. In combination with the panels C and concealed fastenings b, the cap-pieces D and corner-pieces E, substantially as and for the purpose specified.

156,862. DIES FOR FLANGING SOLES FOR BOOTS AND SHOES. F. D. Ballou, Abington, Mass. [Filed Sept. 4, 1874.]

Brief.—Each die is made up of two longitudinal adjustable sections. The sections of the lower or sole-supporting die are connected by spiral springs, those of the upper die by screws, so that the lower die will yield laterally to allow for soles of varying widths.

1. The die A A^1, provided with springs s for drawing the parts A A^1 toward each other, substantially as and for the purpose described.
2. The combination of the laterally-adjustable die B B^1 with the laterally-yielding die A A^1, substantially as and for the purpose described.
3. The laterally-adjustable die A A^1, formed with the ledge a and rim a, in combination with the laterally-adjustable die B B^1, striking inside the ledge a, substantially as and for the purpose described.
4. In an apparatus for turning a flange upon a line near the edge of a boot and shoe sole, the die B B^1 of the width of the sole between the intended flange, in combination with the die A A^1, having a deep central recess slightly wider than the die B B^1, and the ledge a, within and on which to adjust the sole and present it properly to the stroke of die B B^1, substantially as described.

156,863. WAX-THREAD SEWING-MACHINES. F. D. Ballou, Abington, Mass. [Filed July 31, 1874.]



Brief.—A thin roll or flange is formed upon the throat-plate of the machine, around the throat thereof, and serves as an opener for the stitch-channel, and also as a means for guiding the work to the stitching mechanism.

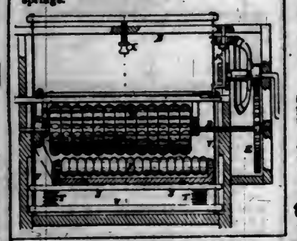
In a wax-thread sewing-machine for sewing the outer seam of boot and shoe soles, an elevated work-support located at or near the edge of the work-plate, and forming a thin wall to the needle-throat higher than the depth of the channel in the sole, and of such size, in plan, that, in the work of the machine, it is lapped to the depth of the channel by the sides of the channel, substantially as and for the purpose described.

156,864. HAY AND COTTON PRESSES. W. C. Banks, Como, Miss., assignor to Mrs. R. Banks, same place. [Filed Nov. 25, 1874.]

Brief.—The lower part of the press is made larger than the top, to relieve the doors of lateral pressure due to the bulging out of the cotton.

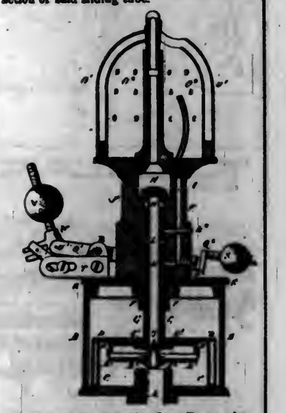
1. The combination, with the radially-moving bar E, of the levers M, having perforated ends and pegs d, and the ropes N, substantially as and for the purpose described.
2. In a baling-press, a box having increasing transverse dimensions as it tapers from the mouth to the part where the bale is compressed, substantially as and for the purpose specified.

156,865. WHEEL-SCRAPERS FOR PLANTERS. J. C. Barlow, Quincy, Ill., assignor to Vandiver Corn-Planter Company, same place. [Filed Aug. 22, 1874.]



Brief.—To the front of the seat-standard is pivoted an eccentric cam; to which, and extending rearwardly, is connected a rod, which is attached to a projecting piece on a transverse bar, to which is attached end scrapers, which are adjusted in and out of contact with the periphery of the bearing-wheels, or locked against them by means of the cam and rod.

The eccentric cam F, lever G, and rod D, in combination with the bar I, provided with the scrapers P, for the purpose of operating the scrapers and locking them upon the wheels, substantially as shown and described.



156,866. WASHING-MACHINE. John F. Bennett, Limestone, N. Y. [Filed Sept. 19, 1874.]

Brief.—The lower bed of rollers is adjusted by the screw, the bars, the rods, and the springs.

156,867. APPARATUS FOR LIGHTING, EXTINGUISHING, AND REGULATING GAS-FLAMES. L. Baumeister, Gaggenau, Germany, assignor to himself and Michael Fürstenhaim. [Filed Dec. 28, 1874.]

Brief.—The bell-float is provided with a diaphragm and valve, to regulate the supply of gas to the sliding tube, and has connected with it shifting weights, for controlling the action of said sliding tube.

1. The combination of a float, D, carrying a vertically-sliding tube, G, provided with openings, a canal, I, parallel to the tube G, and communicating with the same by openings; a main burner arranged above the sliding tube, and an auxiliary burner arranged above the canal I, substantially as described, for the object specified.
2. The regulating device for supplying the gas alternately to the main and auxiliary burner, consisting of bell D, sitting in annular chamber C, and provided with diaphragm B^1, in combination with the sliding valve G, moving in guide-piece F, and provided with apertures, as described, for opening communication to the burners, substantially as herein set forth.
3. The combination, with the bell D, of levers Q and U, connected together and with the bell, and provided with shifting or adjustable weights, for regulating the pressure of gas, substantially as described.
4. The combination, with the auxiliary burner, of the double hood or chamber O' O^2 surrounding the said burner, for supplying the same with air and preventing drafts, substantially as described.

156,868. DENTAL PLUGGERS. J. W. Baxter, Vevay, Ind. [Filed Nov. 14, 1874.]

Brief.—A spring-lever, worked by the finger, forces back the spring-mallet through a ratchet upon one side. An incline upon the tubular case throws up the pawl-lever, and the mallet is then free to be forced by its spring against the plugging-point.

1. The combination of ratchet-formed plunger F, relief-incline a^{xx}, rod L l^1 l^2, and finger-presser J, connected and operating substantially as and for the purpose specified.
2. In combination with rod L, finger-presser J, and bearings k k' on standards I l', the springs K and M, connected and operating substantially as specified.

156,868.

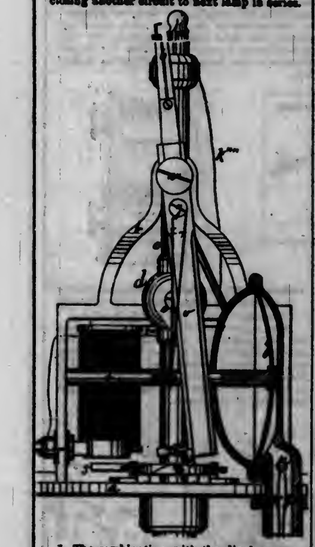
The combination of the adjusting-screw X, the bar W, and the rods V with the top bar of the frame B, and with the bars and springs U S T for regulating the pressure upon the clothes, substantially as herein shown and described.

156,867. APPARATUS FOR LIGHTING, EXTINGUISHING, AND REGULATING GAS-FLAMES. L. Baumeister, Gaggenau, Germany, assignor to himself and Michael Fürstenhaim. [Filed Dec. 28, 1874.]

Brief.—The bell-float is provided with a diaphragm and valve, to regulate the supply of gas to the sliding tube, and has connected with it shifting weights, for controlling the action of said sliding tube.

1. The combination of a float, D, carrying a vertically-sliding tube, G, provided with openings, a canal, I, parallel to the tube G, and communicating with the same by openings; a main burner arranged above the sliding tube, and an auxiliary burner arranged above the canal I, substantially as described, for the object specified.
2. The regulating device for supplying the gas alternately to the main and auxiliary burner, consisting of bell D, sitting in annular chamber C, and provided with diaphragm B^1, in combination with the sliding valve G, moving in guide-piece F, and provided with apertures, as described, for opening communication to the burners, substantially as herein set forth.
3. The combination, with the bell D, of levers Q and U, connected together and with the bell, and provided with shifting or adjustable weights, for regulating the pressure of gas, substantially as described.
4. The combination, with the auxiliary burner, of the double hood or chamber O' O^2 surrounding the said burner, for supplying the same with air and preventing drafts, substantially as described.

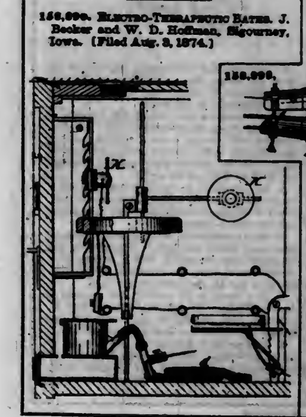
156,868. DENTAL PLUGGERS. J. W. Baxter, Vevay, Ind. [Filed Nov. 14, 1874.]



Brief.—A spring-lever, worked by the finger, forces back the spring-mallet through a ratchet upon one side. An incline upon the tubular case throws up the pawl-lever, and the mallet is then free to be forced by its spring against the plugging-point.

1. The combination of ratchet-formed plunger F, relief-incline a^{xx}, rod L l^1 l^2, and finger-presser J, connected and operating substantially as and for the purpose specified.
2. In combination with rod L, finger-presser J, and bearings k k' on standards I l', the springs K and M, connected and operating substantially as specified.

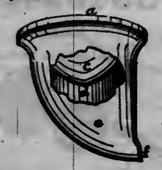
156,868.



156,869. ELECTRO-MAGNETIC GAS-LIGHTING APPARATUS. E. H. Bean, Boston, Mass. [Filed Aug. 6, 1874.]

Brief.—Pressure of air upon diaphragm moves a rod controlling valve, until the rod is checked by a detent attached to an armature. At the moment of checking a circuit is completed at the burner-tip through a wire attached to a pivoted lever, also moved by the rod impinging on a wire at burner. This causes the magnet to attract its armature, releasing the detent, and allowing the rod attached to diaphragm to continue its movement, completely opening the valve, breaking the circuit at the burner to cause a spark, and closing another circuit to next lamp in series.

1. The combination, with the diaphragm f and rod f, of the rocking-lever e, spring-wire e^2, the circuit-breaking wire 6, and the metallic pole e^1, as and for the purpose herein described.
2. The combination, with the electro-magnets o p, and the armature 5, of the swinging frame 3, having catch or recess 2, lever e, insulated wedge 7, springs r t, and their insulated posts q s, and the wires l l^1 l^{xx} l^{xxx} l^4 F, as and for the purpose herein set forth and described.



156,870. ELECTRO-THERAPEUTIC BATHS. J. Becker and W. D. Hoffman, Sigourney, Iowa. [Filed Aug. 3, 1874.]

1. The tube G, provided with internal conductor and binding-screw, as and for the purpose specified.
2. The doubly-adjustable electrodes K K in a bathing-closet, as and for the purpose set forth.
3. The evaporating-vessel, arranged within the closet, and provided with hinged top and nozzle for connection with tube, as shown and described, to allow a general or special delivery of vapor.

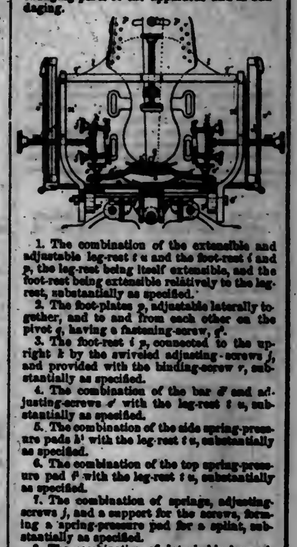
156,891. UTERINE SUPPORTERS. George Bennett and Foster B. Parsons, St. Louis, Mo. [Filed Dec. 23, 1874.]

Brief.—An elastic-ring pessary with rubber-diaphragm support has combined with it an elastic pouch of soft rubber.

The uterine supporter having elastic ring a, cup c with aperture d, and neck or pouch e with aperture f, all combined and constructed substantially as and for the purpose set forth.

156,892. CAR-COUPLINGS. Chas. Billmeyer, York, Pa. [Filed Nov. 4, 1874.]

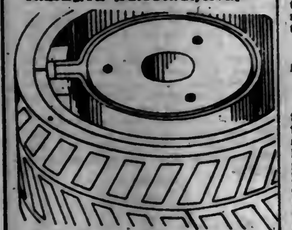
The combination of bolt and nut B F and the three springs H D E with the beam I, all substantially as and for the purpose specified.



156,893. ARM-FRACTURE APPARATUS. D. Bissell, Detroit, Mich. [Filed Dec. 5, 1874.]

Brief.—The concave-convex metallic splints are made up of compound plates, which adjust upon themselves both laterally and vertically. Clamping-bands with set-screws adjust along jointed rods, which sustain the apparatus. Additional narrow pressure-bars adjust so as to press between the two bones of the lower arm.

1. The combination of extensible concave-convex clamping-plates A or B, curved clamping-bars U, sliding upon jointed rods E, and adjusting-screws C, substantially as specified.
2. The combination of extensible clamping-plates A B, bars C, adjusting-screws G, jointed rods E, and an adjustable fastening, as I J K, substantially as specified.
3. The combination of pressure-springs L and adjusting-screws M, with the clamping-plates of a fracture apparatus, as specified.
4. The said springs, arranged to extend out of the plates along the wrist, for supporting it, substantially as specified.
5. The combination of side facing-plates with the pressure-springs, substantially as specified.

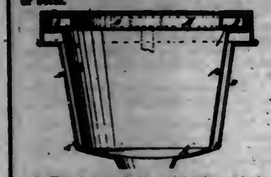


156,894. FRACTURE-BOXES FOR LEGS. D. Bissell, Detroit, Mich. [Filed Dec. 5, 1874.]

Brief.—The bed-plates of this apparatus are adjustable laterally and vertically. The foot-rest also adjusts to the various positions required. Pressure-bars are added, which may be forced against the limb at various points desired. The upper and lower parts of the fracture-box are held at various angles to each other, as required. An extension of one side passes up and rests in the armpit. A peculiarly-constructed bandage secures the foot to its adjustable plate. Hooks connected in pairs hold the bandage when required in changing parts of the apparatus and in bandaging.

1. The combination of the extensible and adjustable leg-rest f e and the foot-rest f and p, the leg-rest being itself extensible, and the foot-rest being extensible relatively to the leg-rest, substantially as specified.
2. The foot-plates p, adjustable laterally together, and to and from each other on the pivot q, having a fastening-screw, q^1.
3. The foot-rest f p, connected to the upright k by the swiveled adjusting-screws j, and provided with the binding-screw r, substantially as specified.
4. The combination of the bar S and adjusting-screws s with the leg-rest f e, substantially as specified.
5. The combination of the side spring-pressure pads h^1 with the leg-rest f e, substantially as specified.
6. The combination of the top spring-pressure pad f^1 with the leg-rest f e, substantially as specified.
7. The combination of springs, adjusting-screws j, and a support for the screws, forming a spring-pressure pad for a splint, substantially as specified.
8. The combination of detachable bars s^1, supporting cross-bars s^2, and screws m^1 r^1, for supporting the spring-pressure pads, substantially as specified.
9. The combination of the detachable bottom and sides with the leg-rest and pressure-pads, substantially as specified.
10. The combination of the leg-rest and pressure-pads, thigh-rest and pressure-pads, and jointed supports R and F, substantially as specified.
11. The combination of supports R F F, rods M, and adjusting-screw T with the leg-rest and thigh-rest and their pads, substantially as specified.
12. The extensible thigh-box composed of bottom plates O O' R R' F, side plates D D^1, adjusting-rods D I, bar R, and screws L, combined and arranged substantially as specified.
13. The combination of adjustable bed-plate F with extensible plates e e^1, substantially as specified.
14. The supporting-bars g, having notches F^1, in combination with the jointed supports R F^1 and the adjusting-screw F, substantially as specified.
15. The combination of a shoulder-extension device, D^1, F^2, T^1, and R^1, with the stand F and the leg and thigh splint, substantially as specified.
16. The combination of thigh-rest A^1 with the leg-rest and its pressure-pads, substantially as specified.
17. The improved strap-fastening, consisting of the staple F^3, holes G^1, and the loop H^1, substantially as specified.
18. The combination of clamping-bars A^1, screws B^1, and attaching-bars D^2 with the side pressure-pads h^1, substantially as specified.
19. The combination of the foot-bandage F^2 and straps D^3 and G^2 with the foot-rest f A, substantially as specified.
20. The combination of hooks s^3 with the pressure-pads, substantially as specified.

156,895. PISTON-PACKINGS. John Bole, Pittsburg, Pa. [Filed Dec. 26, 1874.]

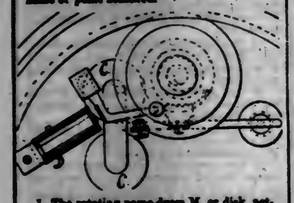


1. In combination with the packing-ring, a band spring, having its ends secured to the ring at or near the joint, so as to exert its force in distending the ring.

2. In combination with the packing-ring of a piston-head, a band free spring, having its ends secured to the ring at or near the joint, and formed or described, so that it may move with the ring around a common center.

156,896. WATER-CLOSETS. H. O. Brinckerhoff, New York, N. Y. [Filed Dec. 12, 1874.]

Brief.—Around the upper edge of the basin is formed a flange, which projects outward and upward to form a seat for the ring-pipe, from which the water is discharged into said basin through numerous small holes formed in the lower side of the said pipe, which pipe should project inward a little beyond the walls of the basin. The cap may be secured in place by straps, the upper ends of which are secured to the outer flange of said cap by pins or bolts.



1. The ring-cap C, in combination with the perforated ring-pipe B and the upper edge of a water-closet basin, substantially as herein shown and described.

2. The combination of the straps D and pins or bolts *b b* with the ring-cap C, the perforated ring-pipe B, and the basin A of a water-closet, substantially as herein shown and described.

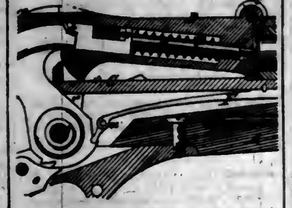
156,897. ELECTRO-MAGNETIC BURGLAR-ALARMS. Richd. J. Bottcher, Newark, assignor to John Middleton, Newark, and J. J. Thatcher, Caldwell, N. J. [Filed Feb. 27, 1874.]

Brief.—Name-drum, rotated by a spring, and indicating point attached, is held by a drop-pin, H, and detent N. Circuit closed at any point causes armature to release drop-pin, closing circuit to magnet controlling detent and operating alarm, sounding alarm and allowing name-drum to rotate and bring to view name of point attacked.

1. The rotating name-drum M, or disk, actuated by a spiral spring or weight, in combination with a drop-pin, H, and electro-magnets C and D, substantially as named, and for the purposes specified.

2. The combination, with the name-drum and alarm-bell, of a single magnet and armature, operating to simultaneously release the name-drum and sound the alarm-bell, substantially as set forth.

156,898. POTATO-DIGGERS. Leonard A. Brockett, Salisbury, N. Y. [Filed Dec. 1, 1874.]



Brief.—A common flat share raises the potatoes from the ground, delivering them with the soil upon a series of spirally-grooved rollers, each of which in the ascending series has a more rapid motion than the roller immediately forward of it. The potatoes are delivered by the rollers upon an obliquely-inclined grating, which completes the separation of the soil, and delivers the potatoes upon the ground in a row at the rear of the machine.

156,898.

The combination of the scraper A, the series of rollers, each of which has an accelerated motion as compared with the one immediately forward of it, and the grating G inclined downward toward the rear, and also toward one side of the machine, substantially as shown and described.

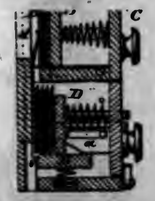
156,899. BREECH-LOADING FIRE-ARMS. J. Broughton, Brooklyn, N. Y. [Filed Feb. 14, 1874.]

1. The firing-pin G, constructed and arranged in relation with the breech-block and its receiver, substantially as described, in combination with the retracting-spring H, whereby said firing-pin in addition to its ordinary function, is made to operate as a lock to the rear end of the breech-block when the latter is closed and the hammer is raised, essentially as specified.

2. The vibrating knob lever or handle K, in combination with the slotted firing-pin G, and the swinging breech-block D, substantially as and for the purpose shown and described.

3. The construction and arrangement of the rear end of the firing-pin and the nose of the hammer relatively with each other, essentially as described, whereby the hammer in its forward motion is made to enter and lock the breech-block before the firing-pin is released from its hold within the receiver, and said firing-pin in its back movement caused to enter the receiver and lock the breech-block before the hammer in moving backward has released it, substantially as specified.

4. In combination with the extractor F, working on the pin *b* of the breech-block hinge, the shoulder *p* on the said pin, for maintaining a proper distance between the extractor of the hinge and the head of the pin, for the free working of the extractor, substantially as herein described.



5. In combination with the extractor F, arranged in relation with the hinge of the breech-block, as described, the working point or nose *o* of the extractor, arranged to pass through a lateral slot in the receiver, and supported by means of a shoulder on its extremity, essentially as specified.

156,900. STATION-INDICATORS. John W. Bryan, Watertown, Tenn. [Filed Dec. 19, 1874.]

Brief.—A station-indicator which slides station-cards from a lower into an upper drawer.

1. A station-indicator constructed of a casing, A, with front opening, station-plates H, upper and lower slide-frames C, with spring-follower D, retaining side springs *d*, false spring-bottom E, and sliding rod, frame, or key F F, to be operated substantially in the manner and for the purpose set forth.

2. The lower slide-frame, C, having spring-follower D and guide-strips *a*, with inclined ends, in connection with the spring-acted false bottom E, for carrying up the lower follower to the bottom of the upper slide-frame on opening the lower slide for returning the station-plates in regular order from the upper chamber to the lower, substantially as specified.

156,901. MACHINES FOR FORMING HEELS FOR BOOT AND SHOE HEELS. T. Bullock, Cincinnati, Ohio. [Filed Oct. 7, 1874.]

Brief.—The runner or rand is placed upon the corrugated face of a disk, with its thick or outer edge bearing against a circular guide, and is pressed down upon the disk by a toothed feed-wheel supported upon the end of a driving-shaft, the disk rotating with the movement of the runner.

1. In a machine for turning the runner for boots and shoes, the combination of the disk D, feed-wheel I, pressure-roller J, and guide H, substantially as set forth.

2. In a machine for turning the runners of boots and shoes, the pressure-roller J, in combination with slotted plate *g* and set-screw *h*, whereby the roller may be set at any desired angle with the vertical plane passing through the shaft of the feed-wheel I.

3. In a machine for turning the runners of boots and shoes, the adjustable guide H, provided with guards *n n'* and slotted flange *t*, as and for the purposes specified.

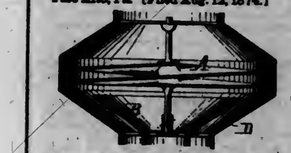
4. In a machine for turning the runner of boots and shoes, the disk D, standard E, and longitudinally-adjustable arm F, arranged to receive and support the standard, all substantially as and for the purposes set forth.

5. In a machine for turning the runners of boots and shoes, the feed-wheel I and shaft N, provided with adjustable collars *y y'* for rendering the feed-wheel and shaft adjustable.

6. In a machine for turning the runners of boots and shoes, the feed-wheel I, shaft *i*, in combination with shaft N and set-screw S, for rendering the feed-wheel adjustable.

156,902. METAL-COATING COMPOSITIONS. Edward J. W. Burrow, Parish of Lambeth, England, assignor of one-half his right to George G. Brower, Baltimore, Md. [Filed Dec. 26, 1874.]

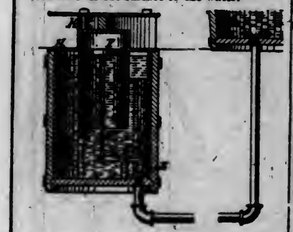
A composition, consisting of chalk, china clay or kaolin, sulphate of iron, copper, or zinc, refuse fat, and linseed-oil or naphtha, substantially as described, for coating various metallic surfaces to prevent oxidation and corrosion, as set forth.



156,903. FOUNTAIN-SPRINKLERS. Cephas A. Buttles, Milwaukee, Wis. [Filed Aug. 1, 1874.]

Brief.—A revolving fountain provided with arms of different curvatures. A rose-head within which a valve is arranged to regulate the flow of water as may be desired.

A revolving fountain with arms D and G, and hub F, and valve K, substantially as specified.



156,904. SPARE-ARRESTERS. John H. Carr, Palo Alto, Pa. [Filed Aug. 12, 1874.]

The combination, in a locomotive smoke-stack, of the central pipe F, deflecting-wheel A, having spiral vanes arranged above the said pipe, the inner casing E, and the guard B, extending from the mouth of the pipe F to or nearly to the outer edge of the wheel, and forming, with the outer casing, an annular chamber, D, for the reception of sparks thrown outward by the rotation of the wheel, all as set forth.

156,905. WATERING-TANKS FOR HOGS. G. A. Carter, Princeton, Ill. [Filed June 6, 1874.]

Brief.—An inverted casing for the float is arranged within the tank to prevent freezing of the water. Partitions between the openings in the cover prevent the circulation of cold air over the surface of the water.

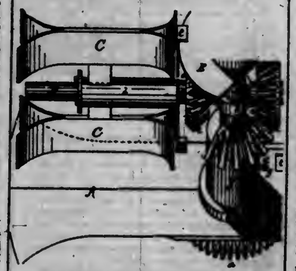
1. The tank C, having the float F, rod *e'*, lever *d*, and valve E, operating in combination with the casing G, substantially as and for the purpose specified.

2. The inverted casing G, combined with the float F and tank C, substantially as described, and for the purpose specified.

3. The wings J, arranged to operate with the tank C and perforated top H, substantially as described, and for the purpose specified.

4. The shield I, in combination with the perforated top H, winged casing G, and tank C, substantially as and for the purpose specified.

156,906. COUPLING-JOINTS FOR CULTIVATOR-TEETH. Edwin Children, Dunleith, Ill. [Filed Oct. 9, 1874.]



Brief.—A convex shovel-block fitting in a concave standard-plate held by an eyebolt passing through an enlarged opening, and capable of adjustment in all directions.

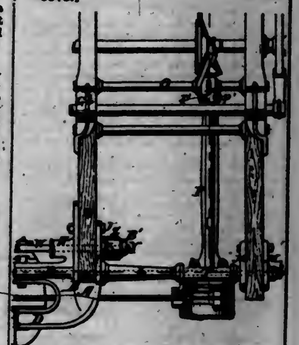
The coupling-joint herein described, consisting of the casting C, made with the concave cavity D, the casting E, made with the convex projection F, the eyebolt G, passing through the nut *g*, and through or thwart pin H, passing through the eye of said bolt and resting on the notches A A, attached and connecting and in combination with the standard A and shovel B, substantially as specified.

156,907. WATER-PROOF LIQUID BLACKING. Edward Clark, New York, N. Y. [Filed Dec. 12, 1874.]

A water-proof blacking made of gum-shellac, methylic alcohol, gum-camphor, lamp-black, sweet-oil, mutton-tallow, turpentine, and oil of mirbane, in about the manner and proportions specified.

156,908. HARVESTERS. George H. Clark, Lockport, N. Y. [Filed Sept. 26, 1874.]

1. The double fans C C', on sleeves *b b*, and arms D D, with the cogs *c c*, the segmental cogs *d*, fan-guide E, and fan-lugs *e e*, in combination with the cutter-shaft B and cutters A A, all arranged and operating substantially as and for the purpose specified.



2. The movable collar *h*, carrying the fan-supporting arms D D, in combination with the movable sleeve *f* and segment *d*, for adjusting the fans higher or lower, as hereinbefore set forth.

156,909. HAND-HARVESTERS. William F. Cochrane, La Fayette, Ind. [Filed Oct. 31, 1872.]

1. In a hemp attachment for harvesters, the combination of the vertical divider and curved divider-fingers with the quadrant-shaped platform, substantially as described, for the purposes specified.

2. The elevated guide-finger, supported near the front corner of the main frame, and extending rearward to intersect the divider-fingers, for the purpose of holding the cut stalks in an upright position, substantially as described.

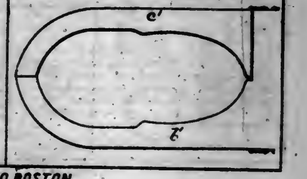
156,910. MOWING-MACHINES. William F. Cochrane, La Fayette, Ind. [Filed Dec. 15, 1873.]

1. The bracket A, cast with the lateral socket H, for the passage of the lifting-hook W, substantially as described.

2. The eyebolt O, extending longitudinally, under the front arm, D, of the bracket, from the frame of the machine to the pivot of said bracket-arm, substantially as described, for the purpose specified.

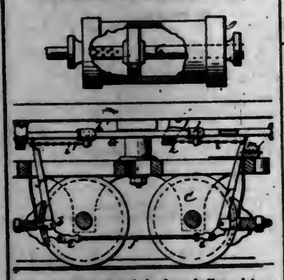
3. The double lifting-cams and the lifting-hook, in combination with the main frame and inner shoe of the finger-bar, for raising and lowering the outer end of the latter, substantially as described.

4. The lifting-hook W, passing through the bracket and inner side bar of the main frame, to catch over the headed pin X upon the upturned front end of the shoe G, substantially as described, for the purpose specified.



5. The combination of the nut Y and sliding cam B' with the angular shank of the lifting-hook W, for adjusting the cam on the hook, substantially as described, for the purpose specified.

6. The cam-thimble B', cast with an angular recess in its end to receive the nut upon the lifting-hook, and prevent it from casually turning thereon, substantially as described.



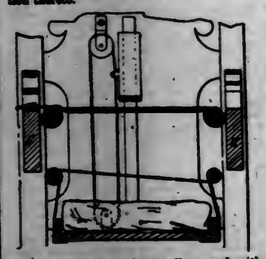
156,911. BOOT-JACKS. Henry N. Conklin, Indianapolis, Ind. [Filed June 27, 1874.]

Brief.—To the base-board a pair of griping-arms are hinged, which close together to hold a boot. Springs are arranged between the base-board and griping-arms.

In a boot-jack, the combination, with the base-board A and the spring S S', of the griping-arms B C, having overlapping shanks *b c*, substantially as specified.

156,912. AIR AND STEAM CAR-BRAKES. James M. Conrad, Newark, Ohio, assignor of one-half his right to R. M. Weaver, Williamsport, Pa. [Filed Jan. 4, 1875.]

1. In a steam or air brake, a hollow piston-rod, which extends under the car-bottom, in combination with one or more pistons and the brake-shoes, to which it is connected, substantially as and for the purposes herein set forth.

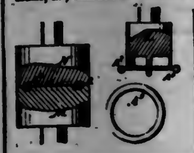


2. The combination, with a hollow piston-rod, G, of the adjustable collars *h h'*, chains *i i'*, and brake-levers, all substantially as set forth.

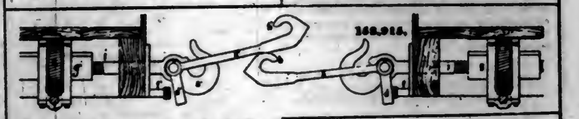
3. The spring *m*, in combination with the levers, chains, and piston-rod, as and for the purposes herein set forth.

4. The combination of the hollow piston-rod G, closed at both ends, and provided with nozzle *n*, the flexible pipes K, having couplings *p*, with packing *s* and the studs *r*, all substantially as and for the purposes herein set forth.

156,913. INVALID-BEDSTEADS. Oscar U. Conby and Geo. W. McGovern, Richmond, Va. [Filed May 23, 1874.]



Brief.—An endless cord is attached to the vertically-moving slide, and passes over two pulleys, one above and the other below the slide. In lowering the hinged head-section of the stretcher, the cord gives a positive motion thereto.



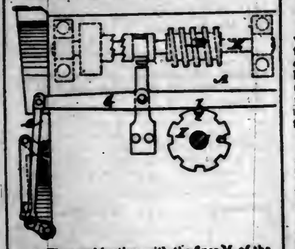
The combination of an endless cord, with mechanism for raising the hinged-head section of the stretcher-frame, consisting of a lever-bracket, a slide, and a band and pulley, substantially as and for the purposes described.

156,914. DIES FOR MAKING HOLLOW RIVETS. Rhubeal Cottle, New York, N. Y., assignor to Mulford, Hale & Cottle, same place. [Filed Oct. 10, 1874.]

Brief.—A number of dies to strike up a planchet, turning the edge until it forms a hollow head; the central flat portion is then cut out by the cutter L, and the ring thus made, A', finished in dies N M.

The combination of the dies, holder, and cutting-tool B C, D E, F, G H, I *J*, I K, L, and M N, constructed as described, and operated successively, and in connection with each other, for forming tubular rings without cross-seams from flat metallic disks, substantially as herein shown and described.

156,915. CAR-COUPLINGS. Andw. Coulter, Riga, Russia. [Filed Dec. 16, 1874.]



Brief.—To uncouple, the draw-bar is withdrawn under the car, and the arm is drawn against the springs, and the hook is raised out of connection thereby.

1. The combination of the draw-bar *i*, its hook, the coupling-hook *h*, having an opening, *e*, and arm *d*, and the spring *f*, to maintain the hook in an extended position, but capable of yielding and allowing the hook to descend, all as set forth.

2. The screw-coupling *g*, uniting the two ends of the draw-bar and rendering the same adjustable, in combination with the hook *h* and its arms *e* and *d*, and spring or stop *f*, as set forth.

156,916. RETORTS' OVENS. Alex. Crumbie, Nyack, and D. Donald, Brooklyn, N. Y. [Filed July 30, 1874.]

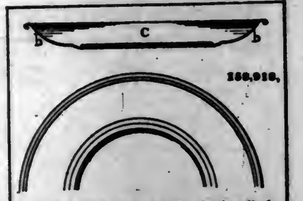
Brief.—The retorts are intended to effect a thorough combustion of the gases in their passage from the furnace to the baking-chamber. The door is made to open when the carriers are brought opposite to it.

1. The combination, with the flues M, of the internally-arranged open-ended retorts N, the lateral openings *l*, the fire-places I, the apertures m, and the baking-chamber A, substantially as and for the purpose herein set forth.

2. The combination, with the stop-lever G, its toe *b*, and the notched disk I, of a door, *j*, and mechanism for automatically opening and closing the charging and discharging apertures *d*, in relation with the traveling bread-holders, essentially as herein set forth.

3. In combination with the traveling bread-holders C and aperture *d*, the door J, hung on an intermediate axis, *k*, and constructed to form, when thrown open, a delivery-board for the baked articles, substantially as shown and described.

156,917. SHEER-BOOMS. W. C. Culbertson, Girard, Pa. [Filed Dec. 16, 1874.]

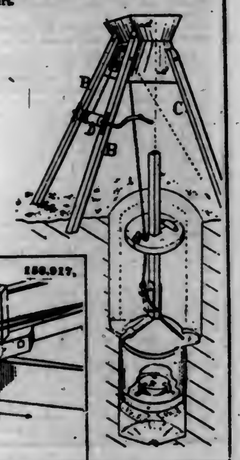


In a sheer-boom, the rudders thereof, several to or controlled by an operating-cord in such manner that they will move to allow the passage of an obstruction, and then resume their normal position, substantially as herein shown and described.

156,918. GAME APPARATUS. David R. De Costa, Philadelphia, Pa., assignor to R. M. De Costa, C. De Costa, and A. De Costa, same place. [Filed Aug. 26, 1874.]

Brief.—Consists of stakes and a dished and quoit-like ring, to be thrown at and encircle the same.

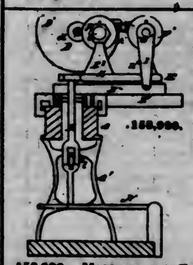
156,918.



156,919.

1. The tubular and flaring derrick-crown A A, substantially as described, and for the purposes specified.

2. The combination of the crown A, rigid legs B B, and folding legs C C, substantially as described, and for the purposes specified.



3. The cutters Nos. 1 and 2, having the peculiar upward and inward curves at their upper and outside ends, as described, in combination with the valve *k*, substantially as shown and described, for the purposes of elevating the loose dirt.

4. The movable bottom m, having conical valve *k*, substantially as and for the purposes specified.

5. The movable cylinder or bucket *f f*, in combination with the frame *e e d* and sliding catch *g*, substantially as and for the purposes specified.

6. In a well-auger, the combination of the frame *e e d* carrying cutters Nos. 1 and 2, the movable cylinder *f f* carrying cutters Nos. 3 and 4, and the movable bottom m having valve *k*, substantially as described, and for the purposes specified.

156,920.

156,921.

156,920. MACHINES FOR TRIMMING AND BEARING SHEET METAL. John De Bats, Philadelphia, Pa. [Filed Oct. 3, 1874.]

1. In combination with a machine for trimming metal, the adjustable pressure-shaft D and slide-rest E, movable simultaneously and in conjunction, substantially as and for the purpose specified.

2. The shaft G', moving in the head F', having a cutter, *h'*, and crank-arm I, substantially as described.

3. The combination of the shafts G G', provided with cutters *h' h'*, said shaft G being stationary, while said shaft G' is movable, so as to bring the cutters together, substantially as set forth.

4. In combination with the pressure-shaft D, provided with a head, *d*, the disk D', recessed as described, for the reception of said head.

5. The head O, slotted as described, to receive the end of the standard M', and having an opening for the passage of the pressure-shaft D, substantially as shown and described.

6. The combination of the crank-arm I, pivoted bar K, and lever L with the slotted bar M, substantially as shown and described.

7. The combination of the slotted bar M, pivoted standard M', head O, and pressure-shaft D, substantially as described.

8. The pivoted standard M', head O, and arms P P, in combination with the slide E, substantially as shown and described.

9. The heads *c c'*, provided with cutters *h' h'*, rings *h'*, and groove *b'*, so as to trim and bead at one operation, substantially as described.

10. A lathe for trimming sheet-metal ware, combining the following elements: A revolving chuck, a slide-rest, and a cutter or cutters, constructed in connection with a pressure-shaft and a disk, or a shaft with solid head, as described, the parts being constructed and arranged substantially as described, so that by depressing a connected treadle the pressure-shaft and slide will be moved toward the chuck, and the cutter or cutters made to operate upon the vessel to be trimmed, as set forth.

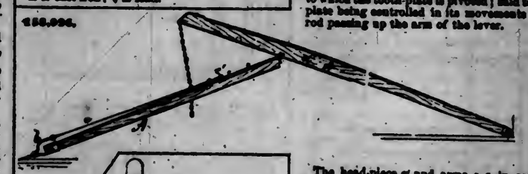
156,921. HAMESAWS. Henry Disston, Philadelphia, Pa. [Filed May 14, 1874.]

Brief.—The saw-blade is cut away in that part to which the handle is attached, so as to place the hand of the operator nearer to the cutting part of the saw than is the case in handsaws of ordinary construction.

A handsaw in which the butt of the blade has a recess, *a*, coinciding with the front edge of the opening *b* in the handle, and arranged in respect to the gripe B as set forth.

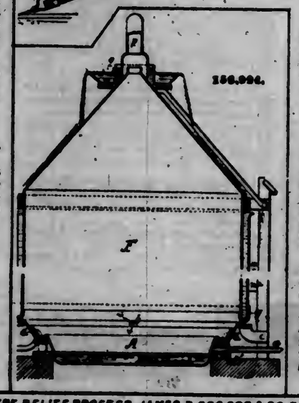
156,922. COMBS. Myer Dittenhoefer, St. Denis, near Paris, France. [Filed Oct. 19, 1874.]

As an improved article of manufacture, a comb made in one piece, of india-rubber or equivalent material, with undulations formed on the back or face of the teeth thereof, substantially as and for the purpose specified.



156,923. ROAD-ENGINES. Riley B. Dean, Sacramento, Cal. [Filed Jan. 2, 1875.]

1. The combination of pulley N, having rigid bearings and slotted socket M, with shaft J, ball I, and projections *r r*, substantially as set forth.



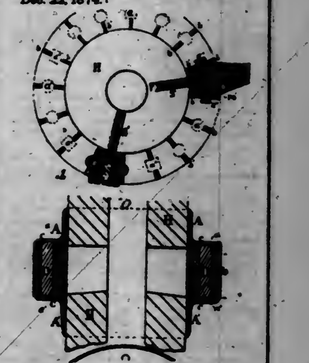
2. A traction-engine, in combination with the four traction and bearing wheels H and I and universal joint, consisting of socket M and ball I, with projections *r r*, so that wheels I can exert their tractive power when turned to an angle with the wheel H, substantially as set forth.

156,924. APPARATUS FOR CONCENTRATING AND EVAPORATING SULPHURIC ACID. M. J. F. B. Pauzet and J. L. Kessler, Clermont-Ferrand, France. [Filed June 20, 1874.]

Brief.—The joint-piece between the bell and pan supports the pan, and is supported on brackets reaching inward from the vertical standards which rise around the bell. The bell rests removably in a groove at the outer edge of the joint-piece. The latter has a space for a continuous current of water. The pan A is of platinum; joint-piece C of lead; *d* is mastic or clay; *g'*, iron covered with lead; E is cast-iron; *g* is lead.

156,924.

156,924.



1. The combination, in an evaporating apparatus, of the bell F, pan A, inlet *b*, and outlet *c*, communicating with the pan a short distance above the bottom, as and for the purpose set forth.

2. The combination of the pan A, the gutter G, luted to the pan, and the bell F, resting in a groove at the upper edge of the gutter, as set forth.

3. A cold-water channel, *g*, combined with the joint between the bell F and pan A, substantially as and for the purpose set forth.

4. The combination of the basin A, annular gutter G, standards *k*, and bell F, supported by the standards above the basin, as set forth.

156,925. WHEELS FOR VEHICLES. John B. Fisk, Saegerville, Pa., assignor of one-half his right to Wm. R. Godshall. [Filed Dec. 22, 1874.]

In a carriage-wheel, the combination of a hub, H, socket-ring A A, spokes S, retaining-rings C C, and dowel-pins D, substantially as and for the purpose set forth.

156,926. CARPET-STRETCHERS. G. H. Ford, Jerseyville, Ill. [Filed July 20, 1874.]

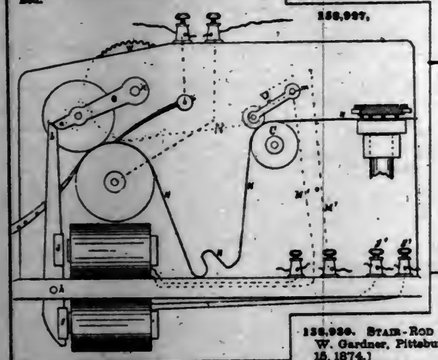
Brief.—The head-piece has projecting arms, to which the teeth-plate is pivoted; said teeth-plate being controlled in its movements by a rod passing up the arm of the lever.

156,926.

The head-piece *c* and arms *a a*, in combination with the adjustable teeth-plate *b* and its connecting-rod *e* and lever A, the whole constructed, operated, and arranged in the manner and for the purpose herein set forth.

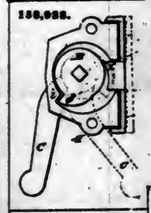
156,927. AUTOMATIC TELEGRAPHIC APPARATUS. Merritt Gally, Rochester, N. Y. [Filed May 11, 1874.]

1. The combination, with a perforator for preparing message matter for telegraphic transmission, and with a transmitter therefor, of an intermediate device, controlled in certain operations by the paper passing from the perforator to the transmitter, and in turn controlling the transmitter in its action, substantially as and for the purpose specified.



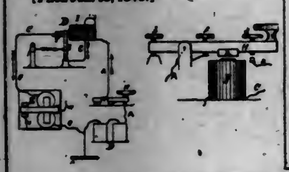
2. The transmitting or receiving mechanism, in combination with the circuit S' S', operated substantially as and for the purpose specified.

3. The combination, with a series of instruments connected to the same or to different circuits, of an electrical or mechanical connection, for controlling any or all the instruments from any one thereof, substantially as specified.



4. The tripping-circuit M' M', with connector E, by means of which the transmitting or receiving movement is interrupted by the tension of the ribbon N, substantially as specified.

5. The combination, with a main-line transmitting wire and instruments therefor, of an additional line-wire, for controlling the instruments of the transmitting-line as to their intervals of transmission, substantially as specified.

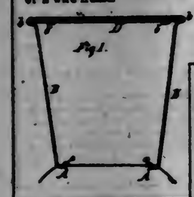


156,927.

156,928.

156,926. TELEGRAPHIC APPARATUS AND CIRCUITS. Merritt Gally, Rochester, N. Y. [Filed Jan. 13, 1875.]

1. The combination, with the telegraphic line A, of the circuit C, with a receiver, a relay, or a repeater, E, and automatic switch for operating the connection between the line A and circuit C, substantially as and for the purpose specified.

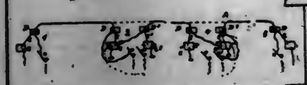


2. The combination of the circuit C and a battery, with and connected to the main line on opposite sides of the magnet I, substantially as and for the purposes specified.

3. The combination of the line A and double sets of station instruments, with circuits crossed from side to side in either or both directions, substantially as and for the purposes specified.

4. The combined manipulating-key, and receiver, relay, or repeater, consisting of a magnet-armature, and key-lever, substantially as specified.

156,929. REFLECTORS. Wm. B. Gardner, New York, N. Y. [Filed Dec. 10, 1874.]



Brief.—A reflector of white glass supported upon and over the globe of a lamp by means of a wire frame.

156,930. STAIR-ROD SECURERS. Thomas W. Gardner, Pittsburg, Pa. [Filed Aug. 15, 1874.]

As a means for adjusting rods to staircases, the slotted and adjustable metallic plate B, provided with the projecting prong D, as shown, in combination with the staple or ring-bolt *f*, attached to the stairs, when arranged and operated substantially as herein described and set forth.

156,931. HYDROCARBON-FURNACES. Chas. M. Gearing, Pittsburg, Pa. [Filed June 17, 1874.]

Brief.—The oil from a tank, in which a perforated basket filled with non-combustible material is placed, percolates to the surface of said material, where a blast of air is supplied. The basket can be easily removed for the purpose of cleaning.

The combination of the outer tank or reservoir a, the inner perforated basket c, supported on the reservoir and filled with fibrous material, and the blast-nozzles *f*, substantially as and for the purpose specified.

156,932. HAND-PIECES OF DENTAL ENGINES. John W. Gilbert, Philadelphia, Pa., assignor to Saml. S. White, same place. [Filed Dec. 22, 1874.]

Brief.—A frame-piece fits over the hand-piece, and carries a tool-holder. The tool-holder is reciprocated by a double traversing screw upon the rotating shaft.

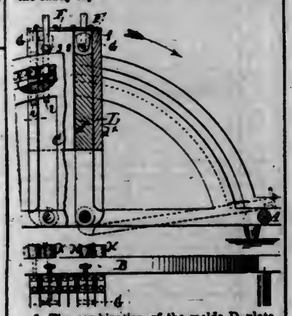
156,933.

1. A wire frame or holder, constructed as described, to form the clamps A A, arms B B, hooks *b b* and *b' b'*, and diagonal brace *c*, substantially as and for the purposes herein set forth.

2. The globe of a lamp and a wire frame or holder, all combined and operating to support the reflector above and over the lamp, substantially as shown at i described, for the purpose set forth.

1. A tool-holder attachment for hand-pieces of dental engines, substantially as hereinbefore set forth, consisting of the combination, of a frame-piece adapted for attachment to the hand-piece, and having a driving-shaft and tool-holder mounted therein.

2. The combination, substantially as hereinbefore set forth, of a hand-piece, a chuck revolving therein, a detachable frame, a tool-holder mounted therein, and a driving-shaft adapted for insertion in the chuck of the hand-piece and actuating the tool-holder.



156,934. SASH-HOLDERS. F. R. Glascock, Hillsborough, Ohio. [Filed Dec. 18, 1874.]

Brief.—A flanged bar or shoe-piece, with suitable tongue, is combined with an eccentric within a recessed plate or case, which eccentric is operated by a crank-handle; the construction being such that this novel shoe-piece serves as a friction-slide, to hold the sash in desired position.

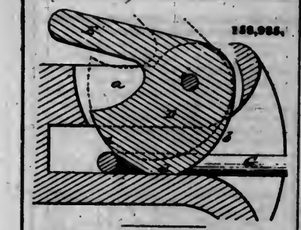
The combination of the recessed plate A, having slot *a* and stop *i*, the eccentric B *b*, having bearing *x*, the crank C, and the flanged bar or slide D, having tongue *e*, all substantially as and for the purposes herein set forth.

156,935. MACHINES FOR MAKING TOY CONFECTIONERY. Jas. Goucher, Stroudsburg, Pa. [Filed July 30, 1874.]

Brief.—The molds are arranged in pairs, each half containing half depressions, and are pivoted at their lower ends, and secured to the bottom of a frame consisting of two horizontal side pieces and two slotted semicircular portions, connected at their ends by end pieces. The top of each pair of molds is covered by a hinged metallic plate, perforated to correspond with the openings in the mold for receiving the plastic confectionery. The molds are moved to any position desired by means of blocks or bearings moving in the semicircular slots of the curved frame, and are kept together and clamped by set-screws. The molds are separated by turning the crank-shaft, which operates a cam, thereby forcing the molds apart, and permitting the removal of the candy toys.

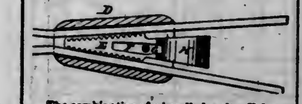
1. The combination of the molds D, plate F, and side frame A' B, substantially as shown and described.

2. The cams G, in combination with the molds D, substantially as and for the purpose shown and described.



3. The set-screws J K, in combination with the molds D and the side frames provided with the curved slots, substantially as and for the purpose shown and described.

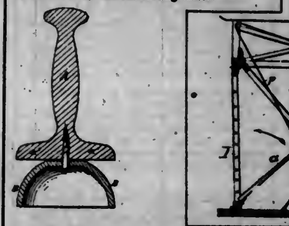
4. The combination of the molds provided with the grooves *l*, the set-screws J K, and the side frames provided with the curved slots, substantially as and for the purpose shown and described.



156,936. CAR-COUPLINGS. W. O. Gunckel, Terre Haute, Ind. [Filed Dec. 28, 1874.]

The pivoted tongue or lever D, provided with the handle B, and having its front *b* curved, lower end *d* straight, and rear *c* eccentrically curved, in combination with the draw-head A and coupling-link G, substantially as and for the purposes set forth.

156,937.



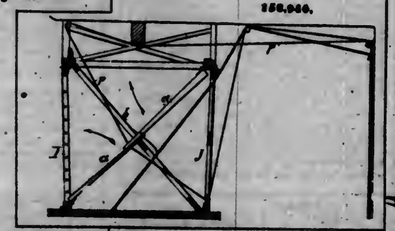
156,938. REIN-HOLDERS. Benj. R. Hamilton, South Deerfield, Mass. [Filed Nov. 30, 1874.]

The combination of a handled wedge, E, having slot F, and the cross-pin G, with the tapered tube D, as shown and described.

156,939. VENT-CLEARERS FOR WASH-BOWLS, &c. John S. Hawley, Stapleton, N. Y. [Filed Dec. 19, 1874.]

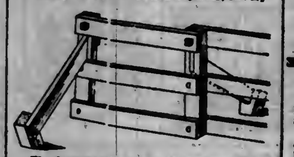
Brief.—A rubber cup, attached to a handle by a screw and washer, is effective by letting a small quantity of water flow into the bowl or tub, so as to cover the discharge-orifice, and the handle forced downward suddenly forces the water beneath the cup into the discharge-pipe with a sudden impulse, which dislodges obstructions, and allows them to be carried off by the outflowing water.

As improved vent-clearer, formed by attaching a rubber cup, B, to a handle, A, substantially as herein shown and described.



156,940. GUIDES FOR STAGE-SCENERY. Charles Higbee, Philadelphia, Pa. [Filed Nov. 11, 1874.]

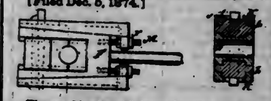
Brief.—The grooved bars for guiding the scenery are so constructed that they can be raised out of sight when increased width of stage is required.



1. The combination of the fixed frame E, the grooved bar G, the frames I and J, hinged to the said bar and to the fixed frame, and the rope *o*, arranged substantially as described, so that the bar is caused to assume either of the positions shown, all as set forth.

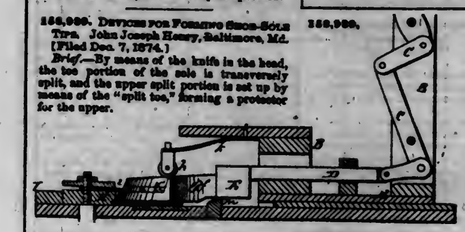
2. The combination of the fixed frame E, frames I and J, grooved bar G, brace *b*, arms *a* and *a'*, and the operating rope *p*, attached to the said arms, all as shown and described.

156,940.

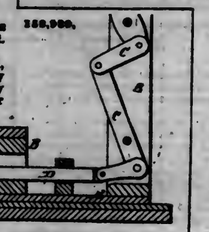


156,941. FARE-FENCES. Lovren H. Hogue, Sandy Lake, Pa. [Filed Sept. 22, 1874.]

The fence resting upon the surface of the ground, its posts grasped by the ends of the adjacent rails and secured between them, said fence being anchored by the inclined braces and ground stakes, substantially as set forth.



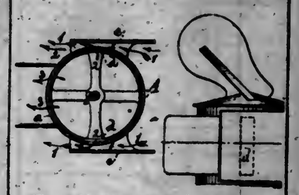
156,942. OSCILLATING ENGINES. Geo. W. Heald, Baldwinsville, N. Y., assignor to himself and Wm. F. Morris, same place. [Filed Dec. 5, 1874.]



The combination of the wedge-shaped bearings, stud-screws M and adjusting-nuts N, with the cross-head P and the guides I of an oscillating engine, substantially as specified.

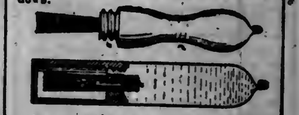
156,943. DEVICES FOR FORMING SHOE-SOLE TIPS. John Joseph Henry, Baltimore, Md. [Filed Dec. 7, 1874.]

Brief.—By means of the knife in the head, the toe portion of the sole is transversely split, and the upper split portion is set up by means of the "split toe," forming a protector for the upper.



156,943.

156,944. CHIMNEY-CAPS. Albt. B. Hussey, New York, N. Y. [Filed Dec. 29, 1874.]



Brief.—The currents through the side passages tend to create a vacuum in the rear of the exit-opening.

The combination, with the revolving vertical chimney-cap A, provided with the open mouth *a* and the side openings, *d d*, of the wings *c c*, attached at their upper and lower ends to the cap to create the air-channels *f f*, which communicate with the side openings, *d*, for producing an upward current, which partially escapes through the side openings, and increases the outward current through the mouth of the cap, substantially as described.

156,945. BRUSHES. Chas. A. Hussey, New York, N. Y. [Filed Sept. 21, 1874.]

Brief.—The reservoir-tube is of thin metal, and the fluid is placed in it through the upper end, which is afterward closed by being turned down.

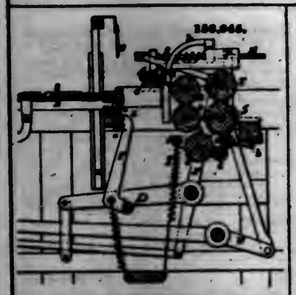
A reservoir-brush, comprising the metallic tube C, provided at one end with neck B, adapted to receive the shield G, and closed at the opposite end by bending the material of the tube C after the manner of closing tube-points, in combination with brush A and tube D, all as and for the purpose specified.

156,946. THILL-COUPLINGS. N. P. Engelke, St. Paul, Minn. [Filed July 6, 1874.]

Brief.—The safety-strap is held in place, easily detachable, by a key and spring.

1. The combination of the eccentric *b'* and the pin *b* on the coupling-piece B, substantially as and for the purpose described.

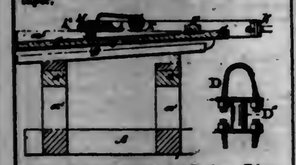
2. The combination of the elevated projection *e* and spring *d*, attached to the shaft, and the key E, attached to the safety-strap, substantially as set forth.



156,947. PAPER-BAG MACHINES. Chas. H. Kellogg, Leverett, Mass. [Filed Nov. 14, 1874.]

Brief.—The invention consists in the construction of the bottom-folder and the guard for opening the bottom and smoothing the folds.

1. A bottom-folder, E, pivoted in the ends of reciprocating and vibrating arms F F, as and for the purpose specified.



2. The combination, with folders C and carrier-arm K, of arms G G, pivoted together at the end of a movable spring-rod, I, and from the middle connected with said carrier-arm by the links J, as and for the purpose described.

3. A carrier-arm, K, mounted on a sliding and revolving arm, M, in combination with a rest, P, having incline Q, as and for the purpose set forth.

156,946. MACHINES FOR DRESSING SHINGLES. Samuel M. King, Lancaster, Pa. [Filed Jan. 4, 1875.]

Brief.—Two slides carrying cutting-blades move in converging ways, thus giving the shingle, as it passes between them, a proper taper.

The combination, with rest E, clamp F, upper cutter, H A, and inclined track D, of the shingle-support G, provided with a planing-knife, and movable over the bottom of shingle, in the manner and for the purpose described.

156,947. MACHINES FOR GROOVING SEWING-MACHINE NEEDLES. Samuel C. Kingman, Bridgeport, Conn. [Filed Dec. 30, 1874.]

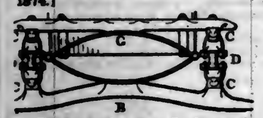
Brief.—A series of circular cutters mounted on a hinged arm or frame, to operate on a series of needles held in a clamp on a slide under the forward end of said frame; said slide being reciprocated automatically, the rear end carrying a former, which, by traveling over an anti-friction roll on the rear end of arm, regulates the length and depth of groove in the needles by elevating and depressing the cutters.

1. The combination, with the die-seat D, series of two or more tapering keys, a a, cross-bar E, connecting-bar Y, lower X, adjustable bed O, and slide B with the series of two or more milling-cutters, f f, revolving upon one arbor, constructed substantially as and for the purpose specified.

2. The combination of the series of two or more milling-cutters, f f, cutter-arbor F, swinging beam G, adjustable slide H, roll r, and former O with the slide B, constructed substantially as and for the purpose specified.

3. The combination of the clamp E, die-seat D, series of two or more keys, a a, cross-bar E, connecting-bar Y, lower X, adjustable bed O, slide B, die-seat lever I, cutter-arbor F, spindle A, center bearing e, swinging beam G, adjustable slide H, roll r, and former O, constructed substantially as and for the purpose specified.

156,948. GAS-COUPLINGS. John J. Lahaye, Reading, Pa. [Filed Nov. 2, 1874.]



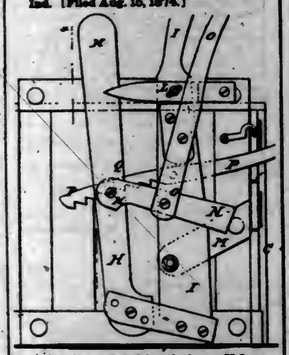
1. A draw-head, having a recess, *d*, and having combined therewith a movable backing in front of the recess to resist the movement of the link until the application of excessive pressure, when it will yield and permit the link to pass into the said recess, all as set forth.

2. The combination, with the movable dog B and its ribs h, of the slots *f* and recesses *i* formed in the coupling-head, all substantially as and for the purpose set forth.

3. The rib *n*, formed directly on the coupling-pin D, and serving to impart the weight of the said pin to the movable dog, as and for the purpose described.

4. The combination, with the coupling-pin D, its slot *n*, and opening *o*, of the sliding bolt *p*, to operate as and for the purpose set forth.

156,949. VEHICLE SIDE SPRINGS. Davis M. Lane, Philadelphia, Pa. [Filed Nov. 16, 1874.]

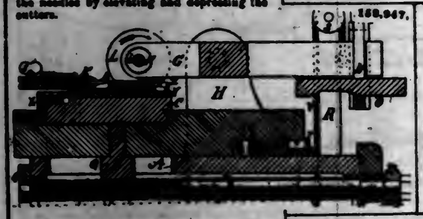


1. The two spring-spars C, of reversely-curved order, in combination with the rigid couplings D, separating said spars, and connecting them at their centers, substantially as and for the purpose set forth.

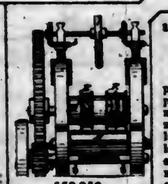
2. The two spring-spars C, of reversely-curved order, in combination with the coupling-posts D''', interposed between the spars and connecting their centers, substantially as and for the purpose set forth.

3. The two spring-spars C, in combination with the couplings D, constructed of the posts D''' with arms D'', and the clips D', substantially as and for the purpose set forth.

4. The two spring-spars C, in combination with the transverse spring G and cross-bar E, substantially as and for the purpose set forth.



156,950. HOG-TRAPS. Peter Lane, Elwood, Ind. [Filed Aug. 10, 1874.]



A hog-trap, comprising the levers H I, connected at the bottom, and one of them pivoted to bar M, the lever N O, ratchet-lever P, and staple Q, serving as means of connection and adjustment of the upper portion of said levers, all combined and arranged as shown and described, to operate as specified.

156,951. HYDRAULIC ELEVATORS. Philander P. Lane and Samuel R. Smith, Cincinnati, Ohio, assignors to Lane & Bodley, same place. [Filed Dec. 11, 1874.]

Brief.—Employs two sets of traveling pulleys, one set rigidly connected with the piston-rod, the other set capable of being connected by hooks with the first set, or disconnected from it—in the former case for raising light weights with economy of water, in the latter for raising greater weights by full stroke of piston. In the latter case the journals of the detachable set, the cable, and curved abutments cause to make the detached set stationary, and properly at the beginning of the lift.

156,952.

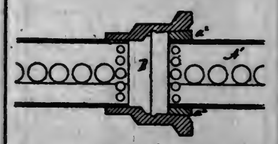
1. The combination of the die-seat D, series of two or more tapering keys, a a, cross-bar E, connecting-bar Y, lower X, adjustable bed O, and slide B with the series of two or more milling-cutters, f f, revolving upon one arbor, constructed substantially as and for the purpose specified.

2. The combination of the series of two or more milling-cutters, f f, cutter-arbor F, swinging beam G, adjustable slide H, roll r, and former O with the slide B, constructed substantially as and for the purpose specified.

3. The combination of the clamp E, die-seat D, series of two or more keys, a a, cross-bar E, connecting-bar Y, lower X, adjustable bed O, slide B, die-seat lever I, cutter-arbor F, spindle A, center bearing e, swinging beam G, adjustable slide H, roll r, and former O, constructed substantially as and for the purpose specified.

156,953.

1. A hydraulic lift-engine, having two sets of sheaves, one stationary and one traveling, both of them located at one end of the cylinder.



2. The stops or abutting-posts, which bear against the tube or other member of the separable travelers, and which co-act with the hoisting-cable to hold said travelers to their inert position, corresponding with the lowest position of the platform, as and for the purpose explained.

3. The cross-head that carries the set of main traveling sheaves adapted to run up so as to permit an easy engagement or disengagement of the hooks of the separable travelers, in the manner specified.

4. In combination with the hydraulic cylinder, the fixed and traveling sheaves, (one portion of the traveling sheaves being detachable,) and the stop, to arrest the motion of the detachable portion of the sheaves, the whole combined so as to enable the connection and disconnection of the detachable portion of the traveling sheaves when the platform is at or near the bottom of its run, substantially as set forth.

156,954. JOINTS FOR WROUGHT-IRON PIPES. George Lander, Pittsburg, Pa., assignor to himself and Thos. M. Carnegie, same place. [Filed Dec. 8, 1874.]

Brief.—A metal ring is secured to the spigot end of the pipe; said ring being slightly tapered to correspond with a taper formed on the inside of the socket, whereby the close union may be made between the pipe and socket without the usual leading and luting.

A joint for wrought-iron pipes, consisting of the socket B bored, as described, in combination with pipe A', provided with a tapered spigot-ring, *a*', secured to the pipe, substantially as and for the purpose specified.

156,955. POCKET-BOOKS. Charles Lieb, New York, N. Y. [Filed June 24, 1874.]

Brief.—The side flaps or gussets and partitions are connected together by metal clasps struck out from a single blank, and formed up as shown in Fig. 2.

The metallic clasp herein described for connecting together the flaps of pocket-books, the same consisting of the strip or back *b*, formed with the point *c* and cheeks *c c*, at right angles to said back, and the whole adapted to be clinched into position for connecting the flaps of pocket-books, in the manner herein shown and described.

156,956. HOT-AIR FURNACES. Jas. A. Lawson, Troy, N. Y. [Filed Apr. 4, 1874.]

Brief.—On opening the upper feed-door the gases in the upper portion of the magazine are discharged into the cross-pipe which leads to the exit-flue. The staves composing the lower section of the magazine may be separately detached from the central supporting-ring, and removed through the lower feed-opening.

1. The dome D, provided with the long and short discharge-pipes *d* and *d'*, respectively, in combination with the ring E, having the hollow legs E' and E'', and inlet-openings *e* and *e*, substantially as and for the purpose specified.

2. The ring E, provided with the hollow legs E' and E'', inlet-openings *e* and *e*, and discharge-openings *c'*, *c''*, and *c'''*, in combination with the dome D, having the long and the short discharge-pipes *d* and *d'*, respectively, substantially as and for the purpose shown.

3. The ring E, provided with the large discharge-openings *c'* and *c''* within its forward portion, and the smaller discharge-opening *c'''* within its rear side, in combination with the cross-pipe G, substantially as and for the purpose set forth.

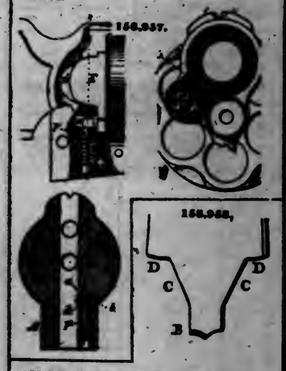
4. In combination with the ring E, provided with the discharge-openings *c'*, *c''*, and *c'''*, the cross-pipe G having thimbled inlet-openings which coincide with said discharge-openings, and provided with an exit-flue, G''', substantially as and for the purpose shown and described.

5. In combination with the hinged upward-swinging check-draft door G', provided with the lug *g'*, the ratchet-bar G'' *g''*, pivoted upon the door-frame and engaging with said lug, substantially as and for the purpose shown and described.

6. The combination of the feed-door F', having the locking-arm *f'*, with the check-draft door G', provided with lug *g'*, and with the damper L, having the radial arm *l'*, the bar M, provided with the notch *m* and lug *m'*, by means of which said door and damper are connected, substantially as and for the purpose specified.

7. In combination with the ring H, provided with the flanges A and A', the annular groove A'', and the notches A''', the staves I and I, provided each with the notches *i* and *i*, substantially as and for the purpose shown.

8. The flanged grooved ring H, A, A', A'', and A''', constructed as shown, and combined with the staves I, *i*, and *i*, in the manner and for the purposes substantially as set forth.



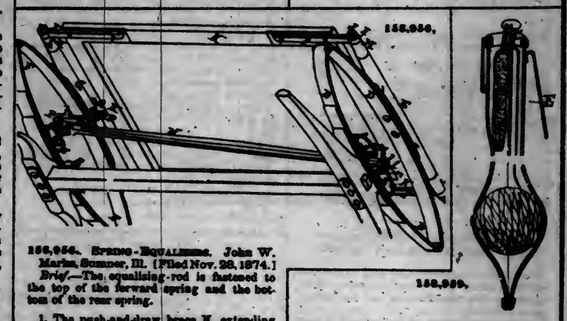
9. In combination with the staves I *i*, the sectional hinged or jointed ring K, substantially as and for the purpose shown and described.

156,957. REVOLVING FIRE-ARMS. William Mason, Hartford, Conn., assignor to Colt's Patent Fire-Arms Manufacturing Company, same place. [Filed Dec. 8, 1874.]

1. The gate E of a revolver, having its trunnion *e* constructed with flat recesses *b d*, and combined with the spring-follower F, substantially as described.

2. In a revolving fire-arm, the boss S on the barrel, and the recess *s* in the frame, combined with the ejector-tube, constructed to enter said recess *s*, and set over the boss S, as a means for securing said tube to the arm, substantially as specified.

3. In a revolver provided with a gate, the rear or recoil portion of the frame, constructed of spherical form, the gate E forming a part of said spherical portion, substantially as described.

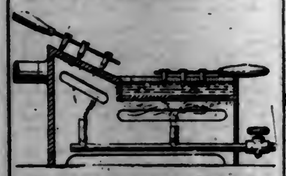


156,958. COMBINED DRILLS, COUNTERSINKS, AND PLANERS. Wm. McCrossen, Philadelphia, Pa., assignor to S. C. Bachman, same place. [Filed Dec. 24, 1874.]

Brief.—A drill-point, B, countersink C, and planing cutter-edges D formed in one piece as a single tool.

The combined drill, countersink, and planer, substantially as and for the purpose set forth.

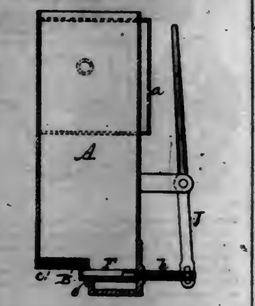
156,959. KNITTING-SATCHELS. C. McFadden, Oswego, N. Y. [Filed July 10, 1874.]



1. A knitting-satchel provided with a longitudinal partition, B, for the purpose specified, in combination with needle-holders D, substantially as described.

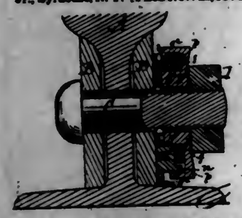
2. The needle-holders D, affixed to a knitting-satchel by means of elastic strips C, as and for the purpose specified.

3. The retaining-book E, in combination with a knitting-satchel, constructed substantially as described.



158,960. METHODS OF LUBRICATING CARTRIDGES. Joe V. Meigs, Lowell, Mass. (Filed Dec. 10, 1874.)

The method herein described of lubricating cartridges, and removing the surplus grease therefrom, which consists in dipping the cartridges in the heated lubricant, drying them, and placing them in contact with a heated surface, substantially as set forth.

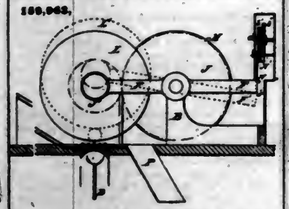


158,961. GLUE-CUPS. Henry Meyer, New York, N. Y. (Filed Nov. 7, 1874.)

Brief.—Slide of bottom of glue-cup carries hot glue across the elastic pad, and on its withdrawal scrapes away all but what is held in cavities in the pad.

In a gluing-hopper, the combination of the open-faced slide F and the pad or cushion B, having cavities *c* in its face, substantially as and for the purpose shown and described.

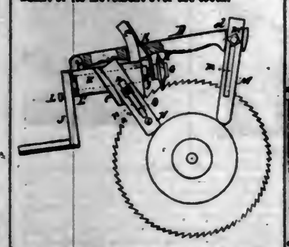
158,962. NUT-LOCK WASHERS. J. Miller, Jr., Syracuse, N. Y. (Filed Nov. 21, 1874.)



The elastic nut-lock washer made of the two box-like parts E' and E', and interposed elastic piece A, the part E having its outer face constructed with the flat central portion *f* and double inclined planes *p*, substantially as and for the purpose shown and described.

158,963. APPARATUS FOR BRANDING AND COUNTING CORKS. N. W. Mitchell, Southsea, England. (Filed July 13, 1874.)

Brief.—A milled wheel is mounted on one end of an oscillating arm. A cog-wheel mounted at the pivot of the wheel gives motion to the milled wheel. A cork is branded by being passed under the milled wheel, which raises the wheel, thereby lowering the other end of the oscillating arm, which, by means of a pawl and ratchet, actuates the registering mechanism.



158,964. GIN-SAW SHARPENERS. Josiah Misall and John Bevell, Colerain, N. C. (Filed Oct. 14, 1874.)

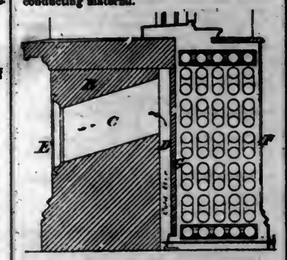
Brief.—The file-shaft has end play in the frame, a screw moving over a cam as the shaft rotates, and a spring at the opposite end of the shaft causes the file at each revolution to move forward to a new tooth on the saw. The circular file is cut away at one side, to admit of its movement over the tooth.

1. The combination, with the pulley H, wheel J, pinion J', driving a milled pulley, L, the frame F, oscillating on the standard B, and the support Q, substantially as described and represented.

2. The oscillating frame F F, mounted on the spindle G, and carrying at one end the milled pulley L, in combination with the lever N and its pawl N', operated by the swinging frame, and a counting mechanism, M, substantially as and for the purpose described.

1. The combination, with file-shaft G, having longitudinal play, of the circular file H, cut away at *h*, as shown and described, to allow the file to be drawn back and thrown forward at the times and in the manner specified.

2. The combination, with file-shaft G, having longitudinal play, of the cam L', screw L, and spring K, as and for the purpose specified.

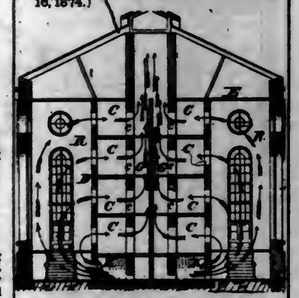


3. The combination, with the bar D, and frame E, having grooved guides, of slotted legs and clamp-screws, to adapt the machine to saws having teeth at greater or less distance from the spacing-blocks.

4. The combination, with bar D, of legs M and N, placed, respectively, upon different sides of saw-shaft, as and for the purpose set forth.

5. The combination, with legs, of spacing-springs O, to bear against the adjacent saws, in the manner specified

158,965. WARMING AND VENTILATING APPARATUS. Alfred B. Mullett, Washington, D. C. (Filed Dec. 16, 1874.)

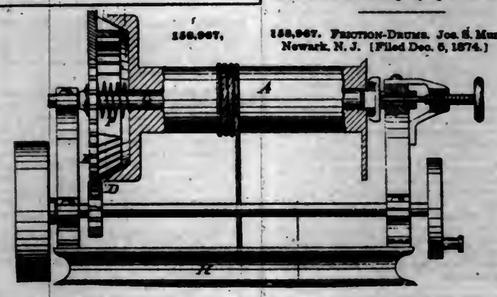


Brief.—The heating-pipes may contain either steam or hot air. The partition G is of non-conducting material.

1. The combination, with the heat-radiator F, of the air-passages C D, formed, as herein described, within the permanent base B of the window, for the purpose set forth.

2. The combination of the non-conducting partition G with the heat-radiator F and the air-passages C D, formed within the permanent base B of the window, as explained.

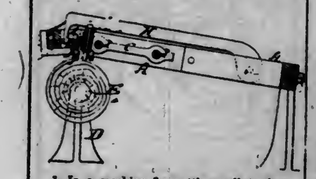
158,966. CONSTRUCTION OF PRISONS. Alfd. B. Mullett, Washington, D. C. (Filed Dec. 16, 1874.)



1. The combination of the two ranges of cells with a double corridor occupying the space between the said ranges of cells, and divided by a partition-wall, serving to prevent communication, while permitting the use of grated doors to the cells.

2. The arches or vaults arranged beneath the cells to contain heating apparatus and prevent tunneling.

3. The combination of the air ducts and passages J J L with the guard-rooms E, cells C, corridors G, and ventilating sky-light I, arranged, substantially as herein set forth, to compel the air to traverse the cells in its passage from the ventilating and heating vaults below to the ventilating sky-light above.

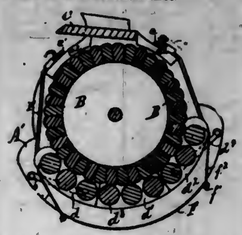


158,967. FRICTION-DRUMS. Jos. H. Mundy, Newark, N. J. (Filed Dec. 6, 1874.)

The combination, with tubular and sliding drum A, loose on a shaft, C, and having friction-cone D, of the fast driven spur-wheel E, having spring I to repel the said cone, and provided with a side flange supporting the cone N, as and for the purpose described.

158,968. MACHINES FOR CUTTING SPLINTS FOR MATCHES. Waldemar Bergin Nielsen, Malmo, Sweden. (Filed Dec. 12, 1874.)

Brief.—The log from which the splints are cut revolves between centers with an intermittent motion, and is operated upon by a reciprocating cutter traveling in a vibrating frame.



1. In a machine for cutting splints from logs, the combination of a reciprocating plane, C, with the vibrating lever F, which holds the vibrating tool *g*, for locking and unlocking the log, substantially as described.

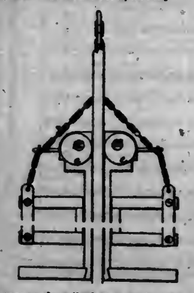
2. In combination with the vibrating lever F and reciprocating plane C, the hooks H and I, arranged substantially as and for the purpose described.

3. In a machine for cutting splints from logs, the combination of the pivoted frame A, which guides the plane, with the supports D D of the log, all arranged so that the log is free to turn between its supports, while the frame A and its plane follow the log as its size is being reduced, substantially as described.

158,969. WASHING-MACHINES. Henry Niermann and Frederick Schlecter, St. Louis, Mo. (Filed Sept. 5, 1874.)

Brief.—Sectional side frames carrying rollers are held by elastic straps. Hinged guard-plates, and a fixed bottom below these, are attached to the solid side frames.

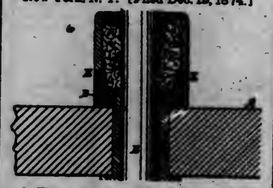
1. In combination with the sectional frames *d d' d''*, carrying rollers *d''*, an elastic supporting-strap, E, extended beneath the sections, as described, and adapted to yield below any one of them without sensibly affecting the others, as set forth.



2. The combination of the elastic strap E, having hooks *e'*, with the fixed board *d''*, having the series of holes described, and the sectional frames *d d' d''*, whereby the strap is made adjustable, as described.

3. The combination of the fixed bottom plate, F, the hinged guard plates *f' f''*, and the adjustable roller-frames, as described

4. The combination of the guard-plate *f'*, having projection *f''*, with the adjustable grooved frames *d d'* and the elastic strap E, as described, the strap being adapted to hold the projection securely in the groove, and thus give the guard-plate movement in harmony with that of the sectional frame, as set forth.

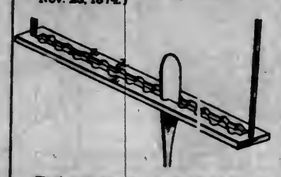


5. The combination of the outer sectional frames, *d d'*, the pivoted bars *d''*, and the side frames, A A', the bar being adapted to unite the sectional frames to the side frames, and retain them in position without interfering with their adjustability, as set forth.

158,970. HOISTING APPARATUS. Henry Opperman and Alexander Black, Steubenville, Ohio. (Filed Dec. 2, 1874.)

The means described for causing the cams *e e* to clamp the guides of frame, consisting of a cage, B, sliding within frame A, the ropes O O' C, and the rock-shafts E E, having arms *e' e'*, as shown and described.

158,971. KING-BOLT BEARINGS. G. J. Ott, New York, N. Y. (Filed Dec. 19, 1874.)



1. The combination of the bush C with the axle and the king-bolt of a truck, substantially as set forth.

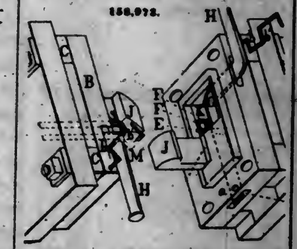
2. The combination of the inverted cup E and nut D with the bush C and the king-bolt, substantially as set forth.

3. The combination of the washer F with the cup E and the king-bolt, substantially as set forth.

158,972. RACKS FOR ELECTROPLATING. H. B. Osborn, Wallingford, Conn. (Filed Nov. 23, 1874.)

The bar A, constructed with the longitudinal slot *a*, and with corresponding notches *d* in opposite sides of said slot, combined with suspending-rods B, all substantially as and for the purpose specified.

158,973. CAR-COUPLINGS. Stephen Ott, Newark, Del. (Filed May 27, 1874.)

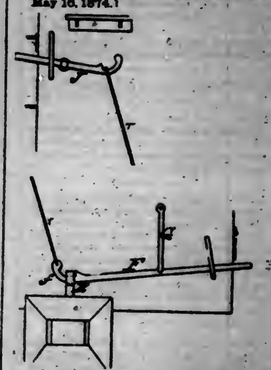


1. The combination, with the transverse locking-bar G, of the pin E connected thereto, and the eyes F F', substantially as and for the purpose set forth.

2. The rotating rod M, with heads *b b'*, in combination with the locking-bar G, substantially as and for the purpose set forth.

3. The combination of the block A, formed with chamber D and opening K, the hook J, the hinged coupling-bar G, extending transversely in the chamber D, and formed with handle H, the pin B secured to the bar G, and the eyes F F' secured to block B, all constructed to operate substantially as and for the purpose set forth.

158,974. HUBS FOR VEHICLE-WHEELS. H. A. Payne, Adams, N. Y. (Filed Jan. 2, 1875.)



Brief.—The axle-box and inner hub-band are in one piece, and the band is provided with spurs to hold it in place.

1. The band B', formed on the box B, and having a beveled flange, *c*, and spurs *b*, substantially as and for the purpose described.

2. The combination of the cap-band C, having beveled flange *c*, with the band B' and hub-box B, the band having beveled flange *c*, substantially as described.

158,975. CAR-COUPLINGS. Simon B. Petree and Adam C. Hensley, Minier, Ill. (Filed May 10, 1874.)

The combination, with the lower lever, F, its swinging fulcrum G, and curved slide end *f*, of the top-lever J, connecting-link *r*, and vertically-moving coupling-pin B, having a sliding connection with said slide end, as specified.

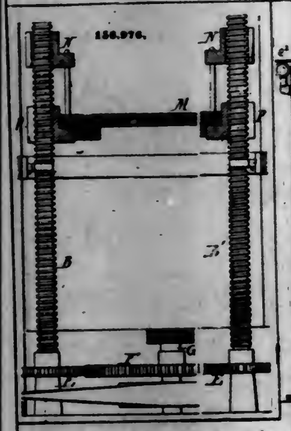
158,976. HOISTING APPARATUS. Henry Opperman and Alexander Black, Steubenville, Ohio. (Filed Dec. 2, 1874.)

1. The combination of the bush C with the axle and the king-bolt of a truck, substantially as set forth.

2. The combination of the inverted cup E and nut D with the bush C and the king-bolt, substantially as set forth.

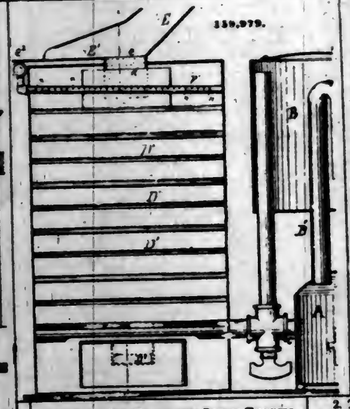
3. The combination of the washer F with the cup E and the king-bolt, substantially as set forth.

158,977. CAR-COUPLINGS. Simon B. Petree and Adam C. Hensley, Minier, Ill. (Filed May 10, 1874.)



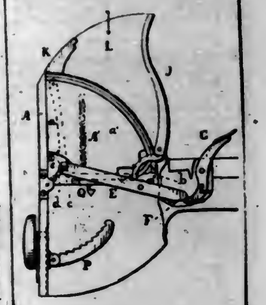
The combination, with the lower lever, F, its swinging fulcrum G, and curved slide end *f*, of the top-lever J, connecting-link *r*, and vertically-moving coupling-pin B, having a sliding connection with said slide end, as specified.

158,978. HOISTING APPARATUS. Daniel M. Pfautz and Leopold Sternberger, Philadelphia, Pa. (Filed Nov. 20, 1874.)

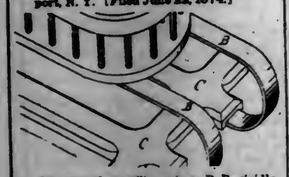


1. The combination of the two screw-shafts, B and B', the upper and lower nuts, N and P, and the platform M, suspended from the upper nuts and adapted to the lower nuts, all as set forth, for the purpose specified.

2. The combination of the upper and lower slotted nuts, N and P, with brackets K, at the junction of the sections of each shaft.



No. 158,976.



No. 158,979.

No. 158,981.

158,977. BAST-TEDDER, Mars Post, Lockport, N. Y. [Filed June 22, 1874.]

The curved metallic springs B B, rigidly connected at one end to the supporting-base C at opposite sides of the same, and extended near their other ends with elongated slots *e e*, in combination with the set-screw *d*, passing through said slots and into the bottom of the cradle, for adjusting and clamping the latter in position, the whole being constructed and arranged as shown and described.

158,978. COATINGS FOR OIL-BARRELS. M. W Quick, Titusville, Pa. [Filed Oct. 26, 1874.]

The process herein described for rendering oil-barrels impervious to hydrocarbons by coating the interior of the barrel with fluid extract of tan-bark, substantially as specified.

158,979. APPARATUS FOR TREATING CANE-JUICE. François Randon, New Orleans, La. [Filed Dec. 11, 1874.]

Brief.—A generator sends sulphurous-acid gas into a receiver, which holds concentrated carbonate of soda and granulated coke. The coke distributes the sulphurous-acid gas to the solution, thus liberating carbonic-acid gas. Both are then passed to the bottom of bleaching-column, which presents the juice over a series of inclined shelves.

1. The vessel B, charged or filled with granulated coke submerged in a concentrated solution of carbonate of soda to a point near that at which the gas is discharged, in combination with a sulphur-burner, A, and a bleaching and drying column, D, whereby the fumes of sulphur, as generated in their passage to the column, are caused to pass through the solution in the vessel B, thus absorbing the sulphuric acid and liberating in its stead carbonic-acid gas, and which, with the sulphurous-acid gas, is conveyed to the column, there to aid in bleaching and drying the saccharine juice, substantially as described.

2. The combination of the trough or chute E E', having an opening, *c*, and an angular inclined sieve, F', and the bleaching and drying column D, arranged to operate substantially as and for the purpose specified.

3. The combination of the injector F and perforated pipe F', and bleaching and drying column D, arranged to operate substantially as and for the purpose specified.

158,980. BED-PLATES FOR STEAM-ENGINES. J. D. Richardson, Houston, Tex. [Filed Oct. 14, 1874.]

A bed-plate for a steam-engine, having base-plate A, cylinder-base D *c*, hollow ridge B, and diagonal fillet *s f*, substantially as and for the purposes specified.

158,981. FARE-BOXES. R. Miles Robinson, Philadelphia, Pa. [Filed Oct. 9, 1874.]

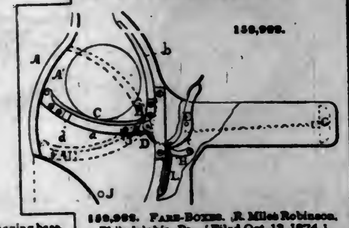
Brief.—The fare being deposited in the opening, the conductor presses the trigger correspending to the character of the fares, which operates the vibrating angular receiving-leaf carrying the pivoted trap leaves, deposits the fare into the chamber below, and operates an alarm and recording mechanism. A serrated hinged dog is provided, which locks the leaf in position in case of the reversal of the box to abstract the fares.

1. In a fare-receiver, the axial leaf B, constructed of two plates, *a b*, and side walls *a'*, in combination with the body A, having curved recesses on its inner face, and receiving the walls *a'* thereon, substantially as and for the purpose set forth.

2. The angular leaf B, in combination with the trap C, jointed to the outer end of the vertical plate *a* of said leaf, and the trap D, jointed to the outer end of the horizontal plate *b* thereof, substantially as and for the purpose set forth.

3. The axial door J, in combination with the axial leaf B, substantially as and for the purpose set forth.

4. The combination, with the receiver A and axial leaf B, of the overhanging piece K, forming part of the hopper L, and the door J, closing against said piece, substantially as and for the purpose set forth.



5. The arms or levers E, jointed to the axial portion of the leaf B, and operating in combination with the trigger or triggers G, substantially as and for the purpose set forth.

6. The dog P, in combination with the leaf B and the traps C D of said leaf, substantially as and for the purpose set forth.

7. The dog P, formed with serrations P', in combination with the leaf B, formed with an opening, *f*, and the traps C D, substantially as and for the purpose set forth.

8. The goog R, in combination with the leaf B, and operated thereby after the fare is registered, and discharged by means of the dog Q on the under side of the leaf, substantially as and for the purpose set forth.

158,982.

158,982. FARE-BOXES. R. Miles Robinson, Philadelphia, Pa. [Filed Oct. 13, 1874.]

Brief.—The fare is received in the angular leaf, which is vibrated by a trigger. A trap pivoted to one end of the leaf is operated by a stud on the frame, to sweep the leaf to insure the discharge of the fare into the receptacle below. A dog is provided, which falls into serrations on the trigger, to prevent the operation of the leaf when the box is reversed.

1. The leaf B, constructed of two plates or parts, *a b*, in combination with the trap C, hinged to one of the plates or parts, substantially as and for the purpose set forth.

2. The stud J and part *b*, with slot or groove *d*, in combination with the trap C, substantially as and for the purpose set forth.

3. The closing-spring K and trap C, in combination with the part *b*, with groove *d* and the opening-stud J, substantially as and for the purpose set forth.

4. The combination, with a fare-receiver, of the trigger E, formed with serrations *e*, and the dog H operating therewith, substantially as and for the purpose set forth.

158,983. COMPOUND IRON BEAMS. Wm. S. Sampson, New York, N. Y., assignor of three-fourths of his right to A. L. Munson, same place, and S. Coit, Hartford, Conn. [Filed Dec. 16, 1874.]

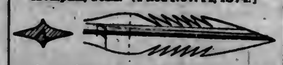
1. A compound metal beam composed of a series of one or more central plates, *a*, *b*, *c*, and *d*, the curved or arched plates A, B, C, and D, and the top and bottom flange-plates E and F, bolted and held firmly together by the bolts A' and A' at the center of the beam, and by the bolts or rivets I, I', I², and I³ at the point of junction of the curved plates A, B, C, and D with the flange-plates E and F at the top and bottom of the beam, all substantially as and for the purposes herein shown and described.

2. In combination with a compound metal beam composed of a series of one or more central plates, *a*, *b*, *c*, and *d*, curved or arched plates A, B, C, and D, top and bottom flange-plates E and F, bolted and riveted together, as shown and described, the metal brackets or wedges H, H', H², and H³ inserted in the spandrels between the curved and central plates, substantially as and for the purposes described.

3. In combination with a compound metal beam or girder, composed of a series of one or more central plates, *a*, *b*, *c*, and *d*, curved or arched plates A, B, C, and D, top and bottom flange-plates E and F, all bolted and riveted together, as shown and described, the wood filling L' inserted in the spandrels and between the metal brackets or wedges H, H', H², and H³, access to the same for the purpose of nailing floors or ceilings thereto being had through openings L, which may be punched or drilled at various points in the flange-plates E and F, substantially as and for the purposes herein shown and described.

4. In combination with a compound metal beam, constructed as described, the straight or curved metal block K used as a support or rest for the beam or flooring when the beam is set into position, all substantially as herein shown and described.

158,984. FIRE-ESCAPE LADDERS. D. Sanford, Ashton, Ill. [Filed July 26, 1874.]



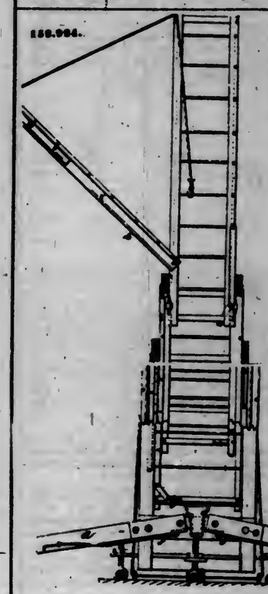
Brief.—The sections are extended by means of ropes and windlasses. A coiled spring on the windlass of the lower movable section is wound up when the section descends, to counteract the weight of all of the movable sections. One side of each section is pivoted at the lower end, so as to swing out against the side of the building, thus forming a ladder. The upper swinging section has a sliding extension, and so connected with cords to the main portion as to cause the extension to slide out. The device is steadied by braces having catch-pawls, which engage with a vertical ratchet.

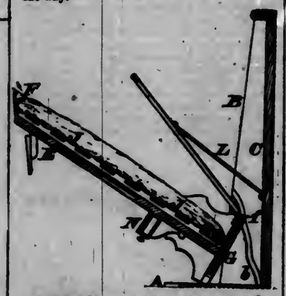
1. The combination of a coiled spring with the windlass of an extension-ladder, to counterbalance the weight of the ladder, substantially as specified.

2. The swinging ladder S, sliding extension T, and ropes U, combined and arranged with an extension-ladder, substantially as specified.

3. The combination of braces *d*, ratchets *e*, and catch-pawls *f* with the ladder, substantially as specified.

158,985. COTTON-AUGERS. A. O. Schultz, Memphis, Tenn. [Filed Nov. 14, 1874.]





As an improvement in cotton-augers, an auger constructed with symmetrically-fluted cross-sections, extending along blades and teeth from stem to tapering point, substantially in the manner specified and set forth.

158,986. TOILET-STAND BEDSTEADS. Chas. Schwartz and Chas. B. Woods, Henderson, Ky. [Filed May 26, 1874.]

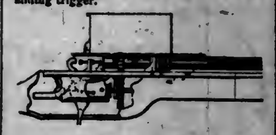
Brief.—A flap is hinged to the head of the bed-frame, and is connected with the back of the case by a strap. When the bed-frame is closed the flap is automatically closed upon the bed-clothing to keep it in proper position, and when the bed-frame is opened or let down the flap is automatically raised out of the way.

No. 158,984.

In combination with the fixed frame A B B', provided with guiding-grooves *b b'* and the movable frame E F F' G, having lugs *f f'*, working in the grooves *b b'*, the flap K, hinged to the head-board G, and connected by a strap, L, to the back C, substantially as and for the purpose set forth.

158,987. HINGES FOR GATES. S. L. Selden, Rochester, N. Y. [Filed June 23, 1874.]

Brief.—One wing has cast upon it a long outwardly-extending arm, which carries a tapering double-end pintle, the ends extending upward and downward from the center. The other wing has a short horizontal arm, which carries the cylinder-shaped eye or pintle-socket.



The reversible gate-hinge, herein described, consisting of the parts C, having a long arm, E, and a tapering double-end pintle, F, and the part D, provided with a short arm, D', and pintle-socket G, substantially as shown and described.

158,988.

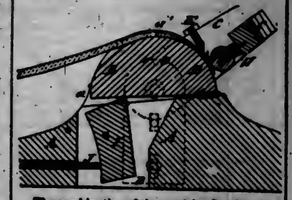
158,988. FIRE-ARMS. M. Sellen, Brighton, Wis. [Filed Oct. 23, 1874.]

Brief.—A rotary motion is imparted to the projectile by means of a revolving breech, which is rapidly revolved at the instant of discharge through the medium of gearing connected with the frame, and operated by the sliding trigger.

1. The rotary breech *b*, having cogs upon its periphery, in combination with the wheel W and operating mechanism, substantially as set forth.

2. The combination of the movable swinging barrel with a cartridge-carrier that is rigidly attached thereto, substantially as described.

3. The combination of the swinging barrel, having the rammer attached to its side, so as to move with it, a cartridge-carrier, and a separate chambered breech, substantially as set forth.



4. The combination of the slide S, rigid trigger or handle, and connecting mechanism, substantially as described, whereby the hammer is tripped and again cocked by the same movement of the slide.

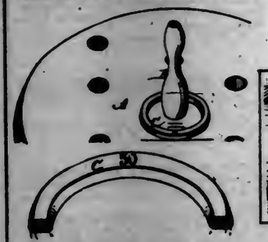
5. The combination of the breech or chamber *b*, and barrel *a*, pivoted near the muzzle, whereby the rear end of the barrel may be moved to one side to open the chamber for loading, substantially as shown.

6. A cartridge-carrier that serves to convey the cartridges to the muzzle of the chambered breech when the barrel is swung laterally to open said breech, and which is adapted to close the bottom of the cartridge box or magazine when the barrel is swung back, substantially as specified.

158,989. MACHINES FOR TAPERING LEATHER. J. Settle and G. W. Settle, Lebanon, Oreg. [Filed Nov. 30, 1874.]

Brief.—The knife is attached transversely to a vertically-adjustable swinging frame, which is provided with a transverse roller turning upon lugs rising above and on each side of an adjustable semi-cylindrical cutting-block.

The combination of the semicircular flanges or lugs *a'*, the semi-cylindrical block B, the pivoted frame C, the knife E, the spring-roller F H, the pivoted block or lever I, the hand-screw J, and the block A, substantially as herein shown and described.

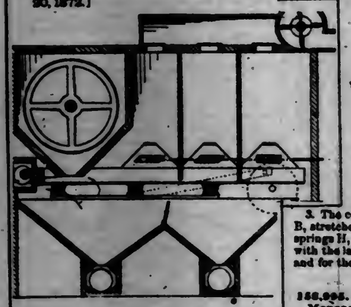


158,999. HORSE-BLANKETS OR LAP-ROBES. G. V. Shepard, Troy, N. Y. [Filed Jan. 14, 1875.]

As a new article of manufacture a horse-blanket or lap-robe, consisting of the knitted fabric-face A, middle piece B of burlap, shoddy, or equivalent material, and lining, C, substantially as described.

159,000. GAME APPARATUS. F. W. Smith, Bridgeport, Conn. [Filed Aug. 6, 1874.]

Brief.—The rings, being of a rubber composed, are substantially noiseless in use, and do not mar furniture accidentally hit thereby.



1. The ring C, of hardened rubber, with its upper and lower surfaces made flat, and its outer edge rounded, substantially as and for the purpose set forth.

2. The game apparatus described, consisting of the ring C of hardened rubber, a series of numbered pins, B, and the portable perforated base, A, for the purposes set forth.

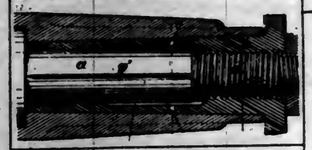
3. The game apparatus described, consisting of the hardened rubber ring C, provided with flat faces, rounded edges, and numbered or lettered on one or both its faces, and the numbered or lettered pins on the base A, substantially as and for the purposes set forth.

158,998. MIDDLINGS-PURIFIERS. Geo. T. Smith, Minneapolis, Minn. [Filed May 20, 1872.]

1. Two or more reciprocating bolting surfaces or shakers, through which a current of air passes, separated from each other by longitudinal partitions, the cloth upon one shaker differing in fineness from the cloth on the other shaker or shakers, thereby adapting them for receiving and bolting flour or middlings of different grades of fineness, substantially as set forth.

2. In combination with two or more reciprocating bolting surfaces or shakers, through which a current of air passes, the cloth upon one shaker differing in fineness from that of the other, a preparatory bolt constructed to divide the flour or middlings into different grades of fineness, the finer grade being delivered to the shaker which is clothed with the finer cloth, and a coarser grade to a coarser cloth, substantially as set forth.

158,992. CARRIAGE-AXLES. J. P. Spicer, Millestown, and Thos. Insull, Philadelphia, assignors to themselves and J. F. Dovey, Philadelphia, Pa. [Filed Dec. 14, 1874.]



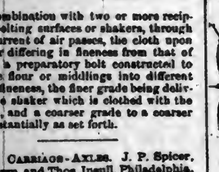
Brief.—The sleeve can be applied or removed while the wheel is in position on the spindle.

1. The removable screw-sleeve D, in combination with a threaded axle-arm, a d, on which it is screwed, and an outwardly-flaring box, B, within which it fits, substantially as set forth.

2. The construction of the removable tapering screw-sleeve D with a collar, E, for retaining the wheel on the axle, as set forth.

3. The combination, with the removable screw-sleeve D, to constitute the bearing-surface of the axle, of the nut E, applied to the axle with a thread in the opposite direction from that of the sleeve D, as set forth.

4. The combination of the broad bearing-collar C with the box B and removable sleeve D, as and for the purposes set forth.

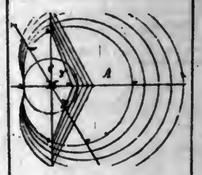


158,994. UMBRELLAS. U. G. Steinmetz, Philadelphia, Pa. [Filed Dec. 3, 1874.]

Brief.—The ribs are in jointed sections, capable of being folded, and when opened are held rigid by the slide F on the end of the brace O.

1. The section *a*, fixed to one end of the stock E, and the section *b*, pivoted to the other end thereof, in combination with the spring-actuated slide F, playing in said stock, and the stretcher G, pivoted thereto, substantially as and for the purpose set forth.

2. The combination, with the sectional ribs B and stretchers C, of the sliding arms G, carrying at their outer ends the locking-slides F, and having their inner ends fixed to the stick A, and the sliding band J, actuating said inner ends, substantially as and for the purpose set forth.

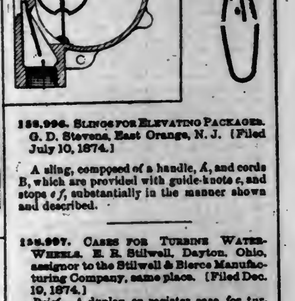


3. The combination, with the sectional ribs B, stretchers C, slides F, and arms G, of the springs H, connected to the stick A and formed with the lateral projections *c*, substantially as and for the purpose set forth.

158,995. LIQUID AND GAS METERS AND MOTORS. J. A. Stenberg, Chicago, Ill. [Filed Aug. 20, 1874.]

Brief.—The outline of the case is composed of segments of three circles, determined by a formula, which enables it to be produced upon a common lathe.

A cylinder or case, A, whose outline is composed of segments of three circles, the centers and radiuses of which are determined by the formula represented in Fig.

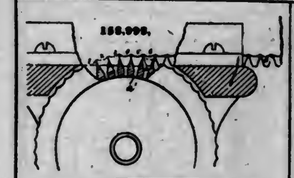


158,996. SLINGS FOR ELEVATING PACKAGES. G. D. Stevens, East Orange, N. J. [Filed July 10, 1874.]

A sling, composed of a handle, A, and cords B, which are provided with guide-knots *e*, and stops *e f*, substantially in the manner shown and described.

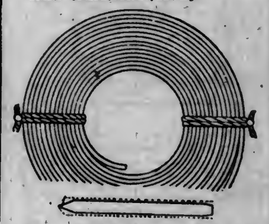
158,997. CASES FOR TURBINE WATER-WHEELS. E. E. Stilwell, Dayton, Ohio, assignor to the Stilwell & Bierce Manufacturing Company, same place. [Filed Dec. 19, 1874.]

Brief.—A duplex or register case for turbine water-wheels, and applied to that class in which the inner part of the case is made to revolve to open or close or regulate the width of the chutes which direct the water onto the wheel; and consists in providing a central axial bearing composed of a hub journaling on a sleeve attached to the crown-plate, the hub being connected to the inner or revolving part of the case by arms or other suitable means.



1. A case for water-wheels, with the inner register or chute provided with a central hub and journal-bearing, located under the crown-plate, substantially as set forth.

2. A case for a water-wheel, with an inner revolving chute or register, provided with an outer annular bearing, O, and a central hub and journal-bearing, I, substantially as herein set forth.



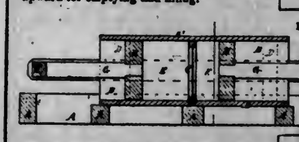
158,998. MECHANISMS FOR COMPRESSING POINTS ON PEGS. B. F. Sturtevant, Boston, Mass. [Filed Dec. 20, 1874.]

1. A rotary peg-point compressor, having a cavity or cavities in which the peg-wood is forced and pointed, substantially as described.

2. The combination with plates, forming a guide or way for the peg-wood, of a rotary point-compressor, for compressing the peg-wood for peg-points, substantially as described.

159,000. FASTENINGS FOR UNITING SOLES TO UPPERS. Benj. F. Sturtevant, Boston, Mass. [Filed Dec. 17, 1874.]

1. A peg, having its head condensed or compacted, substantially as described.



2. A peg-ribbon, having its head-forming edge condensed or consolidated, substantially as described.

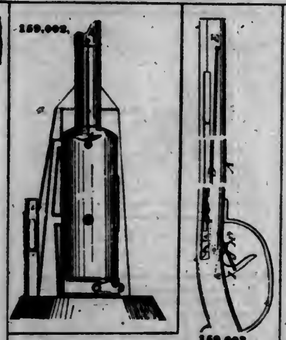
3. A peg or peg-ribbon, having its head and point, or head and point forming edges, compressed or consolidated, substantially as described.

4. Jaws for compressing peg-wood, having their opposite sides beveled, substantially as described, to compress head and point forming edges of the peg-wood, as set forth.

159,000. BUTTER-WORKERS. J. Thompson, Albany, Wis. [Filed Sept. 19, 1874.]

Brief.—A horizontal trough with a wire screen at its center. The butter is placed in one end, and a follower forces it through the screen, whence a follower forces it back, one lever moving both. The followers are trunnioned at their rear ends, and may be turned upward for emptying and filling.

The combination of the sliding bars E, the rollers F, the arms G, the followers H, and the grate C, with the box B *b'*, and the base-frame A, substantially as herein shown and described.



159,001. KINDLING MATERIALS. Wm. C. Tisdale, New York, N. Y., assignor of one-half his right to Wm. Hellins, Jersey City, N. J. [Filed June 9, 1874.]

The improved kindling and self-igniting fuel herein described, consisting of dried condensed peat, covered with an outer coating of rosin and bees-wax in about the proportions herein specified.

159,002. CAR-HEATERS. Thos. W. Tyler, Corry, Pa., assignor of one-half his right to F. M. Lockwood, same place. [Filed Jan. 11, 1875.]

Brief.—The carbonic-acid gas forces the water from the base through the pipes into the fire-chamber on the overturning of the stove.

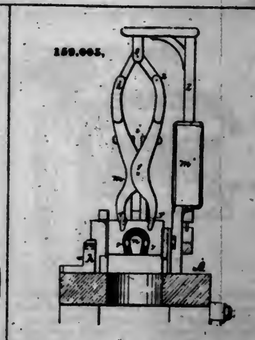
In combination with a heater having a hollow base or vessel for holding water, the tube *i*, containing a vessel for sulphuric acid or other chemical, whereby carbonic-acid gas is generated upon the upsetting of the stove, substantially as specified.

159,002. TOY GUNS. W. Wiedemann and L. Lindsey, Lawrence, Kans. [Filed July 25, 1874.]

A toy gun constructed as shown and described—that is, having a slit, C, in the barrel, formed of two parts, as described, the spring D, wire cross-head E, catch-block G, tumbler H, trigger I, and spring J, when all said parts are arranged to operate as and for the purposes set forth.

159,004. HAIR-CUTTERS' GAGES. A. G. Wilkins, Meadville, Pa. [Filed Dec. 12, 1874.]

Brief.—The gage is set for cutting hair at any required length, by expanding or contracting the ribs by means of the adjusting-links working in the slotted handle.



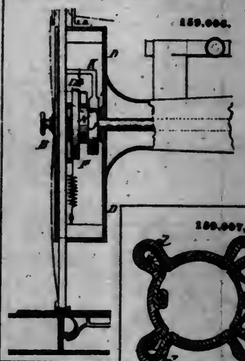
1. The hair-cutter's gage consisting of spring-ribs bent from one piece of sheet metal, to form point, heel, and top parts, being connected at the rear edges by the handle, and adjusting devices, for the purposes of being set and operated in the manner and for the purpose set forth.

2. The spring-ribs of the hair-cutter's gage, bent in inwardly-curved shape between the supporting-heel and point, and with broader top part for holding the hair ready for cutting, substantially as set forth.

3. The combination of the spring-ribs B, adjusting-links *a a*, and handle C, for setting the top of the ribs to greater or lesser height from the base part, and cutting the hair to any required length, substantially as described.

159,005. HORSESHOE-MACHINES. Joseph Williams, Sharpsburg, Pa. [Filed Oct. 26, 1874.]

Brief.—The bar is bent around a projecting former (extending back and forming the inner walls of a die-box) by a pair of levers pivoted together on a slide, and operated, through toggles connecting their upper ends, by a reciprocating bar, the action being to press and bend the metal against the former. Upon the retreat of the bending-levers, a plunger overlapping the former presses the blank into the die-box, from which it is subsequently removed by two rods working through the rear of the box.



159,005.

The combination of the die *a*, swaging-plunger R, and swage A', clamps *m*, vertical arm I, bell-crank lever *n*, arm *j*, cams C, D, and *w*, delivering-plunger 9, arms 8 and 6, connecting-rod *n'*, and arm *k*, constructed, arranged, and operating with relation to each other, substantially as hereinbefore described, and for the purpose set forth.

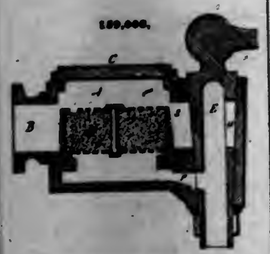
159,006. SEWING-MACHINES. D. Williamson, Sunbury, Pa. [Filed Aug. 1, 1874.]

Brief.—The feed-bar, presser-bar, and needle-bar are operated by means of cams relatively arranged upon the main driving-shaft of the machine.

The combination, with a single rotary shaft, I, of the spring-retracted cam Q on a disk, F, that has a crank-pin working in V-shaped slot O, the screw E, spring-cam J, and spring-armed cam N, all arranged as shown and described, whereby the same shaft shall operate the needle-bar, presser-bar, and feed-bar at the times, in the manner, and for the purpose specified.

159,006.

159,007.



159,007. LIGHTNING-RODS. S. R. Wilmot, Bridgeport, Conn. [Filed Aug. 11, 1874.]

A lightning-rod composed of a locked-seam tube, formed with a series of hollow doubled projecting wings, *d d*, with rounded edges, substantially in the manner and for the purpose specified.

159,008. FILTERING-FAUCETS. G. W. Wilson, West Meriden, Conn., assignor of one-half his right to Wm. and Wm. C. Homan, same place. [Filed Dec. 26, 1874.]

Brief.—When it is desired to draw water without filtering, the spigot is turned to cause the upper orifice therein to register with the corresponding orifice in the filtering-chamber. To filter the water, the lower orifices are caused to register, when the water must pass through the filtering material.

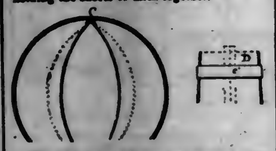
159,008.

The herein-described filtering-faucet, consisting of the chamber A, with its inlet B, two outlets, S and P, intermediate filtering material, and the plug E, with its two openings, *s* and *c*, corresponding to the outlets S and P, all combined substantially as described.

159,009. BUCKLES. T. L. Wiswell, Olathe, Kans. [Filed June 27, 1874.]

As a new article of manufacture, the plate F, provided with the recesses *s s*, shoulders *s' s'*, stud *k*, loops *j j*, and wearing-hook *l*, as and for the purpose set forth.

159,010. WIRE FASTENERS FOR FRUIT-JARS. Caleb Wright, Philadelphia, Pa., assignor to J. H. Rohrman and J. B. Rohrman, same place. [Filed Dec. 7, 1874.]

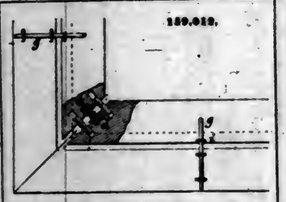


Brief.—The wire was formerly secured by solder. In this improvement the wires are crossed or interlock.

The within-described fastening, composed of one or two pieces of wire, and having lips *a* and *a'*, one or both of which are interlocked, as herein set forth.

159,011. LAMP-CHIMNEYS. R. D. Wright and C. H. Kenney, Springfield, Vt. [Filed Dec. 10, 1874.]

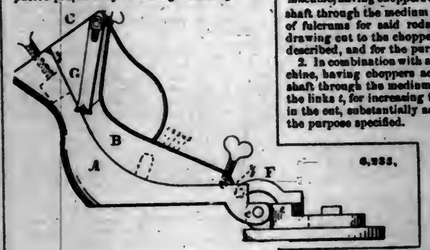
Brief.—V-shaped metallic standards for holding the sheets of mica together.



The mica lamp-chimney, constructed with two sheets held by the flanged standards C C, substantially as and for the purpose described.

159,012. CANVAS-STRETCHERS. John P. Wright and D. W. Gardner, Brooklyn, N. Y. [Filed Nov. 7, 1874.]

The combination, with the doweled miter-joints and springs at the corners of the frame, of the extensible pins *g*, having their inner ends bent and inserted into the side pieces of the frame, and the staples I attached to the said pieces for the reception of the said pins, substantially as and for the purpose herein described.



159,013.

REISSUES.

6,926. FORMS FOR FITTING SHOE-UPPERS. W. J. B. Mills, Philadelphia, Pa. Patent No. 156,936, dated Nov. 17, 1874. [Filed Dec. 30, 1874.]

Brief.—The form is made up of adjustable sections, and provided with spring-clamps to hold the parts in place while being fitted and pasted preparatory to sewing or lasting.

1. As an improvement in the art of manufacturing boots and shoes, the process of fitting the parts of uppers over a form, and holding the same thereon while they are being pasted and adjusted, for the purpose set forth.

2. The improvement in the manufacture of boots and shoes, the same consisting in placing the prepared quarters and linings over a form, and adjusting them preparatory to stitching, for the purpose set forth.

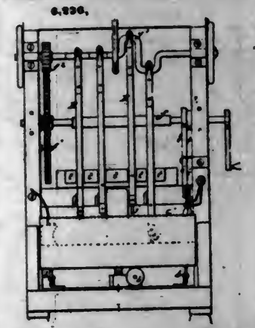
3. The improvement in the manufacture of boots and shoes, the same consisting in placing stitched quarters and linings over a form, and adjusting the vamp preparatory to stitching, for the purpose set forth.

4. As a new article of manufacture, apparatus over which boot and shoe uppers are vamped and fitted, the same consisting of a form shaped to the requirements of the boot or shoe, and provided with clasps to assist the operator in holding the parts in place, substantially as set forth.

5. A form for fitting and holding boot and shoe uppers, consisting of the sectional parts A and B, relatively adjustable, and provided with the guide H, substantially as and for the purpose set forth.

6. The removable cap-piece C, provided with clasps G and guide H, in combination with the parts A and B, substantially as and for the purpose set forth.

7. The holder H, in combination with the front piece B of the form, substantially as and for the purpose set forth.



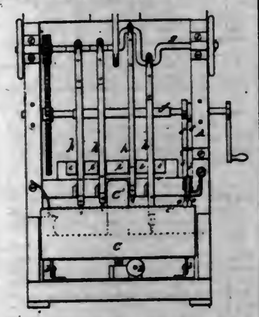
8. The slots clasps G G, in combination with the form A B C, substantially as and for the purpose set forth.

9. The form for fitting and holding shoe-uppers, when provided with cheeks *d d* and screw *f*, substantially as and for the purpose set forth.

6,934. MEAT-CHOPPERS. D. Peters, Burlington, Iowa, assignor, by mesne assignments, to himself and Murray Iron-Works Company. Patent No. 123,725, dated Feb. 13, 1872. [Filed Jan. 2, 1875.]

Brief.—Knives or choppers suspended from rods are moved vertically by donkey-cranks near the knife ends, links serving as fulcrums, causing each blade to make a drawing cut.

6,220.



1. The combination, with a meat-chopping machine, having choppers actuated by a crank-shaft through the medium of rods or handles, of fulcrums for said rods, which will give a drawing cut to the choppers, substantially as described, and for the purpose specified.

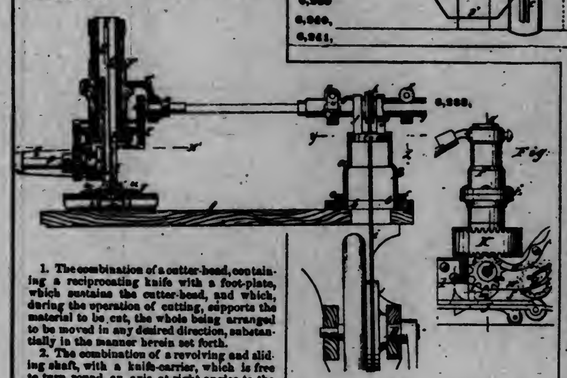
2. In combination with a meat-chopping machine, having choppers actuated by a crank-shaft through the medium of rods or handles, the links *t*, for increasing the amount of draw in the cut, substantially as described, and for the purpose specified.

6,235.

6,937. MEAT-CHOPPERS. D. Peters, Burlington, Iowa, assignor, by mesne assignments, to himself and Murray Iron-Works Company. Patent No. 123,726, dated Feb. 13, 1872. [Filed Jan. 2, 1875.]

Brief.—The vertical rods or handles of the knives move between guides of comb-like construction, but the whole series hinged to throw in or out of gear, the cross-head on which the tab rests rising or falling as rotated on its ways; combined cams, levers, and pawls serving to rotate the tab.

1. The hinged guide bars or rack *i*, arranged to operate with the choppers h *j*, substantially as described, and for the purpose specified.



2. The combination of the frame D, adjustable vertically to the manner described, chopping-block C, and choppers h *j*, arranged and operating as set forth.

3. The plow N *n*, constructed and operating as described, in combination with the choppers h *j*, chopping-block C, and post C', arranged and operating substantially as described.

4. The combination of the set of pawls *e e*, rods *e' e'*, on the rim of the cylinder of chopping-block C, eccentrics of shaft *f*, and the choppers h *j*, arranged and operating as described.

6,922. MACHINES FOR CUTTING CLOTH. A. Worth, Stapleton, N. Y. Patent No. 130,243, dated Aug. 6, 1872. [Filed Jan. 2, 1875.]

Brief.—The cutter-head, with its reciprocating knife and certain other devices, is supported on a foot-plate, and the whole is arranged to be moved in any desired direction, motion being transmitted by means of a sliding and revolving shaft arranged within a tubular shaft carrying the actuating-pulley, and supported on a revolving cylinder with a swiveled head.

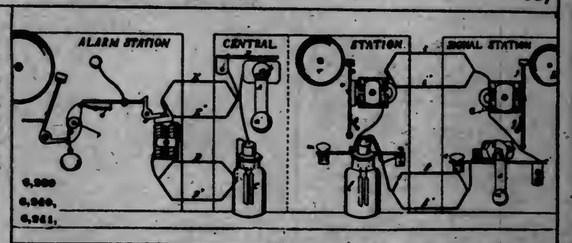
1. The combination of a cutter-head, containing a reciprocating knife with a foot-plate, which sustains the cutter-head, and which, during the operation of cutting, supports the material to be cut, the whole being arranged to be moved in any desired direction, substantially in the manner herein set forth.

2. The combination of a revolving and sliding shaft, with a knife-carrier, which is free to turn round an axis at right angles to the revolving and sliding shaft, said shaft serving to impart the requisite motion to the knife, substantially in the manner described.

3. The combination, with a cutter-head containing a reciprocating knife, and with a foot-plate which sustains the cutter-head, of a presser-roller, the whole being arranged to move in any desired direction, the presser-roller serving to hold the material down upon the foot-plate, while the same is moved under the material to be cut, substantially as set forth.

4. The combination of a hollow guide-rod, G, with a knife-carrying bar, H, said hollow guide-rod being provided with a handle for moving the cutting mechanism in any desired direction, substantially in the manner described.

5. The combination, with a cutter-head, containing a reciprocating knife, of a foot-plate, arranged to support the cutter-head, and provided with a socket, one or both edges of which form cutting-edges to co-operate with the cutting-edge of the knife, the whole being arranged to move in any desired direction, substantially as set forth.



6. The combination, with a cutter-head containing a reciprocating knife, and with a foot-plate supporting the cutter-head, and provided with a socket, one or both edges of which form cutting-edges to co-operate with the cutting-edge of the knife, of a standard which supports the cutter-head, and which is grooved to form a guide for the knife, the whole being arranged to move in any desired direction, substantially as described.

7. The lever *i'*, which is hinged to the standard I, or to any part rigidly connected to said standard, and forms the bearing for a pin supporting the presser-roller *h'*, in combination with a cam which receives motion from a sliding and revolving shaft, and from which motion is transmitted to the presser-roller, substantially as and for the purpose described.

8. The finger or presser *m'*, hinged to the center pin of the presser-roller, arranged to travel in front of the knife, said finger being free to adjust itself to the varying thickness of the material to be cut, substantially as set forth.

9. The combination of a revolving cylinder, B, swivel-head *d*, and a pulley with a sliding and revolving shaft, C, substantially as described.

10. The combination, with a cutter-head containing a reciprocating knife, and with a foot-plate which supports the cutter-head, of one or more rollers connected to the under surface of the foot-plate, and allowing the same to move freely, substantially as described.

6,929.
6,930.
6,931.

1. A signalizing apparatus, consisting of an electric circuit, a sounding or recording mechanism, and several automatic circuit-breakers adapted to give determinate and different signals, substantially as described.

2. A signalizing apparatus, consisting of an electric circuit, a sounding or recording mechanism, and several automatic circuit-breakers adapted to give determinate and different signals, substantially as described, and a device, whereby the several circuit-breakers, after being put in motion to break or close the circuit for signalizing, shall automatically be stopped in position to restore the circuit to its normal condition or to correctly commence a repetition of the signals, as described.

3. A signalizing apparatus, consisting of an electric circuit, a sounding or recording mechanism, and an automatic circuit-breaker adapted to give determinate signals, and a device, whereby said circuit-breaker, after the giving of each a signal, shall automatically be stopped in such a manner that a signal may be repeated by a direct forward movement, as described.

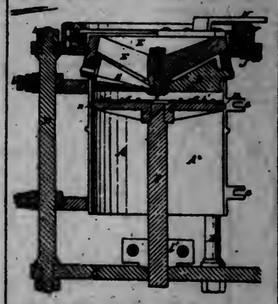
4. An electric circuit and a circuit-breaker, permanently organized with two or more groups of circuit-breaking or circuit-closing points, the several groups being separated by spaces greater than the spaces separating the individual points of the groups, substantially as and for the purpose described.

5. The combination, with the same electric circuit or dependent circuits, of a manual circuit-breaking key for general signalizing, and an automatic circuit-breaker adapted to give determinate signals, substantially as described.

6,929. ELECTRO-MAGNETIC FIRE-ALARM TELEGRAPHS FOR CITIES. W. F. Channing, Providence, R. I., and Moses G. Farmer, Salem, Mass. Patent No. 17,265, dated May 19, 1857; extended seven years. [Filed Dec. 18, 1874.]

1. The signal system herein described, consisting of a series of signal-stations scattered at intervals through a wholecity or town, or any part thereof, and telegraphically connected with a common center or point, or with each other, by one or more signal-circuits, by which means a constant communication may be established and maintained between all parts of a city or town, however extended, and with the center or centers at which the signal circuit or circuits converge or meet, so that the moment a fire occurs its existence and locality may at once be known at the center of the system, and efforts for subduing it be properly directed.

2. The alarm system herein described, consisting of a series of alarm-stations suitably constructed throughout a whole city or town, or any part thereof, and telegraphically connected with a central station by one or more alarm-circuits, by which means a public alarm of the existence and locality of the fire may be given at different points.



6,930. ELECTRO-MAGNETIC FIRE-ALARM TELEGRAPHS FOR CITIES. W. F. Channing, Providence, R. I., and Moses G. Farmer, Salem, Mass. Patent No. 17,266, dated May 19, 1857; extended seven years. [Filed Dec. 18, 1874.]

The fire-alarm telegraph, embracing in its construction the alarm-systems for striking the number of the district upon the alarm-bells, and the signal system for communicating the number of the station at which the fire occurs, to all the signal-stations, as well as for communicating an alarm to the central station, as described.

6,931. ELECTRO-MAGNETIC FIRE-ALARM TELEGRAPHS FOR CITIES. W. F. Channing, Providence, R. I., and Moses G. Farmer, Salem, Mass. Patent No. 17,266, dated May 19, 1857; extended seven years. [Filed Dec. 18, 1874.]

6,942. BALING-PRESSES. L. Dodge, Watertford, N. Y. Patent No. 120,048, dated Oct. 17, 1871. [Filed Jan. 4, 1875.]

Brief.—The hay or other material is progressively fed and compressed in small quantities at a time in the bale-forming cylinder or case, until the bale has been gradually built up and formed.

1. A machine for baling hay, straw, cotton, and other material, in which the following elements are combined, substantially as herein shown and set forth: First, a case in which the bale is formed as described; second, compressing devices which compress successive portions of the hay or other material in the cylinder or case until the bale is formed as described; third, a platform or support, substantially as described, upon which the bale during the process of its formation, rests, said platform and the compressing devices being

arranged substantially as stated, so that the one may have a motion away from the other in proportion as the bale is built up.

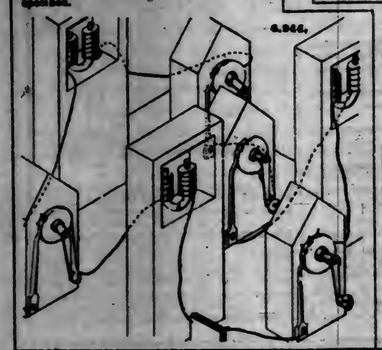
5. The combination, with the cylinder or other case in which the bale is formed, and the devices by means of which successive portions of the material to be baled are compressed in said cylinder or case, of a sliding base or support for the bale, arranged substantially as shown and described, to offer a yielding resistance to the compressing devices, and to move away from the said devices as successive parts of the bale are formed and compressed.

6. The combination of the feed and compressing rollers, and their skeleton supporting-frame, with the ring in which said frame is held and moves, and the devices interposed between the ring and frame for reducing friction, substantially as shown and set forth.

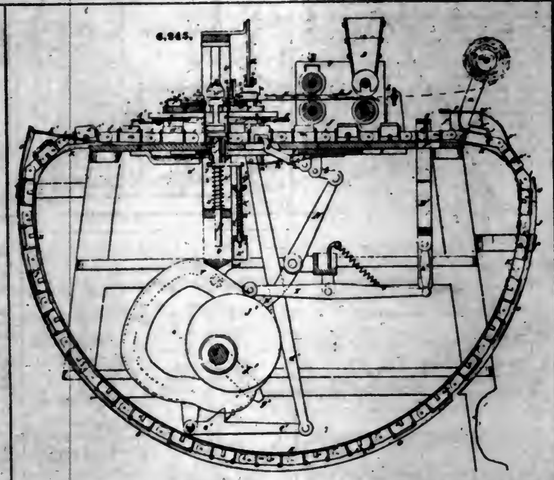
7. In a baling-press, constructed and operating substantially as described, the bale-forming cylinder or case, in combination with devices for its adjustment up and down with relation to the feeding and compressing devices, as shown and set forth.

8. The combination and arrangement of the cylinder, the platform, and the feeding and compressing devices, with the surrounding frame by which they are carried, substantially as herein shown and set forth.

6,945. HAY, STRAW, AND OTHER BALES. L. Dodge, Waterford, N. Y. Patent No. 125,031, dated Mar. 26, 1872. [Filed Jan. 4, 1875.]



A pressed bale of hay, cotton, straw, or other fibrous material, built up endwise in layers which are transverse to the length of the bale, substantially as set forth.



6,946. ELECTRO-MAGNETIC FIRE-ALARM APPARATUS. M. G. Farmer, Salem, Mass. Patent No. 28,000, dated Feb. 22, 1860; extended seven years. [Filed Dec. 10, 1874.]

Brief.—"Village system," wherein signal-boxes and electro-mechanical alarms are in same circuit, dispensing with central station.

The combination, with the same electric circuit, or dependent circuits, of two or more signal-boxes, constructed to operate substantially as described, and one or more electro-mechanical alarm mechanisms, constructed to operate substantially as described, as shown and specified.

6,945.

6,945. PAPER-BOX MACHINE. F. Gates, Frankfort, N. Y., assignor to Wm. Gates, same place. Patent No. 101,455, dated Apr. 5, 1870. [Filed Sept. 10, 1874.]

Brief.—The machine consists of mechanisms for feeding the roll of paper, pasting, cutting, folding, and inserting the box into the drying-receptacles, and discharging it therefrom, all of which operate automatically.

1. The combination, with an inserting-plunger of a box-forming mechanism, of a series of box-receptacles for the reception and retention of the boxes, substantially as described.

2. The combination, with an inserting-plunger of a box-forming mechanism and a series of box-receptacles, of a mechanism for automatically discharging the finished boxes from the box-receptacles, substantially as described.

3. The combination, with the box-receptacles, of folding-plates d^5 d^5 and the inclines E' F', arranged and operating substantially as described.

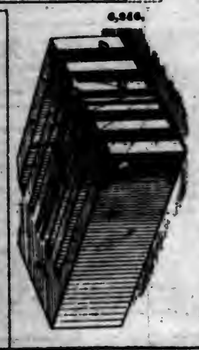
4. The combination of the reciprocating plunger P and spring-follower Q with the sliding side and end pieces X Y, stationary spring-plates l^2 n', and sliding lap-folders r' r', all arranged and operating substantially as herein shown and described.

5. The spring-supports a^1 a^1, arranged in combination with the nicking-knives E E, substantially as herein shown and described.

6. The side and end pieces X Y of the mold, arranged to slide on the platform T, and pushed in by springs c' c', substantially as herein shown and described, for the purpose of holding the sides and ends of the box firmly and vertically against the plunger.

7. The stationary side and end spring-plates l^2 n', arranged below the slide-plates X Y, for the purpose of forming the lower part of the mold, and for preventing the ascending plunger from elevating the finished box, as specified.

8. The horizontal folders r' r', in combination with spring-plates l^2 l^2 and plunger P, for the purpose of folding the ends of the sides of the box, so that the parts then folded will secure all the parts of the box in the desired position, as set forth.



9. The spring-catch n', in combination with the pin n^2, arranged to arrest and disengage the follower, substantially as set forth.

10. The combination of a perforated plunger, P, with a reciprocating follower, Q, recessed upon its face, the latter supporting the blank, and the former bending its sides, while both descend a certain distance together, all as set forth.

6,946.

6,946.

6,946. FIRE-KINDLING. J. D. Husbands, Jr., St. Louis, Mo., assignor to the American Fire-Kindler Company, same place. Patent No. 154,796, dated Sept. 8, 1874. [Filed Jan. 12, 1875.]

Brief.—A block of wood having numerous channels therein is saturated with inflammable material. A wick may be attached to facilitate lighting.

1. A fire-kindler made from a block of wood, constructed with a series of draft-flues created by thin partitions, for admitting the draft into or through the block to intensify the heat, and to obviate smothering of the flame.

2. The combination, in fire-kindlings, of a block possessing a head or body with a series of partitions to form a series of air-passages or draft-flues saturated or impregnated with an inflammable material agent.

3. In a fire-kindler, a block of wood combined with draft-flues or partitions varying in size, for admitting draft into or through the block, to intensify the heat and secure gradual combustion and rapid ignition of the kindler, substantially as described.

4. The combination of an igniting-wick with a fire-kindler constructed of a block of suitable material, having a series of draft-flues for admitting draft into or through the block, substantially as described.

ANNUAL REPORT
OF
THE COMMISSIONER OF PATENTS
FOR THE YEAR 1874.

To the Senate and House of Representatives of the United States of America in Congress assembled:

In compliance with section 9 of the patent law, I submit the following report for the year ending December 31, 1874.

1. *Statement of moneys received.*

Amount received on applications for patents, reissues, extensions, caveats, disclaimers, appeals, and trade-marks		$655,625 00
Amount received for copies of specifications, drawings, and other papers		53,914 53
Amount received for recording assignments		18,400 70
Amount received for subscriptions to the Official Gazette		9,011 94
Amount received for registration of labels, (since August 1, 1874,)		1,326 00
Total		738,278 17

2. *Statement of moneys expended.*

Amount paid for salaries		$152,157 89
Amount paid for photolithographing current issues		42,315 15
Amount paid for photolithographing back issues		31,765 05
Amount paid for illustrations for Gazette		29,512 29
Amount paid for tracings of drawings		17,418 40
Amount paid for contingent and miscellaneous expenses, viz:		
Advertising	$2,621 21	
Stationery	13,217 20	
Painting, glazing, varnishing, paper-hanging, etc.	959 33	
Furniture, carpeting, &c.	10,096 86	
Fitting up cases in model-rooms, carpenter's work, and repairing furniture	16,591 68	
Plumbing and gas-fitting	1,203 78	
English patents and foreign periodicals	1,781 21	
Refunding money paid by mistake	550 00	
Hardware	1,497 30	
Pay of temporary employés	17,752 81	
Miscellaneous items, viz: Books for library, ice, subscriptions to journals, freight, washing towels, withdrawals, repairing carriage and harness, keeping horse, etc.	9,788 25	
		76,119 63
Total		679,288 41

3. *Statement of the balance in the Treasury of the United States on account of the patent fund.*

Amount to the credit of the patent fund, January 1, 1874		$806,124 21
Amount of receipts during the year 1874		738,278 17
Total		1,544,402 38
From which deduct expenditures for the year 1874		679,288 41
Balance January 1, 1875		865,113 97

4. *Statement of the business of the Office for the year* 1874.

Number of applications for patents during the year 1874	21,602
Number of patents issued, including reissues and designs	13,509
Number of applications for extension of patents	216
Number of patents extended	199
Number of caveats filed during the year	3,181
Number of patents expired during the year	4,906
Number of patents allowed but not issued for want of final fee	2,561
Number of applications for registering of trade-marks	648
Number of trade-marks registered	559
Number of applications for registering of labels	221
Number of labels registered	151

Of the patents granted there were to—

Citizens of the United States	13,072
Subjects of Great Britain	358
Subjects of France	74
Subjects of other foreign governments	101

5. *Number of patents issued by the United States Patent Office to residents of the different States, Territories, and Foreign Countries from January 1, 1874, to December 31, 1874.*

[The proportion of patents to population is shown in last column.]

States, &c.	No. of patents.	One to every—
Alabama	39	25,564
Arkansas	14	3,485

f. *Comparative statement of the business of the Office from 1837 to 1874, inclusive.*

Year.	Applications.	Caveats filed.	Patents issued.	Cash received.	Cash expended.
1837			435	$29,289 08	$33,506 98
1838			530	42,123 54	37,402 10
1839			425	37,260 00	34,543 51
1840	765	228	473	38,056 51	39,090 67
1841	847	312	495	40,413 01	52,666 87
1842	761	391	517	36,505 68	31,241 48
1843	819	315	531	35,315 81	30,776 96
1844	1,045	380	502	42,509 26	36,244 73
1845	1,246	452	502	51,076 14	39,395 65
1846	1,272	448	619	50,264 16	46,158 71
1847	1,531	553	572	63,111 19	41,878 35
1848	1,628	607	660	67,576 69	58,905 84
1849	1,955	585	1,070	80,752 98	77,716 44
1850	2,193	602	995	86,927 05	80,100 95
1851	2,258	760	869	95,738 61	86,916 93
1852	2,639	996	1,020	112,656 34	95,916 91
1853	2,673	901	958	121,527 45	132,809 83
1854	3,324	868	1,902	163,789 84	167,146 32
1855	4,435	906	2,024	216,459 35	179,540 33
1856	4,960	1,054	2,502	192,588 02	199,931 02
1857	4,771	1,010	2,910	196,132 01	211,582 09
1858	5,364	934	3,710	203,716 16	193,193 74
1859	6,225	1,097	4,538	245,942 15	210,278 41
1860	7,653	1,084	4,819	256,352 50	252,820 80
1861	4,643	700	3,340	137,354 44	221,491 91
1862	5,038	824	3,521	215,754 99	182,810 39
1863	6,014	787	4,170	195,503 20	189,414 14
1864	6,932	1,063	5,020	240,919 98	229,868 00
1865	10,664	1,937	6,616	348,791 84	274,190 34
1866	15,269	2,723	9,450	495,665 38	361,724 28
1867	21,276	3,597	13,015	646,581 99	630,263 32
1868	20,420	3,705	13,378	681,565 86	628,679 77
1869	19,271	3,624	13,986	693,145 81	486,430 78
1870	19,171	3,273	13,321	669,456 76	557,149 19
1871	19,472	3,366	13,033	678,716 46	560,595 08
1872	18,246	3,090	13,500	699,726 39	665,591 36
1873	20,414	3,248	12,864	703,191 77	691,178 98
1874	21,602	3,181	13,599	738,278 17	679,288 41

The business of the office during 1874 presents several interesting features. From the above statement it will be seen that, notwithstanding the general prostration of business, a larger number of applications was received during the year 1874 than in any preceding year; and a larger number of patents was granted than in any year before, with the exception of 1869. It also appears that 2,561 applications were allowed, but patents were not issued, because the final fee was not paid within six months, as the law requires. If this number be added to the number of patents issued it will be seen that, of the 21,602 applications filed during the year, 16,160 were allowed, leaving only a little more than one-fourth of the entire number of applications finally rejected. The fact that nearly three-fourths of the applications were decided favorably to the petitioners is a sufficient answer to the inconsiderate charge sometimes made of illiberality on the part of the officials of the Patent Office.

I desire, also, to call attention to the fact that, notwithstanding the heavy expenditures of the Office, for photolithographing the drawings of current and back issues, and for the publication of the GAZETTE, the excess of receipts over expenditures during the year amounts to $58,989.76, an increase of $46,976.97 over and above the surplus of the year immediately preceding.

EXPENSES OF THE OFFICE.

An examination of "Table 6" will show that for the last eight years the average number of applications for patents has been about 20,000 per annum. It is probable that this may be expected as the average annual business of the Office for years to come, unless some great change should occur affecting directly the operation and influence of our patent system. Should the business keep up to the present standard, however, it will not materially increase the expenses of the Office. The photolithographing of the drawings of current and back issues has so facilitated the labor of making examinations that the same force can do very much more, and much better, work than ten years ago. This is accomplished by putting into each examiner's room a full set of the photolithographs in his class as soon as the work is completed, so that his examinations, to the extent of patents granted in this country, can be made without leaving his room, and yet with a certainty that all the drawings in the class are before him. The full benefit of the reproduction of old drawings cannot be realized, however, until the work is entirely completed. It will be of great advantage, not only to the Patent Office, but also to the public if this can be speedily accomplished. I have recommended, therefore, an increase of the appropriation for this purpose for the next fiscal year. If the amount asked for, one hundred thousand dollars, is appropriated it will enable the Commissioner to complete the work within the year. The sale of copies will be largely increased by having in store photolithographs of the drawings of all patents, thus enlarging the receipts of the Office, while at the same time the facilities for examining applications will be improved to such an extent that, I am confident, the working force of the Office can be decreased by dispensing with one entire grade of the examining corps. A large saving in the annual expenses of the Office will thus be effected, while the increase in appropriation desired is only about one thousand dollars more than the surplus receipts for the last year.

Of course the annual increase of patents granted adds just so much to the labor of examining subsequent applications; but, with the completion of the reproduction of the old drawings, and the improvement in working facilities in other particulars, which may be obtained, it is hoped this increase will not be felt so seriously as heretofore.

APPROPRIATIONS.

Upon the completion of this work the Patent Office will be relieved of one large item of expense, while, as I have shown, the amount required for payment of salaries may probably be diminished. This will result in a much larger surplus of receipts over expenditures. There is yet much to be done before the mass of information stored away in the Patent Office will become easily accessible to the public.

From 1836 to the present time over 158,000 patents have been issued. Since 1866 the specifications have been printed, and copies can be obtained at very small expense. But no information can be gained by the public of patents granted prior to 1866, except from the old and very meager reports, from manuscript copies of the records, and from photolithographs of the drawings of some classes only. When the photolithographing of the drawings of all back issues has been completed I believe that a portion of the surplus receipts of the Office should be devoted from year to year to the printing of the specifications of all patents granted prior to 1866. We shall then have all the American patents, like the English, in symmetrical, easily-examined printed form, with an ample supply, so that libraries in different parts of the country may be provided with the complete record of all patents granted, and full information in relation to old patents may be obtained as cheaply and readily as of the current issues.

As the records of this Government now stand, of part of the patents granted prior to 1866 only one copy of the drawings (excepting that in possession of the patentee) is in existence; of the specifications the office has only one or two manuscript copies; and it is easier for our inventors to gain full information of English patents than of those of their own country, for the reason that some public libraries in the country are provided with complete printed records of English patents. In fact, this Office (by the liberality of the English government) has all these printed records of English patents, but not of its own. But the multiplication of copies in printed form concerns not only the public at large. The records of the Patent Office sustain a relation to the current work differing widely from that of any other bureau under the government. In other government offices the papers in cases once decided are filed away, with little probability of ever being consulted again; but in the Patent Office an application once made and decided upon may become, in turn, a reference for subsequent applications of its class. Hence the files of the Office must be inspected daily in the work of examining pending applications. I therefore respectfully urge that these records, which are truly the only complete history of the progress of invention in the country, the only reliable exponent of the state of the arts, the sole and constant reference both of the Office and inventors, may be multiplied in printed form.

There is also urgent need of complete digests of all the patents in each one of the one hundred and forty-five subdivisions, as inventions have been classified in the office. These would render the work of examining more expeditious and certain. The English government has published such digests. These contain, in greatly-abridged form, properly classified and arranged, all the patents issued by the government, and appear to have met with great favor. There is also a strong demand for the publication of such abridgment of specifications in this country. If the Commissioner should be authorized to publish the volumes as fast as completed, in form something like that of the English abridgments, they would doubtless meet with a ready sale, which would nearly if not quite cover all the expense of publication. So seriously is the want of this abridgment felt by inventors and manufacturers, that every year Examiners in the Patent Office are importuned by persons outside to prepare complete abridgments of patents in their class for publication and sale as a private enterprise; and in some instances large sums have been offered for complete digests of some special classes.

There is no occasion for any reduction of the fees demanded of applicants. They are trifling compared with the expenses attending the grant of a patent in other countries, and there is no complaint that they are exorbitant. I firmly believe that they should be kept at their present rate, and that most of the surplus receipts should be expended in the direction indicated for the benefit of the Office and that large portion of the public vitally interested in patents. Such use of the funds of the Office would meet a continually-increasing demand, and be received with popular approbation. I should be glad if a small appropriation could be made this year for the commencement of digests, and most earnestly recommend a special appropriation for this purpose, even though it may not exceed five or ten thousand dollars.

GENERAL INDEX.

For the purpose of providing for the public some readily-accessible information in regard to patents already granted in this country, the Commissioner has caused to be prepared, within the last two years, a general index of all patents issued from 1790 to 1873, inclusive. This index will be published in two sets of three volumes each—one being an index of subject-matter, and the other of the names of patentees. Of the first, one volume has been published, the second will be out soon, and the third will follow shortly. The first edition has been limited to a thousand copies; but the matter has been stereotyped, so that any future demand can be readily supplied. A small number of copies is required for Office use, the remaining volumes will be sold at $20 per set. The patentees' index is not yet completed. Many orders have been received already for these indexes, and it seems reasonable to expect that the receipts from their sale will ultimately reimburse the Treasury for the expense of their publication.

OFFICIAL GAZETTE.

The Patent Office OFFICIAL GAZETTE, the publication of which was commenced in 1872, has grown in popularity from year to year. The increase in its circulation, however, has not been rapid, owing in great measure to the fact that there is no authority for advertising it. Persons coming to the Office for the transaction of business frequently express surprise on learning of the publication of this journal. If some provision could be made for giving more general information of the publication of the GAZETTE, it is believed there would be large increase in subscriptions. A change has been made in the mode of publication during the last year. Up to the commencement of the current fiscal year the illustrations were produced by photolithography, and each weekly edition numbered ten thousand. This large number was necessary because the edition was not stereotyped, and as the GAZETTE is now the only Patent Office report there will be a steady demand in the future for full sets. More than half the edition was stored for sale, and the pressure for more room in the Office made it desirable that some change should be effected by which less space for storage would be required. Accordingly, in the advertisement for proposals for the year commencing June 1, 1874, bids were asked for plate-illustrations for an edition of five thousand copies only, the plates to become the property of the Office. A proposal for doing this work by the "heliotype" process, submitted by J. R. Osgood & Co., of Boston, Mass., was accepted, and a contract entered into with them by my predecessor for illustrations and plates for an edition of five thousand copies. The plates occupy very little space, and are readily stored in the Office. The letter-press portion of the GAZETTE is stereotyped at the Government Printing Office, so that plates of both letter-press and illustrations are preserved, and a new edition of any number or volume of the GAZETTE can be produced, should a necessity therefor arise.

At the same time, a change was made in the arrange-

ment of the matter. A brief of the invention and the claim of each patent are placed on the same page with the illustrations, the whole page being then reproduced by the heliotype process. On account of these changes, the appearance of the illustrated portion was for a short time quite unsatisfactory, but for the last three months it has been constantly improving, and is now very acceptable.

The GAZETTE is regarded with favor, not only by inventors and manufacturers, but also by gentlemen engaged in patent suits, both lawyers and judges. Since its first appearance it has contained, from time to time, reports of such decisions of the courts in patent cases as the Commissioner has been able to obtain. Under this practice these decisions are published some time before their appearance in any official report; hence the GAZETTE has become valuable as a medium for the prompt publication of judicial decisions. I have perfected an arrangement by which, during the year 1875, all decisions of the United States courts in patent cases will be reported at once in the GAZETTE. This, it is hoped, will enhance its value and increase its circulation.

The subscriptions for the GAZETTE do not cover the expense of publication; but it will be remembered that, in authorizing the work, Congress also provided for a large gratuitous circulation, each Senator and Representative being entitled to one copy for himself and to eight for public libraries designated by him. If the regular subscription price were received for these free copies the cost of publication would be nearly if not quite repaid.

Of the first volume of the GAZETTE an edition of only one thousand was published. This edition was exhausted long since, and there is a constantly-increasing demand for the volume. I respectfully recommend that provision be made for the publication of a new edition of this volume, which covers the first half of the year 1872. An edition of five thousand copies will cost from ten thousand to twelve thousand dollars. If this is authorized, I suggest that the Commissioner be allowed to send an unbound copy, gratuitously, to each person and library that received the second volume free of expense.

REVISION OF THE LAW.

Although a new and revised patent law was enacted in 1870, very little material change was effected, and the law to-day is essentially that of 1836. In the meantime business relating to patents, both inside and outside of the Office, has increased enormously. In the Office the organization is substantially the same as thirty-five years ago, when the number of applications was only a few hundred a year. The annual applications have increased from four hundred and thirty-five to twenty-one thousand six hundred and two, and the corps of Examiners from one to one hundred. These officials make the primary action on all applications received, and if the decision is favorable to the petitioner, it is final.

After an experience in the Patent Office of nearly eleven years in various positions, I have no hesitation in saying that the present organization is not entirely adapted to the large amount of business now transacted. Among so many persons, acting to some extent independently, mistakes will inevitably occur, and they are as likely to be in favor of an applicant as against him. There should be some provision for revising the favorable as well as adverse decisions of Examiners. Other changes are demanded in the law to make the practice of the Office more simple, certain, and satisfactory.

There is also great complaint of the burden of litigation under the present law, which has become a great hardship to patentees under the present practice. A final decision by the United States Supreme Court cannot be expected in any case much short of six or seven years from the commencement of suit. The expense of money attending patent litigation is fully as extravagant as that of time. It must be remembered, too, that all this expenditure of time and money occurs in the determination of rights which have only a limited duration. If seven years of the lifetime of a patent are consumed in litigation the enjoyment of the exclusive privilege intended by the grant is in reality reduced to ten years. The establishment of some more summary and inexpensive method of determining patent suits seems almost imperative.

I have great hesitation, however, in recommending changes in the law, and have hitherto only presented to the Committees on Patents of the two Houses of Congress some few special amendments to overcome difficulties which have occurred in the conduct of business in the Office. What is needed is a careful and thorough revision of the entire law by persons familiar with our patent system, the respective interests of inventors and manufacturers, and the rights of the general public. In order that this may be done for the benefit of all classes interested therein, an examination should be made of the relations between patents and our manufacturers, the general effect of our system, and the practice and wants of the Patent Office. I, therefore, very respectfully and earnestly recommend the appointment of either a special committee or a commission to prepare a new and revised patent law, to be reported at the first session of the next Congress.

OFFICIALS OF THE PATENT OFFICE, CIVIL SERVICE, &C.

The work of the Patent Office calls for the exercise of judgment and intelligence of a high order. A thorough knowledge of the applied sciences and useful arts, especially on the part of those employed in the examining corps, is absolutely necessary. It gives me pleasure to speak in commendatory terms of the persons thus employed.

The operation of the civil service rules has been of great advantage to the Patent Office. The entire force has been improved, but the change in the examining corps is more marked than elsewhere. The examinations for appointment and promotion have been conducted with great fairness and with the single intention of obtaining accurate information of the qualifications and aptness of candidates for the special work of the Patent Office. No system will produce uniformly satisfactory results. The operation of competitive examinations in the Patent Office forms no exception to this rule. But, notwithstanding occasional complaints, the opinion is quite generally expressed among gentlemen who have been acquainted with the Patent Office for twenty or thirty years past that the examining corps is, on the whole, in better condition now than ever before.

It is to be regretted that the most efficient and competent men cannot be retained in the Office. When they become thoroughly familiar with their duties and efficient in the performance of them, their services will command a much more liberal compensation outside than in the Office. The result is that some of the best examiners are led to resign their positions for the purpose of entering more lucrative employment, where their experience in the Patent Office becomes available.

The ready transaction of business in the Office is considerably impeded by the crowded condition of the rooms. I am compelled to reiterate the request for more room, which has been made repeatedly within the last few years. Some relief must be found before long. The model galleries are already filled to repletion, and new models are received at the rate of fifteen to eighteen thousand annually. In the rooms for drawings it is almost impossible to keep the records inside the doors, while in many other rooms the employés are so crowded as to greatly interfere with good health and the convenient transaction of business. It would be a great mistake to dispense with either drawings or models. The former are indispensable for record purposes and as the basis of all illustrations prepared by the Office, while models furnish the best and sometimes the only satisfactory evidence of what an invention really is. A description or drawing may be obscure and liable to misinterpretation—a model never. Additional room is an absolute necessity for the proper preservation of most valuable records, the public exhibition of an increasing number of models, and a prompt and efficient transaction of the very large amount of business now done in the Patent Office.

Respectfully submitted,

J. M. THACHER,
Commissioner of Patents.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date January 26, 1875.]

8,019.—Combined Clock and Mirror-Frame.—HENRY J. DAVIES, Brooklyn, N. Y.—Application filed November 25, 1874. Term of patent 3½ years.

8,020.—Cooking-Stoves.—LUTHER W. HARWOOD and JOHN C. SMITH, Troy, N. Y., assignors to FULLER, WARREN & CO., same place. Application filed January 2, 1875. Term of patent 7 years.

8,021 to 8,024, inclusive.—**Oil-Cloth.**—CHARLES T. MEYER and VICTOR E. MEYER, Bergen, N. J., assignors to EDWARD C. SAMPSON, New York, N. Y. Applications filed January 14, 1875. Term of patents 3½ years.

8,025.—Cooking-Ranges.—NICHOLAS S. VEDDER and FRANCIS RITCHIE, Troy, N. Y., assignors to NICHOLAS S. VEDDER, same place.—Case B. Application filed December 30, 1874. Term of patent 3½ years.

8,026.—Cooking-Stove.—NICHOLAS S. VEDDER and FRANCIS RITCHIE, Troy, and TOBIAS S. HEISTER, Lansingburg, assignors to NICHOLAS S. VEDDER, Troy, N. Y.—Case S. Application filed December 30, 1874. Term of patent 3½ years.

8,027 to 8,033, inclusive.—**Carpet.**—JOHN T. WEBSTER, Philadelphia, Pa., assignor to JOHN and JAMES DOBSON, same place. Applications filed January 11, 1874. Term of patents 3½ years.

8,034.—Boas.—GILBERT H. PRINDLE, Philadelphia, Pa.—Case B. Application filed December 12, 1874. Term of patent 7 years.

8,035.—Cooking-Stove.—NICHOLAS S. VEDDER, Troy, and TOBIAS S. HEISTER, Lansingburg, N. Y., assignors to FULLER, WARREN, & CO., same place. Application filed January 2, 1875. Term of patent 7 years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each certificate bearing date January 26, 1875.]

2,185.—Prepared Washing-Soda.—C. H. FISCHER & CO., New York, N. Y. Application filed January 7, 1875.
"'C. H. Fischer & Co.'s Washing-Crystal.'"

2,186.—Drugs.—E. FOUGERA & CO., New York, N. Y. Application filed January 14, 1875.
"'H. & W.' in the center of a circle, which is surrounded by a serpent, and round this serpent extends a zone, which contains the name of our firm."

2,187.—Carpet-Tacks.—FRANK F. MCNAIR, Nunda, New York. Application filed January 9, 1875.
"'Star Brand Carpet-Tacks.'"

2,188.—Cotton Jeans.—NAUMKEAG STEAM COTTON COMPANY, Salem, Mass. Application filed October 29, 1874.
"'Naumkeag Satteen Twills.'"

2,189.—Hams.—CHARLES D. SABIN, New York, N. Y. Application filed December 23, 1874.
"the representation of a crown."

2,190.—Germantown Wool.—JOHN H. SMITH, Philadelphia, Pa. Application filed January 13, 1875.
"'EXCELSIOR.'"

2,191.—Medicinal or Mineral Waters.—HENRY A. BENJAMIN, San Francisco, Cal. Application filed October 24, 1874.
"'P. S. Selter's Water.'"

2,192.—Worsted Braids.—HANDEL N. DAGGETT, Attleborough, Mass., (doing business under the style of THE GOLD MEDAL BRAID COMPANY.) Application filed December 14, 1874.
"a flat gilt band, about half an inch in width, formed in the shape of an oval the oval being about four inches long and two in width, and lengthwise of the oval, and extending about half an inch beyond it; at each end a cross-bar of the same width as the band, and leaving a slight space above and below the bar; all outlined in a narrow black line, and inclosed in an ornamental border."

2,193.—Silks, Velvets, and Dress-Goods.—PASSAVANT & CO., New York, N. Y. Application filed January 18, 1875.
"'Bon Marché.'"

2,194.—Soaps.—STRUNZ & WETZEL, Pittsburg, Pa. Application filed January 2, 1875.
"'Transmission Soap.'"

2,195.—Spring-Beds.—THE TUCKER MANUFACTURING COMPANY, Boston, Mass. Application filed December 12, 1874.
"a perspective representation of the Tucker spring bed."

2,196.—Knitted Goods.—TROY HOSIERY MANUFACTURING COMPANY, Troy, N. Y. Application filed January 18, 1875.
"'Alberine.'"

INDEX OF INVENTIONS PATENTED JANUARY 26, 1875.

	Class No.	No. of Patent.
Air compressor for working engines, atmospheric, Carobbi and Bellini	2	159,075
Aerating and cooling apparatus, G. W. Baird	1	159 142
Axle box and sleeve, J. B. Winchell	31	159,240
Bale tie, J. B. Arrants	7	159 060
Bale tie, A. A. Goldsmith	7	159 069
Baling cotton, device for, W. Iler	7	159,068
Barrel, G. W. Banker	40	159,064
Barrels, machine for cutting heads for, O. Osten	40	159,114
Bed bottom, spring, Fowler and Dewar	62	159,096
Bee hive, J. S. Coe	9	159,081
Boats, towing, G. Burnham	139	159,151
Boiler feeder, &c., automatic, J. W. Hopkins	148	159,095
Boiler, wash, S. M. Marsden	91	159,196
Boilers, low water indicator for steam, O. B. Kendall	148	159,184
Boilers, pipes, &c., covering for, W. O'Hara	149	159,206
Bolt fastening for tongues, whiffletrees, &c., E. H. Pettit	31	159,161

	Class No.	No. of Patent.
Boot, gaiter, B. C. Young	16	159,135
Boots and shoes, manufacture of counter stiffeners for, H. Rogers	16	159,220
Boring machine, G. Dryden	173	159 164
Bottle stopper, C. M. Blydenburgh	1	159,067
Bottles, stopper and discharge for, F. B. Michell	1	159,200
Box, revolving spice, T. W. F. Smitten	88	159,122
Boxes, manufacture of wooden, A. Robinson	30	159,042
Bracelet, E. F. Presbrey	86	159,214
Bridge, iron, E. I. Farnsworth	21	159,084
Bridges, joint for iron truss, E. S. Shaw	21	159,046
Bridges, metallic post or girder for truss, F. C. Lowthorp	21	159,194
Bridle bit, P. Casey	72	159,077
Bristles machine for combing dry, Parks and Lannay	22	159 209
Buildings, movable front for, J. Murphy	4	159,203
Burial casket, W. G. Algeo, Sr. and Jr	39	159,059
Burner, self regulating gas, D. D. McMillan	64	159 108
Burners, lens attachment for gas, M. C. Meigs	64	159 199
Button, sleeve, Mason and Richardson	38	159 106
Car berth, sleeping, C. E. Lucas	121	159,195
Car coupling, A. A. Kellogg	122	159,099
Car coupling, G. W. E. Row	122	159,190
Car coupling, Tuttle and Thompson	122	159,125
Car coupling, L. Vote	122	159,128
Car ventilator, E. Korting	166	159,187
Car wheel and axle, B. A. Berryman	122	159,145
Cars, truck for street railway, H. C. Ball	121	159,070
Carpet fastener, A. Burroughs	62	159,153
Carriage wheel fender, A. Shoeninger	31	159,047
Cartridge loading device, G. W. Ansley	32	159,013
Chain gripe and tightener, J. N. and G. J. Ackerman	79	159,057
Chair, folding, P. W. Nolan	62	159,205
Cheese mill, J. F. Landis	45	159,189
Churns, cream saver for reciprocating, R. Whiting	45	159,237
Cigar mold, N. Dubrul	160	159,165
Cisterns, apparatus for walling, F. Wilford	51	159,239
Clasp for stockings or skirt supporters, G. J. Capewell	38	159,154
Clock frame or case, H. J. Davies	36	159,160
Clothes line, T. S. Cary	91	159,076
Connecting rod, J. F. Haskins, (reissue)	67	6 255
Crop thinning machine, M. Eustace	43	159 169
Croquet mallet, T. H. Logan	143	159 194
Cutter head, G. J. Shimer	174	159 236
Dairies, cooling, J. Wilkinson	45	159 055
Demijohn, C. Newman	68	159 038
Dental engines, apparatus for protecting and moistening the disks of, E. T. Starr	46	159,048
Dental plugger, L. J. P. E. Gaillard	46	159,173
Dental tool, electro magnetic, G. F. Green	46	159,028
Derrick, C. L. Duroy	79	159 024
Ditching machine, T. F. Randolph	51	159,148
Dredging machine, C. J. Sands	82	159,223
Drier for fertilizers, Bowman and Chapman	44	159,147
Drilling machine, rock, E. S. Winchester	124	159,242
Drilling machines, &c., supporting clamp for rock, E. S. Winchester	124	159,241
Egg holder, A. W. Porter	88	159,213
Engine, rotary, J. V. Beekman	150	159,066
Engine, rotary, Deming and Wickes	150	159,021
Engines, adjustable cut off for steam, H. Webster	152	159,130
Engines, atmospheric air compressor for working, Carobbi and Bellini	2	159,075
Fan, E. Schmidt	165	159,224
Feather renovator, Russell and Seamans	62	159,222
Felt, manufacture of vegetable, Sweeney and Beach	76	159 051
Fence, farm, I. L. Landis	52	159,188
Fifth wheel for vehicles, G. F. Putnam	31	159 117
Fire extinguisher, H. S. Parmelee, (reissue)	118	6 257
Flue cover, H. Tongue	154	159 231
Furnace, boiler, W. Allensworth	149	159,134
Furnace doors, device for opening and closing, G. Lees	149	159,190
Furnace grate, C. Knoblauch	149	159,186
Furnace grate, H. Ryder, (reissue)	149	6,259
Furnace metallurgic heating, H. Ragot	99	159,039
Furnace, puddling, H. Ragot	99	159,040
Furnace, smoke consuming, Argerbright and Allensworth	149	159,141
Furnaces, steam distributer for, A. B. Corey	149	159,156
Gas light and pressure indicator, W. W. Goodwin, (reissue)	61	6,254
Gas machine, J. C. Henderson	66	159,179
Gas meters, register for, H. H. Edgerton, (reissue)	64	6 251
Gas regulator, J. Anderson	64	159,139
Gear wheels with their shafts in harvesting machines, &c., connecting, J. M. Rosebrook	71	159,221
Generator, sectional steam, H. Whittingham, (reissue)	148	6,262
Generator, steam, H. C. Bull	148	159 069
Generator, steam, W. E. Haxtun	148	159,178
Glass articles, mold for and process of manufacturing, T. R. Atterbury	68	159,061
Glass mold, B. Bakewell, Jr	68	159,062
Grain binder, J. M. Groover	74	159,176
Grain drier, H. H Beach	48	159,014
Grain, machine for hulling and scouring, L. S. Chichester	57	159,080
Grain preparatory to grinding, moistening, W. M. Kennedy	59	159,100
Harrow and planter, B. Butler	73	159,073
Harrow and roller combined, W. R. Downing	73	159,163
Harvester, cotton, L. K. Miller	41	159,109
Harvesting machines, &c., connecting gear wheels with their shafts in, J. M. Rosebrook	74	159,221
Hat block, F. R. Going	76	159,089
Heater radiator, steam, C. Comstock	147	159,155
Heater, water, S. L. Latta	154	159,103
Hog trap, J. Klar	144	159,185
Hoist or elevator, cellar, C. D. Walters	79	159,233
Horse power, J. M. Albertson, (reissue)	159	6,247
Horseshoe, R. Lee	60	159,191
Hygroscope Seebass and Simon	101	159,043
Inhaler and nasal douche, combined, E. Schofield, (reissue)	156	6,260
Ironing board, S. B. Morrell	91	159,111
Jack, lifting, W. F. Morrow	79	159,202
Jeweler's lathe, N. W. Holt	36	159,180
Kiln, brick, W. Bull	20	159,072
Kiln, brick, W. L. Gregg	20	159,091
Ladder, fire escape, M. Davis	33	159,022
Ladder, step, R. S. Van Zandt	30	159,126
Lamp cap and chain holder, W. R. Park	90	159,208
Lamp wick inserter, W. H. Fitz Patrick	90	159,171
Leather, apparatus for stretching, S. D. Castle, (reissue)	92	6,252
Leather, machinery for finishing, Groff and Marvel	92	159,092
Lens attachment for gas burners, M. C. Meigs	64	159,199
Letter boxes, electrical indicator for, H. R. David	50	159,083
Liquids, apparatus for drawing effervescent, T. Warker	1	159,054
Lock, alarm, J. Walton	93	159,129
Loom temple, E. S. Stimpson	95	159,050
Map exhibitor, S. C. Adams	146	159 058
Metal creasing machine, G. W. and C. P. Howell	136	159 096
Meter, W. R. Baker	42	159,143
Mill, rolling, Chalfant and Hahn	125	159,078
Millstones, dressing, J. Williams	153	159 133
Motor for light machinery, D. Baldwin	67	159,063
Mower, lawn, H. T. West	75	159,131
Music leaf turner, W. H. King	102	159,101
Musical merchandise box, J. Restelli	102	159 218
Nail assorting machine, J. Coyne	103	159,082
Newspapers, device for changing heads in, P. Forsyth	117	159,172
Nursing bottle, J. L. Mason	156	159,197
Nut lock, J. J. Adgate	14	159,136
Ordnance, breech loading, G. H. Felt	105	159,170
Ore concentrator, Moore and Campfield	3	159,110
Ox shoe, R. French	60	159,026
Paddle wheel, feathering, B. Vater	139	159,127
Paper bag, T. W. Grinter	109	159 029
Paper bag machine, T. W. Grinter	109	159,030
Paper ruling machine, T. F. Collins	15	159,018
Pavement, wood, W. Disney	110	159 102
Pawl and ratchet, Tomlinson and Smith	67	159,124
Pawl and ratchet mechanism, J. L. Bond	67	159,016
Photograph burnisher, A. C. Mcatue	111	159,035
Piano lid prop, D. P. Ramadell	112	159,041
Picture exhibitor, C. S. Mills	111	159,201
Picture rod molding, A. C. Funston	54	159,027
Pipe and apparatus for molding the same, clay, W. K. Black	20	159,146
Planter, rice, J. C. Braud	133	159,148
Planter, seed, J. G. Garner	133	159,087
Planters, check row cord for corn, G. D. Haworth	133	159,177
Plow, H. Gale	114	159,174
Pocket tool, F. R Woodward	173	159,134
Printing, preparing gelatine plates for, F. Edwards	54	159,166
Printing, &c., producing photo relief plates for, Levy and Bachrach	111	159,104
Pruning implement, E. E. Stedman, (reissue)	63	6,261
Pulleys flask for casting, W. Hutton	33	159,097
Pump, A. A. Burr	118	159,152
Pump bucket, chain, J. Neil	118	159,037
Quicksilver strainer, H. H. Oakes	3	159,113
Quilting frame clamp, A. P. Grabham	38	159,090
Radiator, steam heater, C. Comstock	147	159,155
Railway crossing, J. Cumming	120	159,158
Sash holder, H. C. Perry	94	159,212
Sash supporter, H. F. Jenks, (reissue)	94	6,256
Saw handle, E. Andrews	29	159,140
Saw mill head block, Whitcomb and Rawson	130	159,236
Scaffold, Lapp and Sweet	30	159,032
Scarf, A. Mueller	38	159,112
Seeding machine, C. E. Patric	133	159,210
Sewing machine, Bartlett and Plant	134	159,065
Sewing machine, E. Kappmeyer	134	159,183
Sewing machine ruffler, E. W. Darby	134	159,020
Sewing machine tables, leaf support for, R. W. Whitney	134	159,235
Sewing machine, wax thread, E. E. Bean	134	159,144
Shaft support J. Nellis	31	159,204
Sheep scratch box, I. B. Dillon	135	159 161
Shoe blacking case, C. P. Ellis	16	159,167
Shoe horn, A. M. Cushing	16	159,159
Shoe nail blank, Blake and McKay	103	159,015
Shoe tips, machinery for forming, J. H. Hussey	16	159,181
Sleigh, T. F. Moore	31	159,036
Spark arrester, D. Allard	94	159,137

	Class No.	No of Patent.
Spark arrester, J. W. Buel	94	159,017
Spinning frames, bolster for, J. A. Matteson	87	159,034
Spoke socket and felly plate, H. T. Briggs	31	159,149
Spooling machines, bobbin supporter for, A. M. Wade	142	159,053
Staple blanks, manufacture of, J. W. Shannon	103	159,044
Stockings or skirt supporters, clasp for, G. J. Capewell	38	159,151
Stone, wheel for dressing, P. B. Laird	151	159,031
Stool support, C. J. Woodward	63	159,243
Stove, cooking, M. D. Seward	154	159,225
Stove, heating, N. A. Boynton, (reissue)	154	6,251
Stove lid lifter, G. Sprague	154	159,228
Stove, magazine, J. E. Tallmadge	154	159 052
Stove pipe collar and thimble, G. F. Brinkerhoff	154	159 150
Stove polish, S. J. Wilson	154	159,056
Strainers, construction of, R. J. P. Goodwin, (reissue)	170	6,248
Street sprinkler, G. A. Jeromiah	167	159,182
Street sweeping machine, J. Edson	110	159 025
Surveyors, target for, T. Davies	157	159,021
Syringe, hypodermic, J. Leiter	136	159,192
Table, folding, H. B. Sinclair	62	159,227
Tea pot handle, T. Shaw	136	159,121
Telegraph pole, metallic, R. D. Radcliffe	52	159,215
Tiles, manufacturing, E. L. Hall	20	159,093
Tire tightener, H. B. Robbins	31	159,219
Tobacco, coloring, O. Knab	160	159,102
Toy cartridge exploder, J. B. McHarg	143	159 107
Trap, animal, L. F. George	143	159,175
Trunk fastener, A. Frankel	93	159,085
Twine cutter, C. P. Ellis	44	159,168
Umbrella, W. Tetley	165	159,230
Valve, automatic relief, L. D. Shaw	110	159,045
Valve, safety, H. C. Bull	148	159,068
Valve, safety, G. H. Crosby	148	159,157
Valve, steam, J. H. Corey	152	159,019
Valve, steam, G. McNaughton	152	159,198
Valves, adjusting apparatus for cut off, H. C. Bull	152	159,071
Vehicle wheel, J. M. Stephenson	31	159 049
Vehicle wheel hub, W. Teegarden	31	159,123
Velocipede, J. A. Vander Waag, (reissue)	31	6,250
Ventilating and warming drum, P. H. Carman	154	159,074
Ventilator, car, E. Korting	166	159,187
Vise, E. Parker	100	159,115
Wagon bodies, stay iron for, A. A. Livingston	31	159 033
Wagon, dumping, Patton and Walters	31	159,211
Wagon jack, S. Chard	79	159,079
Washers, machine for forming spiral, S. Trethewey	14	159,232
Washing compound or fluid, W. S. Williams	91	159,132
Washing machine, S. W. Holbrook	91	159 094
Watch case bezels, device for making, F. H. Wilby	36	159,238
Water, apparatus for removing obstructions under, S. Lewis, (reissue)	82	6,249
Wells, increasing the capacity of oil, E. A. L. Roberts, (reissue)	124	6,258
Whip tip ferrule, E. B. Light	72	159,105
Windmill, W. D. Parson	118	159 207
Wood, machine for polishing, S. G. Randall	173	159,216
Wrench, S. E. Robinson	100	159,119
Wrench, pipe, H. C. Stouffer	100	159,229
Wrench, pipe, J. B. Westwick	100	159,234
Yoke, neck, J. B. Relyea	144	159,217

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED JANUARY 26, 1875.

	Patent No.
Ackerman, J. N. and G. J., Chain gripe and tightener	159,057
Adams, S. C., Map exhibiter	159,058
Adamson, W., assignee	155,143
Adgate, J. J., Nut-lock	159,136
Adler, Clement, and Weil, assignees	159,181
Albertson, J. M., Horse power, (reissue)	6,247
Algeo, W. G., Sr., and Jr., Burial casket	159,059
Allard, D., Spark arrester	159,137
Allensworth, W., Boiler furnace	159,138
Allensworth and Argerbright	159,141
Anderson, J., Gas regulator	159 139
Andrews, E., Saw handle	159 140
Ansley, G. W., Cartridge loading device	159,013
Argerbright, D., and W. Allensworth, Smoke consuming furnace	159,141
Arnold, D. H., assignee, (reissue)	6,256
Arrants, J. B., Bale tie	159,060
Atterbury, T. R., Mold for, and process of manufacturing, glass articles	159,061
Bachrach and Levy	159,104
Baird, G. W., Aerating and cooling apparatus	159,142
Baker, W. R., Meter	159,143
Bakewell, B., Jr., Glass mold	159,062
Baldwin, D., Motor for light machinery	159,063
Banker, G. W., Barrel	159,064
Bartlett, J. W., and F. Plant, Sewing machine	159,065
Beach, H. H., Grain drier	159,014
Beach and Sweeney	159,051
Bean, E. E., Wax thread sewing machine	159,144
Beekman, J. V., Rotary engine	159,066
Bellini and Carobbi	159,075
Berryman, B. A., Car wheel and axle	159,145
Black, W. K., Clay pipe and apparatus for molding same	159,146
Blake, L. R., and G. McKay, Shoe nail blank	159,015
Blydenburgh, C. M., Bottle stopper	159,067
Bond, J. L., Pawl and ratchet mechanism	159,016
Borer, J., assignee	159,101
Bowers, H. L., assignee	159,233
Bowman, J., and A. Chapman, Drier for fertilizers	159 147
Boynton, N. A., Heating stove, (reissue)	6,251
Braud, J. C., Rice planter	159,148
Briggs, H. T., Spoke socket and felly plate	159,149
Brinkerhoff, G. F., Stove pipe collar and thimble	159,150
Brooks, J. A., assignee	159,176
Buel, J. W., Spark arrester	159,017
Bull, H. C., Safety valve	159 068
Bull, H. C., Steam generator	159,069
Bull, H. C., Truck for street railway cars	159,070
Bull, H. C., Adjusting apparatus for cut off valves	159,071
Bull, W., Brick kiln	159,072
Burnham, G., Towing boats	159,151
Burr, A. A., Pump	159 152
Burroughs, A., Carpet fastener	159 153
Butler, B., Harrow and planter	159,073
Byers, E., & Son, assignees	159 211
Campfield and Moore	159,110
Cammeyer, W. H., assignee, (reisane)	6,249
Capewell, G. J., Clasp for stocking or skirt supporters	159 154
Carman, P. H., Ventilating and warming drum	159,074
Carobbi, C., and G. Bellini, Atmospheric air compressor for working engines	159,075
Carpenter, T. B., assignee	159,041
Cartwright, M. E., assignee	159 009
Cary, T. S., Clothes line	159 076
Casey, P., Bridle bit	159,077
Castle, S. D., Apparatus for stretching leather, (reissue)	6,252
Chalfant, G. A., and I. Hahn, Rolling mill	159 078
Chapman and Bowman	159,147
Chard, S., Wagon jack	159 079
Chessman, R., assignee	159,082
Chichester, L. S., Machine for hulling and scouring grain	159 080
Childs, J., assignee	159,229
Coe, J. S., Bee hive	159,081
Collins, T. F., Paper ruling machine	159,018
Comstock, C., Steam heater radiator	159,155
Consolidated Wax Thread Sewing Machine Company, assignee	159,144
Cooke, A., assignee, (reissue)	6,250
Corey, A. B., Steam distributer for furnaces	159,156
Corey, J. H., Steam valve	159,019
Coyne, J., Nail assorting machine	159,082
Crosby, G. H., Safety valve	159,157
Cumming, J., Railway crossing	159 158
Cushing, A. M., Shoe horn	159,159
Daniels, A. W., assignee	159,171
Darby, G. W., Sewing machine ruffler	159 020
David, H. R., Electrical indicator for letter boxes	159,083
Davies, H. J., Clock frame or case	159,160
Davies, T., Target for surveyors	159,021
Davis, M., Fire escape ladder	159 022
Davis, W. E., administrator	159,236
Deming, D. A., and S. W. Wickes, Rotary engine	159 021
Dewar and Fowler	159 086
Dillon, I. B, Sheep scratch box	159,161
Disney, W., Wood pavement	159,162
Divine, J. F., assignee	159,195
Downing, W. R., Combined harrow and roller	159,163
Dryden, G., Boring machine	159,164
Dubrul, N., Cigar mold	157,165
Duroy, C. L., Derrick	159,024
Dutcher Temple Company, assignee	159,050
Edgerton, H. H., Register for gas meters, (reissue)	6 253
Edson, J. Street sweeping machine	159,025
Edwards, E., Preparing gelatine plates for printing	159,166
Edwards, R. J., assignee	159 234
Ellis, C. P., Shoe blacking case	159,167
Ellis, C. P., Twine cutter	159,168
Eustace, M., Machine for thinning crops	159,169
Farnsworth, E. I., Iron bridge	159,084
Felt, G. H., Breech loading ordnance	159,170
Fitz Patrick, W. H., Wick inserter for lamps	159,171
Fursyth, F., Device for changing heads of newspapers	159,172
Fowler, J., and J. R Dewar, Spring bed bottom	159 966
Frankel, A., Trunk fastener	159,085
French, R., Ox shoe	159 026
Funston, A. C., Picture rod molding	159 027
Gaillard, L. J. P. E., Dental plugger	159,173
Gale, H., Plow	159,174
Garner, J. G., Seed planter	159,087
George, L. F., Animal trap	159,175
Going, F. R., Hat block	159,088
Goldsmith A. A., Bale tie	159,089
Goodwin, R. J. P., Construction of strainers, (reissue)	6,248
Goodwin, W. W., Gas light and pressure indicator, (reissue)	6,254
Grabham, A. P., Quilting frame clamp	159,090
Green, G. F., Electro magnetic dental tool	159,028
Gregg, W. L., Brick kiln	159,091
Grinter, T. W., Paper bag	159,029
Grinter, Paper bag machine	159,030
Groff, A. M. L., and J. A. Marvel, Machinery for finishing leather	159,092
Groover, J. M., Grain binder	159,176

	Patent No.
Habn and Chalfant	159 078
Hall, E. L., Manufacturing tiles	159,093
Haskins, J. F., Connecting rod, (reissue)	6,255
Hawey, J., assignee	159,146
Haworth, G. D. Corn planter check row cord	159,177
Haxtun, W. E., Steam generator	159,178
Henderson, J. C., Gas machine	159 179
Holbrook, S. W., Washing machine	159 094
Holt, N. W., Jeweler's lathe	159,180
Hopkins, J. L., assignee	159,222
Hopkins, J. W., Automatic boiler feeder, &c	159,095
Howell, G. W. and C. P., Metal creasing machine	159,096
Hussey, J. W., Machinery for turning shoe tips	159,181
Hutton, W., Flask for casting pulleys	159 097
Iler, W., Device for baling cotton	159 098
Jenks, H. F., Sash supporter, (reissue)	6,256
Jeremiah, G. A., Street sprinkler	159,182
Jewett, J. F., assignee	159,029, 159,030
Kappmeyer, E. Sewing machine	159,183
Kellogg, A. A., Car coupling	159,099
Kendall, O. B., Low water indicator for steam boilers	159,184
Kennan, J. and T., assignees	159,169
Kennedy, W. M., Moistening grain preparatory to grinding	159 100
Kink, W. H., Music leaf turner	159,101
Klar, J., Hog trap	159,185
Knab, O., Coloring tobacco	159,102
Knoblauch, C., Furnace grate	159,186
Korting, E., Car ventilator	159 187
Lagowitz, J., assignee	159,085
Laird, P. B., Wheel for dressing stone	159,011
Landis, I. L., Farm fence	159,188
Landis, J. F., Cheese mill	159 189
Lannay and Parks	159 209
Lapp J., and J. M. Sweet, Scaffold	159 032

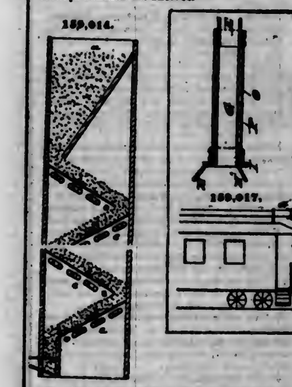
TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED JANUARY 26, 1875.

159,012. CARTRIDGE-LOADING DEVICES. Geo. W. Ansley, Marshall, Mich. [Filed Nov. 6, 1874.]

1. The shell-holder B B, having the groove y y, when constructed substantially as shown and specified.

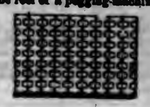


2. The block A A', provided with gage f f and cut-off e, in combination with the shell-holder B, when arranged substantially as and for the purpose shown and specified.

3. The combination of the slides d and e with the block A A' and gage f f, when arranged substantially as and for the purpose shown and specified.

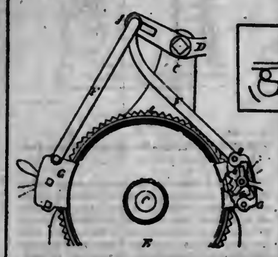
159,013. GRAIN-DRIERS. Henry H. Beach, Rome, N. Y. [Filed Aug. 11, 1874.]

Brief.—The inclination of the perforated shelves is such that the grain will slowly descend by its own gravity. The shelves are arranged within an imperforate casing, and the requisite heat is radiated from steam-pipes located beneath the shelves.



159,013.

In a grain-drier, the combination, with the shaft or case A, having imperforate sides, of the steam-pipes s and the stationary perforated inclined shelves d, arranged and operating together as described, for the purposes set forth.

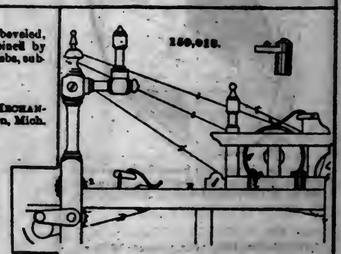


159,014. SHOE-NAIL BLANKS. L. B. Blake, Brooklyn, N. Y., and Gordon MacKay, Cambridge, Mass. [Filed Mar. 11, 1874.]

Brief.—The blanks are joined by a very thin lateral connecting-web, produced in the process of rolling the plate, and which can be readily severed, while thick enough to maintain the integrity of the plate in handling, or upon the reel of a pegging-machine.

A metal nail-plate having one edge beveled, and having a series of nail-blanks joined by the lateral or transverse connecting-webs, substantially as shown and described.

159,015. PAWL-AND-RATCHET MECHANISMS. Joseph L. Bond, Port Huron, Mich. [Filed Dec. 14, 1874.]



1. The combination of the slotted lever D, working on fulcrum C', the connecting-links F F, pivoted at f to lever D, and movable boxes G, containing pawls H H, with the ratchet-wheel E, constructed and arranged to operate the ratchet-wheel in one direction, substantially as and for the purpose described.

2. The pawl-boxes G, constructed with grooves g', in combination with the flanges e on the sides of the ratchet-wheel E, substantially as and for the purposes described.

3. In a mechanical movement, as above described, the combination of the lever D and the two connecting-links F with movable boxes G, containing reversible pawls H, to revolve the ratchet-wheel continuously in either direction, substantially as described.

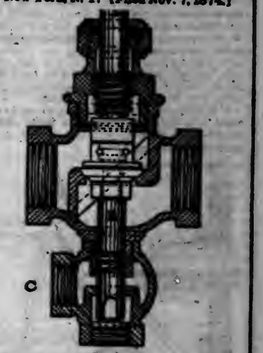
159,016.

2. The combination of the posts B and their rotary arms c, with the two separate frames A B, provided with sheet railing and carrying mechanisms, substantially as set forth.

159,017. SPARK-ARRESTERS. Jas. W. Beal, St. Louis, Mo. [Filed Sept. 16, 1874.]

159,017.

1. The combination of the locomotive A, tender M, stack C, sections D E, provided with the extensions G G', consisting of the tube O, spring P, and flange I, provided with an elastic facing and supports, F F, substantially as described and shown.



2. The combination of the locomotive A, tender M, stack C, sections D E, provided with the extensions G G', consisting of the tube O, spring P, and flange I, provided with an elastic facing, guides H-H' H'', and supports F F', substantially as described and shown.

159,018. PAPER-RULING MACHINES. Tyrannus F. Collins, Boston, Mass. [Filed Dec. 9, 1874.]

Brief.—The machine may be used as a single or double ruling machine. When used as a single, the upper cylinder and tapes may be raised out of contact with first-ruling devices.

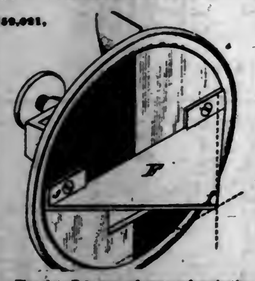
1. In combination with the frame B and the two ruling and sheet-carrying mechanisms, substantially as described, the separate frame A, supporting the upper of said ruling and carrying mechanisms, and arranged with and applied to the frame B, essentially in manner to be operated, as and for the purpose specified.

159,019. STEAM-VALVES. Jas. H. Covey, New York, N. Y. [Filed Nov. 7, 1874.]

The globe-valve for admitting steam or water, in combination with the discharge-valve, provided with inlet C and discharge D, both valves being operated by a single spindle, E, substantially as and for the purpose set forth.

159,020. SUPPLIES FOR SEWING-MACHINES. Geo. W. Darby, Hamilton, Ohio. [Filed June 24, 1874.]

Brief.—The corrugation in the foot affords room for the fullness of the gather made by the ruffling-blade, which is on one end of a straight lever pivoted to the upturned toe of the presser-foot.



The presser-foot A, provided with the transverse slot or corrugation a in front of the needle-opening, when combined with the holding-blade B, ruffling-blade C, link D, and lever E, substantially as described, for the purpose specified.

159,021. TARGETS FOR SURVEYORS. Thos. Davies, Cincinnati, Ohio. [Filed June 19, 1874.]

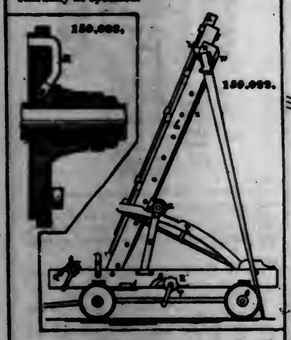
Brief.—Indicates inclination of target-staff to or from observer.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

160,021.

The plate F, arranged upon and projecting horizontally from the front of a surveyor's target, in the manner herein described, and for the purpose designated.

160,022. FIRE-ESCAPE LADDERS. M. Davis, Covington, Ind. [Filed Dec. 5, 1874.]



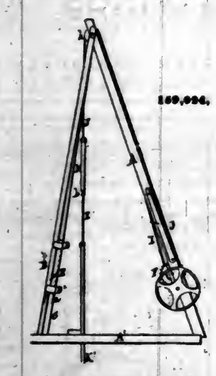
Brief.—The ladder is raised to an inclined position by means of a cogged roller, which engages with an adjustable inclined rack. The sides of the ladder are each composed of two pieces of wood, with a strip of sheet metal interposed between them to give strength.

1. The pinions Z Z and pulley t, with rollers between the pinions Z Z and pulley t, in combination with the ladder G, pulleys W W, wire ropes h h, idle-pulleys h, and windlass a, for the purpose of elevating the ladders, substantially as shown.

2. The pinions Z Z, pulley t, with the rollers between them, in combination with the racks E E, for the purposes specified.

3. The combination of two or more strips of wood with thin iron w between them, when used to form the side rails of a ladder, substantially as specified.

160,023.

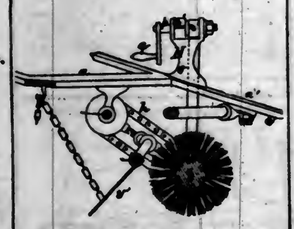


160,023. ROTARY ENGINES. D. A. Deming and Sterling W. Wisbon, Geneva Falls, N. Y., assignors to E. C. Sibley, same place. [Filed June 10, 1873.]

Brief.—A tube inserted in the casing conveys steam from the journal to the exhaust-port, thereby preventing steam from leaking through the packing.

The combination, in rotary steam-engines, of the chamber A and the pipe B, communicating with the exhaust-chamber N, in the manner and for the purposes substantially as specified.

160,024. DERRICKS. Chas. L. Darcy, Pioneer, Ohio. [Filed Dec. 8, 1874.]



The herein-described derrick, consisting of of the frame A, windlass F, ropes I J, arranged in relation to each other and to the drum of the windlass, as described, braces H, provided with extension pieces or slides C, attached thereto by notches c and loop E, in the manner as and for the purpose specified.

160,024.

160,025. STREET-SWEEPING MACHINES. Jacob Edson, Boston, Mass. [Filed Dec. 9, 1874.]

Brief.—A street-sweeping machine in which the brush is raised by means of a pair of cams, to which are attached straps secured to the outer ends of the brush-shaft, the periphery of said cams passing through the axis, so that the straps draw centrally when at rest. An independently-adjustable dust-guard is used. The brush is rotated from the revolving axle, and is controlled by means of a ratchet-wheel secured on the main axle. The supporting-wheels, revolving freely on the axles, are geared with the same by means of a pawl, which is kept in contact with the ratchet-wheel by a spring, and when it is desired to stop the rotation of the brush the pawl is raised from the ratchet by means of a cam or button.

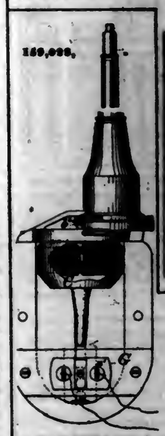
1. The combination of the frame or shafts *a a'*, with the support *l* and stay or brace *u*, as and for the purpose described.

2. In combination, with the straps or bands *m n*, the cams or eccentrics *m' n'*, as and for the purpose set forth.

3. The cam or eccentric 3, in combination with the pawl 1, spring 2, ratchet-wheel *y*, the shaft *a*, and the driving-wheel *b*, as and for the purpose set forth.

4. In combination with the rotary brush *g* 44 of the independently-adjustable dust-guard *o*, as and for the purpose herein set forth and described.

160,026. OX-SHOES. Raymond French, Seymour, Conn. [Filed Dec. 22, 1874.]



In combination with the pad *d* of an ox-shoe, the flange, rib, or inside calk, *c*, as and for the purpose described and represented.

160,027. PICTURE-ROD MOLDINGS. Abram C. Frankton, Philadelphia, Pa. [Filed Mar. 26, 1874.]

Brief.—A molding formed with a projection, the back part to receive the nails which secure it to the walls, and at the same time are hidden from view. A bead is formed on the front of the molding to receive the hooks which support the pictures.

A molding consisting of the part A to receive the nails, and the bead D, for the purpose specified.

160,028.

160,027.

160,028. ELECTRO-MAGNETIC DENTAL TOOLS. Geo. F. Green, Kalamazoo, Mich., assignor to Saml. S. White, Philadelphia, Pa. [Filed Jan. 13, 1871.]

Brief.—Drill driven through gearing from the spindle of the revolving electro-magnet, which is mounted on the same frame with the drill. Cam-wheel upon drill serves to impart a reciprocating motion to a file, saw, or burnisher, which may be attached to the frame.

1. The combination, substantially as hereinbefore set forth, of an electro-motor and a dental instrument, upon which it is mounted.

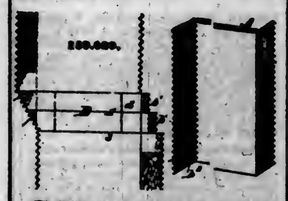
2. The combination, substantially as hereinbefore set forth, in a dental implement, of a permanent magnet, a rotating electro-magnet, and gearing actuated by the rotating magnet.

3. The combination, substantially as hereinbefore set forth, of a dental instrument with an electro-motor and a reversing-button mounted thereon, for the purposes described.

4. The combination, substantially as hereinbefore set forth, of the magnets, the socketed spindle *d'*, and the casing.

5. The combination, substantially as hereinbefore set forth, with an electro-motor, its driving-gearing, and casing, all mounted on a common frame, of a detachable tool-holder, for the purposes described.

6. The combination, substantially as hereinbefore set forth, of a dental instrument, an electro-motor mounted thereon, and a reciprocating tool-holder.



7. The combination, substantially as hereinbefore set forth, of the horseshoe-magnet, the rotating electro-magnet, and the frame B, for the purposes described.

8. The combination, with the frame of a dental instrument, of the electro-motor, the spindle *d'*, the gear-wheel *c*, and the cam-wheel M, for imparting to the tool either a rotary or a reciprocating motion, substantially as set forth.

160,029. PAPER BAGS. Thos. W. Grinter, Cincinnati, Ohio, assignor to himself and Joseph F. Jewett, same place. [Filed Apr. 16, 1874.]

Brief.—A blank cut in form of Fig. 1, and pasted as shown, dart lines indicating the upper and broken lines the under surface, is folded as in Fig. 2, and the side rings secured to the body. The bottom may then be spread open in satchel form.

160,030.

The bellows-fold satchel-bottom paper bag herein described, made from a blank of the form shown, with side seams only, with only a single fold of paper in the overlapping side flaps, and with additional folds of paper in the bottom corners, as set forth.

160,030. PAPER-BAG MACHINES. Thos. W. Grinter, Cincinnati, Ohio, assignor to himself and Jos. F. Jewett, same place. [Filed Sept. 30, 1874.]

Brief.—The web of paper, of a width equal to twice the depth of the bag plus the bottom folds, passes through feed-rolls and between the two stationary serrated cutters, where the reciprocating knife severs the blank, it being held between the creasing-rolls. The first set of tapes then carry the blank under the sheath, which descends upon it, when the angular folding-blades push the middle of the sheet into sheath. The blank is then seized by the rolls and carried to the second set of tapes, which deliver it against the second stop, when the vibrating pasting-knife descends upon the blank, folding the side flap, and forcing it into the bite of the third set of rolls and tapes. These convey it to the third stop, when another vibrating paster descends, folding the other flap, and forcing the bag into the discharge-rolls.

1. The combination of the fixed cutters, between which the web of paper passes, and the double-acting reciprocating cutter vibrating across the edge of the fixed cutters, whereby a blank is severed at each stroke.

2. The combination of the feed-rolls, the fixed cutters, between which the web of paper passes, and the double-acting reciprocating cutter, whereby the paper is alternately fed over and under the movable cutter.

3. The combination of the feed-rolls, the cutters, the creasing-rolls, and the first set of carrying-tapes geared to run faster than the rolls, whereby the creased and severed blank is drawn away from the web.

4. The combination of the supporting-tapes, the folding-sheath, and the folding-blades, whereby the bottom folds of the bag are doubled into, and the sides laid upon, the sheath.

5. The combination of the creasing-rollers, the carrying-tapes, the sheath, and the folders, whereby the blank is creased and folded.

6. The combination of the sheath, the folders, and the compressing-rollers, whereby the bottom folds are formed and compressed.

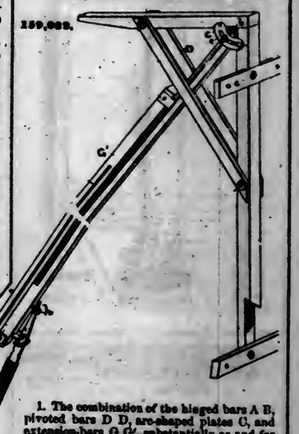
7. The combination of the waved or indented cutter, the carrying-tapes, the sheath, the folders, the compressing-rollers, the guide-frames, the second set of rollers, the carrying-tapes, and the first pasting-knife, whereby the blank is severed, folded at the bottom, reversed, and presented in proper position to the first pasting-knife.

8. The combination of the first pasting-knife, its compressing-rollers, the third set of carrying-tapes, the second pasting-knife, and its rollers, whereby both edge-flaps of the bag are pasted and folded.

9. The combination of the double-acting cutter, the vibrating arms which actuate it, the endwise-moving rock-shaft, on which the arms are mounted, the roller-arms on the rock-shaft, and the rotating double-faced snail-cam acting alternately on each roller-arm, whereby the knife is alternately and intermittently reciprocated.

160,031.

160,031. WHEELS FOR DRESSING STONE. Peter R. Laird, St. Johnsbury, Vt., assignor to himself and R. R. Laird, same place, and H. Moody, Peacham, Vt. [Filed Oct. 26, 1874.]

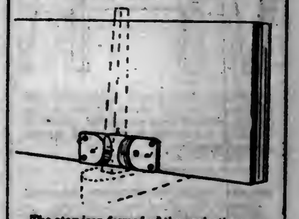


Brief.—A stone-dressing wheel having curved recesses formed in its under surface, to draw in and distribute the supply of abrading material toward the center, instead of having the abrading material supplied through a central eye and distributed outward.

A metallic stone-dressing wheel, having hooked recesses *a*, as described, arranged in or with its lower or reducing surface *b*, substantially in manner and to operate as explained.

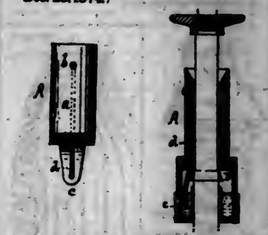
160,032. SCAFFOLDS. John Lapp and John M. Sweet, Batavia, N. Y. [Filed July 1, 1874.]

Brief.—The scaffold-bracket is formed so as to fold readily for transportation, and is used in connection with the extensible bars G G', which are supported at the lower extremity by the spear-headed rod H, in connection with staple I and pin *h*.



160,032.

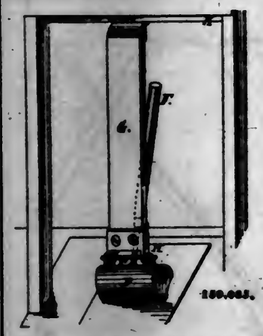
1. The combination of the hinged bars A B, pivoted bars D D, arc-shaped plates C, and extension-bars G G', substantially as and for the purpose specified.



2. The lever H, constructed as described, and arranged to operate with the staple I, pin *h*, and bars G G', substantially as and for the purpose specified.

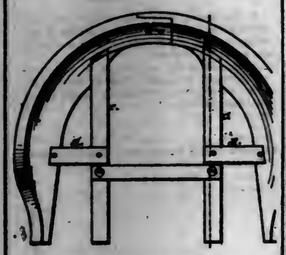
160,033. STAY-IRONS FOR WAGON-BODIES. Augustus A. Livingston, Wilmington, Ill. [Filed Oct. 20, 1874.]

The stay-iron formed of the projections *e e*, connected by the plate *b*, said projections made curved, and the plate *b* let into the wagon-box, substantially as specified.



160,034. BOLSTERS FOR SPRINGS-FRAMES. Jas. A. Matteson, Johnston, R. I. [Filed Dec. 28, 1874.]

The bolster A, with its inclosed wick *d* and finger *e*, in combination with the oil-cup B and collar D, substantially as shown and for the purpose specified.



160,035. PHOTOGRAPH-BURNISHERS. A. C. Moulton, Burlington, Wis. [Filed Oct. 2, 1874.]

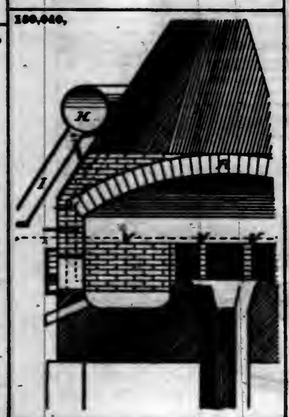
The burnishing-block D, in combination with the lever F, hinge-joint B H, and pressure-bar G, substantially as and for the purpose described.

159,035.

159,036. SLEIGHS. T. F. Moore, Owego, assignor of two-thirds his right to Luther S. Wright and Robt. B. Linderman, Groton, N. Y. [Filed Dec. 28, 1874.]

The boot pieces *a a'*, in combination with the sills *c c'* and side braces *d d'*, to form the frame, bunk, and arms of the rear portion of the sleigh-box, substantially as and for the purpose described.

159,037. CHAIN-PUMP BUCKETS. John Noll, Chicago, Ill. [Filed Dec. 15, 1874.]



Brief.—The disk is readily applied to the basket-iron and replaced when worn, and at the same time the endless chain of buckets can be disconnected for the purpose of lengthening or shortening, or to replace worn disks.

The combination of the hook A, flange C, and elastic disk D, in a chain-pump bucket, substantially as described.

159,038.

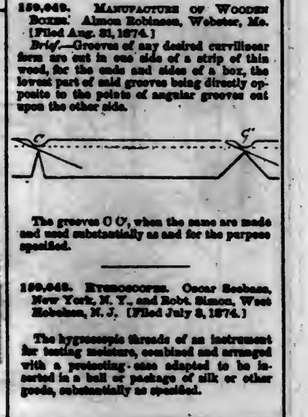
159,039.

159,040.

159,039. METALLURGIC HEATING-FURNACES. H. Bagot, Pittsburg, Pa. [Filed Mar. 4, 1874.]

1. A circular heating-furnace, provided with a partition charging and drawing door and central fire, around which rotates the bottom of said furnace, the travel of said bottom being from the charging-door toward the inlet of flame and drawing-door, the heating-chamber of the furnace communicating with a fire-chamber or gas-generator and with the central stack, substantially as herein described, and for the purpose set forth.

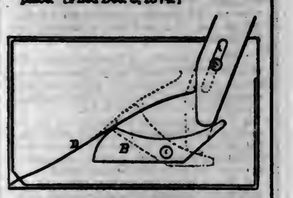
2. A circular heating-furnace, provided with a partition-wall, having the charging-door arranged on one side of said partition and the drawing-door and inlet of the heat or flame on the other side of said partition, substantially as herein described, and for the purpose set forth.



3. A circular heating-furnace, provided with a central fire and rotating bottom, with the opening communicating with said central fire, arranged opposite or nearly opposite the charging-door, substantially as herein described, and for the purpose set forth.

4. A circular heating-furnace with a rotating bottom, provided with a sand-distributing chamber, substantially as herein described, and for the purpose set forth.

5. A circular heating-furnace with a central fire and revolving bottom, having a slag-discharging opening communicating with said fire, substantially as herein described, and for the purpose set forth.



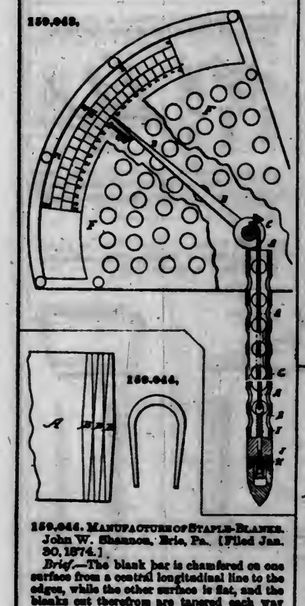
159,040. MANUFACTURE OF WOODEN BOXES. Almon Robinson, Webster, Me. [Filed Aug. 31, 1874.]

Brief.—Grooves of any desired curvilinear form are cut in one side of a strip of thin wood, for the ends and sides of a box, the lowest part of said grooves being directly opposite to the points of angular grooves cut upon the other side.

The grooves C C', when the same are made and used substantially as and for the purpose specified.

159,041. PIANO-LID PROPS. Daniel P. Ramsdell, New Haven, Conn., assignor of one-half his right to T. B. Carpenter, same place. [Filed Dec. 3, 1874.]

1. The prop A, provided with the straight slot *c*, in combination with the stud *a*, lever B, and spring D, as set forth.



2. In an automatic lid-prop device, the lever B, arranged to operate in connection with the prop A and spring D, in the manner described, substantially as set forth.

3. In an automatic lid-prop device, the prop A, made with the straight slot *c*, as set forth.

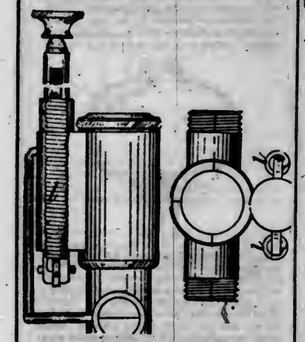
159,042. STEREOSCOPES. Oscar Seeban, New York, N. Y., and Robt. Simon, West Hoboken, N. J. [Filed July 8, 1874.]

The hygroscopic threads of an instrument for testing moisture, combined and arranged with a protecting-case adapted to be inserted in a ball or package of silk or other goods, substantially as specified.

159,043.

159,044.

159,044. MANUFACTURE OF STAPLE-BLANKS. John W. Shannon, Erie, Pa. [Filed Jan. 20, 1874.]



Brief.—The blank bar is chamfered on one surface from a central longitudinal line to the edges, while the other surface is flat, and the blanks cut therefrom are tapered each way from the middle on both cut edges.

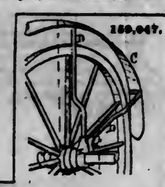
1. The staple-blank bar A, having a contour substantially as described, as a new article of manufacture.

2. The staple-blank B, having a contour substantially as described, as a new article of manufacture.

159,045. AUTOMATIC RELIEF-VALVES. L. D. Shaw, Boston, Mass. [Filed Aug. 10, 1874.]

Brief.—Pressure in the hose-pipe, exceeding that for which it is adjusted, raises the valve in the supplemental chamber, and gives access of water to the piston in the main chamber, which is depressed, exposing thereby the port leading to the suction-pipe. On reduction of said pressure the valve is reseated by the pressure of a spring.

The combination, with the cylinders *a a'* and their pistons *b d* and openings *e f*, of the valve-cylinder *g*, its openings *h i*, and double-acting valve *k*, with its openings *r s*, and the return-pipe *t* to the suction-pipe, as and for the purpose set forth and described.



159,046. JOINTS FOR IRON TRUSS-BRIDGES. Edwd. S. Shaw, Cambridge, Mass. [Filed Jan. 6, 1875.]

A joint formed by cutting, stamping, or molding into the surfaces of the parts to be connected concentric annular depressions or grooves, interposing rings or an annulated washer fitted to said depressions or grooves, and confining the surfaces in juxtaposition by a bolt contained in eyes concentric with said depressions or grooves, and provided with suitable nuts or heads and washers, as botanically as and for the purposes described.

159,046.

159,047.

159,047. CARRIAGE-WHEEL FENDERS. A. Shoeninger, Chicago, Ill. [Filed May 5, 1874.]

Brief.—A bent wood fender, easily detachable, and held in place by arms clasped upon the axle.

The wheel-fender C, of bent wood, and the radial braces D D, clamps E E', and screw *e*, all combined substantially as and for the purpose set forth.

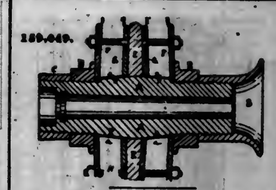
159,048. APPARATUS FOR PROTECTING AND MOISTENING THE DISKS OF DENTAL ENGINES. Eli T. Starr, Philadelphia, Pa., assignor to S. S. White, same place. [Filed Jan. 8, 1875.]

Brief.—A sleeve fits over the end of the hand-piece, and carries at its outer end a partial cover for the emery-disk used for separating teeth. A sponge or rubber bulb is used in connection with it, for wetting the disk to prevent its heating.

1. A shield or disk-protector constructed substantially as herein before set forth, and adapted to be applied to the hand-piece of a dental engine.

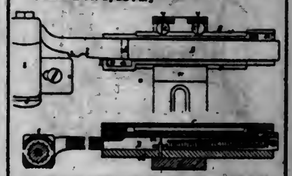
2. The combination, substantially as herein before set forth, of a disk-protector and a moistening device for dental engines.

3. The combination, substantially as herein before set forth, of a disk-protector, its tubular socket, a hand-piece, a chuck or tool-holder, and a rotating disk mounted on a shank passing through the socket of the disk-protector and into the tool-holder.



159,049. WHEELS FOR VEHICLES. Jas. M. Stephenson, Pendleton, Ind. [Filed July 30, 1874.]

1. The box A, provided with a screw at each end for the nuts B B, and with the cones P P and bands C D, in combination with spokes H H, substantially as specified.



2. The rubber cushion E, in combination with the two hub-sections F F, substantially as specified.

3. The combination of the two hub-sections F F and box A, having cones P P to dish the wheel more or less, and to tighten the fellies, substantially as specified.

159,049.

159,050. TENPLES FOR LOOMS. Edwd. S. Stimpson, Hopedale, Mass., assignor to the Dutcher Temple Company, same place. [Filed Dec. 9, 1874.]

1. The shank-supporting case A, provided with the closed friction-roller chambers *a a*, and their rollers *b b*, in combination, and arranged with the shank or bar B, all substantially as specified.

2. The cap C, provided with the abutment *c* and projection *e*, arranged as described, in combination with the case A, provided at its front end with the friction-roller *b*, and its receiving-chamber *e*, all being substantially as described.

3. The shank B, provided with the recess *l* and shoulder *i*, in combination with the case A, friction-roller *b*, and chamber *e*, all arranged as set forth.

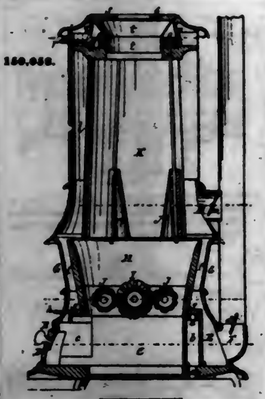
4. The shank B, provided with the chamber *m*, in combination with the spring D and case A, all arranged and operating together as set forth.

159,051. MANUFACTURE OF VEGETABLE FELT. Peter Sweeney, New York, N. Y., and Albert Beach, Jr., of Newark, assignors to Albert Beach, Newark, N. J. [Filed June 22, 1874.]

Brief.—The unpulped seed and down of Typha are incorporated with pulped vegetable fiber to form sheets of felt.

The vegetable felt, substantially as before set forth, consisting of the downy seed-matter of pulu, combined in a sheet by means of vegetable fiber, the same being a new manufacture.

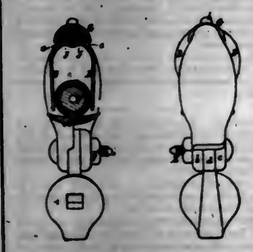
159,052. MAGAZINE-STOVES. John B. Tallmadge, Auburn, N. Y. [Filed June 22, 1874.]



Brief.—The stirrers in the lower part of the magazine are operated by means of pinions on the upper ends of their axial rods. These pinions mesh in internal cogged gear on an annular rim, which is worked by a handle or lever extending through the wall of the stove. The central roller-grate or grate-bar is contracted at its middle part, and the exterior ones are correspondingly enlarged.

1. The combination of the air-passages *a b e f f*, with the fire-box H, ash-chamber U, and its opening *c*, and annular chamber E, for the purpose of introducing and heating the air that is to promote combustion, making a downward draft through the burning coal into the ash-chamber, thence into and through the chamber E to the exit-pipe, as described and represented.

2. In combination with the magazine K, the crushers or stirrers N; as and for the purpose described and represented.



3. In combination with the hollow roller-grates I J, the central grate being concave and the side grates convex, for leaving the draft-openings between and around them of uniform shape and sectional area, the openings *j*, from the exterior of the stove, for taking in cool air, and the exit-openings therefrom, to allow said air, as it becomes heated, to pass out and mingle with the gases to promote their combustion, substantially as described.

159,052.

159,052. BOBBIN-SUPPORTERS FOR SPOOLING-MACHINES. Axel M. Wade, Lawrence, Mass. [Filed Nov. 20, 1874.]

Brief.—The bobbin lies on a curved rest, and is held in position and the necessary tension given by the pressure on the yarn of two gravitating-lips hung loosely on a carrier above. A projection from the lower part of the lips at the end prevents the yarn from passing up and getting caught between the end of the lip and the carrier.

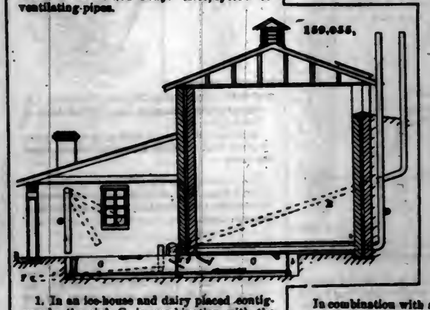
1. The combination of the rest A, with the arm or carrier C, and the gravitating or self-adjusting lips B B, suspended from the latter, all being arranged as specified.

2. The combination of the arched cap G, with the carrier C and its tenons *a*, and with the gravitating or self-adjusting lips B B, provided with slots *f*, to receive such tenons, all being arranged and applied substantially as represented.

3. The gravitating lips B, each provided with the shoulder or projection *i*, arranged as and for the purpose as explained.

159,054.

159,054. APPARATUS FOR DRAWING EFFERVESCENT LIQUIDS. Thomas Warker, New York, N. Y. [Filed June 13, 1874.]



Brief.—The gas-escape valve, connecting with the gas-space of the pressure-relieving chamber, and the liquid-discharge valve, are operated by the same lever, in such a manner that the former is opened first.

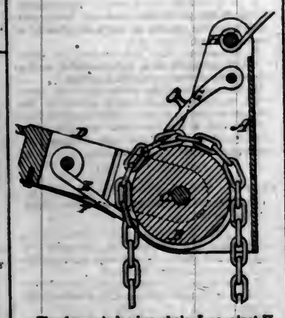
The combination of the lever L with the gas-valve E, stop-valve I, and pressure-relieving chamber A, substantially in the manner and for the purpose herein shown and described.

159,055. COOLING-DAIRIES. J. Wilkinson, Baltimore, Md. [Filed Sept. 4, 1874.]

Brief.—Dairy cooled by circulating currents of cold water from ice-house. Valves interrupt current, and prevent air from passing between ice-house and dairy. Also, system of ventilating-pipes.

159,055.

1. In an ice-house and dairy placed contiguously, the sink C, in combination with the valves *e* and *f*, substantially as and for the purposes specified.



2. The system of air pipes or ducts represented by D E F G, relatively arranged substantially as and for the purposes set forth.

159,056. STOVE-POLISH. Saml. J. Wilson, Farmington, Ill. [Filed Nov. 2, 1874.]

The stove-polish composed of plumbago, vinegar, sugar, dextrine, oil of sassafras, and water, in the mode and quantities substantially as mentioned.

159,057. CHAIN GRIPES AND TIGHTENERS. John N. Ackerman and Geo. J. Ackerman, Hackensack, N. J. [Filed Dec. 10, 1874.]

Brief.—A lever is pivoted on a small strong frame made to abut against the wagon-load. A chain attached to it passes around the load and over a pulley on the lever-fulcrum. A pawl on each piece acts on the chain as on a ratchet.

The frame A, having chain I on pivot H and the pawl G, combined with pulley B and spring-pawled lever D on the same pivot C, as and for the purpose specified.

159,058. MAP-REGISTERS. S. C. Adams, Cincinnati, Ohio. [Filed Sept. 19, 1874.]

The combination, with rollers B, of the frame D E F, having detachably-connected bars E, substantially as and for the purpose specified.

159,059. BURIAL-CASKETS. Wm. G. Algeo, Sr., and Wm. G. Algeo, Jr., Rochester, Pa. [Filed Sept. 11, 1874.]

159,059.

In combination with a wooden coffin, a separate rim-piece, *a*, secured to the coffin-edge, projecting inwardly to afford support for the lining, and having upon its inner edge an upwardly-projecting flange, molded or otherwise ornamented upon its interior, and rabbeted or perpendicular upon its exterior side to hold the cover, substantially as specified.

159,060. BALE-TIES. John B. Arrants, Society Hill, S. C. [Filed Dec. 28, 1874.]

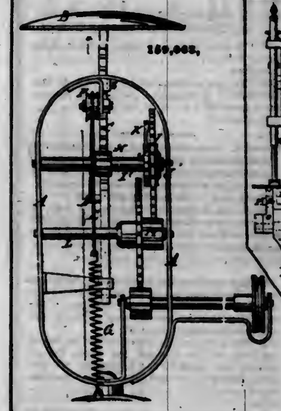
The block or plate A, having grooves D and E, attached to part B of the hoop, in combination with loop F, having part G of the hoop connected to it, all substantially as specified.

159,061. MOLDS FOR AND PROCESSES OF MANUFACTURING GLASS ARTICLES. Thos. B. Atterbury, Pittsburg, Pa., assignor of one-half his right to J. S. Atterbury, same place. [Filed Dec. 10, 1874.]

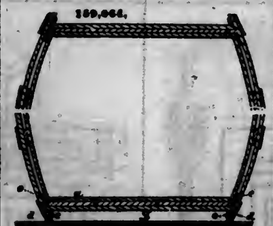
1. The vertically-movable mold-section C, having its upper end protruded through and extended up above the bottom of the mold-section, which forms a lamp-bowl, a fruit-bowl, or a salver, so that the blower can blow the glass for forming the collar and socket upon the top and periphery of the exposed portion of the movable section C, substantially as described.

2. The process herein described of making the specified blown-glass articles with seamless sockets in their bottoms, said process consisting in inserting a vertically-movable section of mold through the bottom of a mold for a lamp-bowl, a fruit-bowl, or a salver, and bringing the hot glass in globe form upon the protruding end of the movable section of mold, and continuing the blowing operation until the article with a collar upon and a socket in its bottom is formed, and then moving the movable section down out of the socket, substantially as described.

3. A blown lamp-bowl, a fruit-bowl, or a salver of glass or other vitreous material, constructed with a collar upon and a blown seamless socket, B, in its bottom, substantially as described.



159,062. GLASS-MOLDS. Benj. Bakewell, Jr., Pittsburg, Pa. [Filed Nov. 30, 1874.]

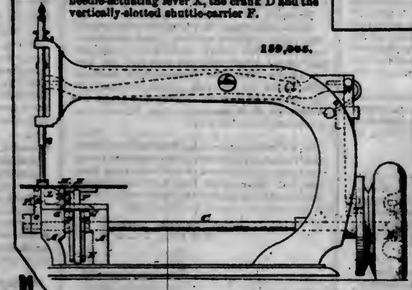


1. The mold and plunger having corrugated faces *a c*, formed so that the convexities of one shall coincide with the concavities of the other, substantially as specified.

2. In combination with the mold and plunger having corrugated faces *a c*, a ring, B, projecting slightly beyond the edge of the concavity of the mold, and having scallops *b'* to accommodate the plunger, substantially as and for the purpose specified.

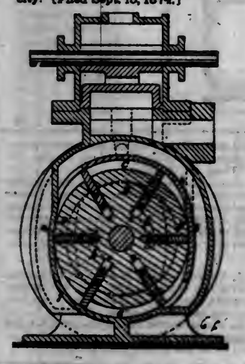
159,063.

159,064.



The combination of the plate *a*, locked within the end of the barrel A, the plate *b* resting on the said end, and beveled on the edge to fit the hoop *c*, the plate *g* resting on the plate *b* and hoop *c*, and beveled on its edge to fit the taper of the chime of the barrel B, the hoop *d*, and stay-hoop *e*, all constructed, adapted, and connected as and for the purpose specified.

159,065. SEWING-MACHINES. Joseph W. Bartlett, New York, N. Y., and Frederick Plant, Bricksburg, N. J.; said Plant assignor to said Bartlett. [Filed Mar. 26, 1874.]

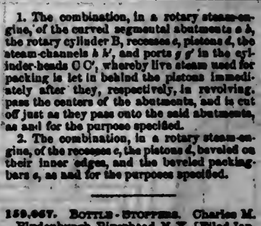


Brief.—The cam that operates the needle-bar, the feed, and the shuttle-carrier are all so arranged on the main shaft as to "time" and to operate in conjunction, the shaft revolving in either direction. The direction of the feed varies with that of the revolution of the main shaft. The shuttle is operated by a crank on the main shaft working in a vertical slot of the shuttle-carrier.

In a machine for sewing under either direction of revolution of the main shaft, in combination with the shaft C, cam T, rod V, and needle-actuating lever X, the crank D and the vertically-slotted shuttle-carrier F.

159,065.

159,066. ROTARY ENGINES. John V. Beakman, Brooklyn, N. Y., assignor to Lidgerwood Manufacturing Company, New York city. [Filed Sept. 10, 1874.]



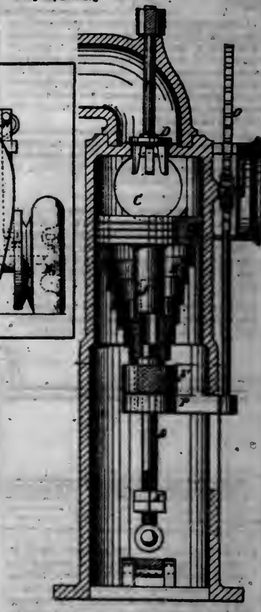
159,066.

159,066. MOTORS FOR LIGHT MACHINERY. David Baldwin, Midland Park, N. J. [Filed Oct. 24, 1874.]

Brief.—The machine is actuated by means of the weight of the operator applied by means of the seat.

The combination with shaft I', having loose spur-wheel I, spring-held side pawl K, fast ratchet J, spring J', and pinion H, of the seat rack-bar C, pulley F, cord E, and spring G, all arranged in connection with frame A, as shown and described, for the purpose of operating the drive mechanism of the sewing-machine.

159,067.

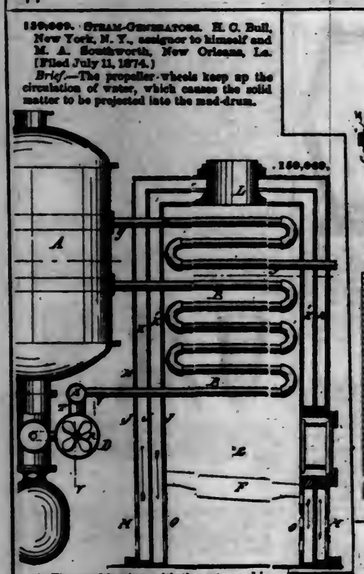


159,067. BOTTLE-STOPPERS. Charles M. Hydenburgh, Riverhead, N. Y. [Filed Jan. 6, 1875.]

Brief.—An ordinary bottle-stopper of cork, the lower end of which is hollowed to receive a piece of sponge or other suitable porous material.

A bottle-stopper provided with a swab, B, of sponge or other suitable material at its lower or inner end, substantially as herein set forth.

159,068. SAFETY-VALVES. H. C. Bull, New York, N. Y., assignor to himself and M. A. Southworth, New Orleans, La. [Filed July 11, 1874.]



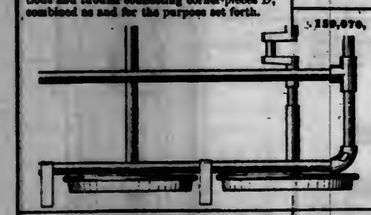
1. The piston A and spring E, connected to the safety-valve by rods G and cross-heads F H, so as to hold the valve shut until the pressure reaches the blow-off point, and combined with rods J L and treadles N, so as to counteract the spring and open the valve at the blow-off pressure, substantially in the manner described.

2. The combination of an adjusting-collar, K, with rods L and J, as described, for varying the set point, substantially as specified.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

159,069. STEAM-GENERATOR. H. C. Bull, New York, N. Y., assignor to himself and M. A. Southworth, New Orleans, La. (Filed July 11, 1874.)

Brief.—The propeller-wheels keep up the circulation of water, which causes the solid matter to be projected into the mud-drum.



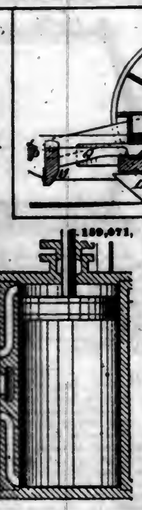
1. The combination, with the outer and inner shells J J, having, respectively, openings M and O, of the central partition J, having openings N, the said parts being arranged with the spaces K K' between them, all as shown and described, whereby air to support combustion is caused to take the course indicated and discharge beneath the grate or into the fire, as set forth.

2. The combination, with the drop-tube and generating-tube B, of the drum D, lateral pipes V, central tube T, and the propeller-wheels, operating in opposite directions, as and for the purpose specified.

159,070. TRUCKS FOR STREET-RAILWAY CARS. H. C. Bull, New York, N. Y., assignor to himself and M. A. Southworth, New Orleans, La. (Filed July 11, 1874.)

Brief.—Truck-frame made of tubular iron with tubular joints, to provide a receptacle for water for steam-power.

The car-truck frame formed of tubular sections and tubular connecting corner-pieces D, combined as and for the purpose set forth.



159,071. ADJUSTING APPARATUS FOR CUT-OFF VALVES. H. C. Bull, New York, N. Y., assignor to himself and M. A. Southworth, New Orleans, La. (Filed July 11, 1874.)

Brief.—The threaded heads of the rods are attached to an adjusting-nut, which is swiveled to the eccentric-rod.

1. The combination of the cut-off valves A B within the steam-chest, connecting-rods C D, having threaded heads, right and left threaded adjusting-nut G, the swiveled sleeve, and the eccentric, substantially as shown and described, to operate as specified.

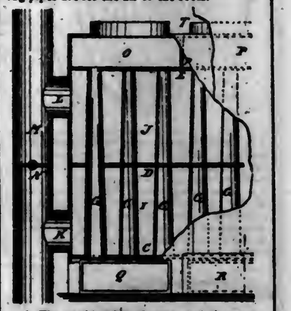
2. The combination of valve-rod D, tubular valve-rod C, stuffing-box E, and sleeve G, substantially as shown and described.

159,072. BRICK-KILNS. Wm. Bull, Ewell, England. (Filed Dec. 5, 1874.)

Brief.—In putting in the brick to be burned, longitudinal spaces are left, which communicate with the firing-flues, and constitute lengthened combustion-chambers. As the top of the brick are progressively covered with refuse, the movable chimney is placed as the further edge of this cover, and the draft is thus led by successive stages through the whole length of the kiln.

In a kiln-oven, the walls, intermediate floor, interwalled ash-flues carried through said floor, superposed firing-flues, brick-receiving fire-bars, and green brick inside walls, all combined and covered with ashes or soil, except at intervals, as shown and described.

159,073. HARROWS AND PLANTERS. Beauman Butler, St. Johnsbury Centre, Vt. (Filed Oct. 31, 1874.)



Brief.—To the under side of the seeding-machine frame is removably attached a frame provided with opening, pulverizing, planting, and covering teeth, for pulverizing the soil and planting. The main frame is provided with pivoted scrapers at the front for leveling the soil.

1. The combination, in a seeder, of the teeth K, spacers L, scraper-bars M N, and tongue-roller O, arranged, as shown and described, to bring the hand into good tilth.

2. A seed-harrow, having the teeth K L and the reversely-obliqued covering-scrapers U, arranged as and for the purposes specified.

159,074. VENTILATING AND WARMING DRUMS. Peter H. Carmen, Brooklyn, N. Y. (Filed Dec. 12, 1874.)

Brief.—The chambers Q O and their connecting-pipes are for fresh air from outside, while the chambers R P and their connecting-pipes are for the air of the room.

1. The combination of connected chambers Q O P R with tubes G, as and for the purpose described.

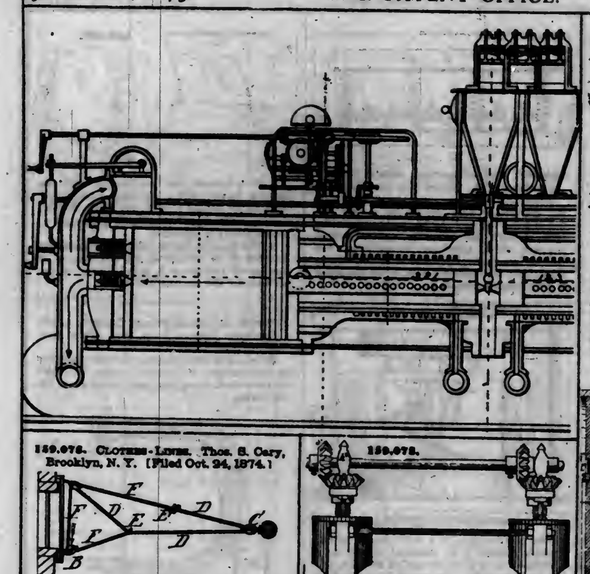
2. The combination, with tubes G, of the chambers I J, connected by tubes L K with the dampered pipe M N, as and for the purpose specified.

159,075. ATMOSPHERIC-AIR COMPRESSORS FOR WORKING ENGINES. Cesare Carobbi and Giuseppe Bellini, Pistoja, assignors of one-third their rights to John Reynolds, Prato, Italy. (Filed May 26, 1874.)

Brief.—A fulminate is introduced from a charger into a space between the pistons, and is ignited by an electrical spark. The pistons are driven forward to compress the air into a tank, from which it is used as desired.

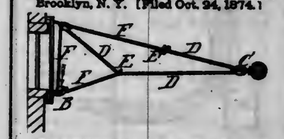
1. The combination, substantially as before set forth, of the charger for the explosive material, the piston for receiving the force of the explosion, and the air-compressing piston and cylinder for compressing air.

2. The combination, substantially as before set forth, of the charger, the piston for receiving the force of the explosion, the air-compressing piston and cylinder, and the electric apparatus for igniting the explosive material.



3. The combination, substantially as before set forth, of the charger, the piston for receiving the force of the explosion, the air-compressing piston and cylinder, the electric apparatus, and the compressed-air tank.

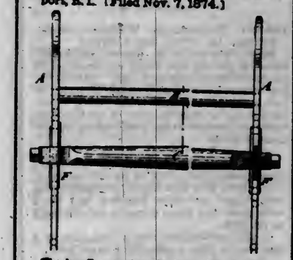
4. The combination, substantially as before set forth, of the charger, the piston for receiving the force of the explosion, the grooved cylinder thereof, and the air-compressing cylinder and piston.



5. The combination, substantially as before set forth, of the charger for the explosive material and the explosion-pistons, arranged to move in opposite directions.

6. The combination, substantially as before set forth, of the two explosion-pistons and their cylinders, and of the two air-compressing pistons and their cylinders, all in the same line.

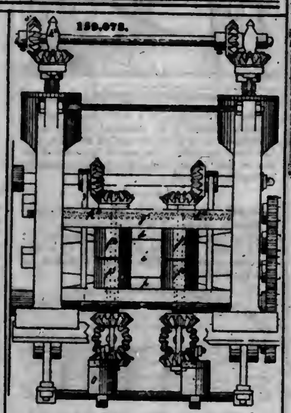
7. The combination, substantially as before set forth, of the charger, the piston for receiving the force of the explosion, the air-compressing piston and cylinder, and the spring for effecting the return movement of the said two pistons.



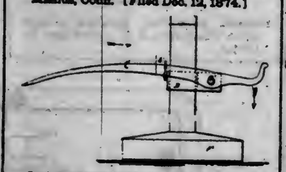
159,076. CLOTHES-LINES. Thos. S. Cary, Brooklyn, N. Y. (Filed Oct. 24, 1874.)

The combination of the double pulley-block A, single pulley-blocks B C, and ropes D and F, connected together at the points E and E', as and for the purpose specified.

159,077. BRIDLE-BITS. Peter Casey, Newport, R. I. (Filed Nov. 7, 1874.)



The bar C, carrying the loops F and adjustable to any fixed point upon the side bars A, in combination with said side bars A and rigidly-connecting bar B, as and for the purpose specified.

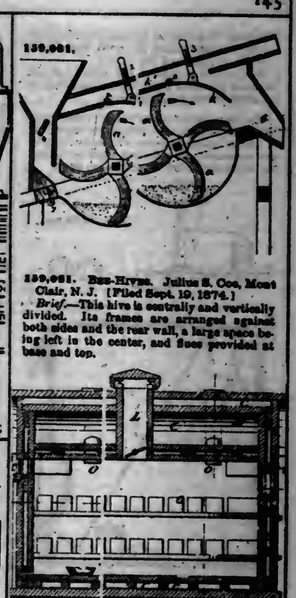


159,078. ROLLING-MILLS. George A. Chalfant, Etna, and Ignatius Hahn, Pittsburg, Pa. (Filed Oct. 6, 1874.)

Brief.—A set of three-high rolls and four pairs of vertical rolls, of which two pair are placed on the one side, and two pair on the other side, of the three-high rolls. Then, to each pass there is a pair of feed-rolls and a pair of delivering-rolls, and each pair is driven by the system of gearing described, positively and irreversibly, in a direction appropriate to the pass to which it belongs.

The combination of the following parts: first, the non-reversing power-driven horizontal rolls *d*, *f*, and *p*, forming a direct and a return pass; second, the non-reversing vertical rolls arranged in pairs on both sides of the horizontal rolls, in the plane of each pass, and turning in the direction of the pass in whose plane they stand; and, third, devices for turning the vertical rolls by power from the power-shaft, for the purposes described.

159,079. WAGON-JACKS. Samuel Chard, Mianus, Conn. (Filed Dec. 12, 1874.)



1. A cramping-band of a hoisting-jack, with the holding-hook arranged as shown and described.

2. The combination of the band B, lever C, fulcrum-pin *c'*, and hook *b'*, with the stand A, for the purposes described.

159,080. MACHINES FOR HULLING AND SCOURING GRAIN. Lewis G. Chichester, New York, N. Y., assignor to J. J. Tyler, same place. (Filed Dec. 12, 1874.)

1. The revolving hands or rubbers *a a*, in combination with the adjustable deflectors *b* and trash *b'*, substantially as set forth.

2. The hands or rubbers made sectionally of a V shape, and curved forward at their ends, and revolved in pairs within the grain-receptacle to loosen and separate the hulls by the rubbing motion specified.

159,081. BEE-HIVES. Julius S. Cox, Mont Clair, N. J. (Filed Sept. 10, 1874.)

Brief.—This hive is centrally and vertically divided. Its frames are arranged against both sides and the rear wall, a large space being left in the center, and flues provided at base and top.

The combination, with a bisected close bee-house, of side shelves arranged around an open space in tiers, the air-inlet pipes O, and the air-discharge flue L, as shown and described.

159,082. NAIL-ASSORTING MACHINES. John Coyne, Pittsburg, assignor to himself and Robert Chessman, Etna, Pa. (Filed Mar. 20, 1873.)

Brief.—An arm rigidly attached to crossbar of the nail-machine frame projects forward, and, by its bent extremity, protects the assorter from accidents. The assorter is supported wholly through the medium of the bracket by the rod, which, at its forward end, is clamped to the bar, and its other extremity extends within a fork on a spring-rod that is vibrated by the beater of the nail-machine. The hood attached to the assorter gathers in the nails a, they fall from the cutters.

1. A nail-assorting spout having both of its inclined side plates adjustable upon their braces, as and for the purpose described.

2. The longitudinal brace *e*, having a turned-up end, *e'*, and guard *h*, in combination with the brace *e'*, to protect the assorter, as described.

3. The rod *d*, in combination with the fork *n* and assorter *a*, as and for the purpose described.

4. The spring *m*, fork *n*, and branch *p*, in combination with the heading-lever *g* of the nail-machine, substantially as and for the purpose described.

5. The combination of the assorter *a* and rod *d* with the heading-lever of the nail-machine, and devices for jarring or striking the rod *d* at a point in the rear of the reed-ring-pan, and directly under the heading-lever, to produce a tremulous vibration of the assorter, for the purpose stated.

6. In combination with a nail-assorter, a receiver interposed between the nail-machine and assorter, for the purpose stated.

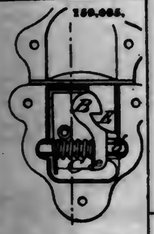
159,065. ELECTRICAL INDICATORS FOR LETTER-BOXES. Henry R. David, New York, N. Y. (Filed Sept. 23, 1874.)

Brief.—The weight of the letter tips the balanced platform, thus closing the circuit to a distant electro-magnetic alarm.

The letter receptacle or box provided with a balanced platform that is moved by the weight of a letter, in combination with a circuit-closer and connections to a distant alarm or indicating apparatus, substantially as set forth.

159,065.

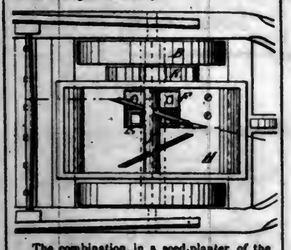
159,066. IRON BRIDGES. H. I. Farnsworth, Leavenworth, Kans. (Filed Jan. 4, 1875.)



Brief.—A bridge-arch consisting of two channel or I-beams, a top plate, transverse plates, and diagonal intermediate braces.

The combination, in an arch for bridges, of channel or I-beams A, top plate B, transverse plates C, and diagonal intermediate braces D, substantially as specified.

159,066.



159,068.

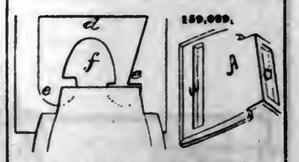
159,067. SEED-PLANTERS. John G. Garner, Pittsburg, Tex. (Filed Nov. 14, 1874.)

Brief.—Upon one axle are placed two laterally-adjustable seed-wheels for sowing different kinds of seed, to be used at the same time, or singly, in connection with removable hoppers, one of which has an opening in the bottom large enough to receive the two wheels for sowing seed and fertilizer, while the other is for a single wheel only.

159,067.

The combination, in a seed-planter, of the dropping-disks E F, mounted loosely on a driving-axle, so as to be shifted thereon, and the interchangeable hoppers H M, adapted for one or both disks, respectively, substantially as herein specified.

159,068. HAT-BLOCKS. Francis R. Going, Boston, Mass. (Filed Dec. 2, 1874.)

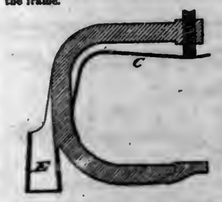


Brief.—A block formed of a paper or felt shell, whose open end is sustained by a base or head piece, in which is held a socket for the machine-spindle.

A hollow hat-block formed of a felt or paper shell and a suitable supporting-base, substantially as described.

159,069. BALE-TIES. Abraham A. Goldsmith, Charleston, S. C. (Filed Dec. 19, 1874.)

159,069.

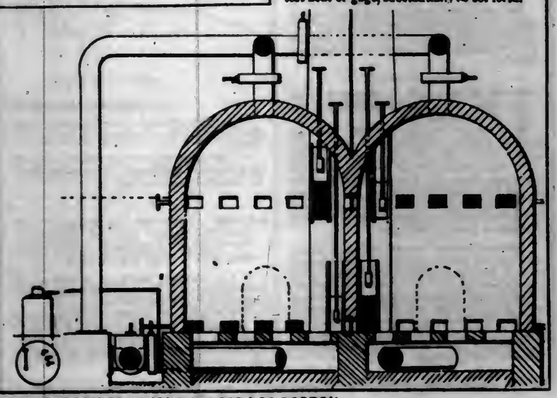


1. In a bale-tie, the combination, with the plate A, having slot *a*, and slotted projecting ug *b*, of the slotted plate B, having the double-barbed catch *f*, and shouldered projection *e*, substantially as specified.

2. The plate A, having slot *a* to receive the free end of the bale-strap, and the slot *c* in its downward projection *b*, substantially as described, for the purpose specified.

159,070. QUILTING-FRAME CLAMPS. A. P. Grabham, Mineral Point, Wis. (Filed Apr. 25, 1874.)

Brief.—The clamp secures the bars together at the corners of quilting-frames, and the socket is for holding standards or supports for the frame.



A clamp for quilting-frames, consisting of the U-shaped device, as shown in Fig. 1 of the accompanying drawing, provided with the thumb-screw B, guard-spring C, and the standard-socket attachment E, all combined to operate substantially as and for the purpose set forth.

159,071. BRICK-KILNS. William L. Gregg, Chicago, Ill. (Filed Dec. 4, 1874.)

Brief.—The gas to be burned may be admitted at the top, and drawn downward or at the bottom with an upward draft. The shrinking of the brick in the process of drying is indicated by the descent of the index, which extends up through the cover of the kiln, and below is attached to the float resting on the mass of brick.

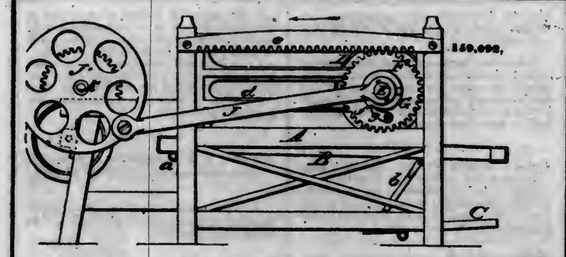
1. The combination of a gas-producer, gas-conduits, and valves for upward or downward draft, and kiln having compartments, with upper and lower dampers, and stack with upper and lower dampers, substantially as set forth.

2. The combination, with a brick-kiln, of a test float or gage, substantially as set forth.

159,064.

159,065.

159,064. TRUNK-FASTENERS. A. Frankel, Newark, N. J., assignor to J. Legowitz, same place. (Filed Dec. 28, 1874.)



The hooked catch B, formed on the oscillating and longitudinally-movable stem *b*, and the spring C, coiled around the stem *b*, and acting on the staple *a*, the whole being applied in a case, A, and combined with the catch E, in the manner and for the purpose set forth.

159,072. SPRING BED-BOTTOMS. Joseph Fowler, New York, N. Y., and J. R. Dewar, Bergen, N. J. (Filed Sept. 29, 1874.)

Brief.—The slats are arranged in sections, each section consisting of two slats connected at their ends by short transverse bars, the ends of which are attached. The several sections rest on long transverse bars, suspended from the head and foot boards by springs, and the notched ends of the short bars embrace the springs to prevent longitudinal and lateral displacement of the several sections.

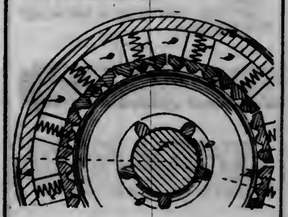
The bars F F, having notched ends *a*, and the slats E E, in combination with the springs C and suspended bars D, as shown and described, to operate as specified.

159,073.

159,073. MACHINERY FOR FINISHING LEATHER. A. M. L. Groff and John A. Marvel, Wilmington, Del. (Filed Nov. 7, 1874.)

1. In a machine for pebbling, graining, and softening leather, the semi-cylindrical rotary rubber, D, having an oscillating rectilinear and reciprocating motion, in combination with an adjustable table, B, which is arranged beneath said rubber, substantially as and for the purpose set forth.

2. The semi-cylindrical rubber D, the axis of which is provided with cog-wheels F F and notched cams G G, in combination with the racks *e e*, pawls *g g*, wheels J' J', and pitman J J, substantially as and for the purpose set forth.



159,074. PROCESSES OF MANUFACTURING TILES. Edwin L. Hall, Zanesville, Ohio. (Filed Oct. 8, 1874.)

1. The process herein described of manufacturing tiles, consisting of taking clay crude from the bank, and when dry subjecting it directly to suitable pressure in proper molds or forms, and afterward baking the same, substantially as described.

2. The process herein described of manufacturing figured or vari-colored tiles by pressing dry clay, impregnated with the desired pigments, into molds, wherein the desired figure is marked out and defined by a thin partition, whereby the mold is sub-divided into compartments, into which vari-colored clays are introduced, after which the figured partition is withdrawn before the dry and vari-colored clays are pressed into a solid mass and afterward baked.

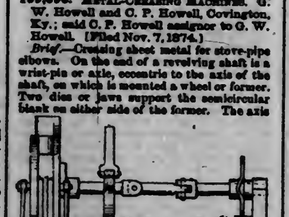
159,075. WASHING-MACHINES. Silas W. Holbrook, Catskill, N. Y. (Filed Nov. 21, 1874.)

Brief.—In a cylindrical tub are arranged vertical ribbed rubbers, attached by springs to the tub, and yield between division-blocks on the sides of the tub.

The combination of the vertical ribbed plates E, guide-blocks D, and springs C, said plates being arranged to form the inner wall or side of the ends-box, and to yield or move outward at either end, as shown and described.

159,076. AUTOMATIC BOILER-FEEDERS, &c. Jos. W. Hopkins, New York, N. Y. (Filed Dec. 26, 1874.)

Brief.—The float in the water-receptacle operates upon a piston-valve, that allows steam from the boiler to move the steam and water valves, that admit steam and water alternately to said receptacle.

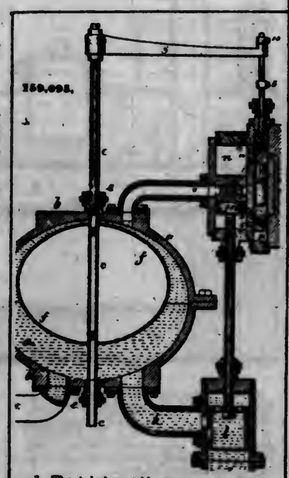


159,074.

159,077. METAL-CREASING MACHINES. G. W. Howell and C. P. Howell, Covington, Ky.; said C. P. Howell assignor to G. W. Howell. (Filed Nov. 7, 1874.)

Brief.—Creasing sheet metal for stove-pipe elbows. On the end of a revolving shaft is a wrist-pin or axle, eccentric to the axis of the shaft, on which is mounted a wheel or former. Two dies or jaws support the semicircular blank on either side of the former. The axis of the revolving shaft, which carries the former, is eccentric to the axis of the semicircular blank, so that a crease or fold is formed in the blank at each revolution of the shaft and former, of slight depth at one edge of the blank, and gradually increasing in depth to the other edge thereof. After the formation of one crease, the jaws recede and the blank is fed forward for a successive operation.

159,075.



159,076.

1. The tubular guide-stem *e*, open to the atmosphere at the lower end, and passing through a packing, *c*, into the otherwise closed float *f* of a boiler-feeder or water-raising apparatus, for the purposes set forth.

2. The auxiliary piston-valve *o*, actuated by tappets and an arm from the float *f* in the vessel *a*, in combination with the main steam-valve *m* and water-valve *l*, connected together and operating as set forth.

159,077.

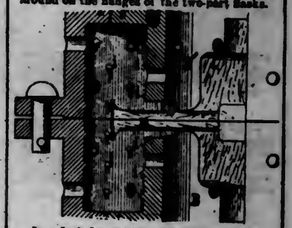
1. The former *d*, having an axle-bearing on the end of the driving-shaft D, with which it revolves concentrically, while both revolve eccentrically to the metal blank, in combination with suitable mechanism for holding semicircular sheets of metal while the same are being creased, substantially as described.

2. The linked jaws *g g'*, arranged to move on two centers, substantially as and for the purpose described, in combination with suitable mechanism for creasing semicircular sheets of metal between their surfaces.

3. The combination of plates E E', jaws *g g'*, and former *d*, adapted to form curves and creases in sheet metal for pipe-elbows, all substantially as herein set forth.

4. Jaws *g g'*, in combination with the pulleys and levers described, for operating the same automatically, substantially as herein set forth.

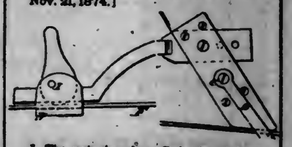
5. Plates E E', in combination with the pulleys, crank, and rods described, for automatically operating the same, as specified.



6. The noned cam J, in combination with carriage K, pawl *h*, and ratchet H, substantially as described, and for the purpose specified.

7. In a pipe-elbow metal-creasing machine, the yoke G, having two hinged semicircular leaves, *b b'*, adapted to embrace the metal blank on its inner and outer peripheries, and thereby preserve its circularity while feeding it into the machine, substantially as shown and described.

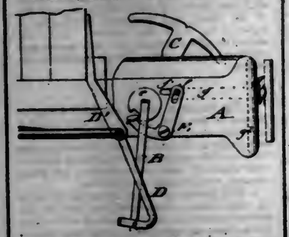
159,078. FLASKS FOR CASTING PULLEYS. William Hutton, Philadelphia, Pa. (Filed Aug. 11, ..74.)



Brief.—The matrix for the rim of the pulley is formed by sweeps adapted to be moved around on the flanges of the two-part flasks.

159,078.

In a flask for making pulleys, the combination of an outer flask, consisting of the bottom A and cope A', provided with the flanges *a a'*, and an inner flask, consisting of the bottom B and cope B', provided with the flanges *b* and *b'*, and adapted to have the molds formed therein by means of the sweeps C and D, substantially as described.



159,079. DEVICES FOR BALING COTTON. William Iler, Shreveport, La., assignor to himself and J. W. Iler, same place. (Filed Nov. 21, 1874.)

1. The swinging clamp B, having right-angled arm D, and pivoted to one side of a lever, A, having an oblique-edged lower end, as and for the purpose described.

2. The combination, with bar G, of the lower lip J and superposed cam I, as and for the purpose specified.

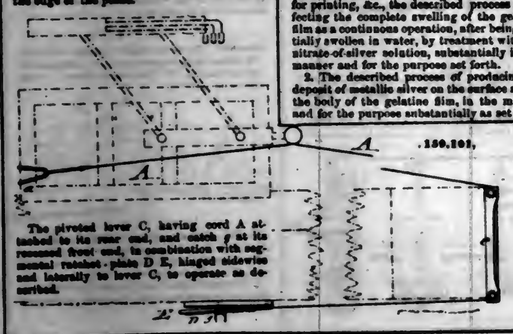
159,099. CAR-COUPLINGS. A. A. Kellogg, Montgomery, Mich., assignor to himself and M. B. Cartwright, same place. [Filed Dec. 28, 1874.]

1. In automatic car-couplings, the combination of draw-head A, having longitudinal top slot, *a*, and bottom perforation, *b*, with swinging and spring-acted coupling-hook B, for locking securely to draw-head and retaining the coupling-link, substantially as set forth.

2. The lateral hook-shaft B, pivoted to rear part of draw-head A, and having rectangular cross-section at the part of the cavity of the draw-head, in combination with recessed end of shank of coupling-hook, for attaching the same securely but detachably thereto, for the purpose specified.

3. The pivoted lever-frame B, having extension-arms, in connection with pivoted nuts *b'* of a spring-acted lever-frame, D, for yielding to the concussion of the draw-head without breaking lever-frame, as set forth.

4. The combination of spring-acted lever-frame D and pivoted lateral shaft B, having notched disk *c*, with pivoted dog E, having end hook, *e'*, for locking shaft B and coupling-hook in raised position, or swinging down lever-frame, substantially as specified.



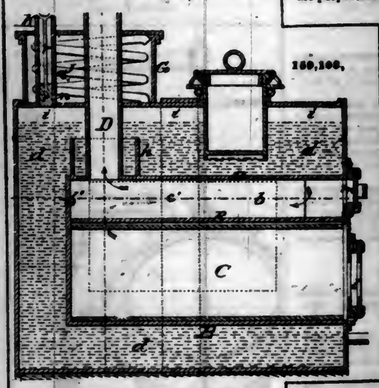
5. The combination of lever-frame D and shaft B, having notched disk *c*, with pivoted elbow-dog E and sliding spring-acted rod *g*, having projecting front piece, *g'*, for releasing shaft B and lever-frame D on concussion of draw-heads, and carrying coupling-hook down for locking link to draw-head, substantially as and for the purpose set forth.

159,100. PROCESSES OF MOISTENING GRAIN PREPARATORY TO GRINDING. William M. Kennedy, Pittsburg, Pa. [Filed Oct. 17, 1874.]

As an improvement in the method of dampening or moistening cereals, subjecting them while in motion to the simultaneous action of separate and independent steam and air currents, so as to condense the steam upon the grain, substantially as specified.

159,101. MUSIC-LEAF TURNERS. William H. King, Petersburg, Ind., assignor to himself and Jerome Borer, same place. [Filed Apr. 13, 1874.]

Brief.—Worked by a knee-plate just under the edge of the piece.



The pivoted lever C, having cord A attached to its rear end, and catch *g* at its recessed front end, in combination with segmental ratchet-plate D E, hinged sideways and laterally to lever C, to operate as described.

159,102. PROCESSES OF COLORING TOBACCO. Oscar Knab, Newark, N. J. [Filed Dec. 12, 1874.]

The process herein described of treating tobacco-leaves for imparting or restoring a dark color of the same, consisting in passing the leaves, in a soft and moistened state, through a solution of sesquichloride of iron, substantially as herein set forth.

159,103. WATER-HEATERS. Saml. L. Latta, Ligonier, Ind. [Filed Nov. 7, 1874.]

Brief.—The water-vessel at the base of the exit-flue is designed to protect the pipe at that point. When desired, water may be admitted from the coil-reservoir by lifting the valve.

1. The combination of the smoke-pipe D, fire-chamber C, and smoke-flues *c c'*, nearly surrounded by water, the latter being arranged as described, so as to cause the products of combustion to pass forward and then backward before escaping through the pipe D, as and for the purpose set forth.

2. The cup A, surrounding the base of the smoke-pipe D, arranged in water-space *c*, and combined with the flues *c c'* and fire-chamber C, substantially as described.

3. The reservoir G, coil-pipe J, and smoke-pipe D, in combination with the feed-pipe K, perforated at *n*, and the valve *r*, substantially as described.

159,104. PROCESSES OF PRODUCING PHOTO-RELIEF PLATES FOR PRINTING, &c. Louis B. Levy and David Bachrach, Jr., Baltimore, Md. [Filed Jan. 4, 1875.]

Brief.—Electrotype casts from bichromated gelatine films are prepared in the manner claimed.

1. In the preparation of photo-relief plates for printing, &c., the described process of effecting the complete swelling of the gelatine film as a continuous operation, after being partially swollen in water, by treatment with the nitrate-of-silver solution, substantially in the manner and for the purpose set forth.

2. The described process of producing the deposit of metallic silver on the surface and in the body of the gelatine film, in the manner and for the purpose substantially as set forth.

3. The described method of producing an electrolytic deposit of sulphuret of silver by means of sulphuret of potassium, as substantially in the manner and for the purpose set forth.

4. The described process of producing relief-plates for printing and other purposes, consisting essentially of the several steps above described, in the order of their succession, substantially as set forth.

159,105. WHIP-TIP FERRULES. Edward B. Light, Denver, Colo. [Filed Oct. 17, 1874.]

As a new article of manufacture, a tube, D, provided with opposite screws E E, as and for the purpose described.

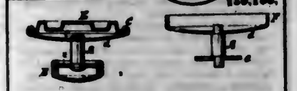
159,106.

159,107. TOY CARTRIDGE-EXPLODERS. J. B. McHarg, Rome, N. Y. [Filed Oct. 28, 1874.]

Brief.—For sport merely, or may be used as danger-signals

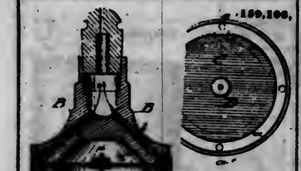
As an attachment for canes, arrows, and similar articles, a blank-cartridge exploder composed of the cylinder H, having a lateral aperture, F, and the cap C, combined to operate as and for the purpose described.

159,108. SELF-REGULATING GAS-BURNERS. Duncan D. McMillan, La Crosse, Wis. [Filed Nov. 21, 1874.]



Brief.—The diaphragm is held between the two sections, in the lower of which is a circumferential annular chamber, and in the upper converging channels.

The combination of the lower section or shell A, provided with a circumferential annular chamber, *a*, having bottom openings *a'*, the top section having upwardly-converging channels *b*, and the flexible diaphragm C and valve D, secured between the two sections, and located inside the annular gas-chamber, as herein shown and described.



159,101.

159,104.

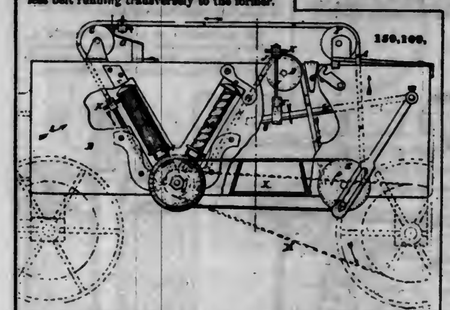
159,106.

159,109.

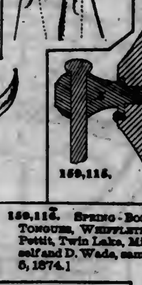
1. The inclined table A, provided with the clamping-bars *a* in combination with the rotating frame F, drums H, and blanket J, substantially as and for the purpose set forth.

2. The rotating frame F, drum H, blanket J, and trough M, in combination with the table A, and washing-tank K, substantially as and for the purpose set forth.

159,111. IRONING-BOARDS. S. B. Morrell, Racine, Wis. [Filed Aug. 20, 1874.]



159,111.



The serpentine hinged spring-brackets, as described, in combination with the board A and the stretching and clamping strip C, substantially as and for the purpose described.

159,112. SCARFS. Andrew Mueller Boston, Mass. [Filed Nov. 26, 1874.]

159,108.

159,112.

1. A scarf having a sliding front piece, held by suitable springs, and covering a photograph or other similar object, and adapted to be depressed by the wearer, so as to expose the photograph to view, substantially as shown and described.

2. A scarf provided with a back piece, B, adapted to hold a photograph or other like object, the sliding piece F, the springs G, and cord H, all combined and arranged to operate substantially as and for the purpose set forth.

159,109. COTTON-HARVESTERS. La Fayette K. Miller, Austin, Tex. [Filed Aug. 10, 1874.]

Brief.—An endless belt carries whirling pickers, which are made to revolve, when entering the cotton, by contact with another endless belt running transversely to the former.

159,109.

159,110.

1. The combination, in a cotton-harvester, of rotary or whirling pickers I and a carrier, A, substantially as herein described, for the purpose set forth.

2. The combination, in a cotton-harvester, of an endless cross-belt, N, and traveling revolving or whirling pickers I, provided with pinions or serrated disks K, substantially as herein described.

3. The combination of pickers I, pivoted supporting-bar J, endless carriers A, and stationary cams O Q, substantially as specified.

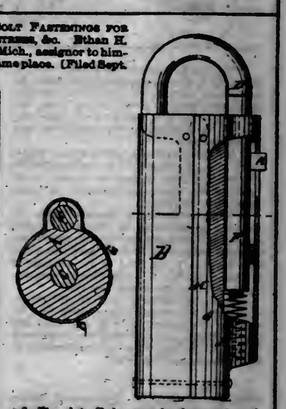
4. The strippers R, tube S, stripping-bar T, and levers U, combined with the pickers, substantially as specified.

5. The strippers arranged in grooves in the revolving pickers, and the tube S, swiveled to the stripping-bar, substantially as specified.

6. The inclined drums M for endless belts L, having a spiral rib for keeping up the said belts, substantially as specified.

159,116. CORE-CONCENTRATORS. Calvin Moore and Chas. H. Campfield, San Francisco, Cal. [Filed Nov. 21, 1874.]

Brief.—Side rails, adjustable toward each other, swing over inwardly onto the table, are hooked together, and clamp the blanket. One blanket, having been charged, is rolled up, the lid *c* thrown upward and backward, the frame revolved, the fresh blanket spread on the table, and the charged blanket washed in the tank, all for use in a tailings-sluice.

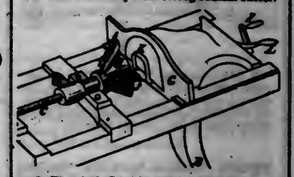


159,110.

159,116.

159,113. SPRING-BOLT FASTENINGS FOR TONGUES, WHIFFLETREES, &c. Ethan H. Pettit, Twin Lake, Mich., assignor to himself and D. Wade, same place. [Filed Sept. 5, 1874.]

159,113.



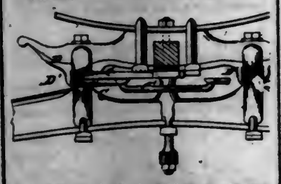
1. The plate B, having circular portions G and I to receive a tongue-yoke, in the manner described.

2. A tongue-yoke consisting of the hook part C and spring-held straight part F combined, and their ends meeting, so as to form a flush-joint, as shown and described.

The tub A, provided with the false bottom F and orifice C, in combination with the spout E and alternating rifles or partitions *d e*, substantially as and for the purpose set forth.

159,114. MACHINES FOR CUTTING HEADS FOR BARRELS. Otto Cotton, North Bend, Oreg. [Filed Nov. 18, 1874.]

Brief.—The material from which the head is to be made is secured in a clamp, and cut to the desired form by a revolving conical cutter.

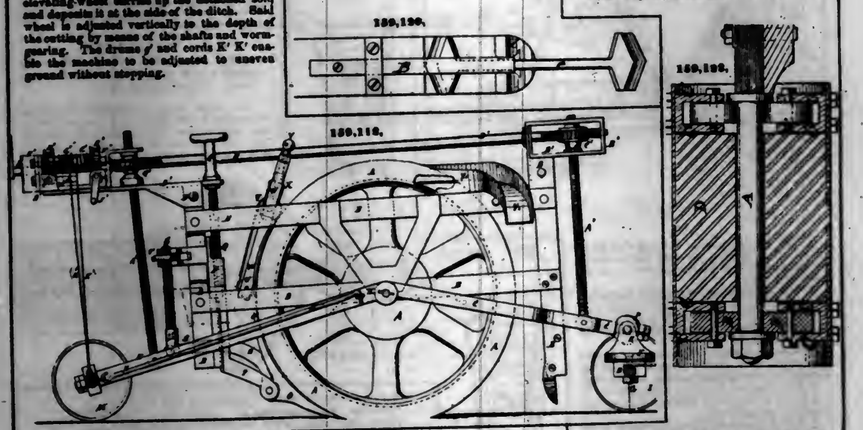


1. The shaft C, with its hollow conical head *d*, said head being provided with adjustable cutting-bits *f*, in combination with the sliding head G, operated by the screw *h* and crank I, substantially as and for the purpose above described.

2. The clamping-bar K, operated by lever L, in combination with the sliding head G and rotating cutter *f*, substantially as and for the purpose described.

159,115. VISES. Edwd. Parker, Plymouth, assignor to Elmore Penfield, Middletown, Conn. [Filed Nov. 16, 1874.]

The solid body or standard A, having a cylindrical bearing for the stem of each of the rotating jaws D C, as shown, in combination with the nut F, screw E, and locking-bolt G, constructed and arranged as described.



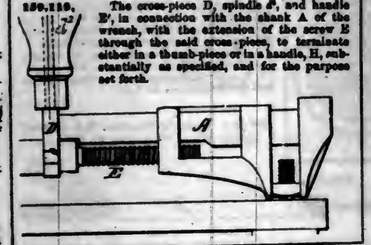
159,117. FIFTH-WHEELS FOR VEHICLES. Geo. F. Putman, Fonda, N. Y. [Filed Nov. 7, 1874.]

In fifth-wheels, the head-block or axle, provided with guard-plates D' at both sides and opposite points of the fifth-wheel, for protecting king-bolt and wheel, substantially in the manner and for the purpose set forth.

159,118. DITCHING-MACHINES. Theodore F. Randolph, Morristown, N. J. [Filed Dec. 12, 1874.]

Brief.—The elevating-wheel is made with sharp edges, to divide the soil by its weight, the sides of soil being further separated by the shoe O, pivoted near its middle, and made adjustable vertically and longitudinally. The elevating-wheel carries up the detached soil, and deposits it at the side of the ditch. Said wheel is adjusted vertically to the depth of the cutting by means of the shafts and worm-gearing. The drums *f* and cords K' K' enable the machine to be adjusted to uneven ground without stopping.

1. The combination of the sliding block P, screws Q S, arm R, and shoe O, the latter being pivoted between its extremities, and near the middle thereof, to the sliding block, and rigidly secured to or formed in one piece with the arm R, substantially as and for the purpose specified.



2. The ball-bearing D, pivots E, and lugged plate F, in combination with the king-bolt G, the forward axle, H, and the forward draft-bar O of the ditcher, substantially as herein shown and described.

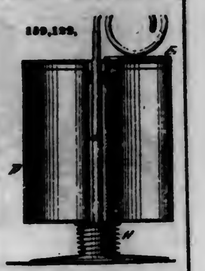
3. The combination of the two drums, G', the two screw-wheels, H', the two swiveled screws, F' J', and the two cords or chains, K', with the frame-work B' B of the ditcher, and with the axle I, swiveled to the rear end of the rear draft-bar, K, of the ditcher, substantially as herein shown and described.

4. The combination of the swiveled screw-rod D', the two swiveled screw-wheel nuts, O', and the two screws, A', with the front and rear draft-bars, O K, and with the frame-work B' B, and ditching-wheel A, substantially as herein shown and described.

159,119. WRENCHES. Sylvanus R. Robinson, Mansfield, Wis. [Filed Dec. 5, 1874.]

Brief.—In addition to the handle, which is parallel with the bars on which the jaws slide, there is an additional handle attached at a right angle thereto, forming a crank to facilitate the operation of the instrument in loosening or tightening a nut.

The cross-piece D, spindle *S*, and handle E', in connection with the shank A of the wrench, with the extension of the screw E through the said cross-piece, to terminate either in a thumb-piece or in a handle, H, substantially as specified, and for the purpose set forth.



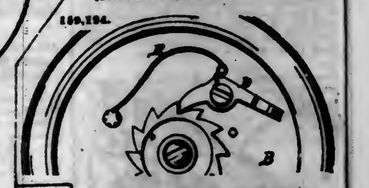
159,120. CAR-COUPLINGS. G. W. R. Row, Steele's Tavern, Va. [Filed Nov. 21, 1874.]

The combination, with a draw-bar, in the front of which is the inclined head *d*, having an outwardly-tapered longitudinal recess, of the horizontal plate-spring B, made fast in the rear, and having its front end resting over said recess, as and for the purpose specified.

159,121. REVOLVING SPICE-BOXES. Thos. W. F. Smitten, New York, N. Y. [Filed Dec. 3, 1874.]

Brief.—The spice-boxes are pivoted on and revolve around a vertical spindle, which is provided with imperforate covers for all the boxes, save one, so that whichever spice-box is open, the others will be closed.

The combination, on a vertical spindle, A, of two or more upright horizontally-revolving cases, C D, and a stationary cover, E, with or without a spring, substantially as specified.

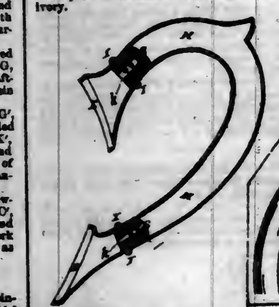


159,122.

159,123. HUBS FOR VEHICLE-WHEELS. William Teegarden, Higginsport, Ohio, assignor of one-half his right to Geo. Teegarden, same place. [Filed July 11, 1874.]

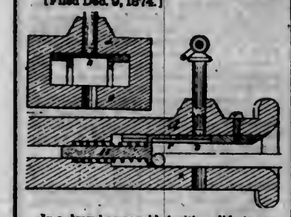
A wooden hub, in combination with lugs C C and friction-rollers B B, substantially as shown and described.

159,124. PAWLS AND RATCHETS. Ralph Tomlinson and Jos. Smith, Boston, Mass. [Filed Dec. 19, 1874.]



159,124.

The combination, with loose pulley B and shaft A, having end ratchet, of the pawl D and spring E, the former having the projection F, as shown and described, whereby said spring may hold the pawl either in contact with or away from the ratchet.

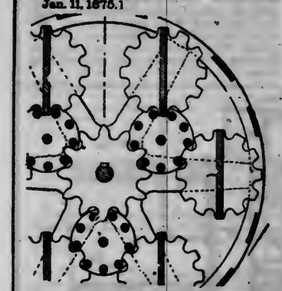


159,125. TEA-POT HANDLES. Thos. Shaw, Providence, R. I. [Filed Oct. 26, 1874.]

Brief.—The insulator is preferably made of ivory.

The insulator composed of a collar, I, shank S, and hollow cavity or socket N, in combination with a metallic shank, *h*, and handle ends of the handle H, in the manner specified, so that the whole may be connected in the manner substantially as described.

159,126. CAR-COUPLINGS. Geo. A. Tuttle and Henry B. Thompson, Lawrence, Mass. [Filed Dec. 9, 1874.]



In a draw-bar, provided with a slide to support the link-pin, and to be moved from under it by the link, the combination of rabbeted guides C C and the movable stop D, with the draw-bar, and the slide-plate B and its spindle and spring, all as specified.

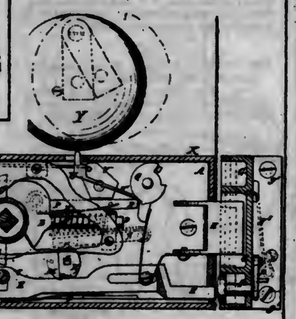
159,126. STEP-LADDERS. R. S. Van Zandt, Williamsburg, N. Y. [Filed Dec. 12, 1874.]

The combination of the long slotted keepers D, the sliding bolts E, and the long keepers F with the parts A B of the ladder, substantially as herein shown and described.

159,127. FEATHERING PADDLE-WHEELS. Bernhard Veter, New York, N. Y. [Filed Jan. 11, 1875.]

A paddle-wheel for vessels, composed of a central stationary cog-wheel, intermediate revolving pinions, and outer vertical paddles with cog-wheels gearing therewith, mounted on a supporting wheel-frame, for producing by the rotation of the frame the vertical position and passage of the paddles through the water, substantially as shown and described.

159,128. CAR-COUPLINGS. Lewis Vote, Pittsburg, Pa. [Filed Jan. 2, 1875.]



1. In combination with the draw-head and the sliding trigger to move upon an inclined key, the coupling-pin provided with a collar, *a*, substantially as and for the purpose specified.

159,128.

2. In combination with a draw-head having a coupling-pin, the collar of which is of greater diameter than the hole in the draw-head through which it works, the key-piece, and sliding face-plate, substantially as and for the purpose specified.

159,129. ALARM-LOCKS. Jonathan Walton, Brooklyn, N. Y. [Filed July 3, 1874.]

1. The combination of the pin I and button J with the hinged catch G *g' g''* and a sliding bolt, E, operated by the knob-spindle B, substantially as herein shown and described.

2. The combination of the spring F, the block K, the post L, the plate M, the stop-pins *m' m''*, the pivoted bar N, and the spring O, and stop *o'*, with the sliding bolt E, to enable the said bolt E to be thrown into and out of gear with the knob-spindle by a key, substantially as herein shown and described.

3. The gong X, constructed, substantially as herein shown and described, to adapt it to serve also as a cap to the lock mechanism, as set forth.

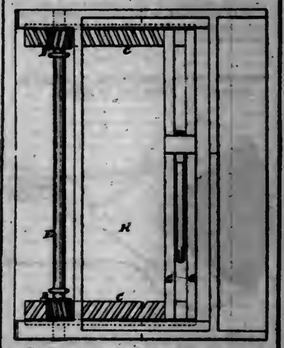
159,130. ADJUSTABLE CUT-OFFS FOR STEAM-ENGINES. Henry Webster, Janesville, Wis. [Filed Oct. 24, 1874.]

The oscillating toe-piece B, having shoulders *b b*, and the rock-shafts having pawls *d d* and arms *d' d''*, combined with the slide C D, having top rail *h*, as and for the purpose specified.

159,131. LAWN-MOWERS. Henry T. West, Philadelphia, Pa. [Filed Aug. 21, 1874.]

The arrangement, substantially as shown, of the frame B B F, constructed as described, the standards G H, the gear J, supported on the axle, the pinion L, crown-wheel M, pinion N, and crank-wheel O.

159,132. WASHING COMPOUNDS OR FLUIDS. William S. Williams, Middletown, Del. [Filed May 2, 1874.]



Brief.—Soda, lime, spirits of turpentine, alcohol, and water. To this compound add soap made by adding grease to the compound fluid. These are all boiled and stirred together until they reach the proper consistency.

1. The compound fluid made by employing the materials in the quantities substantially as described.

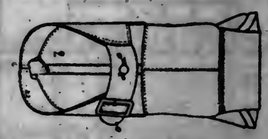
2. The combination of the fluid with the soap, both made of the materials in the quantities substantially as described.

159,133. DRESSING MILLSTONES. John Williams, Dresden, assignor to himself and Geo. J. Stonebreaker, Fayetteville, Tenn. [Filed Oct. 31, 1874.]

Brief.—A longitudinal slide, in which a pivoted tool is worked by hand, guided and worked laterally by a worm and rack gearing at each end of a bed-plate.

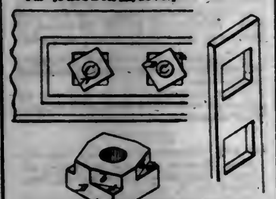
The combination of the stationary base-frame A, the horizontal driving-shaft E, carrying pinions D D and hand-wheel F, the sliding rack-bars C C, the connecting-bars G G, and the dressing-tool I K, all constructed and arranged as herein shown and described.

159,134. POCKET-TOOLS. Frank R. Woodward, Hill, N. H. [Filed Aug. 26, 1874.]



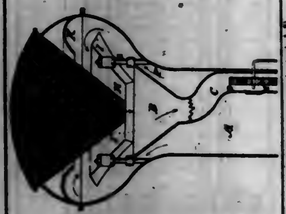
Brief.—A glass-cutter, tweezer, and screw-driver are united in one stock, having a measure or rule on the side.

As a new and improved article of manufacture, a pocket-tool, constructed substantially as and embracing the features described and specified.



159,135. GAITER-BOOTS. Barker C. Young, Boston, Mass. [Filed Dec. 19, 1874.]

Brief.—A button on the back part of the shoe secures the strap independently of the buckle, and also prevents it from slipping up and down.

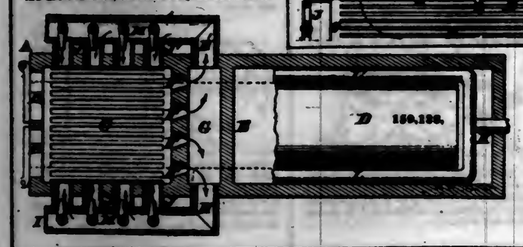


In combination with the gaiter-boot A, provided with the two leg-flaps *a b*, and the strap *c*, and its buckle *f*, arranged as described, the button *d*, fixed to the middle of the back-flap, and the button-hole *e* made in the strap, all substantially as specified.

159,136. NUT-LOCKS. Joseph J. Adgate, Stevensville, N. Y., assignor of three-fourths his right to John Maitland, J. H. Sternbergh, and Caleb Wheeler, Reading, Pa. [Filed Dec. 12, 1874.]

In combination, with the locking-plate G, the nut D, having the diagonal cuts or chambers *b d* arranged so that the nut can only be turned backward, to secure the plated nut after the locking-plate is placed over the nut, as set forth.

159,137. SPARK-ARRESTERS. D. Allard, St. Albans, Vt. [Filed Jan. 19, 1875.]



1. The adjustable pipe C, terminating in a funnel-shaped mouth, B, in combination with the smoke-stack A, the spirally-grooved plate H, and the annular cap K, substantially as and for the purpose described.

2. The combination, with the smoke-stack A, of the adjustable pipe C, having funnel-shaped mouth B, the spirally-grooved plate H, the annular cap K, and the inverted conical cage L, having its lower end open, substantially as and for the purpose described.

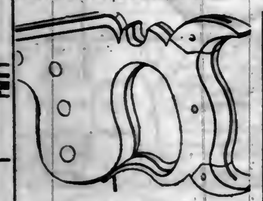
159,138. BOILER-FURNACES. Wm. Allenworth, Troy, Ohio. [Filed Oct. 12, 1874.]

Brief.—The smoke and gases arising from the combustion of coal pass into a chamber in the rear of the furnace; from thence they pass through side pipes, and are injected into the furnace by means of superheated exhaust steam.

As an improvement in steam-boiler furnaces, the steam-bored bridge-wall G, having front perforations F, and communicating, by end passages H H', side pipes I I', and branch pipes J J', with both flanks of the fire-chamber, in combination with pipe K, connected by branches L L', traversing the heart of the furnace, with nozzles M placed within the branch pipes J, for conducting superheated exhaust steam, as and for the purpose set forth, the whole arranged to operate within the fire-chamber, substantially as described.

159,139. GAS-REGULATORS. J. Anderson, New York, N. Y. [Filed Jan. 14, 1875.]

Brief.—The upper gravitating valve is lifted by a certain pressure to allow flow of gas. The lower valve operates under an increased pressure.



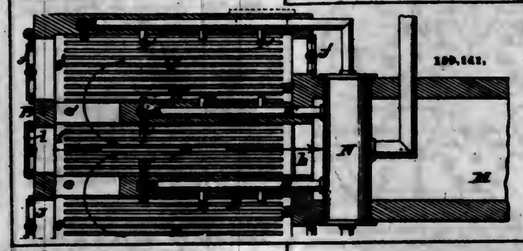
1. The combination of two or more gravitating valves, E F, of different diameter in a gas-regulator, substantially as herein described.

2. The combination, in a gas-regulator, of one or more perforated valves, F, with a solid valve, E, substantially as described.

3. The combination, in a gas-regulator, of two or more valves, E F, and a tubular stem, D, having discharge-holes *c*, substantially as described, for the object specified.

159,140. SAW-HANDLES. B. Andrews, Williamsport, Pa. [Filed May 4, 1874.]

Brief.—The handle is stiffened by having the saw-blade cut to the form of the handle, and inserted between its two sides.

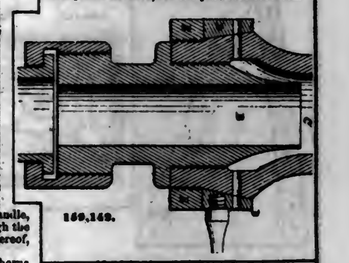


1. In combination with a hand-saw handle, the saw-blade, extended centrally through the same, and conforming to the outlines thereof, substantially as described and shown.

2. In a hand saw handle, the tips or horns D, substantially as described and shown.

159,141. SMOKE-CONSUMING FURNACES. Daniel Argerbright and Wm. Allensworth, Troy, Ohio. [Filed Jan. 2, 1875.]

Brief.—Three furnaces are arranged side by side, the center one being supplied with incandescent fuel. The smoke and gases arising from the side furnaces pass over and through the center furnace, and are therein consumed. Heated air is supplied to all the furnaces from a drum in the rear of the bridge-wall.



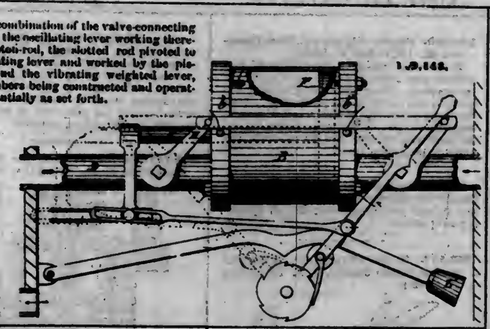
1. The combination, with a measuring-cylinder, of forked pipes at its ends, constituting inlet and outlet pipes, two-way valves working in said pipes, and the connected valve-cranks, substantially as and for the purpose set forth.

2. The combination of the casing, the cylinder, the piston, the piston-rod, the inlet-pipes, the outlet-pipes, their valves, the valve-connecting guideway, and the oscillating lever working in the guideway to shift the valves, these members being constructed and operating substantially as set forth.

1. A smoke-consuming apparatus, consisting, essentially, of a furnace composed of three distinct chambers, F G G', whose division-walls E E' are provided with openings *a a'*, and whose bridge has a single exit, I, when employed in conjunction with the embedded pipes R R' S S' and nozzles *r r' s s'* T T', for introducing a blast of heated air into said chambers, substantially as herein described, and for the purpose set forth.

2. In combination with the blast-pipes R R' S S', applied to a furnace, as described, the exposed drum or cylinder N, arranged athwart the flue M, in rear of bridge-wall H, for the purpose set forth, and herein described.

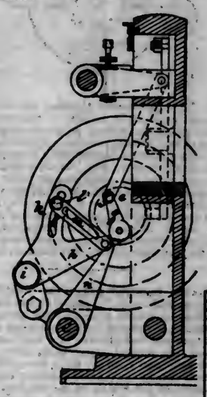
159,142. AERATING AND COOLING APPARATUS. Geo. W. Baird, U. S. N. [Filed Jan. 5, 1875.]



Brief.—Steam being admitted into the nozzle through a pipe connected with a boiler is conducted, through another pipe attached to the nozzle-plug, to the distilling apparatus. When condensation takes place in the distiller, the ring upon the plug is turned until the holes register; then the air enters and the aeration and refrigeration of the liquid products of distillation are simultaneously effected.

The combination of the plug B, the nozzle C, and the ring D, all constructed substantially as described, for the purposes set forth.

159,143. MITTENS. William B. Baker, Chicago, Ill. [Filed Dec. 14, 1874.]



Brief.—A cylinder, piston, and rod—a radial arm upon the latter. An inlet and an outlet converge into one pipe at each end of the cylinder—a double cock in each pair before their convergence. Cocks are operated simultaneously by a slotted connecting-rod and a lever, which oscillates in the slot of the rod. The lever is operated from the radial arm. Promptness of valve-motion is secured by a weighted camming-lever operating upon the oscillating lever.

3. The combination of the valve-connecting guideway, the oscillating lever working therein, the piston-rod, the slotted rod pivoted to the oscillating lever and worked by the piston-rod, and the vibrating weighted lever, these members being constructed and operating substantially as set forth.

159,144. WAX-THREAD SEWING-MACHINES. Edwin R. Bean, Boston, Mass., assignor to the Consolidated Wax-Thread Sewing-Machine Company, same place. [Filed Aug. 3, 1874.]

Brief.—Improvement on Patent No. 137,528, and consists in the link introduced between the crank-pin and the arm connected with the rock-shaft.

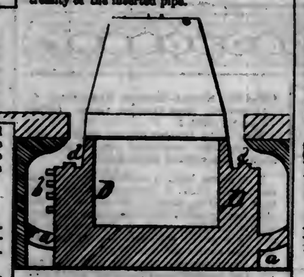
In combination with the driving-shaft *e* and the crank-pin *f*, the link-connection *g* and the intermediate connecting mechanism to the rock-shaft *A*, substantially as herein shown and described.

159,145. CAR WHEELS AND AXLES. B. A. Berryman, St. Louis, Mo., assignor of one-half his right to G. W. Shaw, same place. [Filed Sept. 22, 1874.]

Brief.—Easily-detachable lubricators. Wheels and axles readily connected and disconnected, and provided with receptacles for excess of oil.

1. The combination of the axle, with fixed collar H and removable collar I, and the hub F, with inward extension G, having an interior flange, G', held between the collars H I, all substantially as set forth.

2. In combination with the hub F and the oil-reservoir M, the right and left hand threaded pipe *m*, to draw and hold the receptacle or reservoir in position between the spokes.



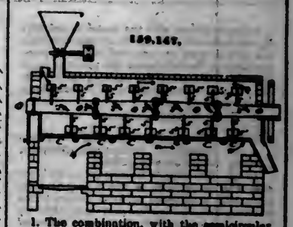
3. The hub F, provided with annular receptacle N, substantially as and for the purpose set forth.

4. The car-wheel E, hub F, extension G G', and oil-chambers M N, in combination with the axle A, collars H I, and cap K, substantially as set forth.

5. The removable oil-receptacle M, communicating with the car-axle by pipe provided with right and left hand screw-threads, and

159,146. CLAY PIPES AND APPARATUS FOR MOLDING THE SAME. William K. Black, Philadelphia, Pa., assignor to Jos. Hawey and Wm. Adamson, same place. [Filed Dec. 21, 1874.]

Brief.—Placed under the clay-box, and coinciding with its outlet, is the socket-former, which descends when filled, while continued pressure on the clay forms the attaching-pipe. The socket-former has projecting pins, which, by a partial revolution, form inside the article annular slots. There is also formed another slot for the reception of a flange on the extremity of the inserted pipe.



1. The combination, in a clay-pipe molding-machine, of the former D, with three or more sets of pins, A, arranged and operating substantially in the manner and for the purpose described.

2. The combination, substantially as described, of the projection *d* and the slotted and curved flange *a*, with the former D, for the purpose set forth.

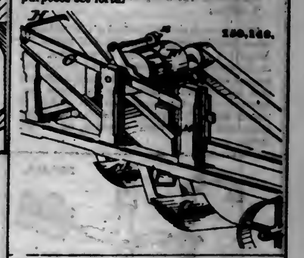
3. As a new article of manufacture a clay pipe, the socket of which has rounded ends *g*, internal grooves *b'*, and an annular groove, *d'*, in the shoulder, against which the end of the adjoining pipe bears, all as set forth.

159,147. DRESSES FOR PERIPHERIES. Joseph Bowman, Weymouth, and Alex. Chapman, Lowell, Mass. [Filed Dec. 19, 1874.]

Brief.—The cast-iron plates, sliding loosely in the grooves, may be readily removed when injured or destroyed by the action of the fire.

1. The combination, with the semicircular sectional cast-iron plates *c*, of the grooves *c'*, substantially as and for the purposes herein specified.

2. The combination, with the hollow sectional tapering shaft *c*, of the arms *s* and shoes or pastiles *c'*, substantially as and for the purpose above set forth.



159,148. SEED-PLANTERS. Jos. C. Broad, Thibodeaux, La. [Filed Oct. 16, 1874.]

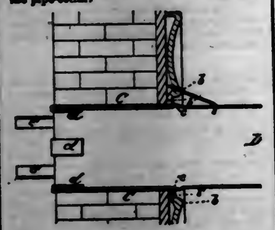
Brief.—Upon a frame are placed uprights, which form journals for the horizontal shaft, carrying a seed-cylinder composed of two sections, working one partly within the other, one of which is rigidly secured to the shaft; the other, being smaller, is adjusted thereon. In the periphery of the adjustable half are made longitudinal slots of different lengths, to regulate the flow of seed successively. Each half of the cylinder is provided with arms, through which pass rods having coil-spring thereon, and nuts for holding the adjusted half at any desired position; or it is entirely closed and held rigidly by a longitudinal bar. Beneath the cylinder, and to the handles, is secured a chute for conveying the seed to the open furrow between the two plows.

1. The hand-lever G, fulcrum-post 14, and notched cross-bar H, between the handles, in combination with the rotary seed-cylinder or hopper F, having a sliding section with discharge-apertures therein for closing the latter and locking the cylinder in closed condition, to prevent waste of seed, in the manner herein set forth.

2. The combination of the closing-lever G, locking-bar H, opening-springs 12, and adjusting-nuts 13 with the rotary seed-cylinder F, constructed as described, for the purpose specified.

3. The combination of the plower-shares O O', arranged diagonally beneath the planter, with mold-boards on one and the same side, and the seed-chute I, arranged to receive the seed from the discharge-apertures and to deliver the same beneath the mold-board of the front plow, the rear plow serving to cover the seed, as herein shown and described, for the purposes set forth.

159,149. SPOKE-SOCKETS AND FELLY-PLATES. H. T. Briggs, Buchanan, Mich. [Filed Oct. 27, 1874.]



Brief.—To clamp the tire and firmly secure together the tire, felloe, and spokes.

In combination with the spoke A and felly B, the ferrule C and cap D, extended beyond the felly to hold the tire, and the pin *d* passing through the felly under the tire, and bearing upon the head of the screw *a*, which holds the union C D to the spoke, all substantially as set forth.

160,150. STOVE-PIPE COLLARS AND THIMBLES. George F. Brinkerhoff, Bucyrus, Ohio. [Filed July 18, 1874.]

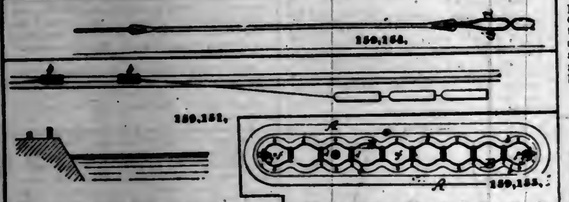
Brief.—The thimble is provided on its inner end with strips, part of which may be bent outwardly to embrace the inner surface of the chimney-flue, and another part bent in the opposite direction to limit the inward thrust of the pipe. It has at its outer end a flange, which engages with a corresponding flange on the pipe-collar.

1. The combination of the collar B, having a flange, *b*, and a bead, *b*, the thimble C, having a flange, *c*, and fastening-strips *c' d*, and the pipe-section D, substantially as specified.
2. The thimble C, having upon one end a flange, *c*, and upon its other end fastening-strips *c' d*, substantially as specified.

160,151. PUMPS. Algernon A. Burt, Campton, Ill. [Filed Oct. 17, 1874.]

Brief.—The plunger is firmly secured to a vertical post attached to the lower surface of the platform. The cylinder being forced downward by the action of the pump-stock allows the water to enter the cylinder, and, by a backward movement of the lever, forces the water from the cylinder into the chamber, and through the pump-stock.

The combination of post B, plunger G, piston-rod D, cylinder E, chamber F, valves *f* and K, and gravitating-lever M, all operating as specified.



160,152. CARPET-FASTENERS. Alma Burroughs, Numda Station, N. Y. [Filed Oct. 23, 1874.]

The carpet-fastener consisting of the body having one end widened, flattened, and brought to an edge, and the opposite end reduced in width and provided with a single point to enter the floor, and an upright point to receive the carpet, the device being made in one piece.

160,153. CLASPS FOR STOCKING OR SKIRT SUPPORTERS. Geo. J. Capewell, Cheshire, Conn. [Filed Nov. 17, 1874.]

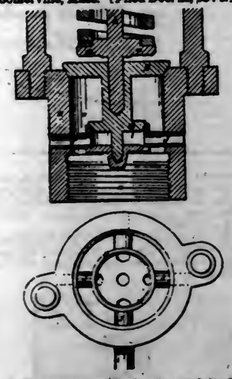
A clasp for stocking and skirt supporters, composed of two pieces of metal, *c d*, riveted together at their loop end, and one passing through a slot in the other, and operating substantially in the manner and for the purpose specified.

160,154.

160,155.

160,154. STEAM-HEATER RADIATORS. C. Comstock, New Canaan, Conn. [Filed Dec. 10, 1874.]

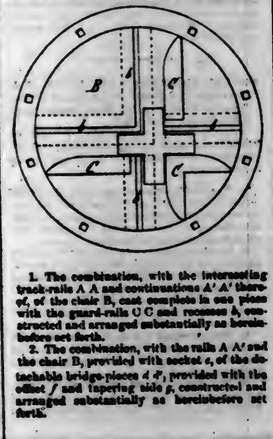
Brief.—The sinuous groove, packing, and fastening-plate correspond with the corrugations of the walls of the radiator.



1. A steam heating-radiator composed of the bottom plate, A, corrugated sheet-metal body B, and top plate, C, the bottom and top plate having each a continuous sinuous groove for the reception of the corrugated body B, and all connected and combined substantially as herein shown and described.
2. The sinuous continuous packing *e* and the sinuous continuous fastening-plate *h*, combined with the grooved end plate, A, and the corrugated sheet-metal body B, of the heat-radiator, substantially as specified.
3. The combination of the V-shaped bar *g*, packing *h*, and outer wedge-plate, *i*, with the corrugated sheet-metal body B of the heat-radiator, substantially as and for the purpose described.

160,155. STEAM-DISTRIBUTERS FOR FURNACES. Alfred B. Corey, Providence, R. I. [Filed July 18, 1874.]

The combination, with the grate-bars of a furnace, of the spheroidal or partially spheroidal distributer C, having the perforations *b* and supply-pipe D, the whole constructed to operate substantially as herein described, for distributing steam in the form of spray directly beneath the grate-bars of an ordinary furnace, for the purpose specified.



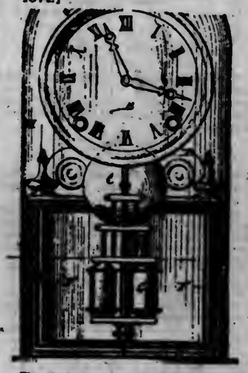
160,156. SAFETY-VALVES. Geo. H. Crosby, Somerville, Mass. [Filed Dec. 21, 1874.]

1. The supplemental chamber and its discharge-passages or outlets, in combination with stop-cocks or other regulator at one or more of said outlets, to regulate the discharge of steam therefrom, substantially as set forth.
2. In combination with the valve-shell and primary valve, the supplemental valve and chamber within the steam-space of the shell, the discharge-passages or outlets leading from said chamber through and out from the shell, and means, substantially as described, for regulating the escape of steam from said outlets for joint operation, as shown and set forth.

160,157. RAILWAY-CROSSINGS. Jas. Cumming, Buffalo, N. Y. [Filed Jan. 9, 1875.]

Brief.—A frog or crossing-plate for the intersection of crossing tracks, cast in one piece, and provided with grooves, into which are inserted the several track-rails; also, with guard-rails and recessed seats, in which rest inclined flange-bearers, for preventing the dropping of the wheels at the cut portion of the rails. The flange-bearers are in two pieces, dovetailed together.

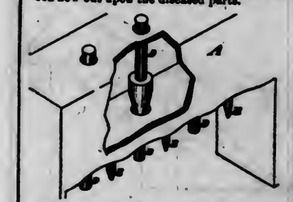
1. The combination, with the intersecting track-rails A A and continuations A' A' thereof, of the chair B, cast complete in one piece with the guard-rails C C and recesses *b*, constructed and arranged substantially as herein-before set forth.
2. The combination, with the rails A A' and the chair B, provided with sockets *c*, of the detachable bridge-pieces *d d'*, provided with the offset *f* and tapering side *g*, constructed and arranged substantially as hereinbefore set forth.



160,159. SHOE-HORNS. Alvin M. Cushing, Lynn, Mass. [Filed Jan. 7, 1875.]

Brief.—The inner surface of one or both jaws is provided with a projection of rubber or other elastic material.

A compound shoe-horn, the griping-jaws of which are one or both plated or provided with an elastic or adhesive substance, substantially as and for purposes stated.



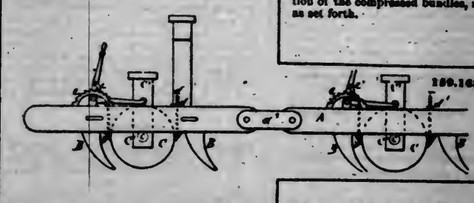
160,160. CLOCK FRAMES OR CASES. Henry J. Davies, Brooklyn, N. Y. [Filed Nov. 25, 1874.]

The clock-frame or standard composed of the angular portions or frames E E, adapted to receive mirrors or other ornamental surfaces, and the portion D supported thereon, and serving as a base for the clock-works, all substantially as herein set forth.

160,161. SHEEP SCRATCH-BOXES. Ira Benton Dillon, Visalia, Cal. [Filed Dec. 28, 1874.]

Brief.—An elevated box contains medicaments for treating diseases of sheep. Valves are operated by spikes protruding outwardly from the bottom of the box. While the animal scratches its back against the spikes, it opens the valves and lets the contents of the box flow out upon the diseased parts.

The device consisting of the box A, with its spikes E, valves C, and guides D, for the purpose substantially as herein described.



160,162. WOOD PAVEMENTS. Wm. Disney, Cincinnati, Ohio. [Filed Apr. 7, 1874.]

The improved wood pavement herein described, the ranks or rows of which transverse of the street are each composed of two or more sections of blocks, having upper rear cleats, B, and lower front cleats, C, arranged and applied so as to unite the blocks in the preliminary sections, and to unite the sections in each row by breaking joints, and to interlock the several rows, and to form the footholds, substantially as specified.

160,163. COMBINED HARROWS AND ROLLERS. Wm. R. Downing, Murfreesborough, Tenn. [Filed Nov. 21, 1874.]

Brief.—The roller and harrow is made in two sections, each of which has a roller and harrow in front. These sections can be used singly or in pairs, side by side, or end to end. In one section the roller is vertically adjustable, so that the teeth of one section can be raised above the ground.

160,163.

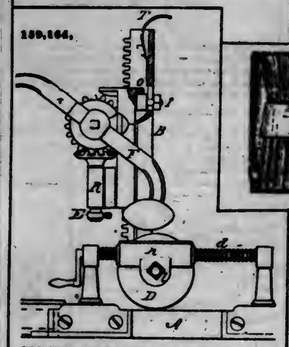
1. A combined harrow and roller, made in sections, provided with detachable hinges at both the sides and ends of the frame, whereby one section may be arranged in front of the other or by the side thereof, substantially as set forth.
2. In a combined harrow and roller, composed of two sections provided with detachable hinges or connections, substantially as set forth, the vertically-adjustable rollers, substantially as specified.
3. The combination of the bent levers E, pawls *e'*, and ratchets *e*, with the hanger C, roller C, teeth B, and the supporting-frame, substantially as set forth.

160,164. CIGAR-MOLDS. Napoleon DuBrul, Cincinnati, Ohio. [Filed Oct. 26, 1874.]

Brief.—The halved matrix closes by the descent of the upper section into the lower, guided by a vertical wall on one side, the opposite wall being inclined.

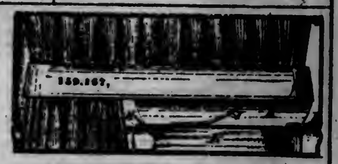
A cigar-mold, the walls on one side of whose matrices are made perpendicular to the plane of parting, and whose matrix-walls on the other side have sufficient draft for the extrication of the compressed bundles, substantially as set forth.

160,165. PROCESSES OF PREPARING GELATINE-PLATES FOR PRINTING. Ernest Edwards, Boston, Mass., assignor to Jas. R. Osgood, same place. [Filed Apr. 27, 1874.]



The described process of printing from plates of gelatine, gum, albumen, and other analogous bodies which are absorbent of water, with soluble colors known as dyes, in contradistinction to those known as printing-inks, the parts not required to produce an impression having been previously rendered non-absorbent of water (and hence incapable of printing) either by exposure to light, the application of a coagulating substance, as copaiva varnish or mast, or other suitable means, substantially as specified, and for the purposes set forth.

160,166. BORING-MACHINES. Geo. Dryden, Worcester, Mass. [Filed May 31, 1872.]



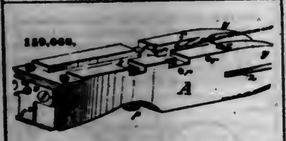
Brief.—The boring-tool is adjusted and held at any desired angle by improved method of adjustment in the conical plates D and the screw-rod *d*, for movement laterally.

1. A boring-machine having its standard B provided with the conical journals C, in combination with the conical boxes D, and bolt *l*, substantially as described.
2. The sleeves *a*, secured to the boxes D, mounted on the rods *b d*, one of which has a screw-thread on it for the purpose of adjusting the operating-mechanism of the bit back and forth, as described.
3. The standard B, provided with the adjustable stop I and spring-catch T, in combination with the sliding frame R, provided with the projection *o*, all constructed to operate as set forth.

160,164.

160,165.

160,167. SHOE-BLACKING CASES. Chas. F. Ellis, Parker City, Pa. [Filed Oct. 1, 1874.]



Brief.—The receptacle for the blacking-box is on the inside of the case, and has a hinged cover held in place by a catch. The box is held in its position by three side springs, that press upon the edges of the box. A spring on the hinged cover serves to hold a blacking-brush in place by pressing upon it.

1. The springs D D D, constructed and applied substantially as herein described, to adapt them to receive and hold boxes of various sizes, in combination with the hinged flap F and catch H, as set forth.
2. The combination of the base B, springs D D D, hinged flap F, catch H, back-spring I, and cover C, substantially as and for the purposes set forth.

160,168. TWINE-CUTTERS. Chas. F. Ellis Parker City, Pa. [Filed Nov. 16, 1874.]

Brief.—A tension-spring is arranged within a groove, in which the twine passes, and holds the twine therein with an adjustable pressure. This spring has a thumb-piece for applying pressure, and a lifter for instantaneously removing the spring from contact with the thread. The entire fixture is held in the hand while the twine is passed around the package, and when not in use remains suspended to the twine.

159,068.

1. The attached twine-cutter herein specified, having a solid stock, A, constructed with knife-guards *y y* at one end, and a longitudinal groove in one side or face to constitute the twine-passage, substantially as herein shown and described, for the purpose specified.

2. The combination of the entrance-aperture or eye *v*, the longitudinal groove *w*, and the tension-spring *t*, arranged within the latter, for guiding and holding the twine, in the manner set forth.

3. The tension-spring *t*, having a thumb-piece, *q*, by which to apply additional pressure, in combination with the stock A, having a knife or knives, *z*, in one end, substantially as shown and described.

4. The elevation or projection *s*, in combination with the longitudinal twine-groove *w* tension-spring *t*, and knife or knives *z*, arranged as herein described, for the purpose set forth.

5. The lifter *p*, arranged transversely of the stock, and operating to release the twine at will, in combination with the longitudinal tension-spring *t*, applied externally, as herein specified.

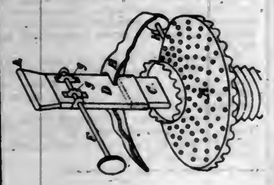
159,069. MACHINES FOR THINNING CROPS. Marcus Bustace, Highfield, Drumcondra, assignor to J. Kennan and Thos. Kennan, Dublin, Ireland. [Filed Dec. 6, 1873.]

Brief.—A series of frames of double-runner form, each carrying a hoe, and designed to be drawn across the rows. The shape of the runners permits the hoes to strike the top of the ridges, and raises them over the furrows.

1. The machine herein described for thinning or spacing root and other crops, consisting of a series of hoe-blades F, arranged and operating in combination with guides A^1 A^2, substantially as hereinbefore set forth.

2. In machines for thinning or spacing root and other crops, the frames A, consisting of the trough-shaped guides A^1 A^2, connecting-bar A^3, and hoe-blade F, coupled together in an adjustable manner by means of the transverse rods B B' and collars H, substantially as herein before described with reference to the accompanying drawings.

1. The spindle G, with piston-head H and nut L, in combination with the rubber cylinder or cylinders I', all combined with the spindle B, rubber cylinder or cylinders O, nut E, and piston-head H, to be constructed and operated together, with and in the bore of a cannon, substantially as represented in the drawings, for the purposes hereinbefore described.



2. The combination of the spindle G, rings I and K, screw-plug M, and rubber cylinder P, to be made and operated together, with and in the rear end of a cannon having an enlarged bore from the shoulder J backward, substantially as and for the purposes herein described.

3. A cannon made with corrugated surface for contact with the rubber plug, or any portion thereof, to aid in holding the same in the bore, substantially as shown in Fig. 3.

4. The combination, arrangement, and adaptation of cylindrical rings, made of vulcanized rubber or other similar material, of any number and length required, divided by cylindrical metallic rings, combined with metal appliances for screwing up and compressing the rubber rings in separate sections, to hold the compound plug thus made and adjusted to the bore in the breech of a cannon from being blown out of the bore when a charge of powder is exploded therein, substantially as herein shown and described.

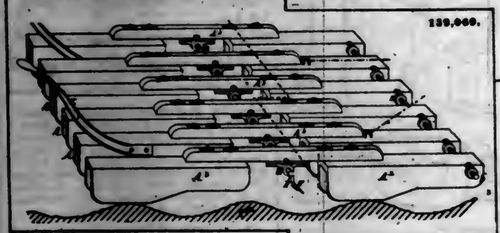
159,171. WICK-INSERTERS FOR LAMPS. W. H. Fitz Patrick, Boston, assignor of one-half his right to Albt. W. Daniels, Allston, Mass. [Filed Dec. 4, 1874.]

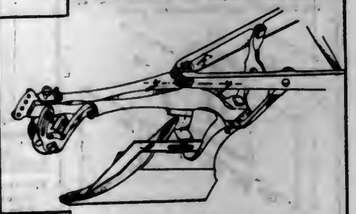
Brief.—To facilitate the insertion of the wick. Has ratchet-wheels like the ordinary wick-tube, and a flaring mouth-piece.

The improved wick-inserter described, the same consisting of the tube D, having the flaring mouth-piece E, and provided with the wheels *g g* and shaft F, substantially as and for the purpose specified.

159,172. DENTAL PLUGGERS. L. Jean Paul Eugene Gaillard, Paris, France. [Filed Jan. 2, 1875.]

Brief.—The filling is crowded down by inserting between the tooth operated upon and the one opposite to the other jaw a plugging-pin inserted in a disk padded upon one side with rubber.



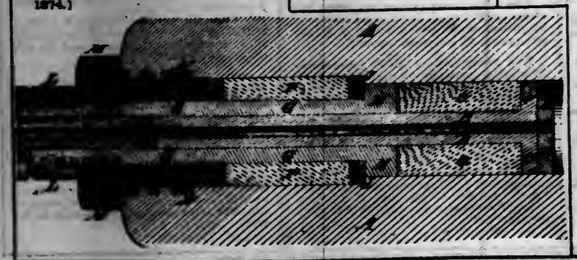


The within-described instrument for plugging teeth, constructed of the handle *a* and the disk *b*, provided with a pad, *d*, and a plugging-pin, *c*, the whole being combined substantially as and for the purpose described.

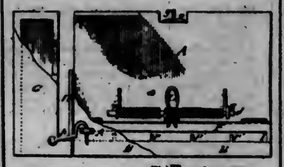
159,174. PLOWS. Horatio Gale, Albion, Mich. [Filed Dec. 11, 1874.]

Brief.—A pivoted block allowing the handles lateral adjustment, and a serrated and grooved block to adjust and secure the colter on the standard.

159,069.

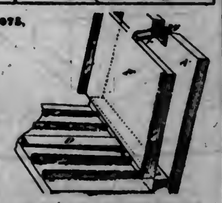


1. The horizontally-recessed and serrated colter-block C, in combination with a serrated plow-standard, substantially as described.



2. The triangular washer E, combined with the standard-shank and handles of a plow, substantially as and for the purpose set forth.

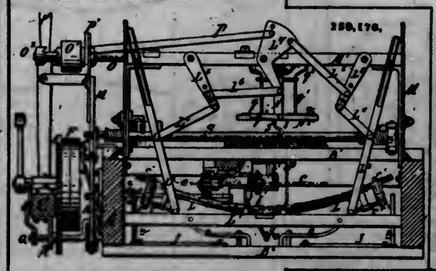
159,170. BREECH-LOADING ORDNANCE. G. M. Felt, New York, N. Y. [Filed June 26, 1874.]



159,175. ANIMAL-TRAPS. Levi F. George, San Francisco, Cal. [Filed July 31, 1874.]

Brief.—Has a removable attachment which fits a rat-hole in floor or side wall, thus leading directly into the trap-passage. The pan-lever is also flush with the top of the corrugations or ribs, making it more inviting for the foot-hold which springs it.

159,073.



1. The combination of the platform D, ring wire catches *w y*, loop L, flap F, and spring S with the bottom strip, B B, provided with partitions *p p' p''*, substantially as and for the purposes herein set forth and specified.

2. The adjustable box C, provided with bottom and side openings K K, respectively, in combination with the trap, fitted with lid T, as herein described, substantially as and for the purposes herein set forth.

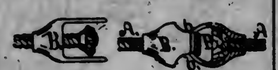
159,176. GRAIN-BINDERS. Jos. M. Groover, Oxford, Mich., assignor of one-fourth his right to Jas. A. Brooks, same place. [Filed Oct. 21, 1874.]

Brief.—A band is made from the cut grain, with which the sheaf is bound.

159,176.

1. The driving-shaft D, pulley F, crank-pin *a*, pitman *b*, cross-head *c*, link *d*, lever *e*, link *f*, block G, ways H, shaft *g*, hooked sector *h*, flanges *i*, racks I I', gears *j j' j''*, shaft *k*, gripping-plate k^1, spring-bail k^2, hook k^3, rail *l*, parting-post l^1, frame *m* m^1, and spring m^2, constructed and combined with the sills A A', table B^1, bottom board, B^2, platform B^3, and adapted to be driven by the mechanism of a reaper for forming a straw band, substantially as described.

2. The combination, with the lever *q*, of the levers J^1 J^2 J^3 J^4 J J, rods *n n*, and guides *o o*, for carrying the ends of the band to the carriers L L, substantially as described.



3. The combination of the jointed carriers L L, each provided with a bell-crank, *r*, clamp-plate r^1, and spring r^2, the levers L^1 L^2 L^3 L^4, bell-crank L^5, and rod L^6, with the frame P^1 and lever P^2, for wrapping the band around the bundle, substantially as described.

4. The combination of the shaft O, clutch-pulley O^1, clutch-box O^2, vertical shaft N, gears N^1 N^2, slotted arms N^3, hooks *q*, shafts q^1, studs q^2, and springs q^3, with the pulley F, for twisting the ends of the band, substantially as described.

5. The shaft S, hook S^1, bearings *s s'*, springs *v v'*, segment T, cam *u*, treadle Q', lever R, crooked shaft Q, and pinion R^1, combined with the spur-wheel H and standards M M, for tucking the ends of the band under itself, substantially as described.

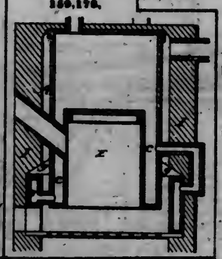
159,177. CHECK-ROW CORDS FOR CORN-PLANTERS. George D. Haworth, Decatur, Ill. [Filed June 13, 1874.]

Brief.—Cords for check-row planters are cut in sections, to the ends of which are secured annular pieces of metal made concave with tapering projections. The cord is secured in the concavity (after being passed through) by a knot and a metal strip secured in rear of the knot. The sections are fastened by binding the metal connections together, as shown.

1. The flexible stop B B *b b b b* on a check-row cord, substantially as and for the purpose set forth.

2. The combination, in a check-row planter, of stop B B *b b b b* with swivel D and cord A, as and for the purpose set forth.

3. The combination, in a check-row planter, of stop B B *b b b b*, swivel D, connecting-ring C, and cord A, all constructed to operate in the manner and for the purpose set forth.



159,178. STEAM-GENERATORS. W. B. Hanton, Kewanee, Ill. [Filed Sept. 7, 1874.]

1. The boiler A and lugs *g*, in combination with the boiler B, forming the space *c*, and furnishing a support for the boiler, substantially as and for the purpose specified.

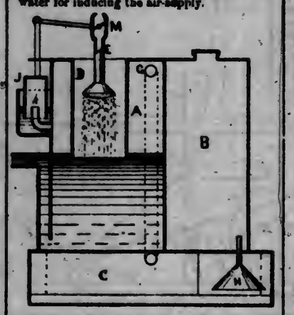
2. The combination of the single upright boiler A, water jacket or boiler B, and horizontal boiler C, all constructed and operating substantially as and for the purposes specified.

159,178.

159,179.

1. The driving-shaft D, pulley F, crank-pin *a*, pitman *b*, cross-head *c*, link *d*, lever *e*, link *f*, block G, ways H, shaft *g*, hooked sector *h*, flanges *i*, racks I I', gears *j j' j''*, shaft *k*, gripping-plate k^1, spring-bail k^2, hook k^3, rail *l*, parting-post l^1, frame *m* m^1, and spring m^2, constructed and combined with the sills A A', table B^1, bottom board, B^2, platform B^3, and adapted to be driven by the mechanism of a reaper for forming a straw band, substantially as described.

2. The combination, with the lever *q*, of the levers J^1 J^2 J^3 J^4 J J, rods *n n*, and guides *o o*, for carrying the ends of the band to the carriers L L, substantially as described.



3. The combination of the jointed carriers L L, each provided with a bell-crank, *r*, clamp-plate r^1, and spring r^2, the levers L^1 L^2 L^3 L^4, bell-crank L^5, and rod L^6, with the frame P^1 and lever P^2, for wrapping the band around the bundle, substantially as described.

4. The combination of the shaft O, clutch-pulley O^1, clutch-box O^2, vertical shaft N, gears N^1 N^2, slotted arms N^3, hooks *q*, shafts q^1, studs q^2, and springs q^3, with the pulley F, for twisting the ends of the band, substantially as described.

5. The shaft S, hook S^1, bearings *s s'*, springs *v v'*, segment T, cam *u*, treadle Q', lever R, crooked shaft Q, and pinion R^1, combined with the spur-wheel H and standards M M, for tucking the ends of the band under itself, substantially as described.

159,179. GAS-MACHINES. J. C. Henderson, San Francisco, Cal. [Filed Oct. 13, 1874.]

Brief.—Air is supplied to the carburetor by means of a stream of water from a small pipe placed within a larger pipe, the lower end of which is sealed by water to prevent back flow. The water-seal is kept at a constant height by an overflow-pipe. A float and valve automatically regulate the current of water for inducing the air-supply.

In a gas-machine, the large pipe D and the small interior pipe E, provided in its upper

1. The combination of the tripod B, rack S, and pinion C, threaded standard A, nut E, collars F and H, head-stock G, collar-spring O, locking-device Q P, and holes U U U, spindles J X Y Z, each provided with a pulley actuated by a friction driving-pulley, T, attached to the standard A, and the adjustable pitman K L M, all constructed and arranged as and for the purpose set forth.

159,180. JEWELERS' LATHES. N. W. Holt, Bennington, Vt. [Filed Sept. 29, 1874.]

Brief.—A rotatable head-stock, carrying a number of different tools, is arranged around the upper portion of the post A. The head-stock, when the pulley of the tool desired is brought over the frictional driving-wheel, is locked in position by the pin P. The pressure of the frictional driving-wheel upon the pulleys is regulated by a nut, R, which, when moved upward, raises the head-stock, thus decreasing the pressure, and vice versa.

as shown in Figs. 1, 2, and 3, and operating substantially as described.

2. The threaded standard A, nut E, rotary head-stock G, collar-spring O, collars F and H, radial spindles N X Y Z, and driving-wheel T, attached to the standard A, as shown and described.

3. The within-described means of regulating the degree of friction necessary to operate and bring into adjustment the several spindles attached to the head G, when the same are provided with pulleys of different diameters to obtain different velocities, and consisting of the threaded standard A, nut E, collar H, spring O, and head-stock G, conjointly operating and constructed as shown.

4. The vertically-adjustable standard A, driving-wheel T, and adjustable socket-pitman K L M, combined and operating as described.

159,180.

159,181. MACHINERY FOR FORMING SHOE-TIPS. John H. Hussey, Baltimore, Md., assignor of one-half his right to Adler, Clement & Weil, same place. [Filed Jan. 12, 1875.]

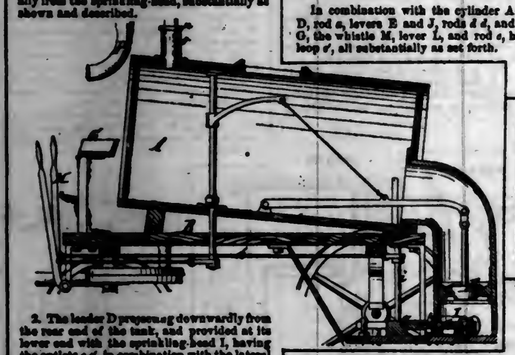
Brief.—The sole, channeled around the toe upon its upper surface, is held between clamps, when the cone or opening device, attached to a vertically-yielding shaft, enters the channel, and turns the lip up against the concave beveled jaw, leaving it in the form required for a toe-tip.

1. The combination of the cone *d* and concave beveled jaw J, for raising and forming tips on soles, substantially as herein set forth.

2. The combination of the shaft *a* with cone *d*, spring *e*, regulating-screw G, and jam-nut E, for the purposes herein set forth.

3. The combination of the clamp I J, plunger A, and spring *i*, as and for the purposes herein set forth.

4. The jaw J, provided with concave bevel-edge, and flange *p*, in combination with the plate or jaw I and lever K, all substantially as and for the purposes herein set forth.



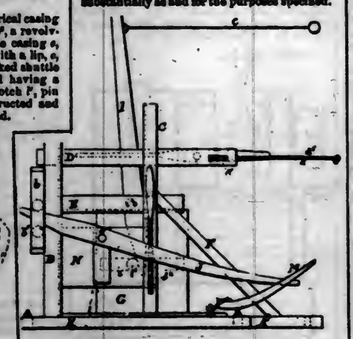
5. The combination, with the shaft *a* and plunger *h*, of the levers E L and treadle-rod *f*, with the adjustable collar *o*, substantially as and for the purposes herein set forth.

6. The combination of the shaft *a*, arm *p*, swivel-joint *q*, lever *w*, and knife *s*, for the purposes herein set forth.

159,182. SPRINKLING-MACHINES. George A. Jerrish, New York, N. Y. (Filed Dec. 17, 1874.)

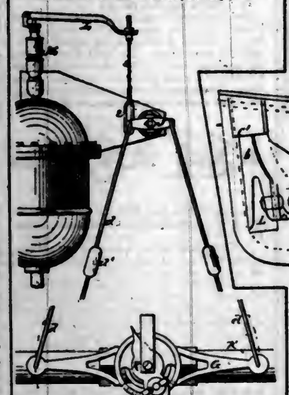
Brief.—The sprinkling-head is provided with jets in front, and with lateral branches having jets in their front sides and in their ends, and with this sprinkling-head is combined a cut-off valve, for shutting off the water from either of the side branches, so that when the sprinkler is driven close to the sidewalk the discharge of water on that side can be stopped.

1. The combination, in a street-sprinkler, of the tank A, leader D, sprinkling-head I, having the outlets *o o'* and the sprinkling-tubes K K' communicating with and projecting laterally from the sprinkling-head, substantially as shown and described.



2. The leader D projecting downwardly from the rear end of the tank, and provided at its lower end with the sprinkling-head I, having the outlets *o o'*, in combination with the lateral tubes K K' and the valve L, arranged to move within the sprinkling-head, substantially as described, for the object specified.

3. The combination of a cut-off valve, L, with the sprinkling-head I, side tubes K K', tank A, and lever M, substantially as and for the purpose set forth.

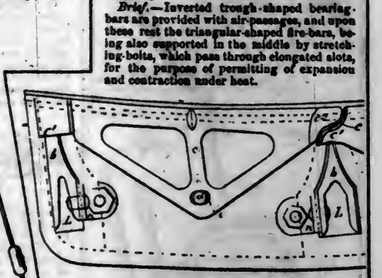


159,183. SEWING-MACHINES. Edwd. Kappmeyer, Hamburg, Germany. (Filed May 18, 1874.)

The combination, with the cylindrical casing *c*, provided with a hinged portion, *d*, a revolving disk, *b*, forming one side of the casing *c*, and a loop-protector, *a*, provided with a lip, *q*, and pin *d*, as described, of the hooked shuttle F, constructed of plates *f' f''*, and having a hook piece, *g*, nose *f*, projection *l*, notch *l'*, pin *f'''*, and turning piece *m*, all constructed and operating substantially as described.

159,184. LOW-WATER INDICATORS FOR STEAM-BOILERS. Orson B. Kendall, Buffalo, N. Y. (Filed Dec. 16, 1874.)

In combination with the cylinder A, float D, rod *a*, levers E and J, rods *d d*, and lever G, the whistle M, lever L, and rod *s*, having loop *s'*, all substantially as set forth.



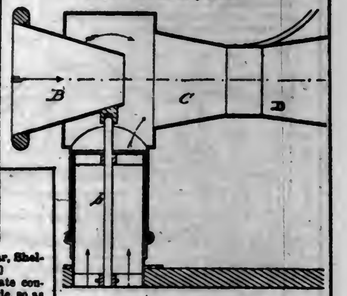
159,185. HOG-TRAPS. Joseph Klar, Shelbyville, Ill. (Filed June 26, 1874.)

Brief.—A pen is formed with a gate converging from the top and from one side, so as to secure the animal by the neck, when it may be thrown upon its side. The platform upon which it falls is then drawn laterally with the animal upon it.

The slides H and G and moving platform L, with their several arms, levers, and ratchets, substantially as and for the purposes specified.

159,186. FURNACE-GRATES. Chas. Knoblauch, Munich, Bavaria. (Filed June 16, 1874.)

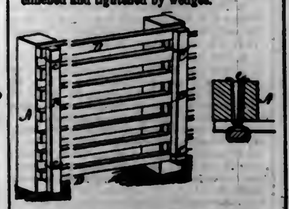
Brief.—Inverted trough-shaped bearing-bars are provided with air-passages, and upon these rest the triangular-shaped fire-bars, being also supported in the middle by stretching-bolts, which pass through elongated slots, for the purpose of permitting of expansion and contraction under heat.



1. The combination, with the side frames *a*, stretching-bolts *d*, and bearing-bars *b*, of a series of fire-bars, *c*, adapted to rest on the bearing-bars *b*, and in the center on the bolt *d*, substantially as described.

2. In a furnace-grate, a series of fire-bars, *c*, of open triangular form, having seatings at their ends *c'*, adapted to rest in seatings *c''* in adjoining bars, and supported at their ends *c'* on bearing-bars *b*, and in the center on stretching-bolts *d*, passing through slots *e*, substantially as described.

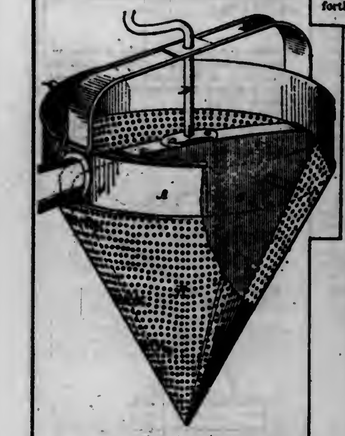
159,187. CAR-VENTILATORS. B. Korting, Hanover, Germany. (Filed Dec. 3, 1874.)



Brief.—Constructed upon the plan of the "Giffard injector," and is applicable to the ordinary uses of chimney-cowls.

The car-ventilator consisting of the flaring mouth or nozzle B, the pipe A, the mixing-nozzle C, and the diverging tube D, constructed and combined substantially as shown.

159,188. FARM-FENCES. Israel L. Landis, Lancaster, Pa. (Filed Dec. 16, 1874.)

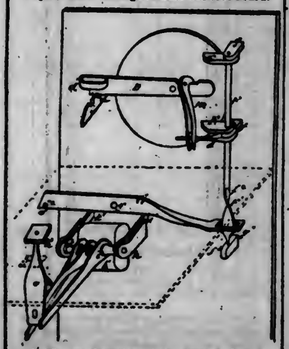


Brief.—The plates which clamp the ends of the overlapping loose rails are secured in position by staples, which encircle said plates, and, after passing through the fixed parts, are clinched and tightened by wedges.

The combination of the wires *a a*, constructed as described, and pins *c c*, with the perforated post A, plates B B, and rails D, all substantially as set forth.

159,189. CHEESE-MILLS. Jacob F. Landis, Harrisburg, Pa. (Filed Dec. 19, 1874.)

Brief.—An inverted hollow cone, perforated; a triangular blade revolving loosely within it, pendent from a shaft centered in a cross-head above, and operated by a crank; a handle at right angle to the top rim of the cone.



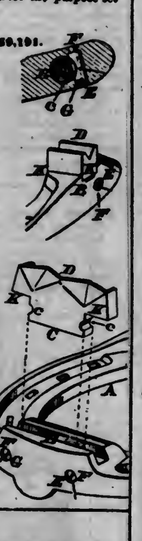
1. In a cheese-mill, a conical perforated reservoir containing a rotary removable agitator or grinder, substantially as described.

2. A cheese-mill consisting of a conical perforated reservoir, removable agitator, lugs L, and handle H, substantially as described.

3. A perforated conical cheese-mill, provided with a graduated scale to indicate the amount of material granulated, substantially as described.

159,190. DEVICES FOR OPENING AND CLOSING FURNACE-DOORS. George Lees, Philadelphia, Pa. (Filed Dec. 5, 1874.)

Brief.—Furnace-doors are opened and closed by means of a treadle, connected by levers to a spiral shaft arranged under the foot-board.



1. The combination of the furnace-door C, latch D, pintle-post F, having the screw or twist F', lever G, arm *d*, and dog *m*, substantially as shown and described.

2. The combination, with lever G, of the arms H, I, and K, and treadle A', constructed and operating in conjunction with the tripper L and arms *i* and *k*, substantially as shown and described.

3. The pintle-post F, having a twist or screw, F', and a flattened part, *f'* or *f''*, for preventing the accidental rotation of said post when the furnace-door is opened or closed, substantially as shown and described.

159,191. HORSESHOES. Robert Lee, Cincinnati, Ohio. (Filed Dec. 19, 1874.)

The sunken and riveted rotatable plug F, having nicked heads G and flattened depressions *f*, in combination with a horseshoe, A, having sockets B, and calks D, having coved shanks C *c*, as and for the purpose set forth.

159,192. HYPODERMIC SYRINGES. J. Leiter, Vienna, Austria. (Filed Jan. 12, 1875.)

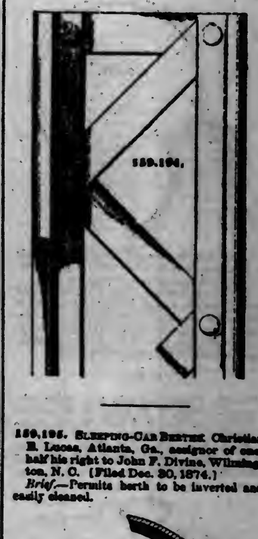
Brief.—A spring-hammer running in a guide-tube forces the piston of the syringe down, and also forces the body of the syringe forward, so that the hollow acupuncture-needle enters the flesh. A nut adjusts length of piston to determine the quantity of fluid to be injected.

1. The combination of a regulating-sleeve, *f*, with a syringe, *c*, provided with a lancet-shaped spout, *g*, substantially as described.

2. The regulating-screw *m*, in combination with the syringe *c*, tube *d*, and regulating-sleeve *f*, substantially as set forth.

3. The combination of a head or hammer, *e*, and trigger *k* with a syringe, *c*, and guide-tube *d*, substantially as described.

159,193. CROQUET-MALLETS. T. H. Logan, U. S. A. (Filed Sept. 10, 1874.)



Brief.—The head is of metal, in sections, and adapted to receive detachable faces of wood, leather, rubber, &c., and when screwed together firmly secures the handle.

A croquet-mallet stock made in two sections, O O, having recesses to receive handle and elastic heads, and held by detachable clamp-screws, as shown and described.

159,194. METALLIC POSTS OR GIRDERS FOR TRUSS-BRIDGES. Francis O. Lowthorp, Chambersburg, N. J. (Filed Dec. 21, 1874.)

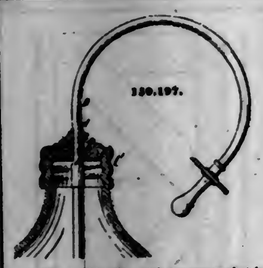
A post or compression member composed of the within-described angle-bars, combined with connecting bars or plates *a*, as specified.

159,195. SLEEPING-CAR BERTHS. Christian B. Lucas, Atlanta, Ga., assignor of one-half his right to John F. Divine, Wilmington, N. C. (Filed Dec. 30, 1874.)

Brief.—Permits berth to be inverted and easily cleaned.

1. A sleeping-car berth, provided on its rear side with eyes *g*, in combination with spring or snap hooks J attached to the side of the car, substantially as and for the purpose set forth.

2. In a sleeping-car, a berth detachably connected at its rear side to the car, and supported at its front side, substantially as and for the purpose set forth.



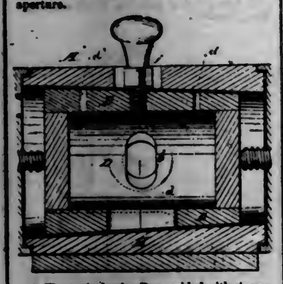
159,196. WASH-BOILERS. S. M. Marsden, Wilkesbarre, Pa. (Filed Mar. 20, 1874.)

Brief.—The water is introduced and filtered above the clothes. A capped tube communicates with the lower chamber for the introduction of soap.

The water-chamber B, steam-chamber B', movable bottom A'', tube F'', in combination with valve B'', as constructed, substantially as and for the purpose set forth.

159,197. NURSING-BOTTLES. J. L. Mason, New Brunswick, N. J. (Filed May 1, 1872.)

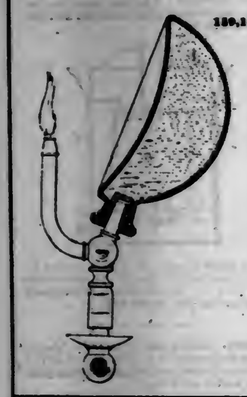
Brief.—The stopper is of glass, held in place by a metallic screw-ring.



No. 159,197.

1. The combination, with the nursery-bottle A, of the stopper B, constructed of glass, substantially as and for the purpose set forth.

2. The combination, with a threaded-neck nursery-bottle, A, and metal screw-cap C, of the stopper B, constructed of glass, and having an opening, *c*, for the pipe D, and a flange overlapping the top of the bottle, substantially as and for the purpose set forth.



159,198. STEAM-VALVES. Geo. McNaughton, Brooklyn, N. Y., assignor of one-half his right to Gustav H. Roth, Boston, Mass. [Filed Dec. 12, 1874.]

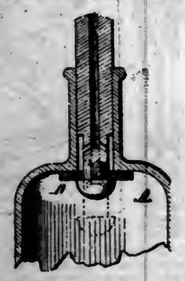
Brief.—Exhaust steam passes through ports in its lower surface to the large end of the valve-chest, from which it escapes through an aperture.

1. The conical valve D, provided with steam-inlet *b*, outlet *d*, balancing-openings *b' d'*, and exhaust-grooves *i i*, all constructed and arranged substantially as and for the purposes herein set forth.

2. The conical valve D, with steam-inlet *b*, outlet *d*, openings *b' d'*, and grooves *i i*, in combination with cylinder A B and screws and seats *c' d'*, all as and for the purpose herein set forth.

No. 159,199.

159,199. LENS ATTACHMENTS FOR GAS-BURNERS. Montgomery C. Meigs, Washington, D. C. [Filed Mar. 11, 1873.]



Brief.—A bracket adapted to fit upon a common burner, with a lens and burner thereon, adjustable independently of each other horizontally or vertically.

1. The combination of a supplementary bracket, adapted to be mounted on an ordinary gas-burner, a hollow glass lens mounted on the supplementary bracket, and adapted to contain transparent liquid, and a burner also mounted on said bracket, these members being constructed and operating substantially as set forth.

2. The supplementary bracket, provided with a socket adapted to fit on an ordinary gas-burner, a support for a dioptric lens, and a burner adjustable both vertically and horizontally, substantially as and for the purpose set forth.

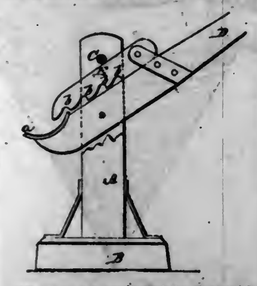
159,200. STOPPERS AND DISCHARGES FOR BOTTLES. Frederick Baron Micheli, Truro, England. [Filed Dec. 17, 1874.]

Brief.—The cork or stopple, which is provided with a discharge-opening, is kept in place by the pressure of the gas from the liquid within the bottle upon a stationary gasket.

In combination with the cork or stopper, having the discharge, as herein described, the stationary gasket D, through which the cork passes, whereby the gas from the contained liquid of the bottle, by its upward pressure upon said stationary gasket D and discharge device, serves to close and keep closed the vessel or bottle A, substantially as and for the purpose herein described.

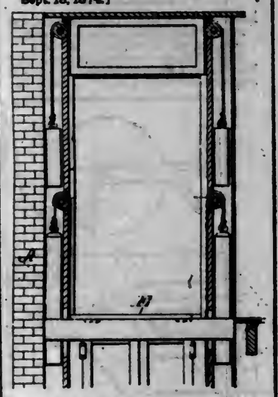
159,201. PICTURE-EXHIBITORS. C. S. Mills, Sterling, assignor of one-half his right to L. B. Starkweather, Chicago, Ill. [Filed May 20, 1874.]

Brief.—The pictures are placed on the inner surface of the cylinders, being slid into grooved ribs, and are viewed through apertures covered with glass.



1. The cylindrical tubes A A A, provided with internal longitudinal grooved ribs, caps B, gears C, and cords D, combined and arranged substantially as described and shown, and for the purpose set forth.

2. The cylindrical tubes A A A, grooved ribs, caps B, gears C, cords D, supporting-plates *e e*, and operating-screw *b*, all combined and arranged, substantially as and for the purpose set forth.

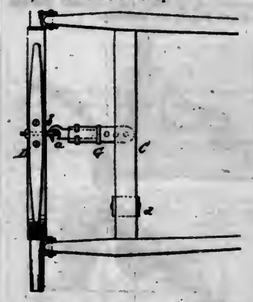


159,202. LIFTING-JACKS. Wm. F. Morrow, Newville, Pa., assignor of two-thirds his right to W. A. Middleton, same place, and Jas. M. Mance, Washington, D. C. [Filed Jan. 9, 1875.]

Brief.—The notched bar is hinged or pivoted to the lever, so that it will fall upon the lever and under the bar, thereby dispensing with an assistant to release the rack-bar.

The combination, with the bifurcated standard A, having bolt or bar C, of the pivoted lever D and the notched bar E, hinged or pivoted to the lever so that it will fall upon the lever and under the bar C, substantially as set forth.

159,203. MOVABLE FRONTS FOR BUILDINGS. John Murphy, Fond du Lac, Wis. [Filed Sept. 18, 1874.]



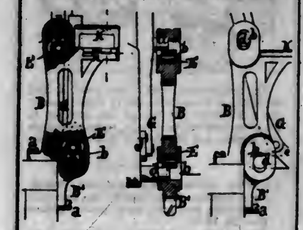
1. A door or window frame having its door or sash mounted therein as usual, arranged in vertical guides, substantially as shown and described, so that it can slide downward and carry its door or sash below the floor, as set forth.

2. A store-front consisting of upright pillars and intermediate sliding frames, containing the doors and windows, and arranged to slide downward below the floor, in order to leave the front open and unobstructed save by the pillars.

3. In combination with the sliding frame C, having the doors mounted therein, the foot-plate E, arranged to fit within the frame below the doors, as shown.

159,204. SHAFT-SUPPORTS. Jas. Nellis, Ypsilanti, Mich., assignor to himself and Charles McIntosh, same place. [Filed Dec. 8, 1874.]

Brief.—A strap secured to the cross-piece of the shaft hooks onto a staple in the spring-bar, and holds the shafts up.



1. The combination, with the spring-bar D and cross-bar C, of the strap G, hook *a*, and eye *b*, for the purposes set forth.

2. The loop *d*, attached to the cross-bar C, in combination with the strap G and hook *a*, for the purposes set forth.

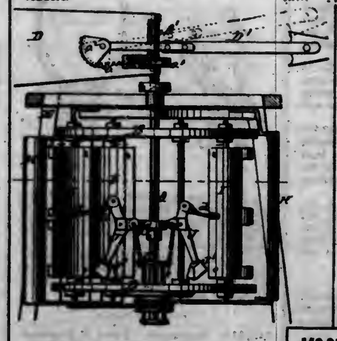
159,205. FOLDING CHAIRS. P. W. Nolan, New York, N. Y. [Filed June 10, 1874.]

Brief.—Cushions of elastic material are combined with the bearings of the chair, so as to reduce the noise in folding or unfolding. Brackets for supporting the seat and back of the chair are provided with angular or stepped base-pieces, fitting upon a corresponding support, so as to effect a saving in material. An hinge-joint is combined with the side straps, for connecting the seat and back, so as to exclude the play of said seat and back in the act of folding and unfolding. The leaves of the folding arms are hinged to the arm portion of the brackets, and are subjected to the action of a spring to keep them in a folded condition.

1. The supporting-brackets B, having recesses *h*, terminating in oval sockets *f*, in combination with the elastic cushions E, studs *d*, seat H, and back I, all constructed substantially as herein shown and described.

2. The hinge-joints J J, in combination with the side straps G G, for connecting the seat and back, substantially as hereinbefore set forth.

3. The seat and back supporting brackets B, formed with angular bases, as described, for connecting with a supporting-base, substantially as described.



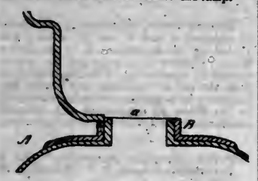
4. The sections K K, hinged at *g* to the arm portions of the bracket B, in combination with a spring for retaining the sections in folded condition, substantially as set forth.

159,206. COVERINGS FOR BOILERS, PIPES, &c. Walter O'Hare, Fall River, Mass. [Filed Dec. 5, 1874.]

A non-conducting covering for boilers and steam-pipe, consisting of a layer of plastic compound—of ashes and silicate of soda—spread upon canvas or other suitable fabric, which has previously been treated with silicate of soda or water-glass, substantially as herein set forth.

159,207. WINDMILLS. Warren D. Parson, Denver, Colo. [Filed Aug. 10, 1874.]

Brief.—The fenders or guards prevent the wind from striking the wheel in such a direction as to run it backward, and they also convey wind into the wheel. The vane and weighted lever, with their connections, cause the fender to recede in heavy winds, and the weighted lever brings them back in place after the wind has subsided. The shafts are independently connected to the frame, but in combination with the vane, lever, weight, and fenders.



1. The fenders or guards H H', constructed as described, and operated by means of the lever D^1, substantially as and for the purposes herein set forth.

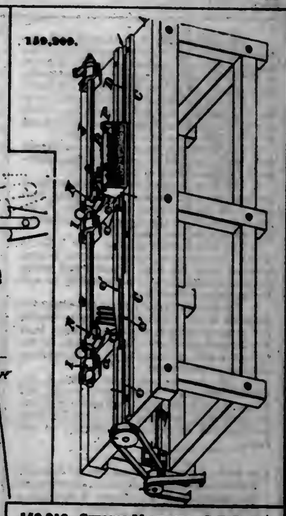
2. The combination of the vane D, grooved segments *d' d'*, chain *a*, and lever D^1, all constructed substantially as and for the purposes herein set forth.

3. The shafts A A', independently connected to the frame, in combination with vane D, lever D^1, weight D^2, and fenders or guards, substantially as and for the purpose specified.

159,208. LAMP-CAPS AND SHADE-HOLDERS. William R. Park, Philadelphia, Pa. [Filed Dec. 19, 1874.]

Brief.—The plate rests upon the bowl, while the collar embraces the neck of the lamp.

As a new article of manufacture, the cast-metal lamp-cap consisting of the plate A, adapted to rest upon the bowl and the collar B, to embrace the neck of the lamp, substantially as shown and described.

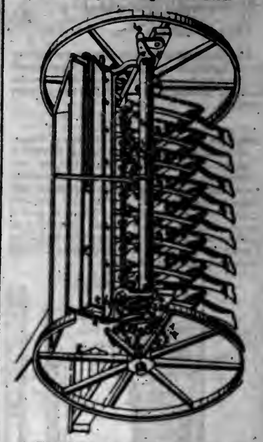


159,209. MACHINES FOR COMBING DRY BRISTLES. W. F. Parks and L. F. Lannay, Cincinnati, Ohio. [Filed Sept. 22, 1874.]

Brief.—The comb has several arms, each of different lengths, and are T-shaped at their ends, so that they comb the bristles in both their upward and downward movements as they are oscillated vertically through the same. The bristles are held and carried horizontally forward and backward in front of the comb in a clamp.

1. The double-acting comb having the series of double-pointed blades O of unequal lengths, substantially as and for the purpose set forth.

2. The combination of comb N O, housing P Q, carrying the armed and padded clamp-jaws S S', and eccentric R.



3. The described combination of double-acting comb N O, traveling clamps P Q, flanged and slotted way C *c c'*, and screw D.

No. 159,209.

159,210. SEEDING-MACHINES. C. E. Fabric, Springfield, Ohio. [Filed Oct. 17, 1874.]

Brief.—Eccentric lifting-roller lever having trip-foot, latch, and pawl, and provided with projection at one end, working in curved arm, for throwing seeding devices out of gear simultaneously with adjustment of drill-teeth. Forked lever for operating slide of adjustable grass-seed hopper. Pivoted bars for adjusting drag-bars, having plates and hooks for holding them in position. Mitrers made staple form for agitating seed. Slide having a series of holes for graduating flow of seed. Pivoted plates to seed-channels of distributing-wheels for graduating flow of seed.

1. The lifting-roller lever F, provided with the tripper-foot, in combination with the latch or pawl *d'*, arranged and operating substantially as described.

2. The eccentric lifting-roller arm *e*, in combination with the pivoted cam-hook *g*, for throwing the distributer-wheel shaft into and out of action, substantially as and for the purpose set forth.

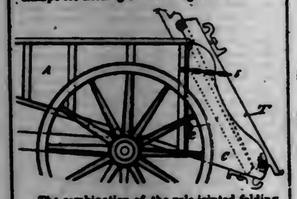
3. The pivoted cam-hook *g* and link h^1, in combination with the lever h^2, to which the intermediate transmitting gear-wheel H^1 is secured, arranged and operating substantially as described.

4. The lifting-roller E, connected with the eccentric-arms *e e'*, in advance of their pivotal center, whereby a backward thrust is given to the lifting-lever in raising the drill-teeth, substantially as and for the purpose set forth.

5. The forked lever O, in combination with the changeable grass-seed hopper, for actuating the grass-seed-agitator slide either in front or rear of the grain-box, as described.

6. The stirrers *r*, made in staple or stirrup form, and combined in pairs with the reciprocating agitator-slide, as described.

7. The slide S, provided with the series of perforations *s* for discharging the grass-seed, and with the indicator-perforations *s'*, arranged outside of the hopper, in the manner and for the purpose described.

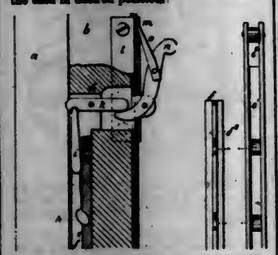


8. The eccentrically-pivoted bars L *L'*, to which the drag-bars D are connected, in combination with the hook-braces *l* and perforated retaining-plate *l'*, substantially as and for the purpose described.

9. The pivoted plates I, arranged within the channels of the vertical distributing-wheels, and made adjustable toward and away from the flanged periphery of said wheels, for varying the size and capacity of the measuring-channels, as described.

10. The several adjusting-plates I, arranged within the measuring-channels, and connected with the single rock-shaft by means of crank-arms, as described, whereby their simultaneous adjustment is effected, as set forth.

150,211. DUMPING-WAGONS. William F. Patton and Chas. D. Walters, Harrisburg, Pa., assignors to Sby Byers & Son, same place. [Filed Dec. 26, 1874.]



Brief.—A long tapering rule-jointed folding chute attached to a wagon, and provided with clamps for holding sections together.

The combination of the rule-jointed folding chute T with the locking-clamp *c*, fixed apron C, swinging doors *e e*, and inclined-bottom cart-body A, substantially as and for the purpose set forth.

150,212. HARE-HOLDERS. Henry C. Petty, Williamsburg, Pa. [Filed Dec. 2, 1874.]

Brief.—A friction or pressure bar, let vertically into a groove of the sash, is actuated by suitable connecting-levers, pitman, and cams, forcing it with the desired pressure against the window-frame. There is also a supplementary locking device, consisting of pawl-and-ratchet attachment, which locks the handle of the projecting lever, thus holding the sash in desired position.

1. The combination of the lever a with the presser-bar *f* by means of the pivoted lever *k* and pitman *i*, substantially as and for the purpose shown.

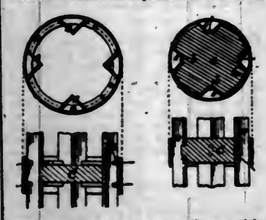
2. The sash-holder consisting of the presser-bar *f*, cams A, pitman *i*, levers *k* and a, pawl *o*, and ratchet *m*, when arranged to operate substantially as and for the purpose specified.

150,213. EGG-HOLDERS. Ansell W. Porter, Syracuse, N. Y. [Filed Jan. 13, 1875.]

Brief.—The removable egg-holder is provided with spring-arms extending both ways, the upper series for grasping the egg, and the lower series for securing the holder within the hollow shank of the standard, while an elastic ping serves to wedge the lower arm within the shank, and also forms a cushion for the egg to rest on.

1. The clamp or holder consisting of the part B, arms C C, with jaws *a a*, and arms D D, and the ring *d*, surrounding and fastened to the part B, substantially as and for the purpose herein set forth.

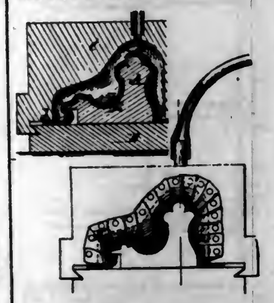
2. The combination of the hollow stand A, clamp or holder B C D, with exterior ring *d*, and the elastic ping G, all substantially as and for the purposes herein set forth.



150,214. BRACELETS. Edwd. F. Prentrey Providence, R. I. [Filed July 30, 1874.]

The combination, with a bracelet constructed of segments A and B, and the slides C and D, having the depressions K of the hollow frame F, having at its inner end the spring-catches H, constructed of tongues bent over from the end of the frame, and having projections J for engagement with depressions K in the slides, all constructed and arranged substantially as herein shown and described.

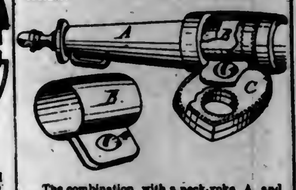
150,215. METALLIC TELEGRAPH-POLES. R. D. Radcliffe, Albany, N. Y. [Filed Jan. 19, 1875.]



Brief.—The angle or T bars, cores, and the exterior bands are interlocked without riveting or bolting, so that they can have no longitudinal movement independent of each other.

A metallic skeleton post or pole, comprising the combination of central core-pieces, external bands, and intermediate longitudinal angle or T bars, interlocked or positively connected with the same, by the means described, at required points in the length of the post or pole to prevent independent longitudinal movement of the bars, as set forth.

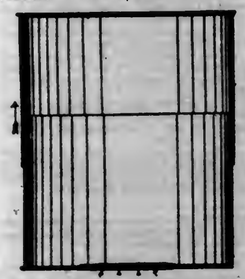
150,216. MACHINES FOR POLISHING WOOD. Silas G. Randall, Providence, R. I., assignor to Amelia A. Randall, same place. [Filed July 9, 1874.]



Brief.—The block is lined with an air-cushion, so that, under pressure from the tube G, the polishing material can be forced into the recesses, &c., of the molding.

The polishing block, form, or base, in combination with its attached lining, and air, under pressure, or its equivalent, applied to said lining, essentially as and for the purpose herein set forth.

150,217. NECK-YOKES. Jerome B. Relyea, Hicksville, Ohio. [Filed Nov. 7, 1874.]



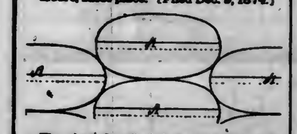
Brief.—A metallic clip next to the wood covered with leather prevents the wear of the leather.

The combination, with a neck-yoke, A, and leather C, of the metallic clip B, placed around the yoke under said leather, and fastened to the same by a bolt or rivet, *e*, passing through the leather and the ears of said clip, as set forth.

150,218. MUSICAL MERCHANDISE-BOXES. John Eastein, Philadelphia, Pa., assignor to Eastein Brothers, same place. [Filed Nov. 10, 1874.]

Brief.—For paper collars and other merchandise.

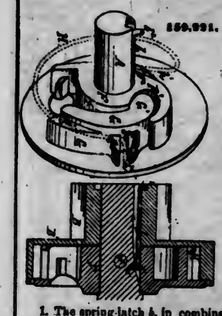
A collar or other box, provided with a closely-fitting cover, made to slide telescopically therewith, and having a reed or whistle arranged to be sounded by opening or closing the box, substantially as and for the purpose specified.



150,219. TIRE-TIGHTENERS. H. B. Robbins, Tekonsha, Mich. [Filed Dec. 26, 1874.]

Brief.—To tighten the tire by expanding the felly.

A metallic bolt, composed of the sides A B, stationary end C, and sliding end D, in combination with the adjustable wedge F, tap-bolt *g*, provided with the rim *i* and plate *h*, to operate in the manner and for the purpose herein described and set forth.

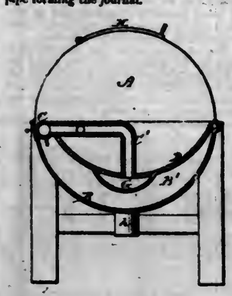


150,220. MANUFACTURE OF COUNTER-STIFFENINGS FOR BOOTS AND SHOES. H. Rogers, Sudbury, Mass., assignor to himself and S. Moore, same place. [Filed Dec. 9, 1874.]

The above-described improved method of forming counters or heel-stiffeners, it consisting in first separating the sheet of stock into ellipses or duplex forms A, and next splitting each of them obliquely through its longer axis or medial line, all substantially as shown and explained.

150,221. MEANS FOR CONNECTING GEAR-WHEELS WITH THEIR SHAFTS FOR USE IN HARVESTING-MACHINES, &c. J. M. Rosebrook, Hoosick Falls, N. Y., assignor to Walter A. Wood Mowing and Reaping Machine Company, same place. [Filed Nov. 26, 1874.]

Brief.—The cylindrical ratchet-case, having a pinion cast or otherwise secured thereto, is retained loosely on its shaft, so as to leave it free to rotate relatively thereto by means of a spring-latch; and it is also provided with a bent friction-rod or spring, which holds the pawl engaged with the ratchet in the forward movement, and disengaged and away from the ratchet, while at the same time obviating clicking due to the backing of the machine.



1. The spring-latch *b*, in combination with the shaft and pinion for retaining the latter in position on the shaft, as described.

2. The pawl G, connected with its shaft A by means of the recessed hub F, and provided with the spurs *g*, in combination with the friction-rod H and ratchet-rim B', rigidly connected with the pinion B, all constructed, arranged, and operating as described.

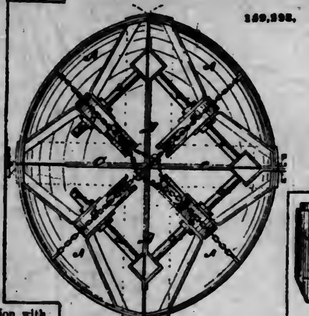
150,222. FEATHER-RENOVATORS. Charles Russell, Appleton, Wis., and Charles W. Seamans, Aurora, Ill.; said Russell assignor to John L. Hopkins, Oswego, Ill. [Filed Dec. 16, 1874.]

Brief.—Two semicircular parts hinged together and pivoted upon a frame, so that the lower part may be let fall, the main steam-pipe forming the journal.

1. The combination of the two semicircular parts A B, hinged together, the curved and perforated false bottom D, the trough C, chamber B', pipe *b*, and the pipe *f*, leading into pipe *b*, all substantially as set forth.

2. The combination, with the frame E, of the two semi-cylindrical parts A B, hinged together, the perforated steam-pipe C at the back edge of the part B, and forming journals for the cylinder, and the pins *b b* at the front of the cylinder *a e*, substantially as set forth.

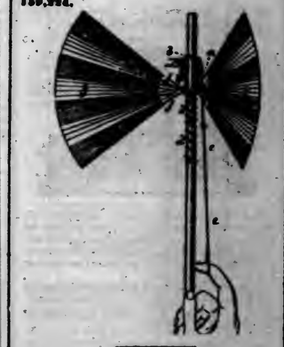
3. The combination of the steam-pipe C, with stop-cock *d*, and forming journals for the cylinder-pipe C', with stop-cock *d'*, bottom D, with perforations *a a*, trough C, cylinder A B, and outlet-pipes *f b*, all constructed and arranged to operate substantially as and for the purposes herein set forth.



150,223. DREDGING-BUCKETS. C. J. Sands, Brooklyn, N. Y. [Filed Aug. 11, 1874.]

Brief.—A dredging-bucket constructed in four sections, supported by a frame-work consisting of cross-bars combined with brace-rods, tie-rods, and grooved blocks, over which the chains pass.

A dredging-bucket, substantially such as herein described, constructed with cross-bars C and D, combined with brace-bars *c*, blocks *b*, and tie-rods *a*, as shown, for the purpose of sustaining the sections.



150,221.

150,223.

150,224. FANS. Ernst Schmidt, New York, N. Y. [Filed Nov. 17, 1874.]

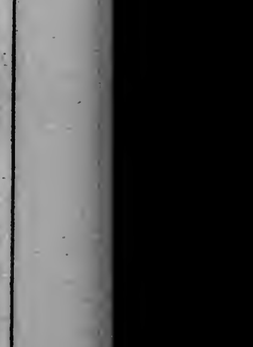
The combination of the rod A, carrying the spring *d*, with the collar B, pin *c*, groove *b*, and with the string *e* and fan-blades *a*, all combined and arranged as described, so that the alternate motion of the string and spring will impart rectilinear reciprocating motion to the sleeve and fan, the groove *b* causing the sleeve to turn during said motion, as set forth.

150,225. COOKING-STOVES. M. D. Seward, Normal, Ill. [Filed Dec. 10, 1874.]

Brief.—The reservoir may be removed, and its chamber used as a warming-closet or oven.

1. The combination of a removable water-reservoir, *l*, arranged outside of and at the rear of the stove within an inclosing-box, *f*, and a removable bottom, *n*, arranged to open and close the communication of said box *f* with a cross-heating flue, *c*, substantially as herein set forth.

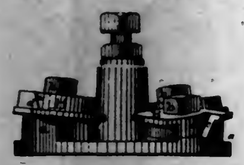
2. The combination, with the removable water-reservoir *l* and the box-chamber *f*, of a removable bottom plate, *n*, and the central cross and sheet flues *c d* of said box-chamber, substantially as herein set forth.



3. The combination, in a cooking-stove, of the removable water-reservoir *l*, the box-chamber *f*, its removable bottom plate, *n*, the sheet and cross-flues *d c*, and the removable open-top flanged frame *o* for said reservoir, substantially as and for the purpose herein set forth.

4. The combination, in a cook-stove having a removable reservoir inclosed within a box-chamber, and a removable open-top flanged frame, *o*, for said reservoir, as described, of a removable cover or reservoir-top, *s*, substantially as herein set forth.

5. The combination, with the heating and draft-flues *c d e*, and the damper *k*, and the removable bottom *n* of a cook-stove, of a convertible receptacle, *f*, for the water-reservoir, and a cooking and warming oven, substantially as herein set forth.

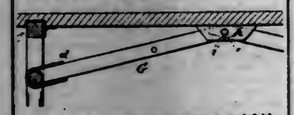


6. The combination, in a cook-stove, of the reservoir-inclosing box-chamber *f*, having a removable bottom plate, *n*, the sheet diving-flue *d* in front of said box-chamber, the flue-strips *i i* below said sheet-flue, and the rolling damper *k*, for the central ascending flue, *k*, with the bottom central cross-flue, *c*, of said box-chamber, substantially as and for the purpose set forth.

7. The combination, with the divided laterally-sliding feed-doors *v*, of the front-projecting plate, *x*, provided with an upper front bearing, *w*, for said doors, substantially as and to obtain the advantages stated.

8. The combination, with the divided laterally-sliding feed-doors *v*, provided with the guide-slips *z z* at their outer edges, of inner and outer bearings *w y* for said doors, arranged in front of and near the top of the stove, whereby the outer holding guide-bearings are carried away from the fire chamber, for the purpose herein set forth.

159,226. CUTTER-HEADS. Geo. J. Shimer, Milton, Pa. [Filed Oct. 24, 1874.]

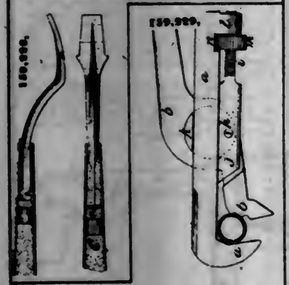


1. A revolving cutter-head, A, provided with hubs or seats *a*, having their faces oblique to the plane of rotation, and alternately inclined inward and outward, so as to cause the bits secured against said faces to cut to the right or left hand, as set forth.

2. A circular cutter or bit, B, constructed as set forth, combined with a revolving cutter-head, A, provided with seats *a*, having inclined faces, as described.

159,227. FOLDING TABLES. Homan R. Sinclair, Chicago, Ill. [Filed Oct. 21, 1874.]

Brief.—The legs are held open by hinged braces engaging with a cleat upon the table. When folded they are secured in a similar manner, the pin passing through perforations in the middle of the brace.



The combination, with the top A and folding legs E, of the rounds D, the braces G, connected to the rounds by strap-hinges *d*, and provided with perforations *x*, the perforated cleats k, attached to the under side of the table-top, and pin *i*, all substantially as and for the purposes herein set forth.

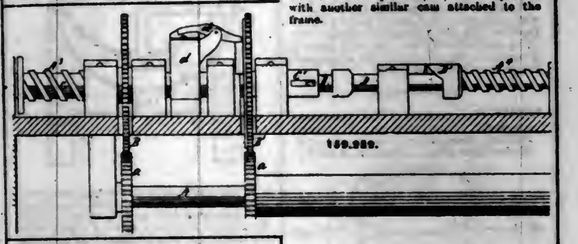
159,228. STOVE-LID LIFTERS. G. Sprague, Lockport, N. Y. [Filed Nov. 21, 1874.]

Brief.—Block or disk of cork interposed between the end of the lifter and the head of the handle.

The combination, with a stove-cover lifter having a handle filled with a plastic non-conducting material, in which the tang of the lifter is held, of the block or disk of cork interposed between the end of the lever and the head of the handle, substantially as and for the purpose herein set forth.

159,229.

159,230. PIPE-WRENCHES. H. C. Stouffer, Canfield, Ohio, assignor of one-half his right to John Childs, Smith's Ferry, Pa. [Filed Aug. 31, 1874.]

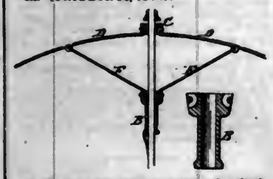


Brief.—The adjustable jaw swings on a plug of a diameter larger than the width of the slotted bar in which it slides; the projecting edge on the front of the bar being attached to an adjusting device, and the edge projecting from the rear of the bar being furnished with side lugs, to bear upon the bar and clamping thereon, to take principally the strain in the operation of the tool.

1. The pipe-tongs having the toothed jaw *b*, adjustable by means of a ping bearing, *f*, secured to the forked block *j*, the latter being provided with an adjusting device, and the plug being guided in its adjustment by projections *k k*, formed upon it, and by the block *j*, substantially as shown and described.

2. The combination of the outside plug-projections *k k* with the jaw-bar *a* and the movable jaw *b*, whereby the gripe of the latter is supported by a clamping action of said projections upon the back of the said jaw-bar *a*, substantially as set forth.

159,231. MACHINES FOR FORMING SPIRAL WASHERS. Samuel Truthewey, Pittsburg, Pa., assignor to Metcalf, Paul & Co., same place. [Filed Dec. 8, 1874.]

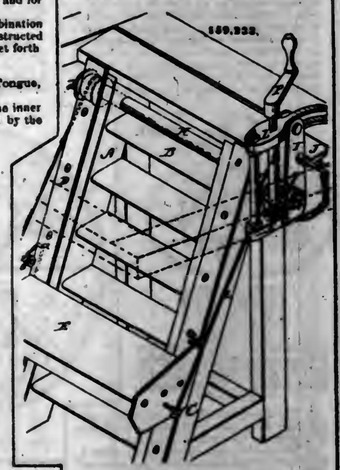


Brief.—Two hollow shafts, C C', with spirally-cut extremities, that meet within an opening, equal to them in diameter, made in an upright or block, grasp the end of the bar thrust through a lateral hole in the wall of said opening, by virtue of a spring, A', coiled around the one, and a spring, A', coiled around a mandrel, D, which latter passes through the one shaft into the other, and is withdrawable from the latter by a cam, D', that co-operates with another similar cam attached to the frame.

159,232.

The combination of the hollow griping-dies having inclined faces, the reciprocating central mandrel, and suitable mechanism for preventing the blank from revolving with the die, substantially as and for the purpose specified.

159,233. UMBRELLAS. Wm. Tetley, Pana, Ill. [Filed Dec. 14, 1874.]



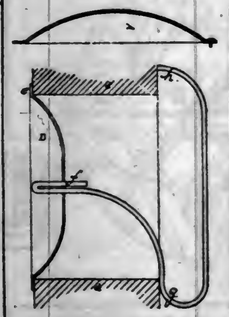
1. The runner and crown-piece of umbrellas or parasols, having the rim which receives the ends of the ribs and stretchers made solid, and provided with curved grooves and stationary pins or lugs, substantially as and for the purpose set forth.

2. The hooked braces F F, in combination with the slide B and ribs D D, all constructed substantially as and for the purpose set forth

---

159,234. CELLAR-DOORS OR ELEVATORS. Chas. D. Walters Harrisburg, Pa., assignor to W. A. Middleton and H. L. Bowers, same place. [Filed Jan. 9, 1875.]

Brief.—A platform is slid up cellar-steps by a rope at each side, wound around drums on a shaft at top, operated by worm-gearing in a frame adapted, when not in use, to swing out of the way, on a pin being withdrawn.

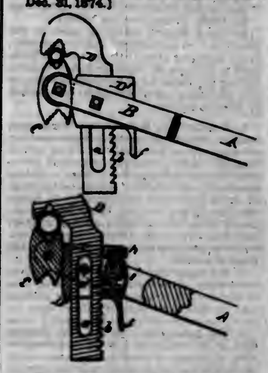


159,235.

1. The crank-shaft I with worm *i* arranged in the frame L L', and said frame adjustably secured to the frame I, in combination with the shaft H and pinion *f*, substantially as and for the purposes herein set forth.

2. The combination, with the stairs, of the platform E, chains or ropes *c*, drums *d d*, shaft H, pinion *f*, pivoted frame I, shaft L, worm *i*, casing J, and pin *h*, all constructed substantially as and for the purposes set forth.

159,236. STOVE-PIPE-COVERS. Henry Tongue, Chicago, Ill. [Filed Dec. 5, 1874.]

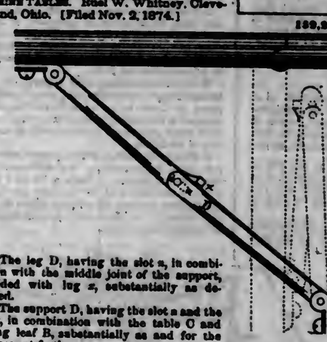


Brief.—The split wedge clamps the inner section of the cover, and is concealed by the outer section.

1. The combination, with a cover or stopper of a stove-pipe opening, of a retaining-spring arm, adjustably connected to the cover or stopper, whereby it may be adjusted to compensate for any loss of elasticity, substantially as described.

2. The combination of the inner and outer pivoted sections, A B, the retaining-spring arm *c*, and the wedge *b*, substantially as and for the purpose described.

159,224. PIPE-WRENCHES. Jas. B. Westwick, Galena, Ill., assignor of one-half his right to R. J. Edwards, same place. [Filed Dec. 31, 1874.]



1. The reversible jaw C, pivoted between the arms B B of the handle A, and operating in combination with the sliding jaw D, substantially as and for the purposes herein set forth.

2. The combination of the sliding jaw D, provided with slot *a* and ratchet-teeth *b*, the box or frame D', pivot *d*, pawl h, lever *f*, and spring *i*, all substantially as and for the purposes herein set forth.

3. The combination of the handle A with parallel arms B B, reversible jaw C, the slotted toothed sliding jaw D, box or frame D', and pawl h, operated by the lever *f* and spring *i*, substantially as and for the purposes herein set forth.

159,225. LEAF-SUPPORTS FOR SEWING-MACHINE TABLES. Read W. Whitney, Cleveland, Ohio. [Filed Nov. 2, 1874.]

159,237.

1. The leg D, having the slot *a*, in combination with the middle joint of the support, provided with lug *x*, substantially as described.

2. The support D, having the slot *a* and the lug *x*, in combination with the table C and folding leaf B, substantially as and for the purpose set forth.

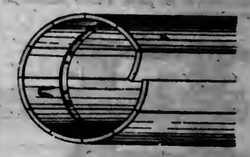
159,226. HEAD-BLOCKS FOR SAW-MILLS. Francis N. Whitcomb, Belmont, N. Y., for himself and W. Hilary Davis and Mary J. Rawson, administrators of David Rawson, deceased. [Filed Dec. 7, 1874.]

Brief.—The ratchet-wheels by which the setting-jacks are moved forward are inclosed in a shell, which protects them from injury, and at the same time serves as a lever, to which the operating-pawls are attached.

1. The combination of the ratchet-wheels D D on shaft *f*, shells C C, pawls A A, springs *i i*, links *p p*, collars G G, and shaft E, all constructed and arranged to operate substantially as and for the purposes herein set forth.

2. The combination of the shells C C, having spring-pawls and arms *h* cast in one piece, and the shaft *u*, having notches *y y* and lever *v*, all substantially as set forth.

159,238. DEVICES FOR MAKING WATCH-CASE BEZELS. Fritz H. Wilby, Philadelphia, Pa. [Filed Dec. 4, 1874.]



Brief.—The blank is clamped to the chuck by the screw-rim E, and is then spun over the ridge *f*.

The chuck A, in combination with the clamping-ring E, for making the bezel B, substantially as set forth.

159,239. APPARATUS FOR WALLING OUT TERMS. Frederick Willard, Regis, Wis. [Filed Dec. 7, 1874.]

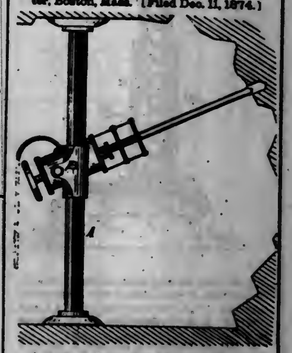
Brief.—A well-curbing consisting of a cylinder composed of slats of boards, connected to and forced out by spring-steel ribs, operated by jointed braces through a platform above, by means of a connecting-rod and ring.

1. A hollow cylinder supported by spring-steel ribs in the main part, which, in connection with movable or swing staves in place, forms a complete cylinder, the diameter of which can easily and evenly be reduced, and which is constructed and operated substantially as herein described and set forth.

2. The platform used on the top of the cylinder, supporting and aiding the operator in his work, constructed and operated substantially as hereinbefore described and set forth.

159,240.

159,240. AXLE-BOXES AND SLEEVES. Jas. B. Winchell, Boston Harbor, Mich. [Filed Sept. 16, 1874.]

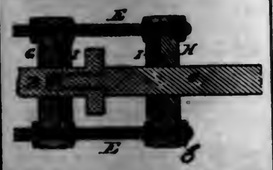


Brief.—To exclude mud and dirt from the axle-box.

1. The box *g*, having its inner end projecting beyond the flange *d*, in combination with the rim *f* and scraper *e* on the thimble, substantially as set forth.

2. The scraper *e*, in combination with the box *g*, having its inner and projecting over the flange *d* to form a guard, substantially as specified.

3. The scraper *e* on the under side of thimble *a*, substantially as and for the purpose described.

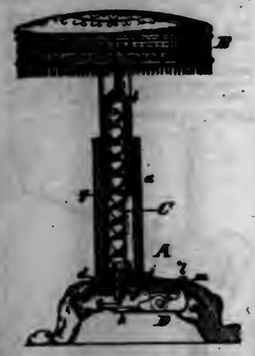


159,241. SUPPORTING-CLAMPS FOR ROCK-DRILLING MACHINES, &c. H. S. Winchester, Boston, Mass. [Filed Dec. 11, 1874.]

A support for rock-drilling machines and similar devices, consisting of a standard, A, a bead, B, encircling the standard, and provided with arms *c*, and a frame, C, provided with a trunnion passing through the arms of the clamp, and provided with a nut, *f*, or equivalent tightening device, substantially as shown and described, whereby tightening the single nut serves to clamp all the parts rigidly in position.

180,949. ROCK-DRILLING MACHINES. R. S. Winchester, Boston, Mass. (Filed Jan. 2, 1874.)

Brief.—Four rods extending forward are secured to the end of the cylinder. Upon these rods are mounted two pistons, into which are secured rubber cushions, which, as the piston moves to and fro, come in contact with one cushion and then the other, thus checking the movement of the piston without material jar or concussion.



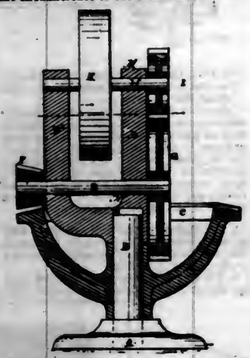
1. In combination with the cylinder and piston of a rock-drilling machine one or more cushions, arranged outside of the cylinder to check the movement of the piston, substantially as shown and described.

2. In combination, the cylinder and piston of a rock-drilling machine, a cushion or cushions, supported by the cylinder and arranged to check the movement of the piston-rod, substantially as shown.

3. The combination of the cylinder A, piston-rod B, rods E, piston G H, nuts *f* or equivalent fastening devices, and the cushions I, constructed and arranged substantially as described.

180,948. SUPPORTS FOR STOOLS. Chas. J. Woodward, Brooklyn, N. Y. (Filed July 26, 1875.)

Brief.—A quick or long-pitch screw, loose in its bearings, is arranged in the standard of a stool, and is provided with a collar and a projecting point at its lower end. The collar rests on a friction-brake arranged in the lower part of the standard. A lifting-treadle is arranged in the leg frame, which bears against the pivoted end of the screw, and lifts it from the friction-brake, when the screw is free to revolve, and allows the seat to drop by means of the fixed nut in the lower part of the seat-standard.



1. A quick or long-pitch screw, C, loose in its bearings, in combination with a non-rotary traveling nut, *g*, and a locking-brake, *h i*, substantially as herein described, for the purposes set forth.

2. The combination of the base A, having a square standard, *a*; the seat B, having a square stem, *b*, adapted to slide within the standard *a*, and constructed with a nut-section, *g*, in its lower end; the quick or long-pitch screw C, having the step-spindle *e e* and brake-disk *h*; the cushion *i*, and the treadle-lever D, having the step-disk *k* and projecting end *l*, substantially as specified, to constitute an improved adjustable stool.

REISSUES.

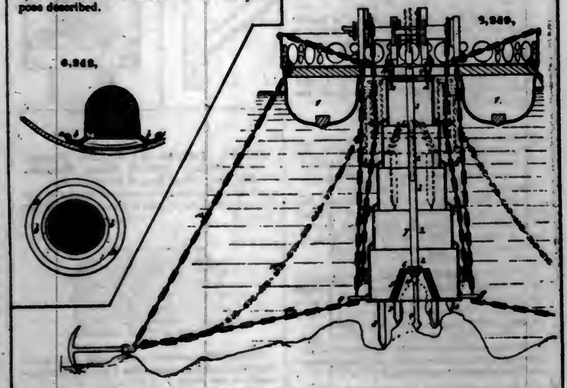
6,947. HORSE-POWERS. Jas. M. Albertson, New London, Conn. Patent No. 89,235, dated May 4, 1869. (Filed Nov. 27, 1874.)

Brief.—The machine is placed upon the ground-floor of the building, in the center of the horse-path. Power is transmitted to machinery placed upon the floor above by means of belts carried by pulleys mounted within the circumference of the main wheel.

1. The arrangement of the gear-wheel C, pinion F, shaft E, and wheel G, to allow the revolution of the wheel G within the wheel C, and to bring the shaft E at such height as to engage the pinion F.

2. In combination with above arrangement, the frame D D', consisting of two arms provided with journals for the shaft E, the whole attached to the upper end of shaft B, substantially as herein described.

3. The central shaft or spindle, B D, having its lower portion, B, surrounded by the master-wheel C, and its upper portion, D, provided with bearings M N and arm D' for the support of counter-shafts E and H, the shaft E carrying the pinion F, gearing with wheel C, and operating with reference to each other, substantially as described.



6,946. CONSTRUCTION OF STRAINERS. R. J. P. Goodwin, Manchester, N. H., assignor to R. P. Woods, Danl. Sherwood, and C. H. Latham, Lowell, Mass. Patent No. 63,879, dated Apr. 16, 1867. (Filed Nov. 26, 1873.)

1. The wire-cloth strainer A, the rim of which is at, or nearly at, right angles with the sides of the body, and secured between annular plates *a* and *b* by a hem on plate *a*, substantially as described.

2. In a strainer for liquids, the annular plate *a*, constructed in the manner and for the purpose described.

6,948.

3,949.

6,949. APPARATUS FOR REMOVING OBSTRUCTIONS UNDER WATER. Saml. Lewis, Williamsburg, N. Y., assignor, by mesne assignments, of one-half interest to Wm. H. Cammeyer. Patent No. 80,402, dated July 28, 1868. (Filed July 20, 1874.)

Brief.—A floating platform, open in the center, carries a telescopic dam or inclosure, firmly anchored at the bottom, which adjusts itself to changes of water-level, and inclosses drilling apparatus for subaqueous drilling, so that operations can be carried on undisturbed by tides or currents.

1. A submarine inclosure or breakwater, made in sections, one entering within another, substantially as described—that is to say, so that, by a sliding edgewise or vertical movement as contradistinguished from a folding movement, the height of the entire inclosure or breakwater may be increased or diminished by the diminution or increase of the entrance of one section within another, to adapt said inclosure to the different depths of water, or to facilitate its transportation from one place to another.

2. The combination, with a portable dam, breakwater, or inclosure, of the sliding bars or anchors 3 3, whereby said bars or anchors may be allowed to descend into or upon inequalities in the surface to be operated upon.

3. The arrangement of the open floating deck 14 in relation to a portable submarine dam, inclosure, or breakwater, substantially as described—that is to say, with the opening in the deck over the space inclosed or protected by the said submarine dam, inclosure, or breakwater, by which arrangement operations necessary within the said dam, inclosure, or breakwater may be carried on through the opening in said deck, substantially as hereinbefore set forth.

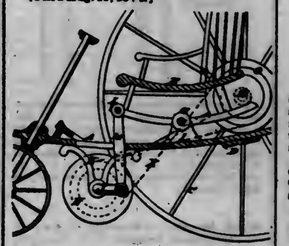
4. The combination, with a portable dam, breakwater, or inclosure, of a drill support or frame attached to said dam, inclosure, or breakwater.

5. The arrangement, in the lower portion or section of a submarine dam, breakwater, or inclosure, of a drill support or frame attached thereto.

6. The combination, with a floating deck or floor supported above the water, of a submerged drill-frame, arranged directly under said deck or floor, or under an opening through it, substantially as hereinbefore set forth.

7. The combination, with a portable submarine dam, breakwater, or inclosure, of boats, supports, or floats, and a set or series of anchors to hold said boats, supports, or floats in position in a tideway or current, substantially as hereinbefore set forth.

8. The combination, with a portable dam, breakwater, or inclosure, and with the boats, supports, or floats to be used therewith, of the chains 10, for raising the lower portion of the dam when necessary, substantially as hereinbefore set forth.



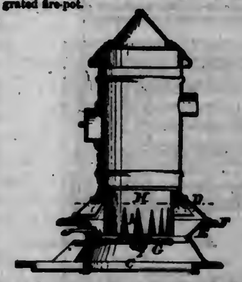
9. The combination, with a portable submarine dam, breakwater, or inclosure, and with the boats, supports, or floats to be used therewith, of the chains 11, for holding the bottom of the dam against the current while it is being lowered, or afterward, substantially as hereinbefore set forth.

10. The combination, with a submarine dam, inclosure, or breakwater for breaking the force of the current, and with a drill-frame attached to the lower portion or section thereof, of a drill-frame arranged above said lower drill-frame, substantially as hereinbefore set forth.

11. The combination, with a floating deck or flooring supported above the water, and with a drill-frame arranged in the lower portion of the stream, to guide the drills in proximity to the rock to be drilled, of a drill-frame placed above said lower drill-frame, all being arranged in the same vertical plane, substantially as hereinbefore set forth.

12. The attachment of the upper section of a submarine sectional dam, inclosure, or breakwater to a floating support, and the connection of the lower sections of the said dam, inclosure, or breakwater to the said upper section, substantially as described, whereby the said floating support is made to keep the said dam, inclosure, or breakwater extended to the proper height to adapt it, in that respect, to any change (within certain limits) of the depth of the water, substantially as hereinbefore set forth.

6,950. VELOCIPEDES. J. A. Vander Waag, Brooklyn, N. Y., assignor, by mesne assignments, to A. Cooke, Cincinnati, Ohio. Patent No. 88,347, dated Mar. 30, 1869. (Filed Aug. 19, 1874.)



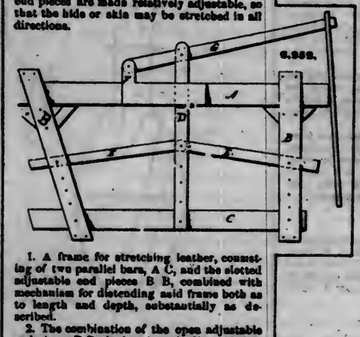
1. The combination of seat or chair E, fitted with rockers and crank J, joined by a connecting-rod to said seat, as and for the purposes described.

2. The combination of oscillating seat E, connecting-rod M, and crank J, as and for the purposes described.

3. The combination of rocking seat E, crank J, connected directly to rocking seat E by connecting-rod M, belt X, pulleys N and O, and driving-wheels C C, as and for the purposes specified.

6,951. HEATING-STOVES. N. A. Boynton, New York, N. Y. Patent No. 116,674, dated July 4, 1871. (Filed May 7, 1874.)

Brief.—The entire draft is upward through the grated fire-pot. The lower slanting plate of the shell inclosing the fire-pot radiates heat downwardly. The upper plate contains illuminating-windows, which receive light from the grated fire-pot.



1. The slanting plate D, provided with illuminating-windows *d*, in combination with a vertical grated fire-pot, H A, disconnected from the horizontal grate G.

2. The lower slanting plate, E, in combination with a vertical grated fire-pot, H A, constructed and applied as herein set forth, so that the entire draft of the stove is carried upward within the said fire-pot.

3. The outer shell or casing, consisting of the converging or oppositely-slanting plates D E, united at their common periphery, and surrounding the vertical grated fire-pot H A, said shell inclosing a dead-air or heat chamber without flue-connections, and radiating the heat upward and downward, as explained.

6,952. APPARATUS FOR STRETCHING LEATHER. Samuel D. Castle, Bridgeport, Conn. Patent No. 129,979 dated Feb. 27, 1872. (Filed Nov. 14, 1874.)

Brief.—The longitudinal bars and vertical end pieces are made relatively adjustable, so that the hide or skin may be stretched in all directions.

1. A frame for stretching leather, consisting of two parallel bars, A C, and the slotted adjustable end pieces B B, combined with mechanism for distending said frame both as to length and depth, substantially as described.

2. The combination of the open adjustable end pieces B B, the bar A, and adjustable bar C with the rods D, rods E, and a lever, all substantially as and for the purpose described.

6,953. REGISTERS FOR GAS-METERS. H. H. Edgerton, Fort Wayne, Ind. Patent No. 116,221, dated Aug. 22, 1871. (Filed Dec. 24, 1874.)

1. A value-register for gas-meters, comprising a series of dollar or value registering dials and indexes, in combination with a proving hand or index, which is at once the unit of value and the unit of measure, substantially as herein shown and set forth.

2. In a gas-meter registering the value of the gas consumed in dollars and cents, the combination, with the registering-train proper and the wheel on the spindle receiving motion from the diaphragms, of means, substantially as herein shown and described, whereby registrations varying according to different values may be obtained without change or alteration in the registering-train.

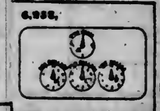
6,953.

6,955.

6,955. CONNECTING-RODS. J. F. Hankins, Fitchburg, Mass. Patent No. 134,276, dated Dec. 24, 1872. (Filed Jan. 10, 1873.)

Brief.—Adjusting the box of a connecting-rod by a wedge, which is movable to and fro by means of two screws passing from opposite sides of the box in contact with said wedge.

1. The combination of a solid connecting-rod, *c*, with the two boxes *d e*, having the flanges *f h* formed upon their ends, and a wedge operated by a screw or screws to tighten or loosen them upon the crank, substantially as set forth.

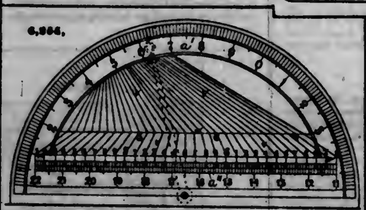


2. The rod *c* and boxes *d e*, having the flanges *f h* upon their ends, in combination with the wedge *j* and screws *l m*, substantially as shown and described.

6,956. SASH-SUPPORTERS. Henry F. Jenks, Pawtucket, assignor, by mesne assignments, of one-half interest to Danl. H. Arnold, Lincoln, R. I. Patent No. 46,472, dated Feb. 21, 1865. (Filed June 15, 1874.)

Brief.—A spring which acts upon a frictional cam is secured in a metal frame, to be inserted in the sash. The cam is operated by a thumb-lever.

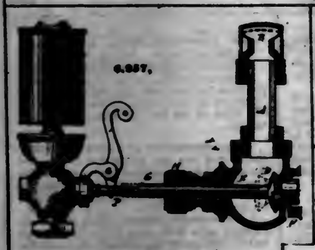
The window-sash supporter, composed of the frame C, the spring D, and the finger-lever E, in combination, as substantially as described, for the purposes specified.



6,958.

6,956.

6,954.

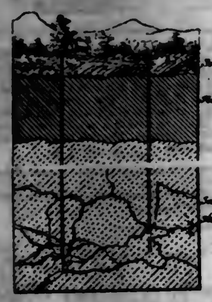


6,954. GAS LIGHT AND PRESSURE INDICATORS. W. W. Goodwin, Philadelphia, Pa. Patent No. 138,016, dated Apr. 22, 1873. (Filed Nov. 18, 1874.)

The combination, with a jet-photometer, provided with an indicator of the variable pressure on the gas, of a candle-power scale, whereby the number indicating the candle-power of the gas burning under the pressure, shown at the time by the said pressure-indicator, will be pointed out on the candle-scale by the index bar or pointer, substantially as and for the purpose hereinbefore set forth.

6,957. FIRE-EXTINGUISHERS. Henry S. Parmelee, New Haven, Conn. Patent No. 156,374, dated Oct. 27, 1874. (Filed Dec. 31, 1874.)

Brief.—The cap fits roughly the base of the distributer, to which its edge is attached by some easily-fusible material. A projection upon the under side of the valve loosely fills the aperture in the valve-seat, and requires a greater movement of the valve before the water is let on. Said movement of the valve sounds an alarm.



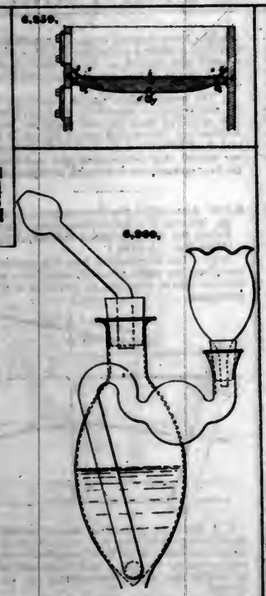
6,957.

1. A perforated distributor with a base below its periphery, combined with a hard-metal cap set over and closely fitting the periphery of said distributor, and extending down to the said base, to which it is secured by a low flexible material, substantially as and for the purpose specified.

2. In combination with the distributor B, constructed with the neck *a* and base *b*, the cap C, attached to the said base by a flexible material, substantially as and for the purpose set forth.

3. In combination with an alarm, an elongated valve, I, in connection with said alarm, and extending through the valve-opening, whereby the passage closed by said valve is not opened until the valve shall have been moved its length, and the alarm sounded.

6,958. METHODS OF INCREASING THE CAPACITY OF OIL-WELLS. Edwd. A. L. Roberts, Titusville, Pa. Patent No. 50,993, dated Nov. 28, 1865; extended May 20, 1873; reissue No. 5,494, dated June 3, 1873. [Filed Jan. 23, 1874.]



The method or process of increasing or restoring the productiveness of oil-wells by causing an explosion of gunpowder, or its equivalent, at or near the oil-bearing point, in connection with superincumbent field tamping, substantially as set forth.

6,959. GRATES FOR FURNACES. H. Ryder, Somerville, assignor, by mesne assignments, to Jos. J. Walworth, trustee, Newton, Mass. Patent No. 150,973, dated Mar. 11, 1873. [Filed Sept. 19, 1874.]

1. In the grate provided with two series of grate-bars, *a b*, the bars of one set arranged with their upper edges extended somewhat above those of the bars of the other set, such being substantially as and for the purpose specified.

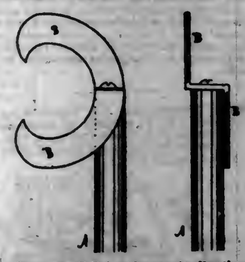
2. In combination with the two series of grate-bars, *a b*, arranged as set forth, and provided with mechanism for moving those of one series reciprocately, as described, the guards B B, applied to the bars and formed substantially in manner and to operate therewith as specified, they being inclined downward and resting against the walls of the furnace and abutments on the supporting grate-bars, so as to move with the said bars during their expansion or contraction, all as set forth.

6,960.

6,960. CONDENSED INHALERS AND NASAL DOUCHES. Edwin Schofield, Worcester, Mass. Patent No. 156,272, dated Jan. 26, 1873. [Filed Dec. 27, 1873.]

Brief.—The acid is held in the lower part of a bulb blown in the inlet-tube. The air is thus carried over, but not through, the acid, as in ordinary inhalers. A nasal plug is inserted in the cork of the containing-vessel, and the apparatus made to serve as a nasal douche.

1. The combination, in an inhaling apparatus, of a main reservoir for containing ammoniated liquid, provided with a draft-tube, a single inlet-passage, and an outlet-tube, when said parts are arranged for operation so that all air passing through the apparatus first becomes impregnated with acid fumes, and is thereafter delivered in contact with or through the ammoniated liquid contained in said main reservoir, for the purpose set forth.



2. An outlet-tube having a continuous inlet and outlet passage above the surface-level of an acid contained therein, in combination with the inlet-passage of an inhaling apparatus, for the purpose set forth.

3. In combination with the main receptacle of an inhaling apparatus, an inlet-tube constructed with a bend, D, and bulb E between said bend and the mouth of the tube, substantially as set forth.

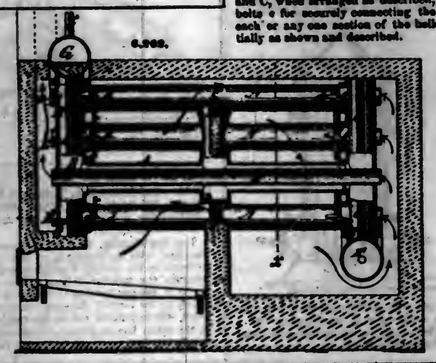
4. The inhaling and nasal-douche apparatus, consisting of the receptacle A, bulbed inlet-tube C E, and draft-tube E, furnished with the nasal plug H, as herein shown, and for the purpose set forth.

6,961. PRUNING IMPLEMENTS. E. E. Stedman, Havanna, Ohio. Patent No. 156,267, dated Sept. 22, 1874. [Filed Nov. 20, 1874.]

Brief.—Two curved blades are bent in different directions from a piece of metal, the center of which is secured upon the end of the single handle. The blades are parallel to each other and to the sides of the handle.

The cutters B B, bent in opposite directions, one upward and the other downward, so that their edges are toward each other, with their blades in different planes but parallel, or nearly parallel, to each other and to the sides of the pole A, at the top of which they are secured, substantially as and for the purpose herein set forth.

6,962. SECTIONAL STEAM-GENERATORS. H. Whittingham, Brooklyn, N. Y. Patent No. 91,300, dated June 15, 1869. [Filed Dec. 23, 1874.]



Brief.—The sections are secured by bolts passed through ears cast upon each section. The products of combustion pass through the horizontal and vertical tubes on their way to the uptake.

1. The combination, in each boiler-section, of front and rear upright or end tubes, a series of longitudinal or connecting tubes, and apertures passed both through the longitudinal and end tubes, substantially as specified.

2. A sectional steam-generator, in which each section is composed of front and rear upright or end tubes, one or more intermediate upright tubes, a series of longitudinal or connecting tubes, and smoke-flues fitted to pass both through the longitudinal and upright tubes, essentially as shown and described.

3. The ears *d d*, formed on the tubes A, B, and C, when arranged as described, to admit bolts *e* for securely connecting the tubes of each or any one section of the boiler, essentially as shown and described.

COMMISSIONER'S DECISIONS.

ROUSE AND STODDARD.—*Appeal.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the application of George L. Rouse and M. W. Stoddard, for a patent for an alleged* "IMPROVEMENT IN WHEELS," *filed May* 18, 1874.—*Decided January* 28, 1875.]

The decisions, rulings, and practice of the Patent Office will be made conformable to the decisions of the courts.

A rejected application will no longer be considered, therefore, a bar to a new application for a patent for the same invention.

The Office, however, will ascertain, if practicable, whether the invention had been before in public use; and if so will take affidavits to that effect, *ex parte*, if necessary.

Brown vs. *Guild*, OFFICIAL GAZETTE, Vol. 6, page 392, cited and commented on.

THACHER, *Commissioner:*

Two claims are left in the application which the examiner rejects for want of novelty, citing as references the patent of P. Murphy, August 12, 1873, and the application of Charles Spofford, filed August 2, 1871, and rejected the 8th day of the same month. The Examiners-in Chief have affirmed the decision of the examiner below, on the ground that the patent of Murphy is a good and sufficient answer to the claims of applicants. They have not discussed the pertinency of the rejected application of Spofford, as a reference.

After a careful examination I have come to the conclusion that the Murphy patent is not a sufficient answer to the claims of Rouse and Stoddard, which are limited to the special construction shown and described by them. It is admitted, however, that the construction of wheel hubs shown and described in the application of Spofford is almost identically the same as that of appellants. More than two years having elapsed since the final rejection of Spofford's claim, his application is regarded as abandoned under the 32d section of the Patent Act.

It is insisted on the part of applicants, that, in view of recent decisions of the courts, a rejected and abandoned application does not constitute a bar to the grant of the patent sought by them. It becomes necessary, therefore, to examine this question and determine the practice of the office in view of the decisions referred to.

Within a few years, several decisions have been rendered in the United States Circuit Courts, in which the effect on patents of prior rejected applications has been discussed; but the question did not receive the attention of the Supreme Court until the case of *Brown* vs. *Guild* came up on appeal during the October term of 1873. One of the defenses set up against the Brown patent was an old application, filed by Remy and Kelly in June, 1850, which was rejected and withdrawn the August following. The evidence showed that only one machine was ever made by them, and this, merely for experiment, in the year 1849. In discussing the effect of this application on the validity of Brown's patent, the court uses the following language:

> The experiment made in 1849, when Remy worked it by hand, was a mere experiment, which was never repeated. It may have presented one or two ideas in advance of other machines, but it can hardly be said to anticipate the machine which we have described as Brown's. Were it not for the application for a patent it would justly be regarded as an abandoned experiment, incapable of being set up against any other claim. Can the fact that such an application was made, and afterward voluntarily withdrawn and never renewed, make any difference? We think not. Had a patent been actually granted to Remy and Kelly it would have been different. The case would then have come directly within the seventh section of the act of 1836, which makes a "patent," or a description in a printed publication of the invention claimed, a bar to a further patent therefor. But a mere application for a patent is not mentioned as such a bar. It can only have a bearing on the question of prior invention or discovery. If, upon the whole of the evidence, it appears that the alleged prior invention or discovery was only an experiment, and was never perfected or brought into actual use, but was abandoned and never revived by the alleged inventor, the mere fact of having unsuccessfully applied for a patent therefor cannot take the case out of the category of unsuccessful experiments. (*Brown vs. Guild*, 6 OFFICIAL GAZETTE, 392.

There can be no mistake as to the meaning of this language; the doctrine is distinctly announced that a *mere application* is not a legal bar to the grant of a pat-

ent to a subsequent applicant. This decision must be heeded by the Commissioner of Patents, and govern him in regulating the practice of the Office. I have had frequent occasion to state my views on the necessity of harmony between the practice of the Patent Office and rulings of the courts. There can be no question about the propriety of this course. The Commissioner ought not either to issue patents which the courts will declare invalid, or to refuse the grant on grounds which have already been considered judicially and declared insufficient. But it will be noticed that the Supreme Court does not entirely ignore abandoned applications, for it is stated that they have a bearing on the "question of prior invention or discovery," and the effect of the application is made to depend on the question of actual use of the invention described therein.

It has been urged in argument that, if no objection appears to the grant sought by Rouse and Stoddard except the abandoned application of Spofford, the Commissioner should issue the patent and allow the question of public use to be determined hereafter in the courts. The suggestion must have its origin in a misconception of the duty of the Commissioner of Patents. The law makes him something more than a mere ministerial officer, whose function is to issue letters patent simply for the asking. The Commissioner is made the guardian not only of the rights of inventors, but also of the interests of the public. It is just as solemnly his duty to refuse to issue a patent which clearly ought not to be granted, as to grant the issue when the applicant shows an unimpeached right to the invention.

In this case, if, without further inquiry, the Commissioner should issue a patent to Rouse and Stoddard, and it should afterward appear that the invention of Spofford was put into public use, it would be invalid, as I understand the decision which has been quoted. It is his duty, therefore, to inform himself on this question, if possible, and the application of Spofford indicates the direction in which inquiry may be made. The only question in my mind is how to prosecute the investigation. The law restricts interferences to unexpired patents and pending applications. An interference, therefore, cannot be declared with an abandoned application. I have no doubt, however, that the Commissioner of Patents has ample authority to institute an *ex-parte* inquiry at any time, for the purpose of determining whether or not a statutory bar exists to the grant of a patent for which application is pending. This is necessary to enable him to comply with the statute. Unsatisfactory as *ex-parte* evidence may be, it appears to be the only source of information open to the Commissioner in cases like the present, without further legislation; and I do not believe that in a single instance a patent should issue for an invention shown in a prior abandoned application without an attempt, at least, to settle the question of public use.

The decision of the Examiners-in-Chief, affirming the examiner on reference to the patent of Murphy, is reversed. The application of Rouse and Stoddard is remanded to the examiner, who is instructed to forthwith dispatch letters of inquiry to the applicant, Spofford, and to his attorney of record, for the purpose of ascertaining whether the invention of the former has been brought into actual use. At the same time they will be informed that an application is now pending for the same invention, and that the inquiry is made for the purpose of determining the right of subsequent applicants to a patent therefor. Information furnished by them should be in the form of affidavits, clearly and fully setting forth the facts in the case. Counter affidavits will also be received from applicants, if they so desire. The issue of a patent will be determined by the information thus received.

Until otherwise ordered, this will be the rule and practice in the Patent Office in like cases.

DAVID HAMMOND *vs.* WILLIAM R. LAIRD.—*Appeal; Interference.*

[*Appeal from the decision of the Examiners-in-Chief in the matter of the interference between the application of David Hammond and the patent of William R. Laird, for* "IMPROVEMENT IN ARCH-GIRDER BRIDGES."—*Decided December* 31, 1874.]

In order to defeat a patent the courts require it to be shown that another not only conceived the invention in dispute before the patentee, but was also the first to perfect and adapt the same to practical use, or was using reasonable diligence for that purpose.

In accordance with this the Office uniformly requires an applicant to adduce the same evidence when he attempts to obtain a patent for an invention for which another has already obtained one in good faith.

Embodying an invention in a model is not a reduction of it to practice.

Where, after making a model, the inventor took no further steps for five years, although able to apply for a patent, and another in the meantime obtained a patent, the first party must be held to have been wanting in diligence; and it is no excuse for his delay that his employers declined to adopt his improvement and put it in practice.

THACHER, *Commissioner:*

This interference arises between the application of David Hammond, filed February 6, 1874, and the patent of William R. Laird, issued January 27, 1874, the application for which was filed May 11, 1871.

The subject-matter relates to an improvement in arch-girder bridges, and consists of "the combination of two rolled segments and two channel-bars connected by bolts through their flanges to form a tubular metallic girder or column."

Ordinarily when the controversy arises between an applicant and a patentee, the burden of proof is upon the former, to show that he was not only the first to conceive the invention in dispute, but that he was also first to perfect and adapt the same to practical use, or was using reasonable diligence to secure this result.

This is the character of the proof that the courts recognize as alone sufficient to defeat a patent on the ground of priority; and this Office has of late years uniformly required the same degree of evidence to be adduced on the part of an applicant before granting to him a patent, when another acting in good faith had already obtained a patent for the same invention.

The reason of this rule is apparent; it is a fatal objection to an application for letters patent that the specification does not describe a complete and practical apparatus; and when a patent is duly granted it is presumptive evidence that the requisite facts existed upon which the issuing of it was conditioned. (*Potter* vs. *Holland*, 1 Fish., 382; *Cahoon* vs. *Ring*, id., 397.) It therefore follows that if any one undertakes to defeat a patent on the ground of a want of novelty he must sustain the charge by evidence of equal weight and significance—viz., proof of actual prior knowledge of substantially the same invention in completed form and ready for actual use. (*Crouch* vs. *Speer et al.*, 6 OFFICIAL GAZETTE, 187.)

The reason that the Office has adopted this rule of the courts for its guidance is also very clear; the United States courts are the authoritative expositors of the patent law; and it is therefore the manifest duty of the Commissioner of Patents to refuse a patent which he is clearly convinced the courts would declare invalid if granted.

In the present case, neither party having embodied the invention in a completed form ready for actual use, the testimony must be considered with reference to which of the contestants has shown greatest diligence in efforts to attain that end, and which was first to introduce the invention to the knowledge of the public by applying for and obtaining letters patent.

Hammond substantially alleges in his preliminary statement that he conceived the invention in dispute in the latter part of June, 1869, and that he embodied the same in a model about the first of the following month. The testimony in his behalf supports these allegations and is uncontradicted. The model referred to is introduced in evidence, and it as correctly represents the invention as the models accompanying the respective applications. It appears, however, that after making the model, Hammond did nothing more in prosecuting his invention until the time of filing his application, nearly five years afterward, except from time to time to urge the members of the company, in which he was a stockholder and by which he was employed, to adopt and introduce his improvement.

In the meantime, in February and March, 1871, Laird made drawings and models of the invention, and at once proceeded, in the following month, to file his application for a patent. The application was pending nearly three years, without any apparent fault of his, however, and letters patent were finally issued to him before Hammond appeared at the Office.

The weight attached by the courts to the construction of a model alone is indicated by the following language, in the case of *Johnson* vs. *McCullough*, (4 Fish., 170:)

> I have also examined all the testimony relating to the Shaw model, and find it does not show more than the making of a model, and not of any practical working machine, which *is necessary to overthrow a patent.*

It would seem, therefore, that in a contest between an applicant and a patentee, neither having embodied the invention in a practical working machine, that the superior right to the invention is in the patentee, although he may have been second to originate, unless his opponent has used due diligence in applying for a patent. It becomes necessary, therefore, to inquire to what extent Hammond used diligence in this direction. As already stated, nearly five years intervened between the construction of Hammond's model and the filing of his application for patent. During this period there is no evidence of activity on his part, except efforts to induce the members of his company to adopt the improvement in question. They excused themselves by saying that the column, and column and arch-bridges, which they had introduced and were manufacturing, were good enough without the improvement. Hammond sought aid nowhere else—in fact, it does not appear that aid was necessary for the purpose of obtaining a patent, as he appears to have been abundantly supplied with means for this object, although it may not have been in his power to construct a bridge. The evidence shows that within these five years he made applications and obtained patents for several other inventions. It is true these were adopted, wholly or in part, by the company, and for this reason there was a stronger inducement for making and prosecuting these applications.

It does not appear, however, that either poverty, sickness, or any similar uncontrollable cause intervened to prevent an application for patent for the invention in controversy. The disinclination of the company, to which the applicant belongs, to adopt his device is the sole excuse relied upon for his inactivity. This, in my opinion, is entirely insufficient under the circumstances. If it were a question of reduction to practice it would perhaps have greater weight; but when, as in this case, the question becomes one of diligence in applying for a patent, such an excuse as is here made is of little importance.

If Hammond deliberately laid aside his invention for years and took no steps whatever to protect his rights therein, he did so at his peril, and must take the consequences. As an inventor he must be regarded as one who, by voluntary neglect to prosecute his claims, has forfeited his rights in favor of one more diligent.

The decision of the Examiners-in-Chief is affirmed.

F. G. AND W. F. NIEDRINGHAUS.—*Appeal.—Design.*

[*Appeal from the decision of the Board of Examiners-in-Chief in the matter of the application of Frederick G. Niedringhaus and William F. Niedringhaus, for patent for* DESIGN FOR ORNAMENTING ENAMELED IRON WARE.—*Decided December* 26, 1874.]

An application for a design-patent should not be entertained by the Examiner if the specification and claim are wholly wanting in clearness, exactness, and particularity.

Such an application will not be allowed.

Although the applicant may have discovered how to give his design a peculiar shade when worked into the surface of articles of enameled iron ware, that does not give him any better title to a patent for a design.

THACHER, *Commissioner:*

The claim of the applicants is as follows:

> The design for enameled iron ware, substantially as shown and described.

The lack of particularity in the claim is not supplied by the specification. The applicants therein assert that they have—

> invented and produced a new and original design of ornament or pattern, to be printed, painted, or otherwise placed on or worked into the various articles of enameled iron ware made and sold by us.

They then refer to an accompanying photograph as distinctly showing—

> the nature and characteristics *as to outline*

of the design, at the same time admitting that the illustration fails to exhibit the chief merit of their device, viz.:

A beautifully-mottled appearance resembling granite in color.

Even this characteristic is not relied upon as constituting the sole merit of the design, but that only on which the applicants place the most importance. No other characteristics are, however, alluded to. Such a specification and claim, so clearly deficient in the requirements of the law respecting clearness, exactness, and particularity, ought not to have been entertained by the Examiner. Compliance with these requirements is especially necessary in an application for patent for a design, which must of necessity be something fixed and determined and capable of specific description, either in words or by illustration. This defect is, in my opinion, a fatal objection to the favorable consideration of the application in its present form. But, in addition to this, I concur in the opinion of the Examiners-in-Chief so far as want of patentability in the general subject-matter embraced by the application is concerned. The so called design is effected by printing, painting, or in any other way placing upon iron ware a peculiarly-mixed color. The enameling of iron ware in various colors is an art well known. If applicant has achieved anything new, it is to be found in the mixing of colors, by which he produces a mottled appearance, having the effect of granite coloring. If he has, in this way, obtained a new paint, it may or may not be patentable; but the application of such paint, in an ordinary way, does not constitute the subject-matter of a design-patent, even under the most liberal construction of the statute.

The decision of the Examiners-in-Chief is affirmed.

DECISIONS OF THE COURTS.

SUPREME COURT OF THE UNITED STATES.

THE RUBBER-TIP PENCIL COMPANY, *Appellant*, *vs.* SAMUEL E. HOWARD, HENRY SANGER, MICHAEL SNOW, AND RICHARD BUTLER.

[*Appeal from the circuit court of the United States for the southern district of New York.—October term*, 1874.]

The idea that if a pencil is inserted into a cavity in a piece of rubber smaller than itself the rubber will attach itself to the pencil, and, when so attached, become convenient for use as an eraser, is not of itself patentable; but a new device by which this idea may be made practically useful is.

Blair's patent of July 23, 1867, is for a rubber head for lead-pencils—not for the combination of the head with the pencil.

As the rubber head described in the patent may be of any convenient external form, and is not limited as to either the form or the longitudinal extent of its socket, it is not new; and, as it was previously well known that if a solid substance was inserted into a cavity in a piece of rubber smaller than itself the rubber would cling to it, the size of the socket in the head, as compared with that of the pencil, does not add to the patentable character of the invention.

[*John S. Washburn*, for appellant.
F. H. Betts and *S. W. Kellogg*, for appellees.]

Mr. Chief Justice WAITE delivered the opinion of the court.

On the 23d of July, 1867, James B. Blair, claiming to be the original and first inventor or discoverer of "a new and useful rubber head for lead-pencils," received a patent for his invention. He claimed "as a new article of manufacture an elastic erasible pencil-head made substantially in manner as described." In his specifications he stated that he had "invented a new and useful cap or rubber head, to be applied to lead-pencils, &c., for the purpose of rubbing out pencil-marks." The "nature of his invention," he said, was "to be found in a new and useful or improved rubber or erasive head for lead-pencils, &c., and consists in making the said head of any convenient external form, and forming a socket longitudinally in the same to receive one end of a lead-pencil or a tenon extending from it." "The said head," he goes on to say, "may have a flat top surface, or its top may be of a semicircular or conical shape or any other that may be desirable. Within one end of the said head I form a cylindrical or other proper shaped cavity. This socket I usually make about two-thirds through the head, and axially thereof; but, if desirable, the socket or bore may extend entirely through the said head. The diameter of the socket should be a very little smaller than that of the pencil to be inserted in it. The elastic erasive head, so made, is to fit upon a lead-pencil at or near one end thereof, and to be so made as to surround the part on which it is to be placed, and be held thereon by the inherent elasticity of the material of which the head may be composed. The said head is to be composed of india-rubber, or india-rubber and some other material which will increase the erasive properties of the head." Drawings were attached to his specification, which, as was said, exhibited "the elastic head so made as to cover the end as well as to extend around the cylindric sides of the pencil; but," it was added, "it is evident that the contour of the said head may be varied to suit the fancy or taste of an artist or other person, and I do not limit my invention to the precise forms shown in the drawings, as it may have such or any other convenient for the purpose, so long as it is made so as to encompass the pencil and present an erasive surface about the sides of the same. A head made in my improved manner, and applied to a pencil, as above set forth, is of great practical utility to book-keepers, accountants, and various other persons. The pointed form of the head will be very useful to draftsmen in erasing lines from their drawings, when it may be desirable not to erase other lines in close proximity to that which it is desirable to erase. The elastic or rubber pencil head, made as above set forth, may be applied not only to lead-pencils, but to ink-erasers and other articles of like character."

The first question which naturally presents itself for consideration at the outset of this inquiry is, whether the new article of manufacture, claimed as an invention, was patentable as such. If not, there is an end of the case, and we need not go further.

A patent may be obtained for a new and useful art, machine, manufacture, or composition of matter, or any new and useful improvement thereof. In this case, as has been seen, Blair's patent was for "a new manufacture," being a new and useful rubber head for lead-pencils. It was not for the combination of the head with the pencil, but for a head to be attached to a pencil or something else of like character. It becomes necessary, therefore, to examine the description which the patentee has given of his new article of manufacture, and determine what it is, and whether it was properly the subject of a patent.

It is to be made of rubber or rubber and some other material which will increase its erasive properties. This part of the invention alone could not have been patented. Rubber had long been known, and so had rubber combined with other substances to increase its naturally erasive qualities.

It is to be of any convenient external form. It may have a flat top surface, or its top may be of a semicircular or conical shape, or any other that may be desirable. This would seem to indicate clearly that the external form was not a part of the invention. It was, however, urged upon the argument that the invention did consist in the projecting surfaces extending out from the head, and which appear, as is claimed, in the drawings attached to the specifications. It is true that in two out of the three drawings projecting surfaces are indicated, but such is not beyond question the case with the third. The shape there shown is conical, extending to a point, and evidently intended to represent the form mentioned as specially adapted to the use of draftsmen in erasing lines from their drawings. It was the end of such a pencil, not the sides, that was to furnish the particular advantage of form. But although drawings do accompany the specification and are referred to, it is evident that this reference is for the purpose of illustration only, because the patentee is careful to say that "he does not limit his invention to the precise forms shown, as it may have such or any other convenient for the purpose, so long as it is made so as to encompass the pencil and present an erasive surface upon the sides of the same." Certainly words could hardly have been chosen to indicate more clearly that a patent was not asked for the external form, and it is very evident that the essential element of the invention, as understood by the patentee, was the facility provided for attaching the head to the pencil. The prominent idea in the mind of the inventor clearly was the form of the attachment, not of the head. If additional proof of this is required, it may be found in the further statement in the specifications, which locates the head for use at *or near* the end of the pencil, and so made as to surround the part on which it is to be placed and be held thereon by the inherent elasticity of the material of which it is to be composed. If intended for use at any other place than on the end of the pencil, the projections could not be essential, as any form that would surround the part would present the requisite erasive surface.

Again, the head is to have in it, longitudinally, a socket to receive one end of a lead-pencil or a tenon extending from it. This socket is to be cylindrical or of any other proper shape. Usually, the inventor says, he made it so as to extend part way through the head, but, if desirable, it might be extended entirely through. It must be within one end, but any particular location at the end is not made essential. This clearly is no more than providing that the piece of rubber to be used must have an opening leading from one end into or through it. This opening may be of any form and of any extent longitudinally. The form, therefore, of the inside cavity is no more the subject of the patent than the external shape. Any piece of rubber with a hole in it is all that is required thus far to meet the calls of the specifications, and thus far there is nothing new, therefore, in the invention. Both the outside and inside may be made of any form which will accommodate the parties desiring the use.

But the cavity must be made smaller than the pencil, and so constructed as to encompass its sides and be held thereon by the inherent elasticity of the rubber. This adds nothing to the patentable character of the invention. Everybody knew, when the patent was applied for, that if a solid substance was inserted into a cavity in a piece of rubber smaller than itself the rubber would cling to it. The small opening in the piece of rubber not limited in form or shape was not patentable, neither was the elasticity of the rubber. What, therefore, is left for this patentee but the idea that if a pencil is inserted into a cavity in a piece of rubber smaller than itself the rubber will attach itself to the pencil, and, when so attached, become convenient for use as an eraser.

An idea of itself is not patentable, but a new device by which it may be made practically useful is. The idea of this patentee was a good one, but his device to give it effect, though useful, was not new. Consequently he took nothing by his patent.

The decree of the circuit court is affirmed.

U. S. CIRCUIT COURT, NORTHERN DISTRICT OF ILLINOIS.

JOHN M. TURNBULL *et al. vs.* THE WEIR PLOW COMPANY.

[*In equity.—Before* DRUMMOND, *J.*]

The object of the statute requiring assignments of interests in patents to be recorded within three months from their dates is for the protection of *bona fide* purchasers, without notice of previous assignments; therefore, an assignment by the patentee of a right under the patent would be valid as between the parties thereto without being recorded.

Where there is a residuary interest left in the assignor under a patent within the territory mentioned, the words "*all the right, title, and interest*" of the patentee, in the conveying clause of an assignment, must be construed as only conveying such residuary interest.

This rule would hold even though the prior deed of assignment, by which the patentee had alienated a part of his original interest in the territory specified, had not been recorded when the later assignment was made.

McQuiston having in the year 1860 assigned away the exclusive right under his patent in and for the counties of Warren and Henderson, in the State of Illinois, and having, on the 18th day of November, 1870, and prior to the recording of such first deed, executed a second assignment, conveying to another party "all my [his] right, title, and interest in and to the said letters patent in the following described territory," (in which was included the State of Illinois,) * * * * "as fully and entirely as the same would have been held and enjoyed by me [him] if this assignment had not been made:" *Held*, That, as there was an interest left in the patentee's hands upon which the second assignment could fairly be said to operate independently of that embraced in the first deed, this last assignment was valid. *Held*, also, that the first assignment was operative, and that a plea to the bill, setting up the second assignment in bar of complainants' right of action, they claiming by virtue of the earlier assignment, must be overruled.

The provisions of the 36th section of the Patent Act of 1870, with regard to the recording of assignments of patents, are substantially the same as those of the 11th section of the act of 1836, as construed by the courts.

[This was a bill for an injunction to restrain the alleged infringement of letters patent for an Improvement in Cultivators, granted to Thomas McQuiston, October 18, 1859, and reissued May 16, 1871, and for an account.

Defendant filed a plea to a portion of the bill and an

answer to the residue; and the case came on for hearing upon the plea. The contents of the bill, and of the plea, are sufficiently stated in the opinion.]

The points urged by the counsel for the respective parties were as follows:

I.—In Support of the Plea.

1. The assignments made in 1860, under which the complainants claim, were not recorded within three months, as required by section 11, act of 1836, and hence are void as against Weir and his assigns, he being a subsequent *bona fide* purchaser, and having duly recorded his assignment. The courts have held that, under said section, the assignment "must be recorded within the three months to defeat the right of a subsequent purchaser without notice, and for a valuable consideration. In order to guard against an outstanding title of over three months' duration, the purchaser need only look to the records of the Patent Office." (*Gibson* vs. *Cook*, 2 Blatchford, 144; *Brooks* vs. *Byam*, 2 Robb, 161; *Pitts* vs. *Whitman*, 2 Robb, 189)

2. The common law distinctions made between warrantee and quitclaim deeds of real estate ought not to be applied to the construction of assignments of patents, because they have not been made under the common law, but under acts of Congress. (See sec. 11, act of 1836; sec. 36, act of 1870.) The act of 1836 provided that patents "shall be assignable by any instrument in writing." That of 1870 says, "by an instrument in writing." These acts make no distinction between different kinds of assignments, and do away with every formality. They must be in writing, and that is the only condition imposed.

3. The words "grant and convey," found in Weir's assignment, are not the usual words used in quitclaim deeds; they import more than mere words of quitclaim.

4. Under registry acts, quitclaim deeds have been held effectual to convey lands, as against a prior unrecorded deed.

5. Contemporary exposition and long-established usage under the statute should be considered. Assignments the same in form as that to Weir have been in general use for more than twenty years. (See forms furnished by the Patent Office, under the authority of Congress, as early as 1852, in use from that time to the present.)

6. The effect of holding that assignments like this one to Weir only operate as a quitclaim to convey the actual residuary interest of the assignor should be considered. Interests of great magnitude will be in jeopardy, and a door will be opened for great frauds.

7. Under the acts of Congress, the decisions cited, and the general practice, this assignment to Weir ought to be held to convey not simply the actual residuary interest of the patentee without regard to the records, but all the right, title, and interest which he had, *as shown by the records*.

8. The act of July, 1870, sec. 36, expressly provides that assignments of patents shall be void as against a subsequent purchaser without notice, unless recorded within three months from the date thereof. This act applies to all assignments, whether executed before or after its passage. (See 3 Peters, 289.) Weir's assignment was given and recorded after the passage of this act, and several months before complainants' assignments were recorded.

II.—In Behalf of the Complainants.

1. The true construction of the 11th section of the act of 1836, requiring assignments of patents to be recorded within three months, is that the statute is not mandatory, but merely directory, and for the protection of innocent purchasers without notice. (*Pitts* vs. *Whitman*, 2 Story, 609; *Brooks* vs. *Byam*, Ib., 542; *Continental Windmill Co.* vs. *Empire Windmill Co.*, 4 Fish., 432.) If, therefore, the assignment to the subsequent purchaser purports to convey only a limited or special interest in the patent, as the assignment to Weir in this case, being in the nature of a quitclaim, it is itself notice to the assignee of all previous grants, against which he cannot protect himself by a prior record of his assignment. In other words, the patentee, by his second grant, conveys only the residuum of title, or residuary interest, remaining in him after his prior grant, and the first assignment, though not recorded, will prevail as against the second. (*Ashcroft* vs. *Walworth*, 5 Fish., 528.) The assignee of a patent can claim no more title than his assignor could lawfully grant, and takes subject to the legal consequences of the patentee's previous acts. (*Pierson* vs. *Eagle Screw Co.*, 3 Story, 403; *McClurg* vs. *Kingsland*, 1 How., 246.)

2. The same principle is to be applied here which governs in conveyances of real estate. The doctrine is well established that a subsequent conveyance of real estate which does not purport to pass the entire fee, being limited in terms to such interest as grantor then has, operates only on his residuary title after having given the former conveyance, even though the first conveyance be not recorded until after the second. (*Brown* vs. *Jackson*, 3 Wheat., 449; *Hope* vs. *Stone*, 10 Minn., 141; *Marshall* vs. *Roberts*, 18 Minn., 405; *McNear* vs. *McComber*, 18 Iowa, 12; *McConnel* vs. *Reid*, 4 Scam., 122; *Butterfield* vs. *Smith*, 11 Ill., 485; *Hamilton* vs. *Doolittle*, 37 Ill., 482.) A purchaser of real estate by quitclaim is not a *bona fide* purchaser without notice. (*May* vs. *LeClaire*, 11 Wall., 222.)

3. The act of 1870 can have no application, since complainants' rights were acquired long before its passage. That act, not being retrospective in its terms, cannot affect conveyances of patents made before its passage.

[*William Marshall, James L. High*, and *R. Mason*, for complainants. *West and Bond*, for defendant.]

The opinion of the court was as follows:

DRUMMOND, *J.*:

The question in this case arises upon the plea of the defendant, from which, and from the bill of complaint, the following facts appear: A patent was issued to one McQuinston on the 18th of October, 1859, for an improvement in cultivators, and a reissue on the 16th of May, 1871. Both parties claim under this patent. The defendant claims under a conveyance from William S. Weir, who purchased from the patentee on the 18th of November, 1870, and the assignment of purchase was recorded on the 5th of December, 1870. The terms of this assignment were that the patentee granted and conveyed to William S. Weir, through whom the defendant claims, "all my right, title, and interest in and

to the said letters patent in the following described territory," (within which, we may concede for the purposes of the case, was included the State of Illinois,) "* * * as fully and entirely as the same would have been held and enjoyed by me if this assignment had not been made."

On the 17th and 26th of April, 1860, the patentee assigned, to the parties through whom the plaintiffs claim, the exclusive right to make and to sell all machines and rights under the patent, in the territory comprising the counties of Warren and Henderson, in Illinois. These assignments were not recorded in the Patent Office at the time that Weir's assignment was recorded; and the question presented by defendant's plea is as to the effect of the assignment to Weir, recorded in December, 1870, as against the assignments through which plaintiffs claim, and which were not then recorded.

I think there can be no question but that, under the 11th section of the act of Congress of 1836, as between the parties, the assignment by the patentee of the right under the patent would be valid without recording. In other words, the recording did not give it effect as between them. The only object, I think, of the law in requiring the assignment to be recorded was to protect *bona-fide* purchasers, without notice of a prior assignment of a right under the patent. It is contended on the part of the defendant that, as it has been the practice for many years for rights under a patent to be conveyed by an assignment, the language of which is "all the right, title, and interest" of the patentee in the patent, it substantially amounts to a warranty on the part of the patentee that he conveys by such language all the right which he ever had under the patent, and therefore that when this language was used in the assignment to Weir in November, 1870, it meant all the interest which the patent originally conveyed to the patentee within the territory named. Of course the controversy turns upon what is the true construction of this assignment. Without deciding what might be the effect of an assignment of all the right, title, and interest of the patentee in a particular county, where there was no residuary interest left in the patentee, I am of the opinion, notwithstanding this alleged uniform practice as to assignments, that the true construction of such an assignment is that where there is a residuary interest left in the assignor under the patent, within the territory mentioned, it must be construed as only conveying that residuary interest. I mean, of course, where he has previously parted with some interest under the patent in a portion of the territory. For example, in this case, so far as we know from the history of the case and what is before us in the pleadings, the patentee had conveyed all his interest in the patent in Henderson and Warren counties in 1860; but he had left, and had a right to convey all his remaining interest in the State of Illinois. And when he stated that he conveyed all the interest which he had under the patent in the State of Illinois, and that the assignment was to vest in the assignee all his right under the patent in the State of Illinois, as fully and entirely as the same would have been held and enjoyed by him if the assignment had not been made, we must construe it as not indicating on his part an intention to convey what he had previously conveyed to other parties—viz., his rights under the patent in the counties of Warren and Henderson. Otherwise we must infer that he was perpetrating a fraud on the assignee by the assignment of 1870.

The question is, What is the legal effect of the language used, or what did he mean? Recollect we have nothing to guide us except the language in the contract. Did he intend, and is it necessarily the legal construction of that contract from the language used, that he intended to convey in November, 1870, what he had previously conveyed in April, 1860? If, as I have already intimated, there was nothing on which the conveyance of 1870 could operate, then a different question would arise. But the whole State of Illinois, except the counties of Henderson and Warren, was left, upon which the conveyance could take effect. And I think that, looking simply to the contract, notwithstanding the practice which is said to have grown up under the law as to the form of these assignments, we must hold that where there was anything upon which the assignment could be said fairly to operate, then we cannot construe it as showing an intention on the part of the assignor to convey what he had previously conveyed. In other words, we will not infer from language such as this, and in the absence of any proof upon the subject, that the patentee intended a fraud upon his assignee.

This is the general rule as applicable to conveyances of real estate. The question always is, Did he intend to convey, and is that the true meaning of the language used in the instrument, the same property and the same rights that he had previously conveyed to other parties? If he did, and if that is the necessary construction of the language, then it may be fairly said that the recording law should operate upon it, as well in the case of the conveyance of lands as the assignments of rights under a patent. But I think the result of the authorities as to the conveyance of real estate is, that where there has been a conveyance of property which is unrecorded, and there is a conveyance afterward of property which is recorded, and there is anything upon which the second conveyance can operate, where it purports to transfer simply his right and title, it does not cut off the prior unrecorded deed. Perhaps the authorities go further and hold, in the case of real estate—at least such seems to be the intimation of the Supreme Court of the United States—that a mere quitclaim of the right and title of the grantor, will not, *per se*, operate as against a prior unrecorded deed, which purports to convey the property.

The act of 1836 declared that a patent should be assignable, either as to the whole interest or any undivided part thereof, by any instrument in writing; and that this assignment should be recorded in the Patent Office within three months from the execution thereof. Now the language of the 11th section of the act of 1836, as construed by the courts, is not essentially different from the language of the 36th section of the act of 1870. The courts have construed the assignment, where it was not recorded, to be void as against parties who held by the subsequent assignment purporting to transfer, recorded and taken in good faith, and without notice of the prior assignment or conveyance. The language of the 36th section of the act of 1870 is, that "said assignment, grant, or conveyance shall be void

as against any subsequent purchaser or mortgagee for a valuable consideration, without notice unless it is recorded in the Patent Office within three months from the date thereof." I do not understand that this language is substantially different from that of the 11th section of 1836, as construed by the courts; so that I hold that we cannot construe the language of the assignment made in November, 1870, to Weir, under whom the defendant claims, as intending to convey the right and title under the patent within the counties of Warren and Henderson, which the patentee in 1860 had conveyed to another party, through whom the plaintiffs claim. So that the result is that the assignment in 1860 is operative.

The plea of defendant is, therefore, overruled.

U. S. CIRCUIT COURT, SOUTHERN DISTRICT OF NEW YORK.

CHARLES N. BLACK, AS ADMINISTRATOR, &c., *et al. vs.* SAMUEL THORNE *et al.*

[*In equity.—Before* BLATCHFORD, *J.—April*, 1874.]

In taking an account of profit in this suit, under the decree therein, (10 Blatch., 66,) the master proceeded on the principle of charging to the defendants as profits the cost or value of all the wood which, but for the use of the patented improvements, they would have burned in their furnaces; and he made a report accordingly. On the accounting, the defendants inquired of one of their witnesses whether he had examined and worked any furnaces substantially differing from the plaintiffs' furnace and worked substantially different from the plaintiffs' process, which existed at the time the defendants constructed their furnaces, and, if he had, what was the economical working of such furnaces as compared with the plaintiffs' furnace and process. The master, on the plaintiffs' objection, excluded the evidence as incompetent. The defendants excepted to the ruling, and afterward excepted to the report on the ground of the exclusion of such evidence:

Held, 1. That the ascertainment of the profits made by the use of the patented improvements to produce heat, by the burning of wet fuel, necessarily presented as the question to be determined, What advantage did the defendants derive, in producing heat, from burning wet tan by the employment of the patented improvements, over what would have resulted to them from the use, to produce equally beneficial results in the way of heat, of other methods of producing such equally beneficial results, open to the public and to them to be used at the time they used the patented improvements?

2. As the solution of this question involved the twofold inquiry whether there was any other open method whereby equally beneficial results in the way of heat could have been obtained, and, if so, what it was; and what would have been the expense of such method, in construction, operation, and fuel, as compared with the expense of the use of plaintiffs' improvements, in construction, operation, and fuel; the evidence excluded was competent and relevant, and ought to have been received.

The report set aside, and the case remanded to the master.

[*Dorman B. Eaton* and *Andrew J. Todd*, for defendants.
Charles N. Black, for complainants.]

BLATCHFORD, *J.*:

The master was ordered by the decree to take an account of the profits derived by the defendants from their infringement of the plaintiffs' two patents. (10 Blatch., 66.) The infringement proved was by the use, in burning wet tan to make heat employed in and about the tanning of hides, of furnaces containing and employing in their use the improvements covered by the plaintiffs' patents. The defendants used the infringing furnaces to produce heat. They burned wet tan in such furnaces to produce heat. The claims of the plaintiffs' patents are confined to the use of the improvements claimed only to produce heat by the burning of wet fuel. The ascertainment of the profits made by the use of the patented improvements to produce heat by the burning of wet fuel, necessarily presents, as the question to be determined, What advantage did the defendants derive, in producing heat, from burning wet tan by the employment of the patented improvements, over what would have resulted to them from the use, to produce equally beneficial results in the way of heat, of other methods for producing such equally beneficial results, open to the public and to them to be used at the time they used the patented improvements? This requires that the inquiry should be limited to the production of heat, and to the production of equally beneficial results in the way of heat, but it does not require that the heat should be that capable of being produced by burning wet tan alone. It extends to any fuel.

The master, in taking the account of profits, has proceeded on the principle of charging to the defendants, as profits, the cost or value of all the wood which, but for the use of the patented improvements, they would have burned in their tanneries. The view is that the cost of the wood was saved, because the wet tan burned cost nothing as fuel, and would otherwise have been useless. This principle is correct, if, to obtain equally beneficial results in the way of heat, by other open methods, would have required the use of wood to the given amount or value. The solution of the question, therefore, involves these inquiries, first, whether there was any other open method whereby equally beneficial results in the way of heat could have been obtained, and, if so, what it was; second, what would have been the expense of such method, in construction, operation, and fuel, as compared with the expense of the use of the plaintiffs' improvements, in construction, operation, and fuel. If the first inquiry should require, on evidence, the answer that it was a method which, to produce the equally beneficial results in the way of heat, would require a certain quantity of wood or other article, as fuel, then the saving in expense, in fuel, would be the cost of the wood or other fuel.

Now, I understand the above inquiries to involve an investigation into the matters inquired about in a question put, on the reference before the master, by the counsel for the defendants, to the defendants' witness, Du Faur. The question was whether he had examined and worked any furnaces substantially differing from the plaintiffs' furnace, and worked substantially different from the plaintiffs' process, which existed at the time the defendants constructed their furnaces, and, if he had, what was the economical working of such furnaces, as compared with the plaintiffs' furnace and process. This question was objected to on the part of the plaintiffs, as being incompetent, and as having been already asked. The master sustained the objection, and the defendants took, on the record, an exception to the ruling. The defendants have also filed an exception to the master's report, (exception 10,) on the ground that he erred in excluding proof of the economy of furnaces used in the combustion of wet spent tan, substantially different from the plaintiffs' furnace, and worked substantially different from the plaintiffs' process, as compared with the plaintiffs' furnace and process, and which furnaces were existing and in use at the time the defendants constructed their furnaces which are complained of. The evidence so excluded ought to have been received. It was competent and relevant. It could not be told, *a priori*, that the answer to it would introduce nothing which had not already been given in evidence in the case. It does not appear whether the master sustained the objection to the question on the ground that it was incompetent, or on the ground that it had been already asked, or on both grounds. Where and when the question had been already asked of the witness is not stated in the objection, or pointed out in the record. There may have been general evidence given by the witness, in the proofs for final hearing, as to the working of furnaces substantially differing from the plaintiffs' furnace, and worked substantially different from the plaintiffs' process, which existed at the time the defendants constructed their furnaces, and which were open to them to be used, and as to the general economical working of such furnaces, as compared with the plaintiffs' furnace and process; but the inquiry before the master involved the details of such economical working, with a view to arriving at the saving in money effected by the use of the plaintiffs' patented improvements.

It is no answer to these views to say that the court has held, in this case, that the patentee was the first to discover and put in practice the true method of economically burning wet fuels, and obtaining from them better results than from equal quantities of dry fuels. That is true; but still the difference in economy which the defendants have derived from using the patented improvements is now the subject of inquiry. It may be that equally beneficial results in the way of heat could not have been obtained by the use of any number of furnaces burning any quantity of fuel, wet or dry, or both. It may be that, to produce equally beneficial results in the way of heat, would have required a certain number of furnaces, involving a certain expense for construction and working, and a certain quantity of a given kind of fuel, costing a certain sum. It may be that the result of all these inquiries will be to show that, after all, the defendants have saved the expense of all the wood it would have taken to produce heat enough for use in tanning the same number of hides which they have tanned by the use of the heat produced by the infringing furnaces; and that, with that saving, they have still had a surplus of unused heat. If so, the proper inquiry will have been made, and the result arrived at will have been reached on a presentation of all the evidence properly bearing on it.

As these views require the report to be set aside, and the case to be sent back for the taking of further evidence, in conformity with this opinion, an order will be entered to that effect.

U. S. CIRCUIT COURT, DISTRICT OF CONNECTICUT.

SAMUEL G. MONCE AND ROLLIN J. IVES *vs.* BENJAMIN F. ADAMS.

[*In equity.—Before* SHIPMAN, *J.; April*, 1874.]

The invention covered by letters patent to Samuel G. Monce, June 8, 1869, for an "improved tool for cutting glass," consists, so far as the revolving steel cutter is concerned, in the fact that the sides, which are parallel at the axis, are beveled toward each other, at the perimeter, at an angle of about forty-five degrees to the axis, thus meeting about midway and forming a cutting-edge, which is approximately a right angle.

Such an instrument embodies the conditions that give efficiency to the glazier's diamond, viz.: the cutting-edge is *curvilinear*; it is formed by two surfaces meeting at *right angles*; these surfaces are *equally inclined* to the axis of the cutter; and when the cutter is properly mounted in its frame the inclination of the cut will naturally be at *right angles to the surface of the glass*.

It is a fact worthy of mention that this small and inexpensive tool has proved to be of great utility and has achieved success, having confessedly superseded all other inventions as a substitute for the glazier's diamond.

Monce's invention is not anticipated by revolving cutters designed and used for other purposes, (as for dressing the surface of grindstones, the cutting of gas-pipes, or the cutting of paper or of pasteboard, or of leather,) in which the distinctive feature of the invention—the double bevel forming the right-angled edge—is present, if at all, by accident, and which, although capable in exceptional cases of being used to cut glass, will not practically perform the office of a successful glass-cutter for glaziers' purposes.

The cutter of the patent, which makes a cut at right angles to the surface of the glass, is not anticipated by the Pike cutter, which bears upon the glass in a slanting direction.

The patentee having disclaimed a revolving cutter, his claim to "The cutter A, constructed substantially as shown and described, and for the purposes set forth," is a claim to the particular form, shape, and angles of the cutter, which adapted it to the purposes of a glass-cutter, and is as exact and accurate as the nature of the subject will permit.

The patent is not void for ambiguity because the specification merely says that the cutter is to be "hardened" without specifying what degree of hardness is to be given to it.

[*Charles E. Mitchell*, for complainants,
W. Edgar Simonds, for defendant.]

SHIPMAN, *J.*:

The complainants are the owners of a patent for an alleged new and useful "improved tool for cutting glass," and have brought their bill against the defendant, alleging an infringement by the latter, and praying for an injunction and an account. The patent was granted to Samuel G. Monce, one of the complainants, on the 8th of June, 1869. The defense contained in the answer, and chiefly relied upon, is a denial that said Monce was the first inventor of the patented article. It is also alleged that the description of the invention set forth in the specification is incomplete and ambiguous.

The patented article was designed to be an economical and effective substitute for a glazier's diamond in the cutting of glass. The alleged invention is thus described in the specification:

My invention consists in the use or employment of a revolving steel roller, the periphery of which roller is beveled on both sides, so as to form a cutting-edge, and is fitted to revolve in a suitable frame, and attached to a handle for operating the same. The cutter is made from steel, and is turned smooth and round, and afterward hardened. The sides are parallel, or nearly so, for a short distance and then beveled toward each other, so as to meet about midway between the same, thus forming the point or cutting-edge. The beveled portions of the sides should be at an angle of about forty-five degrees to the axis of the cutter, and, consequently, will be at near right angles to each other. It is not necessary that the angles of the beveled sides should be at exactly right angles to each other, but, near that angle, or a very little more obtuse, the cutter is found to operate to the best advantage. The cutter can be fitted to revolve upon a pin, or on solid journals at each end, which latter mode I prefer, and show the same in drawings. The frame, near one end, is provided with bearings for the journals, which journals should be a little shorter than the thickness of the sides of the frame, in order that, when the sides are placed against a straight-edge or other gage, the end of the journal shall not come in contact with such gage. The handle C can be of any desired form, and secured to the frame in any proper manner. I construct said handle like the handle ordinarily used for a diamond tool. * * * By my invention I produce a tool for cutting glass, which is equally convenient in use as an

ordinary diamond, and can be sold at a large profit, for one-tenth of the usual cost of a diamond.

The claim is as follows:

I do not claim simply a revolving cutter, but what I claim as new, and desire to secure by letters patent, is—
1. The cutter A, constructed substantially as shown and described, and for the purposes set forth.
2. The combination of the cutter A, frame B, and handle C, substantially as and for the purposes described.

The drawings attached to the specification show that the instrument is a tiny steel revolving cutter or wheel, made as described in the specification, attached to a frame and handle, the whole resembling very much the glazier's diamond ordinarily in use. It is clearly proved that this instrument is exceedingly well adapted to the purpose for which it was designed; that very large quantities have been sold at a cheap rate; that it has superseded the use of all other steel glass-cutters; and that it is an efficient and useful tool, while previous inventions have been failures. A glazier's diamond is sold at from $3.50 to $5, while this article is sold at fifty cents or less. The use of a tool for glass-cutting is thus brought within the reach of every householder. It is admitted that the invention does not consist of a revolving cutter; and it is obvious that it does not consist in a revolving cutter of a high degree of hardness, for "hardened" steel cutters had been known previously to the date of the patent. The invention, then, so far as the cutter is concerned, must consist in its form—in the fact that the sides are made parallel, and then beveled toward each other at an angle of about forty-five degrees to the axis of the cutter, so as to meet about midway between the same, in a cutting edge. The sides, at the cutting-edge, will, consequently, if they are at an angle of forty-five degrees to the axis of rotation, be at right angles to each other. As has been said, the object of the patentee was to make an economical substitute for the glazier's diamond, which should, if possible, possess the requisites which experience had shown were best adapted to successful glass-cutting.

In order to determine whether the utility and success of this invention depend upon any peculiarity in the form of the cutter, it is desirable to ascertain upon what depends the efficiency of the diamond. While almost any diamond will scratch or tear the surface of glass, it is a fact that the value and efficiency of a diamond to be used for the cutting or severing of glass depends not merely on the hardness, but upon the form, of the cutting-surface. Other gems than the diamond will successfully cut glass, provided they can be shaped into forms similar to those of the diamonds used for this purpose. Dr. Wollaston, in the Philosophical Transactions for 1816, thus explains the peculiarities required for the glazier's diamond: "In the natural diamond there is this peculiarity, in those modifications of the crystals that are chosen for this purpose, that the surfaces are, in general, all curved, and, consequently, the meeting of any two of them presents a curvilinear edge. If the diamond is so placed that the line of the intended cut is a tangent to this edge, near to its extremity, and if the two surfaces of the diamond laterally adjacent be equally inclined to the surface of the glass, then the conditions necessary for effecting a cut are complied with. The curvature is not considerable, and, consequently, the limits of inclination are very confined. If the handle be too much or too little elevated, the one extremity of the curve will be made to bear irregularly upon the glass, and will plow a ragged groove, by pressure of point. But, on the contrary, when the contact is duly formed, a simple fissure is effected, as if by lateral pressure of the adjacent surfaces of the diamond, diverted equally to each side. The effects of inequality in the lateral inclination of the faces of the diamond to the surface of the glass are different according to the degree of inequality. If the difference be very small, the cut may still be clean, but, as the fissure is then not at right angles to the surface, the subsequent fracture is found inclined accordingly. When an attempt is made to cut with an inclination that deviates still more from the perpendicular, the glass is found superficially flawed out on that side to which the greater pressure was diverted, and the cut completely fails."

Again, from the testimony given in this case it appears that it is necessary, for practical use as a glass-cutter, that the sides of the instrument should be beveled toward each other at about a right angle, for two reasons: First, a more acute angle would not be sufficiently durable; second, experience has shown that, in order to cut glass successfully, the cutting-edges of the tool, whether of a diamond or of any other cutter, must be at a right angle to each other. This fact is also asserted by the authorities upon the subject. The reason why such an angle is necessary does not seem to be clearly explained. Hence the requisites of the form of a tool best adapted to glass-cutting are three-fold: First, the cutting-edge should be curvilinear; second, the cutting-edges should be at right angles to each other; third, the two surfaces of the diamond which are adjacent to the cutting-edge should be equally inclined to the surface of the glass. The cutter should also be so placed in its frame as most easily to bring the cut which is to be made at right angles with the surface of the glass.

Recurring, now, to the alleged invention, the sides of the cutter are made parallel and then beveled toward each other at an angle of about forty-five degrees to the axis of the cutter, so as to meet about midway in a cutting-edge. The conditions necessary to form a glazier's diamond are thus complied with; for, by making the two sides of the cutter parallel for a short distance, and then beveling them toward each other at an angle of forty-five degrees to the axis of rotation, till they meet, "the two surfaces" of the cutting instrument, "laterally adjacent, are equally inclined to the surface of the glass." The frame being attached to the cutter in the precise way in which the handle is attached to the diamond, the inclination of the cut will naturally be at right angles to the surface of the glass, and the lateral pressure of the adjacent surface of the cutter is "diverted equally to each side." Furthermore, the sides at the cutting-edge, being at or near an angle of forty-five degrees to the axis of rotation, will be at or near an angle of ninety degrees to each other.

Having thus ascertained wherein the peculiarity of the cutter consists, is this form a new invention of the patentee, or has it been anticipated by others? The respondent claims that this alleged invention is an instance of double use—the mere application of an old device to a new purpose. He introduces the patents of Charles Wilson, of March 13, 1847, and April 10, 1849, of Joseph E. Stanwood, of April 26, 1859, and of A. H. Hook, of September 13, 1864, to show, not only that the use of steel cutters for cutting hard substances was well known, but that the cutter in each of these patents was of a similar form with the one in the Monce patent.

The first patent to Charles Wilson was for a mode of cutting stone or other like material, by means of a revolving cutter, operating in a described manner, and was particularly designed for the smoothing and finishing of grindstones. Whether the knives in Wilson's machine are able to cut glass or not is unknown. In either event the particular form or shape of the knives or cutters was not a part of Wilson's machine, and, whether they were or were not accidentally beveled at an angle of forty-five degrees, was an unrecognized circumstance of no value or importance to his discovery.

The second patent of Wilson is entirely immaterial to the present case.

The patent of Stanwood was for a revolving cutter, so operating upon gas or iron pipe, secured in place by a clamp or jaw, as to cut the pipe. Sometimes one of the cutters, detached from the heavy frame in which it is placed, will cut or tear glass. Ordinarily, however, an instrument intended for cutting pipe cannot be successfully used upon glass. The requisites for successful pipe cutting are very different from those for successful glass-cutting, and, consequently, it is only in exceptional cases that a gas-pipe cutter can be used upon glass. Such a cutter could never be made a practical substitute for a diamond. But in this, as in the first Wilson patent, the invention which is the distinctive feature of the Monce patent is unknown and unrecognized. In the Stanwood device the sides of the cutter may or may not be beveled toward each other at a particular angle. The angles vary in different specimens of the article, sometimes exceeding and sometimes being under forty-five degrees.

The Hook patent is for a paper-cutter. It is sufficient to say that one of its sides is at right angles to the axis of rotation.

The respondent also introduced the cutter attached to a book-binder's machine for cutting pasteboard, and claims that it has long been in use, and will cut glass. The pasteboard cutters exhibited upon the trial did not cut glass readily or easily. The truth probably is that such a cutter of unusual hardness will also sever glass, but those ordinarily and usually made will not answer this purpose. The sides of the pasteboard cutter are, apparently, but slightly inclined toward each other.

Thus far the well-known principle relied upon by the respondent is inapplicable to the present case, inasmuch as it is untrue that the distinctive feature of the patented article was used as a part of the cutters previously existing. The alleged invention of Monce was neither a part of the invention of previous patentees nor was it a part of their machines, unless by accident, and, lastly, the cutters in their machines will not practically perform the office of this cutter, to wit: the cutting of glass for glaziers' purposes. The peculiarity in the form of this cutter has accomplished an effect not before produced—that is, has made a successful glass-cutter.

The respondent also claims that the alleged invention had been previously anticipated, in every particular, by the patent of O. M. Pike, of December 29, 1868, and by the harness-leather cutter used and produced by the witness Septimus C. Stokes.

Pike's patent was for a glass-cutter. His cutter was a small rod of hardened steel, turning, near one end, upon two friction-wheels, and, at the other end, in a hardened steel socket in a thumb-screw. The object of the thumb screw, the friction-wheels, and the steel socket was to make the friction on the cutter as little as possible. When the instrument is used, the end of the cutter is placed upon the surface of the glass and the side of the frame drawn along the straight edge or pattern. The instrument is so made that, in order to bring the point of the cutter in contact with the surface of the glass so as to cut, the cutter must be placed upon the glass at an angle of forty-five degrees. This article has not proved practically a success, and, by recurring to the quotation heretofore made from Dr. Wollaston, it is not difficult to understand the cause of the failure. The fissure should be made at right angles with the surface; otherwise, if the cut deviates much from the perpendicular, "the glass is found superficially flawed out on that side to which the greater pressure was diverted, and the cut completely fails." As the Pike tool must be held at an angle of forty-five degrees to the glass, the cut is made at an angle of forty-five degrees, instead of being at right angles, to the surface. The cut becomes a sidewise or slanting cut, and, the greater pressure being constantly directed upon one side, the instrument is unevenly worn, and, in a short time, loses its cutting power. The defect in the Pike instrument is remedied in the Monce patent by making the cutter a wheel instead of a revolving rod. The wheel can then be placed upon the end of the handle, like the handle of an ordinary diamond, instead of at the side of a frame, and can be placed upon the glass so that the lateral pressure of the two sides of the cutter upon the surface will be equal, and, consequently, the cut will be at right angles, and not slanting, to the surface.

The Stokes cutter was originally for cutting leather. It was purchased in 1861 by the owner, who was then a saloon-keeper, and used, at first, for cutting newspapers into cigar-lighters. Stokes discovered that it would cut glass, and has occasionally used it for that purpose since, for his own convenience or amusement. The wheel was evidently, at one time, much larger than it is now, and has been worn to the present edge by use. The wheel is of great hardness, and will, when ground to a sharp edge, cut glass. That it can be uniformly used for a glass-cutter is not claimed. That such an instrument could not be made practically available in the market and by householders, as a glass-cutter, is obvious.

The result is, that the respondent has, in my judgment, failed to show that the alleged invention has been anticipated either by a prior patent or by prior use.

There is another fact in this case not unworthy of mention. The small and inexpensive tool which is the subject of controversy has proved to be of great utility, and has achieved success. The energy and research of the respondent and of his counsel has not discovered a successful substitute for the glazier's diamond, other than the patented article. It has con-

fatally superseded all prior inventions. Under these circumstances, the language of the court in *Stanley Works* vs. *Sargent* (8 Blatchf. C. C. R., 344) is not inappropriate.

Utility is not an infallible test of originality. To be new, in the sense of the act, it must be produced of original thought or inventive skill, and not a mere formal and mechanical change of what was old and well known. But the effect produced by a change is often an appropriate, though not a controlling, consideration in determining the character of the change itself.

The respondent also insists that the patent is void for ambiguity, both in the specification and in the claims; First, because the specification does not state what degree of hardness is to be given to the cutter. It simply says "hardened." As has been before remarked, the patent was not for a hardened revolving cutter. That was a well-known invention. As the term "hardened," among mechanics, implies that it shall be made as hard as can ordinarily be done, and not tempered, it was not necessary for the patentee to set forth in his specification more particularly the degree of hardness to be given to the cutting instrument. Second, it is claimed that the specification is ambiguous, in that it does not point out what is old, and specify what is new, in the alleged invention. In the claim the patentee expressly disclaims a revolving cutter, but does claim a cutter constructed substantially as shown and described, and for the purposes set forth. This claim has reference to the shape, form, and angles of the cutter—to the particular construction and peculiar shape of his cutter, which adapted it to the purposes of a glass cutter. He did not intend to claim, and did not, in my judgment, claim, a hardened roller, or a cutter brought to any particular degree of hardness.

I see no force in the other criticisms upon the ambiguity of the specification, which seems to me to be as exact and accurate as the nature of the subject will permit.

No question is made in regard to the fact of infringement by the respondent. He has made and sold an exact imitation of the plaintiffs' invention.

An injunction must, therefore, issue, and a reference be made to a master to take and state an account.

EXTENSIONS GRANTED.

31,030.—Improved Sausage-Stuffer.—Granted to AUGUST NITTINGER, dated January 1, 1861.

Claim.—1. The cylinder J, with its projection *m*, in combination with the spring-latch *i*, the latter being so constructed and so arranged in respect to the said projection that the cylinder is rendered self-locking, as herein set forth.

2. The hinged table L, and its oblong stop *p*, when arranged on the frame in respect to the cylinder J and its tube K, as and for the purpose herein set forth.

31,082.—Improved Machine for Mixing Dough.—Granted to WILLIAM HOFINE, dated January 8, 1861.

Claim.—I claim the combination and arrangements of the feeding devices in hoppers A B C, the face-plate I, the mixing devices and packer L in the trough G, substantially as and for the purpose specified.

31,094.—Improved Machine for Creasing and Finishing Leather Straps.—Granted to WILLIAM MCK. THORNTON, dated January 8, 1861.

Claim.—I claim the combination of the unequal rollers F and J, operated in the manner and for the purposes set forth.

31,102.—Improvement in Springs for Railroad-Cars.—Granted to TIMOTHY F. ALLYN, January 15, 1861; reissue No. 4,959, dated July 2, 1872.

Claim.—1. A car-spring composed of plates or equivalent forms, held apart by the described arrangement of fulcrums, when the parts are constructed to hold each other in place without bolts, substantially as set forth.

2. I claim, in combination with metallic spring-plates, the central cross-bar or bearing and its India-rubber or elastic packing, substantially as described.

31,128.—Improvement in Hoisting Apparatus.—Granted to ELISHA G. OTIS, January 15, 1861; reissue No. 4,269, (Division A,) dated February 21, 1871, (Benjamin T. Babbitt, administrator.)

Claim.—1. The pawls *f f* and the teeth of the racks C C, constructed of hook form, essentially as shown and described, for the purpose set forth.

2. The arrangement of the ropes T, U, and V, combined and operating substantially as and for the purpose set forth.

3. The arrangement of the slide or belt shipper S, in connection with the shoe or brake Z and rope T, substantially as shown, to admit of the simultaneous application of the brake and the shifting of the belts O P, on the idle-pulleys J K, as set forth.

31,128.—Improvement in Hoisting Apparatus.—Granted to ELISHA G. OTIS, January 15, 1861; reissue No. 4,270, (Division B,) dated February 21, 1871, (Benjamin T. Babbitt, administrator.)

Claim.—The counterpoise combined with the platform or cab of the hoisting apparatus through the intervention of the hoisting-drum, substantially as herein set forth.

31,128.—Improvement in Hoisting Apparatus.—Granted to ELISHA G. OTIS, January 15, 1861; reissue No. 4,271, (Division C,) dated February 21, 1871, (Benjamin T. Babbitt, administrator.)

Claim.—The counterpoise combined with the safety-stop mechanism of the platform or cab through the intervention of the hoisting-drum, substantially as and for the purpose herein set forth.

31,133.—Improvement in Cultivators.—Granted to DANIEL S. STAFFORD, January 15, 1861; reissue No. 5,827, dated April 7, 1874, (Eliza T. Conklin, executrix.)

Claim.—1. The combination, in a straddle-row cultivator, of frame A, wheels B, series of plows G, arranged in two gangs, with a central space between the gangs, and elevated or bent axle C, constructed substantially as combined, to permit the corn to pass under it, and to raise or lower the plow-frame, as set forth.

2. The elevated pole D, segmental slides *c* and *d*, and stirrups *e*, in combination with frame A *a*, as and for the purpose set forth.

3. With the foregoing devices of second claim, the axle C and driver's seat E, in combination, for the purposes set forth.

4. The combination, in a straddle-row cultivator, of the two wheels B, axle C, frame A, series of plows G, and supplementary wheels J, all operating in combination, for the purpose set forth.

5. In a straddle-row cultivator, the share-blades H, constructed as described, in combination with frame A, bent axle C, and wheels B, substantially as and for the purpose set forth.

Disclaimer filed January 14, 1875.

Disclaims the first, fourth, and fifth clauses of claim, as above set forth.

DISCLAIMERS FILED.

129.—Whole number **31,133.—Improvement in Cultivators.**—ELIZA T. CONKLIN, executrix of DANIEL S. STAFFORD, deceased, Decatur, Ill.—Patented January 15, 1861; reissue No. 5,827, dated April 7, 1874. Disclaimer filed January 14, 1875. Disclaims:

"The first, fourth, and fifth clauses of claim, which are in the following words, to wit: (See Extensions Granted.)

"'1. The combination, in a straddle-row cultivator, of frame A, wheels B, series of plows, G, arranged in two gangs, with a central space between the gangs, and elevated or bent axle C, constructed substantially as described, to permit the corn to pass under it, and to raise or lower the plow-frame, as set forth.

"'4. The combination, in a straddle-row cultivator, of the two wheels B, axle C, frame A, series of plows G, and supplementary wheels J, all operating in combination, for the purpose set forth.

"'5. In a straddle-row cultivator, the share-blades H, constructed as described, in combination with frame A, bent axle C, and wheels B, substantially as and for the purpose above set forth.'"

37,991.—Improvement in Machines for Rolling Leather.—JOEL WHITNEY, Winchester, Mass.—Patented March 24, 1863; reissue No. 4,122, dated September 13, 1870; reissue No. 4,562, dated September 19, 1871. Disclaimer filed December 11, 1874. Disclaims:

"The words 'either direct or,' and the words 'when the adjusting device is combined with the treadle action,' in the paragraph beginning 'This invention relates to improvements in rolling-machines;' and also the words beginning 'The combination or arrangement of the general adjustment' and ending 'may be employed when no general adjustment of the rolls is used;' and that the first and second claims of said reissued letters patent are too broad, and when considered in connection with these words in the specification, including the combinations therein respectively mentioned, when used 'in conjunction with an adjusting device by which the rolls are arranged in relation to each other as the varying thickness of the leather may require,' or otherwise.

"Your petitioner, therefore, disclaims:

"'1. The arrangement of levers *f f* transversely of the treadle J and parallel with the axes of the rolls B and B', substantially as described and shown.

"'2. The combination and arrangement of treadle J, rolls B B', and levers *f f*, or equivalent intermediate devices between the treadle and rolls, whereby the action of the treadle serves to move one roll in a direct line toward the other, substantially as described and shown.'"

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date February 2, 1875.]

8,036.—Thumb-Screw Heads.—JAMES S. RAY, East Haddam, Conn. Application filed January, 12, 1875. Term of patent 7 years.

8,037 and **8,038.—Coffin-Screw Heads.**—RUSSELL H. BURR, West Meriden, Conn., assignor to C. ROGERS & BROS., same place.—Cases A and B. Applications filed January 22, 1875. Term of patents 7 years.

8,039.—Coffin-Handle Sockets.—RUSSELL H. BURR, West Meriden, Conn., assignor to C. ROGERS & BROS., same place. Case C. Application filed January 22, 1875. Term of patent 7 years.

8,040.—Grave-Coverings.—ISAAC G. LUNDAY and CALTON G. ANGLIN, Hickory Flat, Ala. Application filed December 31, 1874. Term of patent 7 years.

8,041.—Lamp-Bracket.—FREDERICK R. SEIDENSTICKER, West Meriden, Conn., assignor to BRADLEY & HUBBARD, same place. Case C. Application filed June 3, 1874. Term of patent 7 years.

8,042 and **8,043.—Chandeliers.**—FREDERICK R. SEIDENSTICKER, West Meriden, Conn., assignor to BRADLEY & HUBBARD, same place.—Cases C and D. Applications filed June 3, 1874. Term of patents 7 years.

8,044.—Cooking-Stove.—GEORGE A. WELLS, Troy, N. Y., assignor to FULLER, WARREN & Co., same place. Application filed January 2, 1875. Term of patent 7 years.

TRADE-MARKS REGISTERED DURING THE WEEK.

"the representation of a rose, together with the words 'Key West.'"

2,209.—Cigars and Tobacco.—THE CONSOLIDATED TOBACCO COMPANY, Gilroy, Cal. Application filed July 27, 1874.

"'Monterey, California,' arbitrarily arranged with the arms or seal of the State of California."

2,210.—Silver-Plated Goods.—JAMES W. TUFTS, Medford, Mass. Application filed January 25, 1875.

"two diamond-shaped figures intersecting each other at right angles, and inclosing at the center the letter 'T.'"

2,211.—Wire Goods.—J. H. & N. A. WILLIAMS, Utica, N. Y. Application filed January 25, 1875.

"the figure of a wire heddle."

2,212.—Medicine.—JAMES E. WOODWARD, Boston, Mass. Application filed January 22, 1875.

"'The Castilian Acidulæ.'"

INDEX OF INVENTIONS PATENTED FEBRUARY 2, 1875.

	Class No.	No. of Patent.
Alarm, electric burglar, H. E. Walter	50	159,369
Alarm signal box, fire, G. Floyd	50	159,401
Atomizer, C. Rembof	98	159,278
Bag or box fastening, C. Fogelberg	57	159,311
Bale tie, S. H. Gilman	7	159,258
Bale tie, J. L. Reese	7	159,449
Bale tie, I. T. Smith	7	159,463
Bale tie, cotton, H. B. Jones	7	159,268
Ball and socket joint fastening, Tallman and Mandeville	67	159,471
Bars, tubes, cylinders, &c., machine for cutting off, J. Reese	119	159,448
Bedstead fastening, A. Grillet	62	159,408
Bedstead, sofa, J. K. Underhill	62	159,290
Bell, call, Hawkins and Hull	24	159,411
Billiard tables, bolt for, J. E. Came	143	159,390
Blind stop, J. D. Jones	24	159,417
Bobbins, mold for casting, M. Dimock	34	159,397
Bones, machine for crushing, A. Kumpf	3	159,334
Boom, sheer, T. Irvine	13	159,328
Boot and shoe burnishing machine, McKay and Fairfield	16	159,339
Boot and shoe heel burnishing machine, A. Swallow	16	159,469
Boot and shoe sole and heel shave, G. P. Foster	16	159,312
Boot and shoe tack driving machine, Thompson and Luke	16	159,473
Boot and shoe tack driving machine, Thompson and Luke	16	159,474
Boot and shoe tack driving machine, Thompson and Luke	16	159,475
Boot leg turning machine, D. Bissell	16	159,295
Boots, &c., shank stiffener for, J. M. Watson	16	159,485
Boring machine, J. and G. Richards	173	159,279
Bridge, P. M. Fulton	21	159,315
Broom, W. S. Hancock	22	159,409
Burner, lamp, A. C. Vaughan	90	159,482
Butter worker, J. C. Rorick	45	159,359
Button hole guide clamp, R. Thompson	38	159,288
Calculating machine, F. S. Baldwin	42	159,244
Calipers, dividers, &c., combined, C. Caton	97	159,246

	Class No.	No. of Patent.
Camera attachment, G. W. Parker	111	159,443
Canal lock, T. L. Rosser	82	159,280
Car axle box, railway, J. M. Brosius	122	159,306
Car brake, C. Fogelberg	122	159,310
Car coupling, V. Erbach	122	159,399
Car coupling, J. Graham	122	159,407
Car coupling, A. Langellier	122	159,425
Car coupling, M. Pettengill	122	159,444
Car coupling, B. Slusser	122	159,462
Car coupling, J. B. Winters	122	159,372
Car, hand, Hopkins and Cooke	121	159,266
Car lamp, J. B. Hoyt	90	159,324
Car, sleeping, C. E. Lucas	121	159,428
Car, stock, S. W. Remer	121	159,357
Car truck, J. M. Brosius	122	159,385
Cars, draw head for street, G. Jacoby	122	159,415
Cars, hitch hook for street, D. Demarest	122	159,308
Carbon or lamp black, apparatus for the manufacture of, Neff and Fales	107	159,440
Cartridge feed case for machine guns, W. B. Franklin	105	159,404
Casting bobbins, mold for, M. Dimock	34	159,397
Casting for wheels, W. A. Miles	33	159,434
Casting ingots, apparatus for, J. B. Tarr	33	159,472
Chair, reclining, J. Damm	62	159,395
Chimney and ventilator, combined, L. B. Silver	4	159,285
Chimney top, C. W. Munger	4	159,344
Cistern, J. S. Snider	51	159,364
Clasp for scarf slides, A. Komp	23	159,421
Clutch, friction, G. H. Starbuck	87	159,464
Coffee mill, T. Strobridge	88	159,467
Coffee roaster, M. W. Fry	154	159,405
Coffin clamp for hearses, Houck and Fox	39	159,323
Column, wrought iron, J. B. Cornell	4	159,305
Core forming machine, W. C. Amish	34	159,375
Cotton bales, fastening, A. Baldwin	7	159,378
Cotton chopper, J. D. Mitchell	43	159,436
Cotton openers, &c., beater for, Whitehead and Atherton	28	159,487
Cotton seed hulls, process and apparatus for separating, &c., tufted fiber from, A. Rock	41	159,455
Covering, non-conducting, C. L. Riker	149	159,452
Cow tail holder, J. M. Worden	144	159,490
Cultivator, M. Johnson	43	159,331
Curtain fixture, E. B. Lake	62	159,424
Cutting and polishing machine, Walters and Saunders	70	159,484
Damper regulator, automatic, Tomlinson and Smith	154	159,477
Dash boards, attaching, G. Schaffner	31	159,283
Dental flask for rubber, S. D. Palmer	46	159,442
Ditching machine, Williamson and Sorey	51	159,371
Doll, A. W. Monroe	143	159,437
Door knob fastening, J. B. Wells	93	159,486
Drawing book, A. Forbriger, (reissue)	54	6,271
Drilling machine, metal, C. Van Haagen	100	159,481
Drilling machine, rock, G. Atkinson	124	159,376
Ejector, Fulton and Proeger	118	159,256
Elevator, hay, Martin and Moor	79	159,480
Engine governor, steam, F. M. Brown	69	159,299
Engine valve, J. Bulger, Jr	152	159,388
Engines, &c., packing for pistons of hydraulic, Hughes and Kelly	151	159,326
Engraving machine, W. S. Wight	54	159,488
Faucet, self-closing, J. W. Trafton	167	159,478
Fence, farm, D. Sattler	52	159,459
Flat iron heater, E. Wilmot	94	159,489
Fluting and sad iron combined, C. R. Rand	91	159,356
Funnel, A. Pforr	167	159,445
Furnace, hot air, B. L. Bradley	154	159,303
Furniture caster, W. A. Perkins	24	159,352
Gag runner, J. P. Hisley	72	159,265
Gas, apparatus for generating, Rawlings and Irelan	66	159,355
Gas hydraulic mains, apparatus for sealing and unsealing dip pipes in, Caffall and Thomas	64	159,389
Gases and liquids under pressure, vessel for containing, J. Matthews	66	159,433
Glass, ornamenting, T. Jones	51	159,418
Grain drill, C. E. Patric, (reissue)	133	6,274
Grain hulling machine, C. Schaschue	57	159,461
Grate, S. Kepner	154	159,271
Grate, J. D. Slichter	154	159,361
Grate, stove, J. D. Slichter	154	159,360
Gun dart, air, H. M. Quackenbush	143	159,354
Gymnastic apparatus, H. S. Carley	143	159,301
Hand rest, E. F. French	146	159,254
Harvester rake, J. R. Buckwalter	74	159,387
Harvester rake, Morgan and Motley	74	159,276
Harvester reel, D. S. Fulton	74	159,316
Hat iron, C. E. Ball	76	159,379
Hay loader, H. V. Hawkins	77	159,264
Heater, Tuttle and Larsh	154	159,479
Hoe, M. Johnson	141	159,332
Hook, A. H. Alverson	23	159,374
Hook, M. Mattson	23	159,275
Hook, cast, J. C. Coosley	72	159,304
Hook, snap, J. T. Foster	72	159,313
Hook, snap, J. T. Foster	72	159,403
Hooks, machine for forming snap, J. T. Foster	72	159,314
Hoops, machine for coiling, J. Tomlinson	40	159,299
Horse power, J. S. Schofield, (reissue)	138	6,268
Horse power attachment, J. G. Merchen	158	159,340
Horseshoe blank bars, roll for rolling, W. W. Lewis	60	159,426
Horseshoe nail plates, manufacture of, D. J. Harrington	60	159,410
Horseshoes, elastic pad for, J. B. Wood	60	159,292
Hose, introducing antiseptics into rubber, J. Murphy	81	159,345
House building, J. N. Cherry	154	159,247
Ice creeper, S. R. Phillips	16	159,447
Ice pick, S. Lindley	58	159,273
Insect powder, injector for, C. Chinnock, (reissue)	63	6,265
Iron into steel, converting, Foote and Henry	99	159,402
Journal box for shaft hangers, J. Greenwood	87	159,260
Keyhole escutcheon, H. T. Blake	93	159,382
Knife, revolving pocket, W. Staniforth	44	159,286
Ladder, step, G. Grünewald	30	159,319
Lamp, A. M. Blake	90	159,381
Lamp, car, J. B. Hoyt	90	159,324
Latch, door, O. F. Russ	93	159,281
Latch, locking knob, S. H. Gilman	93	159,257
Level, C. C. Schwaner	157	159,359
Level and slope indicator, O. S. Willey	157	159,370
Locomotives, device for increasing traction of, L. A. Rice	94	159,453
Loom for weaving pile fabrics, S. Sanford	95	159,282
Loom temple, A. D. Fuller	95	159,255
Magnesia, manufacturing milk of, C. H. Phillips	35	159,446
Manure distributer, N. Tomlinson	133	159,476
Map exhibitor, J. Lichtenberger	146	159,335
Meat tenderer, J. A. Cornish	88	159,393
Metal rods, machine for coiling, P. H. Standish	60	159,367
Mill, stamping, H. W. Colver	3	159,303
Mining apparatus, Bloss and White	124	159,296
Miter box, P. and W. G. Saydam	29	159,368
Mortising machine, S. Rydbeck	173	159,456
Mosquito canopy, I. E. Palmer	62	159,441
Mowing machine, Morgan and Motley	74	159,277
Neck tie, O. Kneppers	38	159,272
Neck tie shield, O. Kneppers	38	159,422
Nut lock, C. J. Cummings	14	159,306
Nut machine, P. L. Fitzer	14	159,252
Ore separator, D. Nevin	31	159,347
Oven, desulphurizing, J. C. Brewster	99	159,384
Oven, portable steam, J. H. Lockwood	154	159,427
Pantaloons, stay for the bottoms of, S. D. Mills	38	159,343
Paper box, J. F. Jones	109	159,269
Paper box, J. F. Jones	109	159,270
Pavements, repairing, H. W. Gould, (reissue)	110	6,272
Peat machine, F. Dodge	61	159,398
Pegging machine, H. Kuhlmann	16	159,429
Pegs, machine for forming points on, Sturtevant and Shaw	16	159,287
Pegs, mechanism for compressing points on, F. M. Shaw	16	159,284
Piano insulator, W. R. Miller	112	159,342
Pin, safety, S. F. Merritt	26	159,341
Pipes, by electricity, apparatus for controlling way cocks of water, W. A. Crawford	167	159,394
Pipes, joint for sheet metal, J. Moore	136	159,439
Planter, corn, A. Roark	133	159,451
Planter, seed, J. and W. Campbell, (reissue)	133	6,270
Plants, portable cover for, W. Musgrove	63	159,346
Plow, S. S. Anghe	114	159,377
Plow, A. Hampe	114	159,321
Plow, J. A. Johnson	114	159,267
Plow, T. S. Macomber	114	159,338
Plows, harrow attachment for, Jacobus and Ambrose	114	159,416
Printing machine, ticket, J. Anderson	117	159,293
Propeller, chain, D. C. Johnson	139	159,330
Pulley, differential, J. T. Fewkes	79	159,400
Pump, C. O. Sylvester	118	159,470
Quilting frame, T. C. Maris	38	159,429
Rake, horse hay, B. Owen	77	159,349
Range, E. O. Brinckerhoff	154	159,298
Rectifying and oxygenating apparatus, J. W. Reford	47	159,450
Rectifying cylinder, purification of filtering and oxygenating subetances while in the, J. W. Reford	47	159,451
Roofing and paving composition, tile for, J. P. Jeffries	126	159,329
Ruler, H. and T. H. Belcher	146	159,294
Safes, movable cabinet for, W. J. Barnes	128	159,380
Sash fastener, C. J. Snow	24	159,365
Sash holder, L. J. Baker, (reissue)	24	6,263
Saw gummer, G. W. Griswold	131	159,318
Saw, jig, C. M. Hayden	130	159,412
Saw set, H. Heinicke	131	159,413
Scaffold bracket, S. N. Fisher	30	159,309
Separator, grain, T. J. Hubbell	159	159,414
Sewing machine caster, L. O. Allen, (reissue)	134	6,269
Sewing machine for sewing bags, &c., Garland and Gove	134	159,317
Sewing machine hemmer, A. F. Colby	134	159,391
Sewing machine ruffling and gathering attachment, J. M. Griest	134	159,261
Sheep shears, J. L. Smith	135	159,362
Shirt, C. J. Coyle	38	159,249
Shoe and gaiter, G. Bryant	16	159,245
Shutter, rolling, H. J. Defrenne	30	159,307
Sifter for stoves, ash, J. H. Goodfellow	154	159,406
Skylight bar, A. J. Post	30	159,353
Slate washer, Lyman and Beall	146	159,274

	Class No.	No. of Patent.
Soda fountain, J. Matthews	1	159,431
Soda water, fountain for, J. Matthews	1	159,432
Spading and other forks, Denio and Babcock, (reissue)	77	6,266
Spike, G. N. Sanders	103	159,457
Spool for holding braid, &c., elongated, Koch and Brass	134	159,333
Stocking and skirt holder, A Warren	38	159,291
Stopping mechanisms, drop wire for, L. Dimock	142	159,396
Stove, G. C. Milgate	154	159,435
Stove, D. L. Stiles	154	159,465
Stove attachment, cook, E. B. Patten	154	159,350
Stove attachment, cook, E. B. Patten	154	159,351
Stove grate, J. D. Slichter	154	159,360
Stove pipe thimble, J. S. Elliott	154	159,250
Stove, reservoir cooking, J. H. Goodfellow	154	158,250
Stoves, ash sifter for, J. H. Goodfellow	154	159,406
Straw stacker, G. Sanders	159	159,458
Street sprinkler, E. H. Franz	167	159,253
Tanning pickled skins, W. R. Stace	92	159,366
Telegraph and circuit, automatic and autographic, W. E. Sawyer	50	159,460
Thill coupling, A. Olsson	31	159,348
Thill coupling, H. Tyler	31	159,480
Toy dancer, W. L. Hubbell	143	159 325
Toy money box, J. Hall	143	159,263
Trellis, T. L. Buell	63	159,300
Trestle, builder's, M. M. Lucky	29	159,337
Truck, hand, L. Gilson, (reissue)	31	6,267
Trunk, traveling, W. D. Colt	162	159,248
Umbrella tip retainer, V. Montalbetti	165	159,438
Valve for cylinders, relief, E. Walters	150	159,483
Valve, self-regulating pressure, A. Campbell, (reissue)	152	6,264
Vehicle chafing iron, A. Wright	31	159,373
Vehicle runner attachment, J. A. Hyde	31	159 327
Vehicle side bar, Coe and Merritt	31	159,302
Vehicle wheel, F. W. R. Emery	31	159,251
Vehicle wheel hub, C. H. Guard, (reissue)	31	6,273
Vehicle wheel hub, C. H. Guard	31	159,262
Wagon side bar, C. A. Collins	31	159,392
Wall, hollow brick, F. Hainsworth	4	159,320
Washing machine, S. Hawkins	91	159,322
Washing machine, Stott and Eavenson	91	159,466
Watch crystals, gage for fitting, B. B. Loar	36	159,336
Watches, center wheel for, M. C. Smith	36	159,363
Water closet valve, E. O. Brinckerhoff	8	159,297
Water meter, N. W. Knowlton	167	159,419
Welding together fag ends of bars, device for, J. Sutter	60	159,468
Wrench, pipe and nut, F. Kohler	100	159,420

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED FEBRUARY 2, 1875.

	Patent No.
Allen, L. O., Sewing machine caster, (reissue)	6,269
Almy, J. F., assignee, (reissue)	6,269
Alverson, A. H., Hook	159,374
Ambrose and Jacobus	159,416
Amish, W. C., Core forming machine	159,375
Anderson, J., Ticket printing machine	159,293
Armbruster, J. E., assignee	159,400
Atherton and Whitehead	159,487
Atkinson, G., Rock drilling machine	159,376
Anghe, S. S., Plow	159,377
Babcock and Denio, (reissue)	6,266
Baker, L. J., Sash holder, (reissue)	6,263
Baldwin, A., Fastening cotton bales	159,378
Baldwin, F. S., Calculating machine	159,244
Ball, C. E., Hat iron	159,379
Barnes, W. J., Movable cabinet for safes	159,380
Bateman, J., assignee	159,414
Beebe, C. A., assignee	159,435
Belcher, H. and T. H., Ruler	159,294
Bissell, D., Boot leg turning machine	159,295
Blake, A. M., Lamp	159,381
Blake, H. T., Key hole escutcheon	159,382
Bloss, J., and E. J. White, Mining apparatus	159,296
Boell and Lyman	159,274
Brackett, J. B., assignee, (reissue)	6,269
Bradford, H., assignee, (reissue)	6,263
Bradley, B. L., Hot air furnace	159,383
Brass and Koch	159,333
Brewster, J. C., Desulphurizing oven	159,384
Brinckerhoff, E. O., Water closet valve	159,297
Brinckerhoff, E. O., Range	159,298
Brosius, J. M., Car truck	159,385
Brosius, J. M., Railway car axle box	159,386
Brown, F. M., Steam engine governor	159,299
Bryant, G., Shoe and gaiter	159,245
Buckwalter, J. R., Harvester rake	159,387
Buell, T. L., Trellis	159,300
Bulger, J., Jr., Engine valve	159,388
Caffall, R. M., and A. Thomas, Apparatus for sealing and unsealing dip pipes in gas hydraulic mains	159,389
Came, J. E., Bolt for billiard tables	159,390
Campbell, A., Self-regulating pressure valve, (reissue)	6,264
Campbell, J. and W., Seed planter, (reissue)	6,270
Carley, H. S., Gymnastic apparatus	159,301
Caton, C., Combined calipers, dividers, &c	159,246
Cherry, J. N., House building	159,247
Chinnock, C., Injector for insect powder, (reissue)	6,265
Clark Thread Company, assignee	159,397
Coe, J. W., and D. Merritt, Vehicle side bar	159,302
Coit, W. D., Traveling trunk	159,248
Colby, A. F., Sewing machine hemmer	159,391
Colby Adjustable Hemmer Company, assignee	159,391
Collins, C. A., Side bar wagon	159,392
Colt's Patent Fire Arms Manufacturing Company, assignee	159,404
Colver, H. W., Stamping mill	159,303
Compressing Company, assignee	159,378
Cooke and Hopkins	159,266
Coonley, J. C., Cast hook	159,304
Cornell, J. B., Wrought iron column	159,305
Cornish, J. A., Meat tenderer	159,393
Cox, J. W., assignee	159,348
Coyle, C. J., Shirt	159,249
Crawford, W. A., Apparatus for controlling way cocks of water pipes by electricity	159,394
Crittenton, C. N., assignee, (reissue)	6,265
Cummings, C. J., Nut lock	159,306
Damm, J., Reclining chair	159,395
Defrenne, H. J., Rolling shutter	159,307
Demarest, D., Hitch hook for street cars	159,308
Denio, E. C., and G. K. Babcock, Spading and other forks, (reissue)	6,266
Dimock, L., Drop wire for stopping mechanisms	159,396
Dimock, M., Mold for casting bobbins	159,397
Divine, J. F., assignee	159,428
Dodge, F., Peat machine	159,398
Dutcher Temple Company, assignee	159,255
Eavenson and Stott	159,466
Elliott, J. S., Stove pipe thimble	159,250
Emery, F. W. R., Vehicle wheel	159,251
Erbach, V., Car coupling	159,399
Fairfield and McKay	159,320
Fales and Neff	159,440
Ferren, D. M., assignee	159,251
Fewkes, J. T., Differential pulley	159,400
Fisher, S. N., Scaffold bracket	159,309
Fitrer, P. L., Nut machine	159,252
Fletcher, J. H., assignee	159,383
Floyd, G., Fire alarm signal box	159,401
Fogelberg, C., Car brake	159,310
Fogelberg, C., Bag or box fastening	159,311
Foote, M. S., and G. R. Henry, Converting iron into steel	159,402
Forbriger, A., Drawing book, (reissue)	6,271
Ford, J. W., assignee, (reissue)	6,273
Foster, G. P., Boot and shoe sole and heel shave	159,312
Foster, J. T., Snap hook	159,313
Foster, J. T., Machine for forming snap hooks	159,314
Foster, J. T., Snap hook	159,403
Fox and Houck	159,323
Franklin, W. B., Cartridge feed case for machine guns	159,404
Franz, E. H., Street sprinkler	159,253
French, E. F., Hand rest	159,254
Fry, M. W., Coffee roaster	158,405
Fuller, A. D., Loom temple	159,255
Fulton, D. S., Harvester reel	159,316
Fulton, L. B., and J. Proeger, Ejector	159,256
Fulton, P. M., Bridge	159,315
Gage, H. M., assignee	159,269
Garland, H. P., and A. J. Gove, Sewing machine for sewing bags, &c	159,317
Gilman, S. H., Locking knob latch	159,257
Gilman, S. H., Bale tie	159,258
Gilson, L., Hand truck, (reissue)	6,267
Goodfellow, J. H., Reservoir cooking stove	159,259
Goodfellow, J. H., Ash sifter for stoves	159,406
Gould, H. W., Repairing pavements, (reissue)	6,272
Gove and Garland	159,317
Graham, J., Car coupling	159,407
Greenwood, J., Journal box for shaft hangers	159,260
Griest, J. M., Sewing machine ruffling and gathering attachment	159,261
Grillet, A., Bedstead fastening	159,408
Griswold, G. W., Saw gummer	159,318
Grünewald, G., Step ladder	159,319
Guard, C. H., Vehicle wheel hub, (reissue)	6,273
Guard, C. H., Vehicle wheel hub	159,262
Hainsworth, F., Hollow brick wall	159,320
Hall, J., Toy money box	159,263
Hall, W. G., assignee	159,256
Hampe, A., Plow	159,321
Hancock, W. S., Broom	159,409
Harrington, D. J., Manufacture of horseshoe nail plates	159,410
Hawkins, H. V., Hay loader	159,264
Hawkins, S., Washing machine	159,322
Hawkins, W. E., and G. W. Hull, Call bell	159,411
Hayden, C. M., Jig saw	159,412
Heinicke, H., Saw set	159,413
Henry and Foote	159,402
Hisley, J. P., Gag runner	159,265
Hopkins, L. C., and A. Cooke, Hand car	159,266
Houck, W. H., and J. B Fox, Coffin clamp for hearses	159,323
Hoyt, J. B., Car lamp	159,324
Hubbell, T. J., Grain separator	159,414
Hubbell, W. L., Toy dancer	159,325
Hughes, S., and M. Kelly, Packing for pistons of hydraulic engines, &c	159,326

	Patent No.
Hull and Hawkins	159,411
Hutchins, H., assignee	159,337
Hyde, J. A., Vehicle runner attachment	159,327
Irelan and Rawlings	159,355
Irvine, T., Sheer boom	159,328
Jacobus, P., and D. R. Ambrose, Harrow attachment for plows	159,416
Jacoby, G., Draw head for street cars	159,415
Jeffries, J. P., Composition tile for roofing and paving	159,329
Jenkins, R., assignee	159,325
Johnson, D. C., Chain propeller	159,330
Johnson, J. A., Plow	159,267
Johnson, M., Cultivator	159,331
Johnson, M., Hoe	159,332
Jones, H. B., Cotton bale tie	159,268
Jones, J. D., Blind stop	159,417
Jones, J. F., Paper box	159,269
Jones, J. F., Paper box	159,270
Jones, T., Ornamenting glass	159,418
Kelly and Hughes	159,326
Kepner, S., Grate	159,271
Kinehan, L., assignee	159,435
Knowlton, N. W., Water meter	159,419
Koch, F., and R. Brass, Elongated spool for holding braid, thread, &c	159,333
Kohler, F., Pipe and nut wrench	159,420
Kokosing Oil Company, assignee	159,440
Kemp, A., Clasp for scarf slides	159 421
Kueppers, O., Neck tie	159,272
Kueppers, O., Neck tie shield	159,422
Kuhlmann, H., Pegging machine	159,423
Kumpf, A., Machine for crushing bones	159,334
Lake, E. B., Curtain fixture	159,424
Langellier, A., Car coupling	159,425
Larsh and Tuttle	159,479
Laughlin, J. M., assignee	159,410
Lewis, W. W., Roll for rolling horshoe blank bars	159,426
Lindley, S., Ice pick	159,273
Litchtenberger, J., Map exhibitor	159,335
Loar, B. B., Gage for fitting watch crystals	159,336
Locke, N. C., assignee, (reissue)	6,264
Lockwood, J. H., Portable steam oven	159,427
Lucas, C. E., Sleeping car	159,428
Lucky, M. M., Builder's trestle	159,337
Luke and Thompson	159,473, 159,474, 159,475
Lyman, L. L., and E. A. Boell, Slate washer	159,274
Macomber, T. S., Plow	159,338
Mandeville and Tallman	159,471
Marini, G. L., assignee	159,438
Maris, T. C., Quilting frame	159,429
Martin, G. W., and J. C. Moor, Hay elevator	159,430
Matthews, J., Soda fountain	159,431
Matthews, J., Soda water fountain	159,432
Matthews, J., Vessel for containing, gases and liquids under pressure	159,433
Mattson, M., Hook	159,275
McKay, G., and H. F. Fairfield, Boot and shoe burnishing machine	159,339
Merchen, J. G., Horse power attachment	159,340
Merriam, W. A., assignee	159,444
Merritt, D., assignee	159,348
Merritt, S. F., Safety pin	159,341
Merritt and Coe	159,302
Miles, W. A., Casting for wheels	159,434
Milgate, G. C., Stove	159,435
Miller, W. R., Piano insulator	159,342
Mills, S. D., Stay for the bottoms of pantaloons	159,343
Mitchell, J. D., Cotton chopper	159,436
Monroe, A. W., Doll	159,437
Montalbetti, V., Umbrella tip retainer	159,438
Moor and Martin	159,430
Moore, J., Joint for sheet metal pipes	159,439
Morgan, D. S., and T. Motley, Harvester rake	159,276
Morgan, D. S., and T. Motley, Mowing machine	159,277
Motley and Morgan	159,276, 159,277
Munger, C. W., Chimney top	159,344
Murphy, J., Introducing antiseptics into rubber hose	159,345
Musgrove, W., Portable cover for plants	159,346
Neff, P., and L. S. Fales, Apparatus for the manufacture of carbon or lamp black	159,440
Nevin, D., Ore separator	159,347
Nye, F. C., assignee	159,313, 159,314, 159 403
Olsson, A., Thill coupling	159,348
Owen, B., Horse hay rake	159,349

TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED FEBRUARY 2, 1875.

159,244. CALCULATING-MACHINES. Frank S. Baldwin, St. Louis, Mo. [Filed Sept. 8, 1873.]

Brief.—Revolving cylinder with sets of adjustable teeth, nine to each set. Sets of teeth correspond to units, tens, hundreds, &c. Any number of the teeth of each set may be adjusted into position, so as, by the revolution of the cylinder, to act upon toothed type or register wheels through intermediate toothed wheels. Carrying effected by a sliding horizontal bar with a beveled head, which at every whole revolution of a register-wheel is slid forward by a projection upon said wheel, so that its head is brought into the path of a sliding tooth upon the cylinder, which tooth is thus deflected, so as to turn the wheel of the next higher denomination. For multiplication and division, cylinder adjustable in the direction of its axis, so that its teeth may act upon the wheels of higher or lower denomination. Minor details indicated by claims.

1. A calculating-machine in which a series of toothed type-wheels are combined with a cylinder carrying teeth, which admit of being adjusted to revolve, or partly revolve, any one or more of said wheels, substantially as set forth.

2. In a calculating-machine, the combination, with a series of toothed type-wheels, of a toothed cylinder, E, capable of being rotated in either direction, and of being adjusted longitudinally in respect to the said type-wheels, as specified.

3. The cylinder F, provided with advancing and retracting bolts, and with adjusting mechanism for the same, controlled by knobs *p*, and having graduated slots *r*, so arranged that the positions of the said knobs in the same will indicate the number of teeth advanced, all substantially as specified.

4. The combination, with the teeth *h*, of springs for adjusting the same in one direction, and of cam-like segments F, for adjusting them in the opposite direction, and for retaining them after adjustment, as specified, Fig. 3.

5. The carrying teeth *i*, hung to and arranged to be adjusted laterally on the cylinder, substantially as and for the purpose set forth.

6. The combination of the cylinder-shaft D, its cog or ratchet wheel *c*, and notched disk *d* with the anchor-lever *d*, acted on by a spring, all substantially as and for the purpose specified. (See Fig. 6.)

7. The combination of the cylinder, screw-shaft D, nut *s*, and a locking device, whereby the cylinder and nut may be rotated with the shaft, or retained while the shaft rotates, all as and for the purpose set forth.

8. The combination, substantially as described, of the toothed cylinder E, the series of intermediate toothed wheels G, and the series of toothed type-wheels J.

9. The combination, substantially as described, of the cylinder E, its eccentric Q, and lever Q with the series of toothed type-wheels N, Fig. 7.

10. The disks J, having a frictional attachment to the shaft, in combination with arms or stops, adjustable, so as to arrest the movement of one or more wheels while the shaft is turning, all as set forth.

11. The combination of the cylinder, series of carrying-teeth *i*, and arms M, operated by type-wheels J, and adjusting the said carriers, as set forth.

12. The rods M, adapted to and arranged to slide in slots formed for their reception in the fixed shaft H, between the wheels G.

13. The combination of the said rods M and their double inclined heads *p* with the laterally adjustable teeth *i* and *i'* of the cylinder.

14. The combination, substantially as described, of the said rods M with the double-inclined projections *j* of the cylinder.

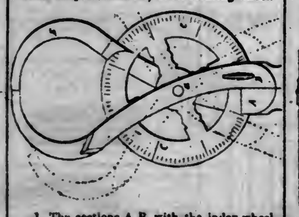
15. The combination of the said sliding rods M with the projections *m* of the type-wheels J.

16. The wheels J, provided with triangular projections *m*, in combination with the stop *s* and arms M, substantially as and for the purpose set forth.

17. The type-wheels J and N, hung loosely to their shafts, and provided with springs arranged to bear against the recessed edges of disks keyed to the said shafts, all substantially as and for the purpose specified.

18. The combination of the shaft U and its arms *n* with the projections *m* of the type-wheels J.

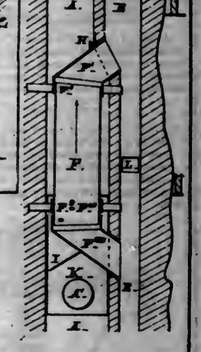
19. The combination of the shaft U and its arms *n'* with the projections *m'* of the type-wheels N.



159,245. SHOES AND GAITERS. G. Bryant, San Francisco, Cal. [Filed Nov. 6, 1874.]

In a shoe, the tongue A, consisting of the exterior parts of cloth and the intermediate water-proof material, and stitched to the quarters to a point above the ankle, substantially as described.

159,246. COMBINED CALIPERS, DIVIDERS, &c. Chas. Caton, Coshocton, Ohio. [Filed Oct. 13, 1874.]



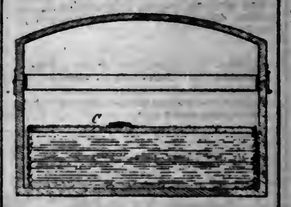
Brief.—The scale-plate is in the form of a wheel, to the center of which both arms of the instrument are pivoted, thus making a combined calipers, dividers, and measuring-wheel.

1. The sections A B, with the index-wheel C pivoted between said sections, and all upon a common axis, *a*, so as to admit of independent movement of said parts, substantially as and for the purpose set forth.

2. The index-wheel C and axis *a*, in combination with the set-screws *f* and sections A B, pivoted to said axis on each side of the wheel C, and the limbs of the sections extending beyond the periphery of the wheel, all substantially as and for the purpose set forth.

159,247. HOUSE-BUILDING. Jas. N. Cherry, Keokuk, Iowa. [Filed Mar. 17, 1874.]

Brief.—The chimney is made with two flues, and these are connected by a pipe leading from one through the other, and returning into the first. The products of combustion warm the air in the adjacent flue by means of this pipe. The deflector protects the pipe from condensed vapor running down the wall of the smoke-flue.



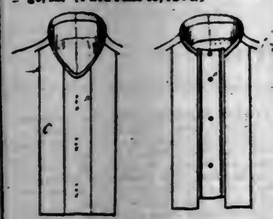
1. The combination of smoke-flue A, the ventilating flue E, and air-pipe F, passing through flue A, to be heated, and connecting with flue E, to cause movement of air in it, as set forth.

2. The combination of the flues A E, the inclosed pipe F, and the door with shutter K, substantially as set forth.

3. In a chimney, the combination of two flues with a pipe, F, passing through, and closed as to one, and opening into the other, to cause action of ventilation, substantially as set forth.

4. The combination of pipe F with parts F' F'' F''', supports F'' F''', and deflector I, as set forth.

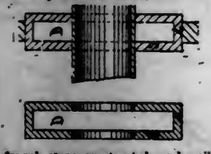
159,248. TRAVELING-TRUNKS. W. D. Colt, New York, N. Y. [Filed Jan. 18, 1873.]



1. A traveling-trunk having straps A A secured to the bottom thereof, in combination with partitions C, substantially as and for the purpose shown and described.

2. A traveling-trunk having straps A A secured to the bottom thereof, in combination with detachable compartments composed of the partitions C and D and straps E E, substantially as shown and described.

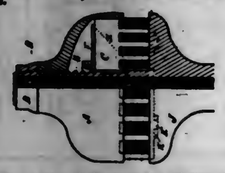
HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON



159,849. SHIRTS. Charles J. Coyle, Chicago, Ill. [Filed June 15, 1874.]

In combination with a shirt-bosom, having suitable eyelets or fastenings to regulate the size of the collar-band, an adjustable reversible center plait, substantially as described and shown, and for the purposes set forth.

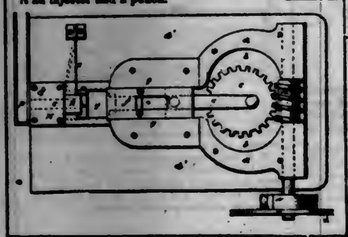
159,850. STOVE-PIPE THIMBLES. J. S. Elliott, Chelsea, Mass. [Filed July 17, 1874.]



Brief.—The funnel stone or thimble has a chambered recess, which surrounds the pipe and lessens the conduction of heat. There are no openings in the end of the thimble except for the passage of the pipe.

A funnel-stone constructed, as described, with a chambered recess, D, closed at both ends, in combination with and opening into the hole made to receive the stove-pipe, as described, and for the purpose specified.

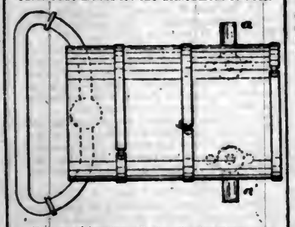
159,851. WHEELS FOR VEHICLES. Francis W. R. Emery, Taunton, Mass., assignor of one-half his right to Danl. M. Ferren, same place. [Filed Dec. 29, 1874.]



Brief.—Spokes can easily be taken out and replaced, and the felly made tight in the tire.

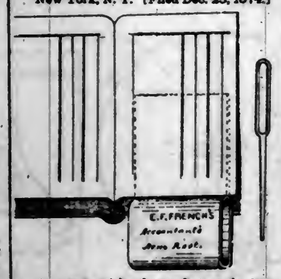
The carriage-hub, consisting of the main portion J, cone F, and disk A, in combination with the quadrantal spoke-holders C, provided with the sockets D and studs E, to operate substantially as and for the purpose set forth.

159,852. NUT-MACHINES. Peter L. Fitzer, Reading, Pa. [Filed Dec. 19, 1874.]



Brief.—A moving plunger operated by the crank on worm-wheel C, and carrying within it an injector and a punch.

The combination of the wheel *c*, screw *d*, crank *e*, connecting-rod *e*, plunger *f*, ejector *i*, punch *k*, and stop *m*, substantially as shown.

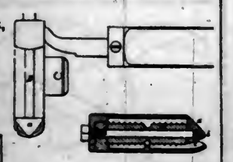


159,853. STREET-SPRINKLERS. E. H. Frank, Cincinnati, Ohio. [Filed May 2, 1873.]

Brief.—The inlet-pipes of the tank have on their inner ends check-valves, and on their outer ends means for the attachment of hose.

The combination of the check-valves *a a* with the feed-pipes and water-tank, as set forth.

159,854. HAND-RESTS. Evelyn F. French, New York, N. Y. [Filed Dec. 23, 1874.]



As a new article of manufacture the herein-described hand-rest, consisting of a tongue and hollow base, substantially as and for the purposes set forth.

159,855. LOOM-TEMPLES. Albt. D. Fuller, Chicopee, assignor to the Dutcher Temple Company, Hopedale, Mass. [Filed Dec. 19, 1874.]

1. In the loom-temple the trough-cap D, provided with the shuttle-deflector *a* and the cloth-guide *c*, arranged therein and with respect to each other, substantially as specified and represented.

2. The trough-cap, provided with the shuttle-deflector *a*, arranged as shown and described.

159,855.

159,856. EJECTORS. Louis B. Fulton and Julius Proeger, Pittsburg, Pa. [Filed Aug. 11, 1874.]

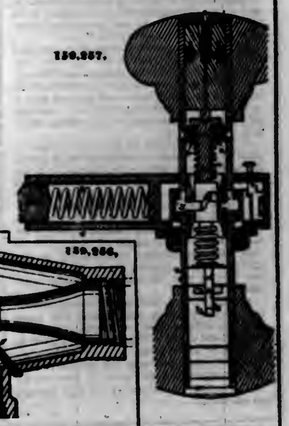
Brief.—The steam is admitted partly through a central apertnre in the spirally-fluted nozzle, and partly through spiral grooves in small streams, each having a whirling motion imparted to it as it enters the shell.

The stationary spirally-fluted hollow plug or nozzle I, and thimble K, arranged wholly outside of the water-space, and combined with the oviform shell C, in the manner shown, for the purposes set forth.

159,857. LOCKING KNOB-LATCHES. Saml. H. Gilman, New Orleans, La. [Filed July 11, 1874.]

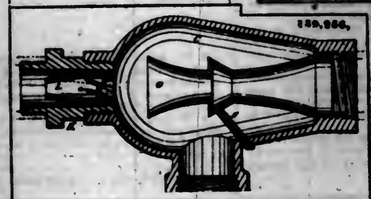
1. The endless groove F' around the key-shaft F, deviating from a right line in one-half of its circumference sufficient to throw the hub D the distance of its entire lateral movement, and deviating back to its starting-point on the other half of its circumference, the two lateral extremes of the groove being similar or precisely the same, all for the purpose of rendering it impossible to turn the key in either direction without obtaining the desired result, substantially as described, and for the purpose set forth.

2. The hub D, constructed with two arms, A', toothed on the whole circumference of one side of its circular portion to match the clutch-wheel H, and an interior groove, I, all being loose on the spindle *e*, on which it has a circular and a lateral movement, moving with the spindle when attached to it by the clutch H, and, when moved laterally out of the clutch H, held fast by the locking-legs U, and the spindle left free to revolve in it, substantially as described, and for the purpose set forth.



3. The clutch H, fastened on spindle *e*, with a groove around its circumference and collar, forming one side of the groove, both groove and collar fitting the interior of the cap V, for the purpose of holding the revolving hollow spindle *e* in its proper lateral position, substantially as and for the purpose described.

4. The two lips at the mouth of the key-hole, facing each other, and having their outer edges circular, in combination with the spindle of the knobs, the said lips being held together by two spring-tongues extending into the key-guide, and fastened to it at their inner ends, so as to press the lips constantly together, and against each other, and against the side of the key when it is pushed in between them, as shown and described.



5. The double-headed key-shaft F, with slots in the sides of its heads for locking it, and with the irregular groove around its central part, all substantially as described, and for the purpose set forth.

6. The traveler E, sliding on the central part of the key-shaft F, and carrying the two cogs G and G', for the purpose of holding in position and moving the hub D, all substantially as described, and for the purpose set forth.

159,857.

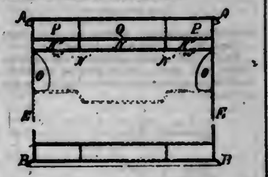
159,856.

7. The dogs M, with their teeth N at each end, for locking the shaft F and key-guide R, substantially as described, and for the purpose set forth.

8. The combination of the key-guide R and key-guards B with the key-shaft F and dogs M, substantially as described, and for the purpose set forth.

9. The combination of the key-shaft F with the traveler E and hub D, and clutch H, substantially as described, and for the purpose set forth.

159,858. BALE-TIES. Saml. H. Gilman, New Orleans, La. [Filed July 31, 1874.]



1. The combination of a hoop having a solid end with a tie made in the form of a flattened tube, both edges of which taper from top to bottom, and with one side flat, while the opposite side is convex on a line tapering from top to bottom, all substantially as and for the purpose described.

2. A hoop for baling purposes, with the extreme head of the wedge on its end wider than any other part, substantially as described, and for the purposes set forth.

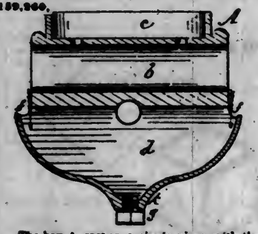
3. A tie for uniting the two ends of bale-hoops, constructed in the form of a section of a flattened tapering tube, tapering in its tube on straight lines from one end to the other on its two edges and on its bottom side, and concave on a corresponding taper line on the upper or top side, all substantially as described, and for the purpose set forth.

159,859. RESERVOIR COOKING-STOVES. J. H. Goodfellow, Troy, N. Y. [Filed Dec. 30, 1874.]

Brief.—Heated air is conducted to chambers at the ends of the reservoir.

1. In combination with the inclosed water-reservoir L, attached to or upon the rear end of a cooking-stove, the flue N, N', and O, which communicates at one end with the outer air, and at its opposite end with the reservoir-casing, and permits air to become heated and brought into direct contact with the ends of said reservoir, substantially as and for the purpose specified.

2. In combination with the oven H, the flues N and N', which communicate with the outer air and with the upper portion of said oven, and the flue O, which extends between the rear part of said oven and the chamber K of the reservoir-casing, said parts being arranged to operate in the manner and for the purpose substantially as shown.

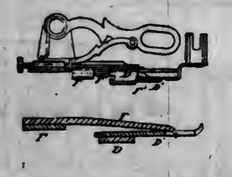


3. In combination with the oven H, and with the reservoir chamber K, the flues O and O, which extend between the same, and permit heated air from said oven to be brought into direct contact with the ends of the reservoir L, substantially as and for the purpose set forth.

4. In combination with the inclosed water-reservoir L, arranged upon the rear end of a cooking-stove, and with a flue for heating and conveying external air to the casing of said reservoir, the opening g, formed in and through the rear plate of the stove, and affording communication between said reservoir-casing and the exit-flue Q, substantially as and for the purpose shown and described.

159,860. JOURNAL-BOXES FOR SHAFT-HANGERS. John Greenwood, Rochester, N. Y. [Filed Oct. 24, 1874.]

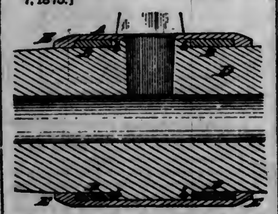
Brief.—The journal-box is cast in one piece, and constructed with lips at the ends, for catching the drippings from the ends of the box, and with a closed chamber beneath, for holding the drippings.



159,860.

The box A, cast in a single piece, with the oil-cup *c*, bearing *b*, and oil-chamber *d* arranged below said bearing, and constructed with the lips A, projecting beyond the ends of the bearing, and with the opening *f* and the nipple *k*, for receiving the plug *g*, and otherwise constructed as herein shown and described, for the object specified.

159,861. RUFFLING AND GATHERING ATTACHMENTS FOR SEWING-MACHINES. John M. Griest, Chicago, Ill. [Filed Nov. 16, 1874.]



Brief.—Notches extend rearwardly between the usual teeth of the blade and shield, and the teeth of the ruffling-blade projecting through the cloth enter the notches of the shield, and are prevented from being dulled by contact with the metallic surface.

1. A sewing-machine ruffler or gatherer wherein the free end of a flexible and sliding ruffling-blade is toothed and supported on a notched or grooved fixed part arranged for contact with that part of the cloth operated upon by the said blade, the said grooves or notches being arranged to receive the said teeth, and being deep enough to keep their points from contact with the fixed part, for the purpose of thereby allowing the teeth to project through the cloth, substantially as specified.

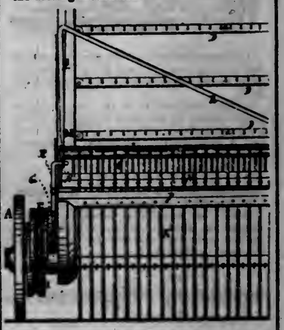
2. The ruffling-blade F', having the downwardly-bent teeth in its free and yielding edge, and also the notches sunken therein rearwardly from the base of the said teeth, in combination with the fixed shield D' arranged below the said shield, and having therein the upwardly-turned teeth arranged to enter the notches in the shield, and also having the deep notches arranged to receive the teeth of the ruffling-blade, all substantially as and for the purposes specified.

159,862. HUBS FOR VEHICLE-WHEELS. C. H. Guard, Tippecanoe, Ohio. [Filed Jan. 7, 1870.]

The combination of a wooden hub, made with projections *b b* on either side of the spoke-tenons, metallic rings B B, and shell A, formed with projections E E outside the bands, substantially as and for the purposes set forth.

159,863. TOY MONEY-BOXES. John Hall, Watertown, Mass. [Filed July 17, 1874.]

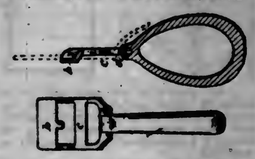
Brief.—Inserting a small coin in the open mouth of the dog figure causes the partial rotation of the cleverly-pivoted head, and the deposit of the coin in a slot for the purpose. The descent of the money tips the inner arm of a rock-lever shaft, the outer arm being the tail of the dog, which wags mechanical thanks therefor.



1. In combination with a toy money-box, the mechanical figure of a dog, B, provided with the pivoted head and the tail-rod *n c*, constructed and arranged to operate substantially as shown and described.

2. In combination with a toy money-box, the removable plate C, for removing the money, as shown by Figs. 3 and 4, when said parts *c*, *g*, and *k* are arranged to operate substantially as described.

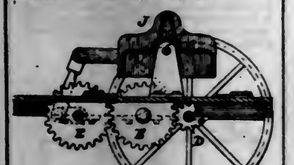
159,864. HAY-LOADERS. Homer V. Hawkins, Amboy, Ill. [Filed Dec. 5, 1874.]



Brief.—Devices for simultaneously raising and lowering the rake, and throwing the endless elevating-apron into and out of gear with the driving mechanism.

1. The rake K, having its head, consisting of the bars L N and sides N', pivoted in the stays M M, so that the rake may vibrate therein, in combination with the rotating levers F F', arms Q E, and lever S, substantially in the manner as described, and for the purpose specified.

2. The combination of the rake K and elevator, consisting of the sides B, screw C, having bars D, provided with studs *a*, teeth O, pulleys E I, and wheels A, as and for the purposes specified.



159,865. GAG-RUNNERS. John P. Hisley, Syracuse, N. Y. [Filed Nov. 18, 1874.]

The combined gag-runner and buckle, consisting of the bar *b*, having the downward-projecting tongue S, bridge *c*, and bar *d*, with its mouse and the attached runner, all substantially as herein shown and described.

159,266. HAND-CARS. Lewis C. Hopkins and Augustus Cooke, Cincinnati, Ohio. [Filed July 29, 1874.]

Brief.—A car for tram or rail ways in which the power is applied through the medium of a double seat vibrating on a pivot.

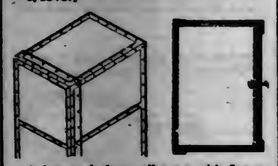
The combination of double seat J, connecting-rod H, and the system of cog-wheels E, F, and D, for actuating driving-wheels, substantially as set forth.

159,267. PLOWS. John A. Johnson, St. Paul, Minn. [Filed Dec. 18, 1874.]

Brief.—An adjustable horizontal cutter attached to the land-side of a plow, to cut under the unplowed land.

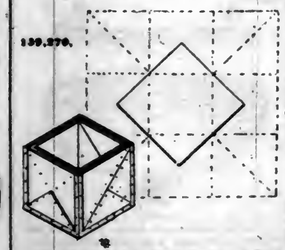
1. The combination of the laterally-projecting blade B, upright C, and flange D, substantially as and for the purpose hereinbefore set forth.

2. The combination of the cutter attachment, formed by the blade B, upright C, and flange D, with the bolt *a*, wedge E, and landside A, substantially as and for the purpose hereinbefore set forth.



159,268. COTTON-BALE TIES. H. R. Jones, Burton, Tex. [Filed Aug. 20, 1874.]

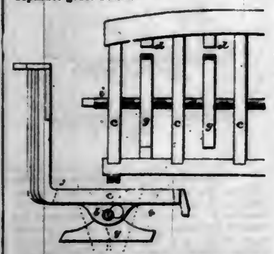
Brief.—In using, the thumb is pressed against the rear end of the base-block, raising the point and allowing the loose end of the band to slip over it.



As a new article of manufacture; the detachable cleat-tie herein described, consisting of the base-block C, having the shoulders *c c*, cleat D, and segmental cleat E F, substantially as and for the purpose specified.

159,269. PAPER BOXES. John Franklin Jones, Marcellus Falls, N. Y. [Filed Jan. 6, 1875.]

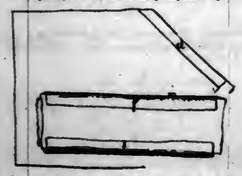
A box made from roll-paper, with flanges around its bottom, stayed with hoop-iron, and provided with a bottom of several thicknesses, each sheet thereof being supported by the flanges of a separate course, substantially as described.



159,270. PAPER BOXES. John Franklin Jones, Marcellus Falls, N. Y. [Filed Jan. 6, 1875.]

A box cut and folded out of pasteboard, so that its rectangular body is strengthened by lapping and riveting upon its sides triangular corner portions, and provided with an extra bottom placed diagonally upon the box, folded and riveted thereon, so that the triangular cut portions of the extra bottom will complete the box, making its entire sides of double thickness.

159,271. GRATES. Solomon Kepner, Pottstown, Pa., assignor of one-half his right to J. B. Parker, same place. [Filed Jan. 11, 1875.]



Brief.—The top of the supplemental is even with that of the main grate at rest, but, when made to turn half-way upon its axis, forms a separate grate below.

1. The combination of a grate with the swinging bars *g*, the bars being adapted to be dropped below the level of the grate, whereby a supplemental grate is formed, substantially as set forth.

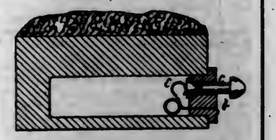
2. The bars *g*, formed upon the top of the rod *f*, in combination with a grate, the rod being pivoted below the level of the bars *e*, whereby the bars *g* are adapted to be used as a shaking device, and to form a double or supplemental grate below the bars *e*, substantially as shown and described.

159,272. NECK-TIES. Otto Kaeppers, Philadelphia, Pa. [Filed May 21, 1874.]

1. A neck-tie the points of which have their edges fastened by a lining composed of a textile fabric or netting and gutta-percha paper, said lining being applied to the edges of the points by pressure with a heated flat-iron or equivalent device, substantially as described.

2. A neck-tie the loops and cross-piece of which are provided with a lining of a textile fabric or netting and gutta-percha paper, the edges of said loops and cross-piece being secured to the lining by pressure with a heated flat-iron or equivalent device, substantially as set forth.

159,273. ICE-PICKS. Saml. Lindley, Green Bay, Wis. [Filed Aug. 17, 1874.]



Brief.—Divides ice into pieces of equal size and thickness.

An ice-pick formed of the plates A B C, bolts A and *l*, and tubes *k k*, for cutting ice into pieces of uniform size and shape, all arranged and combined as and for the purpose described and shown.

159,274. SLATE-WASHERS. Levi L. Lyman and Edward A. Boell, San Francisco, Cal. [Filed Oct. 16, 1874.]

Brief.—The water-receptacle is in the same block with the rubber, but can be used independently thereof.

1. The slate-washer herein described, provided with independent water-chamber, the independent rubbing-surface, and the stopper *b*, provided with a spring-valve, as set forth.

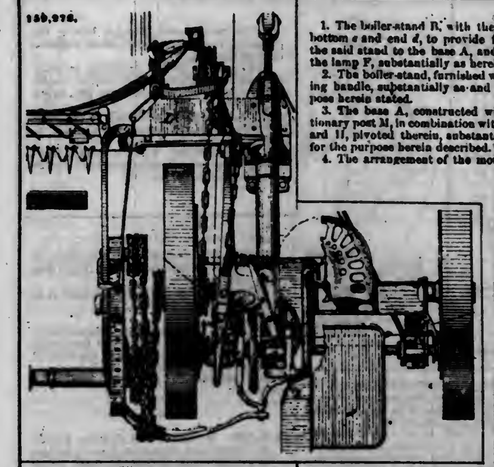
2. The stopper *b*, having the valves *c d f* and spring *e*, arranged as and for the purpose described.

159,275. HOOKS. Morris Matteon, New York, N. Y. [Filed Jan. 14, 1875.]

Brief.—The barb is secured to the plate by means of a spring, and it may be closed inward against the plate, out of the way, when not in use.

1. The plate *a*, having hook *c*, hole or ring *d*, and barb *e*, substantially as described.

2. The plate *a*, recessed to receive the shank of the barb *e*, and the flat spring *f*, the parts being combined for operation, substantially as set forth.



159,276. HARVESTER-RAKES. Dayton S. Morgan and Thos. Motley, Brockport, N. Y., assignors to Dayton S. Morgan, same place. [Filed Aug. 24, 1874.]

1. The combination of the main frame, the coupling-sleeve, the finger-beam, the drag-bar attached to the finger-beam at one end, and pivoted on the coupling-sleeve at the other, the reel-post pivoted thereon, and the supplementary brace J', these members being constructed and operating substantially as set forth, whereby the reel-post is firmly braced, while free to rise and fall with the drag-bar and cutting apparatus, and to vibrate back and forth on its pivot, substantially as set forth.

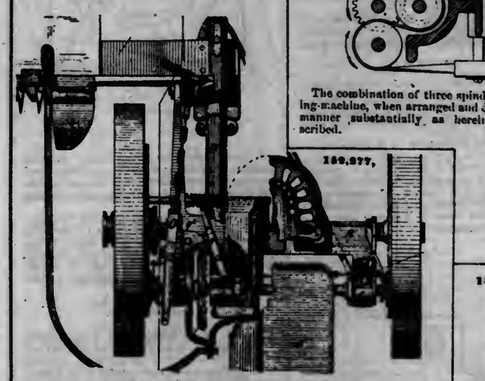
2. The combination of the two main wheels, the main frame, the coupling-sleeve, the caster-wheel supporting the coupling-sleeve, the finger beam pivoted on said sleeve, the rake post mounted on the finger-beam, the slotted rake-stale support mounted on inwardly-projecting bracket-arms on the rake-post, and the rake-arm, these members being constructed and operating in combination substantially as set forth.

3. The combination of the hinged finger-beam, the vibrating sweep-rake mounted thereon, the hinged drag-bar, and the reel mounted on said drag-bar, and vibrating in unison with the rake, substantially as set forth.

159,276.

1. The boiler-stand B, with the head *b* and bottom *c* and end *d*, to provide for securing the said stand to the base A, and to support the lamp F, substantially as herein stated.

2. The boiler-stand, furnished with the folding handle, substantially as and for the purpose herein stated.



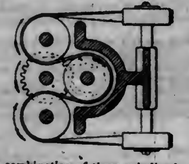
3. The base A, constructed with the stationary post M, in combination with the standard H, pivoted thereon, substantially as and for the purpose herein described.

4. The arrangement of the mouth-piece C, it aperture F, and the cup Q with the atomizing-tubes D and medicine-cup E, to operate substantially in the manner and for the purpose herein mentioned and shown.

159,277. MOWING-MACHINES. Dayton S. Morgan and Thos. Motley, Brockport, N. Y., assignors to Dayton S. Morgan, same place. [Filed Dec. 19, 1874.]

1. The combination of the skeleton main frame, the counter-shaft mounted in pipe-box bearings therein, the forked coupling sleeve pivoted on the pipe-boxes, and the similarly-pivoted brace-bar, these members being constructed and operating in combination, substantially as set forth.

2. The combination of the skeleton main frame, the counter-shaft mounted in pipe-box bearings therein, the forked coupling-sleeve pivoted on the pipe-boxes, the finger-beam hinged to the coupling-sleeve, and the drag-bar secured to the finger-beam in rear and pivoted on the coupling-sleeve in front, these members being constructed and operating in combination, substantially as set forth.

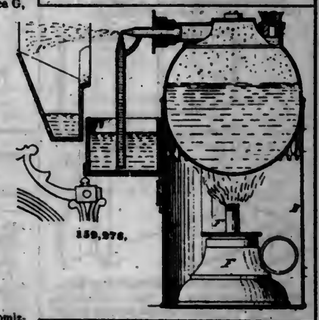


159,278. ATOMIZERS. Chas. Rembof, Brooklyn, E. D., N. Y. [Filed Sept. 5, 1874.]

Brief.—The boiler-stand is of sheet-iron, and has a bead around its lower part. This lower part is held in the opening in a cast base-plate by means of the inserted bottom. The usual mouth-piece is placed upon the top of a pivoted post, which is arranged to swing forward and backward, and be held by a set-screw at any desired angle. The mouth-piece carries at its lower edge a cup to catch the condensed vapor, which can at will be poured into the medicine-cup. The handle folds when not in use.

159,279. BORING-MACHINES. J. Richards, Philadelphia, Pa., and G. Richards, Gothenburg, Sweden. [Filed Dec. 30, 1874.]

Brief.—The spindles which carry the boring-tools are attached to weighted levers, which keep them above the material, unless forced down by the operator, and they are driven by a system of gearing, which communicates motion to them all simultaneously.

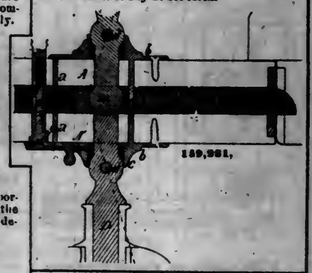


The combination of three spindles in a boring-machine, when arranged and driven in the manner substantially as hereinbefore described.

159,277.

159,280. CANAL-LOCKS. Thos. S. Bonner, Minneapolis, Minn. [Filed Jan. 20, 1875.]

The combined lock herein described, consisting of the large lock B, with its large gate F, which, with the upper gate, *h*, of the lock A, forms the combined lock A B, which will enable a train of several boats to pass altogether from one level to another, as specified, without impairing the efficiency of the old lock for passing single boats.

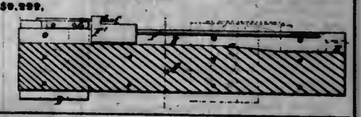


159,276.

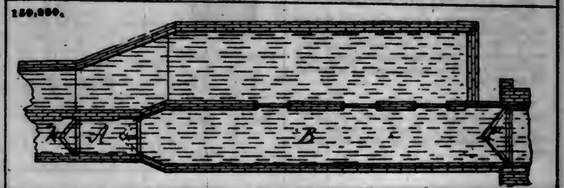
159,281. DOOR-LATCHES. Oscar F. Buss, Albany, N. Y. [Filed Dec. 12, 1874.]

Brief.—A divided case provided with slots for receiving and guiding the rear end of a spring latch-bolt, and with brackets for supporting the bolt-operating levers.

In a door-lock the sectional body A A', each section consisting of the slotted case *a e e'*, rose-plate *b*, and bracket *c*, in combination with the spring-bolt B and one or more levers, D D', substantially as set forth.



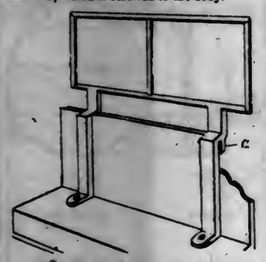
159,281.



159,282. LOOMS FOR WEAVING PILE FABRICS. Stephen Sanford, Amsterdam, N. Y. [Filed Jan. 12, 1875.]

Brief.—The wire-trough is so formed that the wire-head, in the inward movement of the wire into the shed, passes from a higher to a lower plane, by which means it is disengaged from the catch.

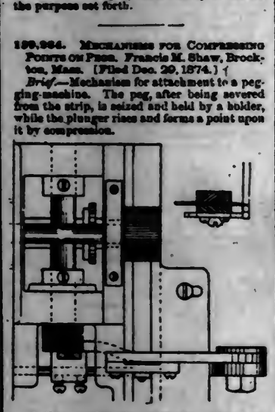
159,282.



159,280.

The grooved bar, into which the wires are withdrawn from the fabric, having a form substantially as described, which allows the respective wires to adjust themselves to a position which clears them from the withdrawing device on their movement into the open shed, as specified.

159,283. ATTACHING DASH-BOARDS. GOTTF. Schaffner, Troy, N. Y. [Filed Aug. 1, 1874.]



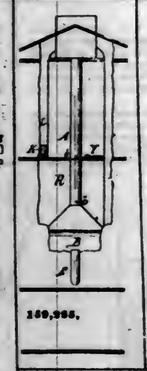
Brief.—The dash-board is held by a clip and arm, which is screwed to the body.

The clip C at the lower part of a dash-board, in combination with the dash-board and the front end of a wagon, substantially as and for the purpose set forth.

159,284. MECHANISMS FOR COMPRESSING POINTS ON PEGS. Francis M. Shaw, Brockton, Mass. [Filed Dec. 29, 1874.]

Brief.—Mechanism for attachment to a pegging-machine. The peg, after being severed from the strip, is seized and held by a holder, while the plunger rises and forms a point upon it by compression.

1. The combination, with the cutter-carrying arm, of the holder and cutter, the holder acting to hold a peg being pointed, while the cutter separates another peg from the ribbon of pegwood or strip, substantially as described.



2. The combination, with the plunger, of a holder for holding the peg, substantially as described.

3. In combination, mechanism for feeding or moving the peg strip, a cutter for cutting a peg from such strip, a holder for holding the peg, and mechanism for forming a point on the peg by compression of its point, substantially as described.

159,285. CORRUGATED CHIMNEYS AND VENTILATORS. Lovern B. Silver, Cleveland, Ohio. [Filed Dec. 14, 1874.]

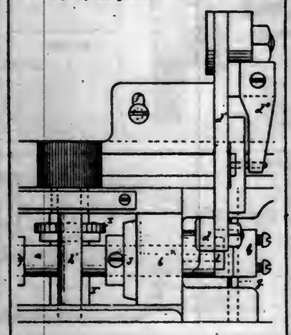
Brief.—By means of the valve the heated air surrounding the smoke-pipe may be admitted into a section of the main hot-air flue, communicating with an upper room. The pipes admit air to be heated in the flue around the smoke-pipe.

The combination, with a grate or stove, of the flue E, smoke-pipe A, cold-air pipes F W, valve Y, and registers G, all constructed substantially as and for the purposes herein set forth.

159,286.

159,287. REVOLVING POCKET-KNIVES. W. Staniforth, Sheffield, England, assignor to William H. Smith and Wm. G. Hall, same place. [Filed Dec. 26, 1874.]

Brief.—The handle proper, containing the blades, rotates in an exterior tubular metal case, which is slotted at one side to allow the blades to be opened when in proper position. When not in use the opening in the handle is rotated away from the slot in the exterior tube or case, and dirt is thus prevented from accumulating around the blades.



1. The blade B and handle revolving in an outer case, for the purposes described and set forth.

2. The spring a, with the bolt b and projection c, in combination with the slit c', or their equivalents, substantially as and for the purposes set forth.

3. The slots i and i', in combination with the spring a and bolt b, or their equivalents, substantially as and for the purposes set forth.

159,287. MACHINES FOR FORMING POINTS ON PEGS. Benj. F. Sturtevant, Boston, and Francis M. Shaw, Brockton, assignor to B. F. Sturtevant, Boston, Mass. [Filed Dec. 18, 1874.]

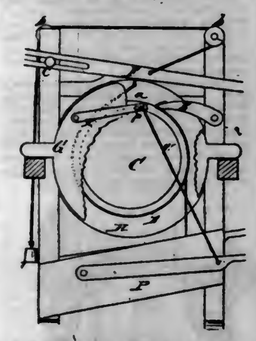
Brief.—The mechanism is designed as an attachment to a pegging-machine. The peg, after being severed from the strip, is grasped and held by a yielding holder, while the plunger rises and forms a pyramidal point upon it by compression, a point of such shape permitting the fibers of a square peg to be more equally compacted.

1. The reciprocating plunger having the pyramidal point-forming depression, substantially as set forth.

2. A yielding holder, operating substantially as described, to hold the peg, in combination with a plunger to point the peg, as set forth.

3. The combination, with the yielding holder and cutter, of the plunger, substantially as and for the purpose set forth.

4. The combination, with the yielding holder and cutter and the plunger, of the intermittent feed-wheels, as described.



159,288. BUTTON-HOLE GUIDE-CLAMPS. E. Thompson, Bridgeport, Conn. [Filed Dec. 14, 1874.]

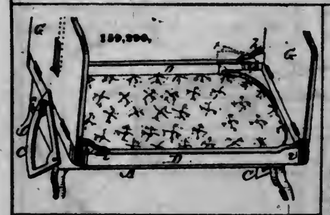
Brief.—The edge of the button-hole to be worked is clamped between.

In a button-hole guide-clamp, the combination of the U-shaped wire A and the double swinging jaw B, secured to one of the arms of the wire in the manner described, both constructed substantially as and for the purpose specified.

159,289. MACHINES FOR COILING HOOPS. Jas. Tomlinson, Goderich, Canada, assignor to himself and Harriett M. Gage. [Filed July 17, 1874.]

Brief.—The invention consists of certain devices, arranged as shown in the drawing, by which wooden hoops are coiled into compact masses for transportation.

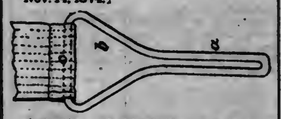
1. In a machine for coiling hoops, the combination of a forming-wheel, C, encircling band or strap D, pivoted arm E, and the weighted lever F, arranged and operating substantially as set forth.



2. In a machine for coiling hoops, the movable face-plate G, pivoted clamp Q, lever R, and pin p, in combination with the forming-wheel C, encircling band or strap D, pivoted slotted arm E, and weighted lever F, all arranged and operating substantially as described.

159,290. SOFA-BEDSTEADS. J. K. Underhill, Turlock, Cal. [Filed Oct. 23, 1873.]

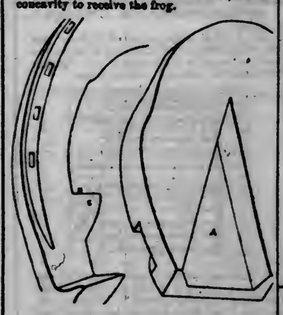
Brief.—The back is turned down onto the base to form a bed, and is held in such position by hooks on the base-frame engaging with pins on the back frame. The hinged boards are held in their vertical positions by buttons, which are turned within the back frame when the end boards are folded down.



1. The combination of the seat-frame A, pivoted segmental braces C C, pivoted back D, pins a, and hooks b, all substantially as and for the purposes herein set forth.

2. The combination, with the pivoted sofa-back D, of the hinged end boards G and the hinged and pivoted buttons h, provided with vertical offsets f, all substantially as and for the purposes herein set forth.

159,290.



159,291. STOCKING AND SKIRT HOLDERS. Andrew Warren, Waltham, Mass. [Filed Nov. 14, 1874.]

A stocking and skirt holder made in one piece, and comprising the clasp a, which, by compression alone, holds the garment, the loop b, and the bends c c.

159,292. ELASTIC PADS FOR HORSESHOES. John B. Wood, Poultney, Vt. [Filed Apr. 6, 1872.]

Brief.—An elastic pad provided with flanges to secure it between the foot and shoe, and a concavity to receive the frog.

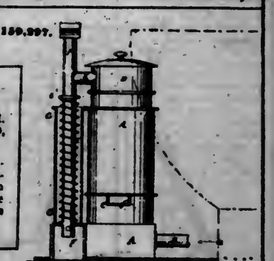
A horseshoe provided with the flanges B C C, in combination with the elastic pad provided with the concavity A, for the purpose set forth.

159,293. TICKET-PRINTING MACHINES. Jas. Anderson, New York, N. Y. [Filed Dec. 6, 1874.]

Brief.—A portable box containing cylinder, which prints tickets, severs them from the web, and registers their numbers.

1. The combination, with spring-pressed cutter F, of push-pin J and lever K L, as and for the purpose specified.

2. The frame a and arms b, combined with the printing-roll, as and for the purpose described.



159,294.

159,294. RULERS. Henry Belcher and T. H. Belcher, Irvington, N. J. [Filed Nov. 30, 1874.]

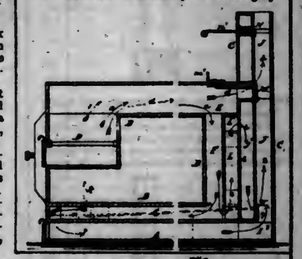
A combination ruler and paper-cutter, constructed with the sharpened metal paper-cutter set at an angle into wooden center, and so arranged that its edge rests upon the same plane as the corresponding flat surface of its wooden center, as herein described.

159,297.

159,295. BOOT-LEG-TURNING MACHINES. David Bissell, Detroit, Mich. [Filed Dec. 5, 1874.]

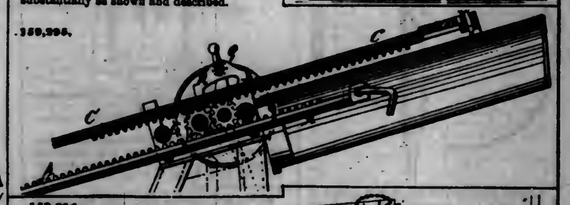
Brief.—The pushing and pulling bars—one operating inside, the other outside, of the leg-holding cylinder—are actuated by an intermediate mechanism, so that they move simultaneously in opposite directions, and are reversed at a given point. The tapering cylinder is adapted to varying sizes.

1. The combination, with the driving-crank shaft and the pulling and pushing bars, of an intermediate gear, to reverse the motion of the crank relatively to the machine and the operator, substantially as specified.



2. The combination, with the driving-shaft I, having a half-clutch pinion, G, and toothed bars A C, of the crank K, provided with a half-clutch, and arranged to slide on said shaft, as shown and described.

3. An interchangeable driving-shaft, I, driving-pulley O, sliding clutch P, slider Q, and vertical housing-extensions R, combined, as herein described.



4. In a boot-leg-turning machine, the reducing-tube formed of a tapering base-section, T, adapted for attachment to the machine, and a section, U, of uniform diameter, substantially as shown and described.

159,296. RANGES. Edwin O. Brinckerhoff, New York, N. Y. [Filed Jan. 11, 1875.]

Brief.—The draft may be direct and through the upper flue only, or through the rear flues in contact with the back, bottom, and sides of the oven, to heat it uniformly and thoroughly.

159,296.

159,296.

159,296. MINING APPARATUS. Josiah Bloss and Elisher J. White, Wilkesbarre, Pa. [Filed Dec. 12, 1874.]

1. A tubular drill-frame, B, provided with tapering external screw at its lower end, as and for the purpose described.

2. The combination of the two-part nut-bar C D, having detachable pins c' d' and staple d', with drill-bit H and screw E, having corresponding shank and socket, as and for the purpose specified.

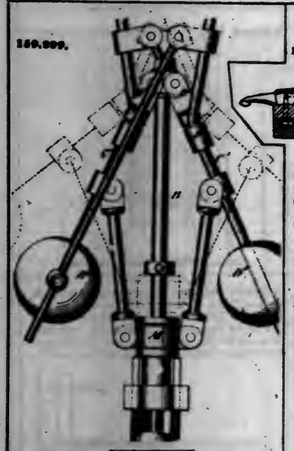
159,297. WATER-CLOSET VALVES. Edwin O. Brinckerhoff, New York, N. Y. [Filed Jan. 11, 1875.]

Brief.—When the rods are pressed down they carry with them the valves, the apertures in which then register with the open ends of the pipe which connects the two sockets. The elasticity of the springs raises the valves when the weight is removed.

The combination of the two sockets A, provided with the pipes B and the connecting-pipe C, the two caps or valves D, the connecting-arms E, the rods F, the springs H, and the sockets G, with each other, to adapt them for use in connection with a water-closet bowl or basin and seat, substantially as herein shown and described.

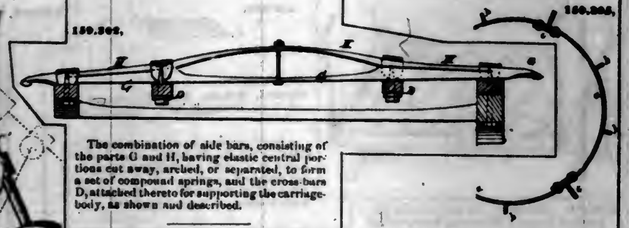
1. The combination of the flues F G H I with each other and with the cases or shells A B of a range, and the chimney-flue J, substantially in the manner herein shown and described.

2. The combination of the damper K with the set of flues F G H I, the set of flues F L J', and the rear chimney-flue J, substantially as herein shown and described.



3. The combination of the damper M with the rear chimney-flue J, the set of flues F G H I, the set of flues F L J', and the opening leading into the space between the top plates of the cases A B of the range, substantially as herein shown and described.

159,298. STEAM-ENGINE GOVERNORS. F. M. Brown, Warren, R. I. [Filed Dec. 19, 1874.]

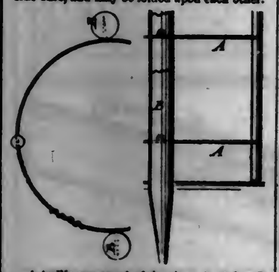


Brief.—The bent arms are connected each to the ball opposite, and as they incline by the rise of the balls, each ball is forced a greater distance from its center of rotation.

The combination, with arms C C, pivoted to the stationary spindle B, of crooked levers C'' C'' and sliding balls D'' D'', connected by pivoted rods D' D', as and for the purpose specified.

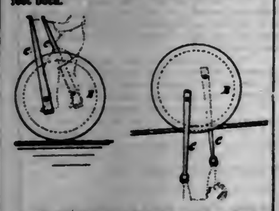
160,899.

160,902.



160,906.

160,899. TRELLISES. Timothy L. Buell, Marietta, Ohio. [Filed Dec. 23, 1874.]



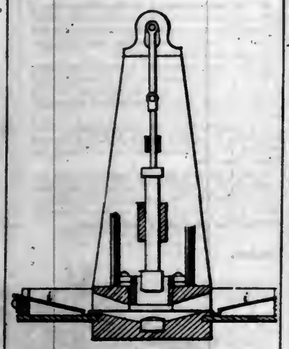
Brief.—Two posts that are designed to enter the ground have hoops swiveled upon them at equal distances, which are pivoted also to side bars, and may be folded upon each other.

A trellis composed of the rings A, stakes B B, and posts C C, arranged substantially as shown and described, and for the purposes set forth.

160,901. GYMNASTIC APPARATUS. Horace S. Carley, New York, N. Y. [Filed June 27, 1874.]

Brief.—For exercise either on the tight-rope by hand, or on the ground by hands and feet both.

1. The combination, in an exercising apparatus, of grooved wheel B, separately pendent handles C, and stretched rod or cord A, as shown and described.



2. The foot-pieces or stirrups D, in combination with handles C and wheel B, when the handles are pivoted eccentrically to the wheel, substantially as specified.

160,902. SIDE RAIL FOR VEHICLES. John W. Coe and Daniel Merritt, Williamsburg, N. Y. [Filed Oct. 27, 1874.]

The combination of side bars, consisting of the parts G and H, having elastic central portions cut away, arched, or separated, to form a set of compound springs, and the cross-bars D, attached thereto for supporting the carriage-body, as shown and described.

160,903. STAMPING-MILLS. H. W. Colver, Waukesha, Wis. [Filed Dec. 9, 1874.]

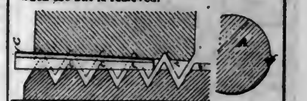
Brief.—The ore passes through the guides r, adjustable box or frame E, and is stamped. It then passes over the inclined copper plates t, which can be inclined at a greater or less angle, as desired, to retain the pulp and make it pass several times out and back over them, so as to insure complete amalgamation. The grooves t' contain mercury.

1. The combination, with the bed and stamp-blocks, of an ore-receiving box, supported above the face of the bed, leaving a space between such frame and bed, as and for the purpose set forth.

2. The combination, with a bed and stamp-blocks, of the inclined and grooved plates t, arranged and operating in connection with such bed, substantially as and for the purpose set forth.

3. In combination, the stamp, constructed as described, the bed, the frame E supported above the bed, and the adjustable plates t, as and for the purposes set forth.

160,904. CAST HOOKS. John C. Coonley, Chicago, Ill. [Filed Dec. 16, 1874.]



The malleable hook A, cast with the pin C and hole D, so as to enable the eye B to be closed when cold and the pin headed, substantially as specified.

160,905. WROUGHT-IRON COLUMNS. John R. Cornell, New York, N. Y. [Filed Dec. 26, 1874.]

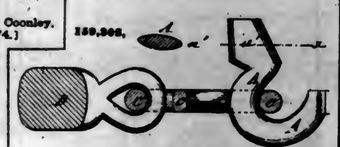
The improved strut or chord herein described, formed of the segmental ribbed plates a b and the T-shaped joint-bars c, the said parts being riveted together in the manner specified.

160,906. NUT-LOCKS. Chas. J. Cummings, Preble, N. Y. [Filed Oct. 10, 1874.]

Brief.—The key is composed of soft metal, the edges of the shallow grooves cutting through the thin V-shaped edges of the key when the nut is removed.

The bolt A and nut B, having angular grooves across the threads, above the bottoms thereof, for the reception of a rectangular tapering key, C, as set forth.

160,907. ROLLING SHUTTERS. Hector J. DeGrenne, Green Bay, Wis. [Filed Sept. 5, 1874.]

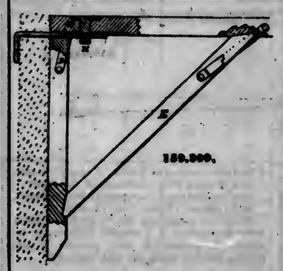


Brief.—The slats are linked together, and are wound upon rollers operated by an endless cord concealed in the casing, except a portion by which the curtain is manipulated.

1. The combination of endless cord C, pulley J, and pulleys K M with the blind-operating roller F, pulley J being in chamber I at the side of the window-frame, and the pulleys K M being in the casing L, all substantially as specified.

2. The slats connected together by wire links O, arranged in transverse grooves in the slats, and covered by straps K, substantially as specified.

160,908.



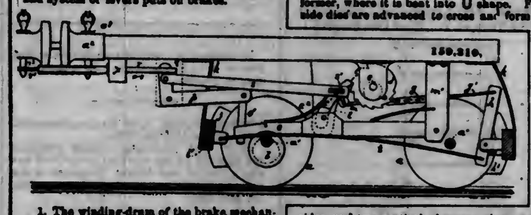
160,908. HITCH-HOOKS FOR STREET-CARS. David Demarest, New York, N. Y. [Filed Jan. 18, 1875.]

In hitch-hooks for street-cars, the bill or head a', formed upon the point of the hitch-hook A, substantially as shown and described, and for the purpose set forth.

160,909. SCAFFOLD-BRACKETS. Saml. N. Fisher, Milford, Mass. [Filed Nov. 14, 1874.]

Brief.—A scaffold-bracket in which the supporting hook is made adjustable, and in which the upright post, plank-supporting piece, and brace are connected together by metallic straps, to enable the bracket to be folded up.

160,909.



1. The adjustable hook G and nut-piece H, in combination with a scaffold-bracket, for the purposes described.

2. The straps D and F, in combination with the parts of a scaffold-bracket, as and for the purposes described.

160,910. CAR-BRAKES. Carl Fogelberg, Cambridgeport, Mass. [Filed Dec. 2, 1874.]

Brief.—Separation of cars by sliding rod, and system of levers pats on brakes.

160,910.

1. The winding-drum of the brake mechanism and its actuating-ratchet, combined with a pawl, pawl supporting and connecting devices, and cam f, all substantially as and for the purpose set forth.

2. The combination, with the shaft a', of eccentric or cam b, radius-bar c, pawl d', ratchet d, and winding-cylinder, as and for the purpose set forth.

3. In combination, the rod r, lever g, link o', bar c, and pawl d', and ratchet and winding-cylinder, as and for the purpose set forth.

4. The rod r and lever p, in combination with the links s s' and pawls d' l, as and for the purposes set forth.

5. The slide-rod e and pawl-lifting device m, as and for the purpose set forth.

160,911. BAG OR BOX FASTENINGS. Carl Fogelberg, Cambridgeport, Mass. [Filed Nov. 22, 1874.]

In combination with the jaws, and with the knobs, the springs d d, on which the knobs are respectively mounted, as and for the purpose described.

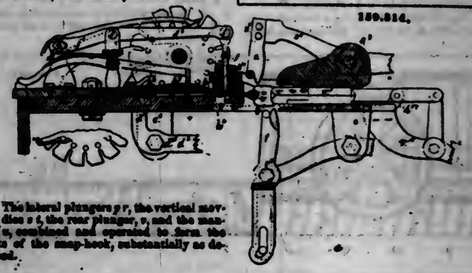
160,912. SOLE AND HEEL SHAVER FOR BOOTS AND SHOES. Perry M. Foster, Leicester, Mass., executrix of G. P. Foster, deceased. [Filed Nov. 30, 1874.]

Brief.—The removable knife is held in place by a device adjusted by means of a set-screw.

1. In combination with a removable knife or cutter, for shaving the heels and soles of boots and shoes, the lever C, substantially as and for the purposes described.

2. The screw F, in combination with the lever C and knife H, for the purposes described.

160,913. MACHINES FOR FORMING SNAP-HOOKS. John T. Foster, Jersey City, N. J., assignor to Francis C. Nye, New York city. [Filed July 31, 1874.]



1. The combination of the loop and swell of a snap-hook with the arms crossed between them, substantially as described.

2. The improved snap-hook, constructed with loop, swell, and eye, and having the arms crossed on both sides of the swell, substantially as described.

160,914. MACHINES FOR FORMING SNAP-HOOKS. John T. Foster, Jersey City, N. J., assignor to Francis C. Nye, New York city. [Filed Dec. 24, 1873.]

Brief.—A sliding frame and pawl feeds the wire into radial notches in an intermittently-revolving roulette, which, after the wire is cut off, carries it between guides to center it, and then under a griper, that holds it while the milling mechanism rounds the points. At the next movement of the roulette a plunger carries the wire out, and presses it against a former, where it is bent into U shape. Four side dies are advanced to cross and form the sides, and two vertical plungers give a semi-circular bend to the ends in reverse directions. Upon the withdrawal of these plungers, a mandrel is inserted into the loop, and a rear plunger advances and bends down the ends, so that they overlap and form a circle. The dies are withdrawn and a pusher removes the finished article.

160,914.

1. The improved machine herein described, for making snap-hooks, consisting of the mechanism for feeding, cutting, and milling the ends of the piece of wire or other suitable material, and bending and forming the same into a snap-hook, substantially as described.

2. The combination of the former k, front plunger, h, lateral plungers a o p r, vertical plungers e f, rear plunger, n, and abutments k^{11} p^{11} r^{11}, arranged and operating substantially as described.

3. The combination of the former k, front plunger, h, the lateral plungers a o, and the lateral plungers p r, arranged and operating to make the loop and the inward and outward bends successively in the arms of a piece of wire or other suitable material, substantially as described.

4. The lateral plungers p r, constructed with the projecting ends p^1 r^1, combined with their respective abutments k^{11} p^{11} a^4 r^{11} and former k, and operated to cross the respective arms of the snap-hook, substantially as described.

5. The lateral plungers p r, the vertical movable dies e f, the rear plunger, n, and the mandrel o, combined and operated to form the hooks of the snap-hook, substantially as described.

6. The combination of the lateral plungers p r and the vertical movable dies or plungers e f, and former k, arranged and operated to make the partially-formed hooks w^{10} w^{10} in the two arms of a piece of wire or other suitable material, substantially as described.

7. The combination of the movable dies e f, the plunger n, and the mandrel o, arranged and operating substantially as described.

8. The movable die or plunger e, constructed with two long dies, e^1 e^1, and two short dies, e^2 e^2, at its inner end, but in reverse positions on each side of the end of the plunger, in combination with the mandrel o, and operating to complete the bending and forming of the snap-hook, substantially as described.

9. The movable dies or plungers e and f, combined together, and arranged so that their ends act upon each other, substantially as described.

10. The plunger t, bearing at its lower end the pin t^5, and connected to and operated by the lever t^6, as described, in combination with the slotted standard t^{10}, as and for the purpose specified.

11. The movable dies a e p r, constructed with loose joints, and moving in seats formed in the recesses in the bed, in combination with the plates having beveled edges, and set in the recesses, so as to allow the dies to rise and fall in the course of their forward and backward motions, substantially as and for the purpose described.

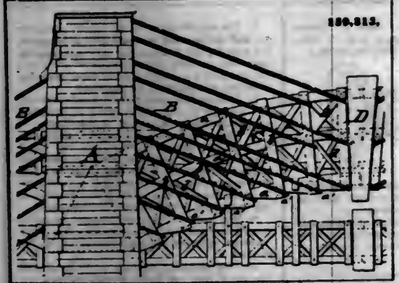
12. The movable die k^1, in combination with the roulettes e e^1 and griper g, operated by the movable die k^1, and arranged substantially as described.

13. The movable die k^1, roulettes e e^1, and the griper g, in combination with the milling mechanism, substantially as described.

14. The movable die or plunger k k^1, constructed in two parts, united by a loose joint, and having the forward part, k^1, depressed to the bed a at its inner end, k^2, with the open recess between the bed and the forward part, k^1, in combination with the bed, upon which the plunger moves, and the notches e^3 of the roulettes, which hold the wire, so as to allow the wire to be advanced on the bed in the recess beneath the forward part, k^1, of the plunger, and to be further advanced on the bed toward the former k by the depressed end of the plunger, which rides over the wire in its backward movement, substantially as described.

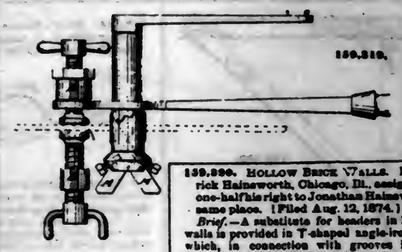
15. The movable die k k^1, in combination with the stud of the standard k^{10}, secured to the said movable die, and the notch e^{10} and pins e^9 of the roulette e, for rotating the roulettes e e^1 at the same time with the return movement of the said movable die, substantially as and for the purposes described.

16. The combination of the pusher f, working through the former k, with the stud k^{10}, moving in a slot in the lever of the pusher, and secured to the movable die k k^1, substantially as described.



160,915. BRIDGES. Peter M. Fulton, Rhinebeck, N. Y. [Filed Oct. 17, 1874.]

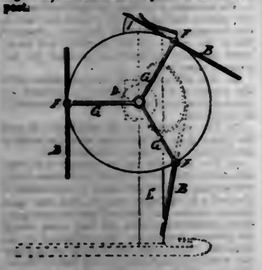
Brief.—Towers support arch-sections by means of a series of stretched cables. A tapering perforated key is inserted between the arch-sections, into which the ends of the sections fit.



1. The combination of the supporting-towers A with the arch-sections C and the series of stretched cables, for serving as arch-abutments and cable-bearings, as specified.

2. The perforated key-piece D, in combination with the grooved and tapering ends of the arc-heads e, for forming the joint of the arches, as set forth.

160,915.



No. 159,315.

No. 159,319.

159,316. HARVESTER-RAKES. David S. Fulton, Paris, Pa. [Filed Oct. 3, 1874.]

Brief.—The beaters are pivoted in a revolving head, and controlled by cams on the rear post.

The wheel A, provided with arms B pivoted thereto, and having the beat sections J H K L, in combination with the stationary cams I M, as and for the purpose specified.

159,317. SEWING-MACHINES FOR SEWING BAGS, &c. E. P. Garland and A. J. Gove, San Francisco, Cal. [Filed Nov. 19, 1874.]

Brief.—The bed-plate of the machine is provided with a circular groove, which extends the entire length of the same, and has arranged in its one end a slotted cylindrical case, that carries within itself a spiral needle having an eye formed in one side, with a groove for carrying the thread, and a shoulder for casting off the same at the proper time, while across the other end of such groove is placed a series of diagonal bars, for drawing the needle out from the case when revolved, and for supporting the cloth while being stitched; the edge of the cloth being held thereon by means of a screw-clamp, which is adapted to be slid over such groove, or back from the same, as may be desired.

1. The combination of the spiral needle having a feathered stem, *b*, with the slotted case adapted to revolve substantially as described.

2. The combination of a spiral needle having a groove around its periphery or spirals, and arranged to operate in a case, B, with the rods *a a*, substantially in the manner and for the purpose set forth and specified.

3. The spiral needle, having a retaining-eye, *c*, and offset *d'*, as and for the purpose specified.

159,318. SAW-GUMMERS. G. W. Griswold, Pottersville, N. Y. [Filed Nov. 30, 1874.]

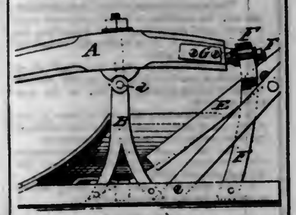
Brief.—The cutters are adjusted diagonally through the cylinder, and held in place by the set-screws.

The combination of the cutters M M and cylinder J, constructed and arranged substantially as shown and described, for the purposes set forth.

159,319. STEP-LADDERS. Geo. Grunewald, New York, N. Y. [Filed Dec. 21, 1874.]

The combination of the main ladder A and the diverging side pieces *a a* with the grooved wedge-shaped attachments *d d*, the concealed rods *f f*, screws *e e*, and parallel ladder B, all arranged substantially as herein shown and described.

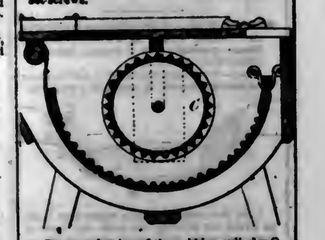
159,320. HOLLOW BRICK WALLS. Frederick Hainsworth, Chicago, Ill., assignor of one-half his right to Jonathan Hainsworth, same place. [Filed Aug. 12, 1874.]



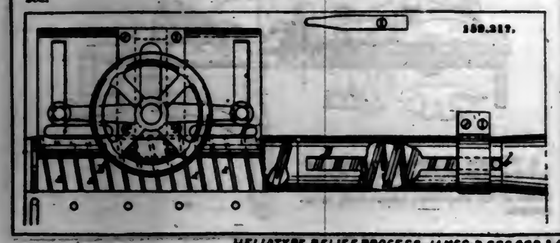
Brief.—A substitute for headers in hollow walls is provided in T-shaped angle-irons, by which, in connection with grooves in the bricks, the two shells are tied together.

In combination with the angle-iron C, the grooved brick B, adapted to receive the angle-iron, as specified.

159,321. PLOWS. Albt. Hampe, Staunton, Ill. [Filed July 20, 1874.]

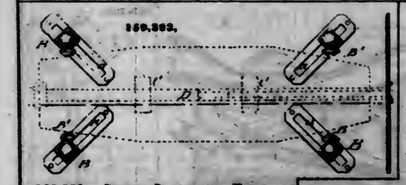


Brief.—The plow-beam swings vertically and laterally on the standard proper, and has also a vertical and lateral movement at the rear end upon a vertical standard rising from the land-side.



The plow beam A, pivoted to swing horizontally on a bolt, C, and vertically on a bolt, *d*, in combination with the slotted rear standard, F, screw-bolt F', and clevis G, to admit of the two adjustments, as set forth.

159,322. WASHING-MACHINES. Samuel Hawkins, Metamora, Ind. [Filed Dec. 17, 1874.]



Brief.—The rubbing-cylinder is adjustable by means of sliding blocks, bridge-pieces, and set-screws.

The combination of the rubbing-cylinder C, bearing-blocks G *g*, fixed bridge-pieces I, and set-screws K, substantially as and for the purpose specified.

No. 159,317.

No. 159,323.

No. 159,326.

159,323. COFFIN-CLAMPS FOR HEARSES. Wm. H. Roucek and John B. Fox, Quincy, Ill. [Filed Jan. 11, 1875.]

1. The improved coffin-clamping device for hearses, consisting of movable clamping-standards, which are guided in slots of the hearse-body and operated in connection with traveling nuts moving on a right and left screw-threaded crank-shaft, capable of admitting the simultaneous adjustment of all the standards, or of the front pair separately, substantially in the manner and for the purpose set forth.

2. The standard-moving nuts C, on right and left screw-threaded crank-shaft D composed of front part D^1, with extension-shaft and sleeve-shaped rear part D^2, to turn thereon by means of the elbow-shaped crank, either separately or jointly, all combined substantially as set forth.

3. The standards B, provided with oscillating clamping-pads B', to conform to the shape of the coffin, substantially as described.

159,324. CAR-LAMPS. James B. Hoyt, Chicago, Ill. [Filed July 27, 1874.]

Brief.—The lamp and globe may be pressed downward away from the globe-cap, and swung horizontally from beneath that cap, in order to remove the globe.

1. In a loose-globe car-lamp, having an immovable globe-cap, the combination of the candle-holder, having the hoop *e*, with a bracket, whereby the candle-holder has a downward, vertical, and a horizontal swinging movement, substantially as described.

2. In a loose-globe car-lamp, having an immovable globe-cap, the combination of the adjustable hoop *e*, socket *j*, arm *d*, set-screw *i*, and bracket, substantially as and for the purpose specified.

159,325. TOY DANCERS. Wm. L. Hubbell, New York, N. Y., assignor to E. Jenkins, same place. [Filed Nov. 24, 1874.]

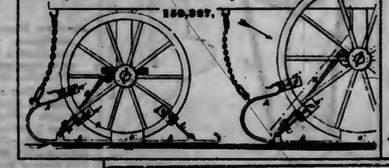
Brief.—The stopper *g* in the top of the head, being of cork or other soft material, serves to hold the tack or pin securing a hat or cap in place.

1. The composition doll-head with the tapering hole passing entirely through the same for receiving the neck *e* and stopper *g*, substantially as and for the purpose set forth.

2. The toy figure made with feet, in each of which there is a mortise at the ankle, receiving the eye at the lower end of the leg, said leg being stiff at the knee, and jointed at the hip to the body, all substantially as and for the purposes set forth.

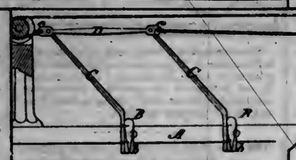
159,326. PACKINGS FOR PISTONS OF HYDRAULIC ENGINES. Samuel Hughes and Michael Kelly, Charleston, S. C. [Filed May 1, 1874.]

Brief.—A packing consisting of a ring of woven fibrous material and rubber, having a V-shaped groove lined with rubber.



A packing for hydraulic engines consisting of a ring of woven fibrous material and rubber, having in its side a V-shaped groove lined with rubber, which forms of said rim a thick and thin lip, the groove being so placed as to make the thick lip on the wearing side, and thinner at its edge than at its base, substantially as set forth.

159,327. RUNNER ATTACHMENTS FOR VEHICLES. John A. Hyde, Englewood, N. J. [Filed Dec. 10, 1874.]



Brief.—By arms and clasps the runner is secured to the wheel.

1. The clamps D, with one hinged jaw, and provided with a hand-screw, *d'*, in combination with the runners A and arms C, to enable said runners to be secured to the wheels of a wagon, substantially as shown and described.

2. The hinged arms C, in combination with the runners A and clamps D, substantially as shown and described.

No. 159,327.

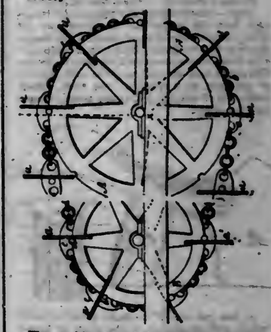
No. 159,328.

159,328. SEWER-BOOMS. Thomas Irvine, Muscatine, Iowa. [Filed Jan. 9, 1875.]

To Letters Patent, to—

1. In a device for arresting and storing floating logs, the combination, with the sheer-boom A, of the revolving rudder-fins B, substantially as specified.

2. The combination, with the levers C, actuating-fins B, of the connecting-rod D, substantially as and for the purpose specified.

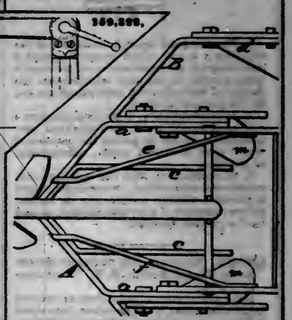


3. The combination, with the vertically-vibrating levers U of fins B, of the cable E, pulley F, and winding-drum H, substantially as specified.

4. The fins B, adapted to revolve on their long axes, for the purpose of exposing their flat surfaces or their edges to the current, as and for the purpose specified.

159,329. COMPOSITION TILES FOR ROOFING AND PAVING. John P. Jeffries, Wooster, Ohio. [Filed Nov. 21, 1874.]

The combination of the silica, sulphate of lime, hydraulic lime, oxide of magnesia, sulphate of potassa, alum, borax, sulphuric acid, and carbonic acid or carbonic anhydride, in the proportions and for the purpose in the foregoing specification set forth.



159,330. CHAIN-PROPELLERS. De Witt C. Johnson, Redding, Cal. [Filed Jan. 12, 1875.]

The combination of the two chain-carrying wheels A B, of different diameters, but having their axes in the same horizontal plane, each wheel provided with groove and roughness in its perimeter, the endless chains provided with the link-plates *c*, and the slotted buckets or paddles a centrally attached thereto, as and for the purpose described and represented.

159,331. CULTIVATORS. Moses Johnson, Three Rivers, Mich. [Filed Jan. 6, 1875.]

Brief.—A cultivator-tooth is cut from a metal plate, and shaped to present a mold-board form with a cutting or coiter edge. The main frame, made of a single metal bar, has removable wings, the front of the whole being of diamond shape.

1. A cultivator-tooth, having the inclined colter *a*, the concave mold-board *c*, with its oblique cutting-edge, and the sloping rear edges *p p'*, forming the acute angle or notch X, substantially as described.

2. The draft-frame A, made of one piece of metal, consisting of the parallel bars *a a*, meeting in front and doubled to form the draft-beam *b*, in combination with the detachable wings B and inner bars *c c*, substantially as and for the purpose set forth.

159,332.

159,332. HOES. Moses Johnson, Three Rivers, Mich., assignor to the Union Manufacturing Company. [Filed Dec. 5, 1874.]

Brief.—The blades of the hoe and the straps that form the socket for the handle are cut from a single piece of sheet metal. The straps forming the socket are bent inward into parallel lines, and secured to the handle by rivets. The space between the straps is made convex or concave, to strengthen the parts, which concavity or convexity extends some distance into the blade.

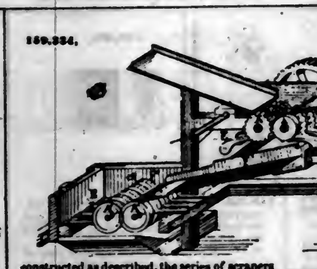
A hoe cut out of a single piece of sheet metal, and consisting of the blade or blades A B, having a convexity or concavity, *a*, between them, and projections C C, bent to form a socket for the handle, substantially as set forth.

159,333. ELONGATED SPOOLS FOR HOLDING BRAID, THREAD, &c. Friedrich Koch and Robert Beuss, Williamsburg, N. Y. [Filed Dec. 23, 1874.]

Brief.—Two pasteboard spools are connected by a band parallel with their axes, and between the flanges of the spools, the object being that the thread or braid wound thereon may be the more readily examined by hand or sight. From the two cylinders or spools are also projections in shape of telescopic tubing, to admit of additional spools being placed thereon. Through the center of the band is an incision to enable the spool to be placed on a pivot.

1. The elongated spool A, composed of the cylinders *a a*, and of the connecting-band *b* and flanges *d*, the cross-section of the band *b* being parallel to the axes and between the flanges of said cylinders, substantially as and for the purpose specified.

2. In combination with the two cylinders *a a* of an elongated spool, the cylindrical projections *c c*, applied to permit the junction of two or more elongated spools, substantially as specified.



3. In combination with the cylinders *a a*, constructed as described, the connecting-band *b*, provided with the incision *g* in its center, for the reception of a suitable support, as and for the purpose specified.

159,334. MACHINES FOR CRUSHING BONES. Adam Kumpf, Buffalo, N. Y. [Filed June 27, 1874.]

Brief.—The material is fed from an inclined board to the upper crushing-rollers, from which it falls upon an inclined reciprocating screen, and the coarser particles pass onto the lower crushing-rollers. The crushed material is taken from the receiver below the lower crushing-rollers by an elevator, and reconveyed to the upper rollers, and the operation is repeated.

1. In a bone-crushing mill, the combination of a pair of rollers composed of a series of sheaves, C, arranged and held upon revolving shafts by means of retaining-nuts D, each of the sheaves C composing the rollers being formed with a belt of V-shaped teeth, C², and a smooth surface, C³, the belt of teeth C² of one roller operating with the smooth surface C³ of the other, in the manner and for the purpose substantially as set forth.

2. In combination with a set of rollers, A,

constructed as described, the series of scrapers E, each engaging with a blank space between the rows of V-shaped teeth, substantially as described, and for the purpose set forth.

3. The combination, with the upper rolls A, composed of a series of sheaves, C, provided with teeth C², and surfaces C³, as described, of the inclined table H, vibrating sifters F F', rolls A' A', scrapers E, receiver L, and elevator K, all when arranged and operating substantially as and for the purpose described.

159,335. MAP-EXHIBITORS. John Lichtenberger, Fort Wayne, Ind. [Filed July 25, 1874.]

The combination, with rack A, of the slotted cylinder F H, provided on the inside with a series of rollers, E, arranged about its shaft G, and having on the outside a drive-pulley connected with an idler, K, by a belt, I, as and for the purpose specified.

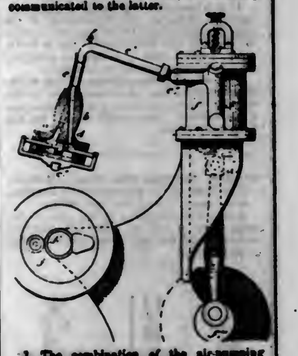
159,336. GAGES FOR FITTING WATCH-CRYSTALS. Benjamin B. Loar, Granville, Ohio. [Filed Oct. 17, 1873.]

The plate A having the point D, in combination with the sliding-piece B having point D', and the bar C sliding in a direction at right angles to the line of motion of the piece B, in combination with standard measures for the purposes herein substantially set forth.

159,337. BUILDERS' TRESTLES. Marion M. Lecky, Indianapolis, Ind., assignor of one-third his right to Hezekiah Hutchins, same place. [Filed Jan. 9, 1875.]

In a trestle, a clamp for attaching the leg or legs to the back, consisting of the plate *f*, provided with the flanges *h i j*, loop *k*, and wedge *n*, substantially as and for the purpose set forth.

159,338. PLOWS. Thomas S. Macomber, Hamilton, N. Y. [Filed Dec. 26, 1874.]



Brief.—Two opposite mold-boards are connected by bent arms pivoted upon the plow-standard. When one plow is down at work the opposite one is raised to a horizontal position.

The combination of the eyes F and their pivot, the bent bar G, and its pivot-eyes H, the double hook J, the eyes or sockets I, the rod K, and lever L, with the two mold-boards and shares D E, and the land-side A, substantially as herein shown and described.

159,339. MACHINES FOR BURNISHING BOOTS AND SHOES. Gordon McKay, Cambridge, and Hadley P. Fairfield, Boston, Mass.; said Fairfield assignor to said McKay. [Filed Dec. 22, 1874.]

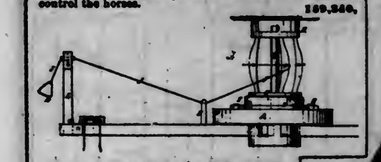
Brief.—The air within the actuating and burnishing cylinders, and the pipes connecting their corresponding ends, is kept compressed to several atmospheres, forming two flexible and unbroken columns extending from each side of the actuating-piston to the relative sides of the burnishing-piston, so that a movement of the former may be instantly communicated to the latter.

1. The combination of the air-pumping mechanism, consisting of the cylinder *g'* and its plunger *g*, and the valves *g'* and *h* or their equivalents, with the actuating cylinder *f* and its piston *f'*, or their equivalents.

2. The combination of the air-pump with the air-passages *h²* and *h'*, and the adjusting-cock *h''* and valve *i*, or their equivalents, acting substantially in the manner described, to create and maintain within the cylinders and passages of the machine a pressure greater than the ordinary atmospheric pressure, as and for the purposes described.

3. The combination of the actuating cylinder, the burnishing-cylinder, and the jack.

4. The triangular-shaped air-apertures *d d*, in combination with the piston *c'*, when so constructed and operating as to cushion the piston without entirely closing the apertures.



5. The combination of the burnishing-cylinder, the flexible pipes, and the spring or counterpoise for supporting the burnishing-cylinder.

6. In a machine in which an actuating piston gives motion to another piston, substantially in the manner described, the combination, with each pistons, of columns of compressed air concurrently employed on both sides thereof, as and for the purposes set forth.

7. The combination of the springs on the burnisher piston-rod with the piston *c'*, and the actuating cylinder.

159,340. HORSE-POWER ATTACHMENTS. J. G. Merchen, Lowden, Iowa. [Filed Dec. 10, 1874.]

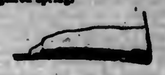
Brief.—In case of accident the driver, by turning the drum, draws all the reins taut at the same time, and is thus enabled readily to control the horses.

The combination of the detachable base D, the spindle G, the skeleton-drum H, the cords J, and the studs K L, with the platform and sweeps of a horse-power, substantially as herein shown and described.

159,341. SAFETY-PINS. Samuel F. Merritt, Springfield, Mass. [Filed Nov. 2, 1874.]

Brief.—The pin enters the slotted sleeve-nut, and is secured therein by the screw-socket being passed over it.

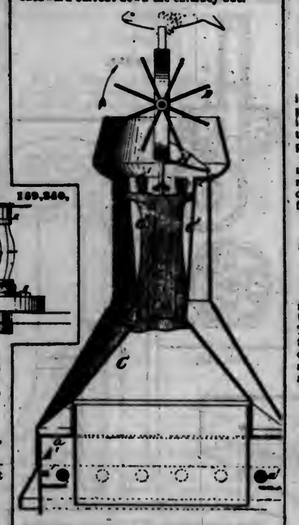
In combination with the pin A, the slotted sleeve-nut *b* and screw-socket *c*, substantially as and for the purpose set forth.



159,342. PIANO-INSULATORS. W. R. Miller, Baltimore, Md. [Filed Dec. 4, 1874.]

An insulator made of glass or equivalent non-conductor of sound, consisting of a disk provided with a central opening for the passage of the holding-screw of a piano-leg, when interposed between the top of the leg and bottom of a piano, and arranged substantially as described, for the purpose set forth.

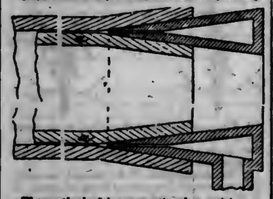
159,343. SEATS FOR THE BOTTOMS OF PANTALOONS. Stephen D. Mills, Kingston, N. Y. [Filed Aug. 25, 1874.]



Brief.—A stay for the bottoms of pantaloons, made water-proof, and shaped to have the required spring.

As an improved article of manufacture, the strip B, for application as a stay for the bottoms of pantaloon-legs, the same being formed wholly or in part of rubber, as shown and described.

159,344. CHIMNEY-TOPS. C. W. Munger, Peru, Ill. [Filed July 27, 1874.]



Brief.—The shield is intended to prevent a backward current down the chimney-flue.

1. The chimney-cap, constructed to protect the top of a chimney on all sides, and having the overhanging hood A' and holes *a* and *a'*, in combination with the pipe B and pipe C, with flange *c*, and having flues C', substantially as specified.

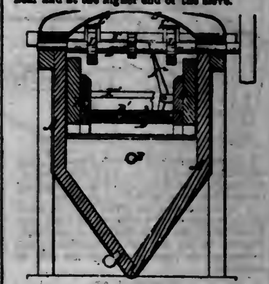
2. The pipes B and C, with air-flues between them, in combination with the revolving suction-ventilator D and shield H, substantially as specified.

159,345. PROCESSES OF INTRODUCING ANTISEPTICS INTO RUBBER HOSE. John Murphy, New York, N. Y. [Filed Nov. 4, 1874.]

The method of impregnating hose with antiseptic substances consisting in the forcible introduction of antiseptic material in solution between the separate tubes which compose the hose.

159,346. PORTABLE COVERS FOR PLANTS. Wm. Musgrove, New York, N. Y. [Filed Sept. 1, 1874.]

Brief.—The frame is constructed of metal and glass, with spirit-lamp and heating-pipes, with ventilating-valves at the top. Different sections are so constructed as to be readily joined end to end by a metallic clip, when it is desirable to enlarge the area of the cover.

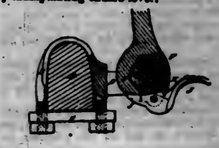


1. The ventilator-plate *a*, made with openings and sliding longitudinally upon the ridge-plate *c*, to open or close the apertures thereon, in combination with the ⊐-shaped bars containing glass and forming a portable cover for plants, substantially as set forth.

2. The portable covers for plants, made with metal frames containing glass, and with the returned strips *i* at the edges receiving the dovetailed strips *l*, for uniting the separate frames together, as set forth.

159,347. ORE-SEPARATORS. David Nevin, Georgetown, Colo., assignor to himself, R. Nevin, and J. Oscar Stewart, same place. [Filed Nov. 30, 1874.]

Brief.—The reciprocating motions of the sieve, both vertical and horizontal, are caused by the action of cams and reacting springs. The sieve has dampered openings in its bottom, through which the heavier particles of ore are discharged, while the lighter particles are sorted and discharged into receptacles near and at the higher end of the sieve.



1. The combination of the springs J J', slide-bar F, cams L L and M, tappets L' L' and M', with the ore-separating sieve and tank, the whole operating to produce an up-and-down and back-and-forward vibration of the sieve within the tank, substantially as and for the purpose described.

2. The relief-passages *m m* in the wire sieve bottom D, in combination with the valves K and levers U² for opening and closing the valves, substantially in the manner shown and described.

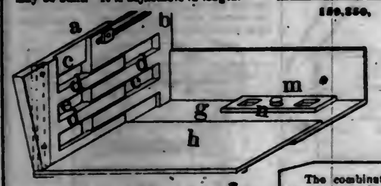
3. The bar F, having the cams M' and L' L' applied to it, attached to the sieve-frame D, and hung loosely upon the tank, and combined with the tappets and tappet-shaft, substantially in the manner shown and described.

159,348. TRUSS-COUPLINGS. Axel Olsson, Williamsburg, N. Y., assignor to himself, J. W. Coz, and D. Merritt, same place. [Filed Jan. 4, 1875.]

Brief.—Pressure of bolt into eye locks the parts. Unlocked either by depressing thill or by manipulating thumb-lever.

1. The combination of pivoted and concave cross-head lever G H I, open and grooved eye F, thill-iron E, and coupling-bolt L, substantially as set forth.

2. The combination of pivoted thumb-lever J, spring K, pivoted cross-head lever G H I, notched open eye F, and thill-iron E, substantially as set forth.

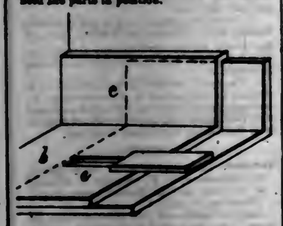


180,849. HORSE HAY-RAKES. Benj. Owen, Dayton, Ohio. [Filed Nov. 21, 1874.]

The hand-lever M, having two arms joined at their outer ends, the upper of which serves as a bearing for the projecting end of the foot-lever G, and the lower comes in contact with the bar K of the shafts, to arrest the downward movement of the teeth when they are held by the foot-lever, as described.

180,850. ATTACHMENTS FOR COOK-STOVES. Edwin B. Patten, Bangor, Me. [Filed Aug. 22, 1874.]

Brief.—The device is used to divide an ordinary fire-box into two parts, in one of which the draft is stopped, and in the other a fire may be built. It is adjustable in length.



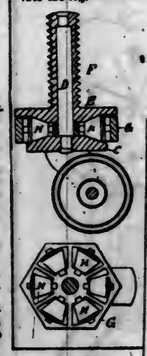
1. In an attachment for cook-stoves, having the sliding plates *g h*, forming a draft-stopper, the combination of the end plates *b c*, forming the partition, substantially as specified.

2. In combination, an attachment for cook-stoves, consisting of a dividing-partition and draft-stopper, the check-draft *m n* in said draft-stopper, for the purpose of diminishing the volume of air passing through the fire, as specified.

180,851. COOK-STOVE ATTACHMENTS. E. B. Patten, Bangor, Me. [Filed July 17, 1874.]

Brief.—The draft-stopper is extensible lengthwise of the fire-box. The lip and slot hold the parts in position.

1. An attachment for cook-stoves, consisting of a partition, *a*, and draft-stopper *b*, cast together or rigidly secured to each other, to form a right angle, or nearly a right angle, with each other, as and for the purposes set forth.



2. In combination with partition *a* and draft-stopper *b*, constructed as described, the slot *c*, supplemental draft-stopper *b'*, and lip *f*, arranged and operating as set forth.

3. In combination with partition *a* and draft-stopper *b*, constructed as herein set forth, the side flange *e*, as and for the purposes described.

180,852. CASTERS FOR FURNITURE. Wm. A. Perkins, Salem, Mass. [Filed Apr. 24, 1874.]

Brief.—The guard-plate, which carries conical rollers, is vertically grooved for the journals of the same, and placed between an upper beveled plate, which carries a hollow screw-shank, and a lower one, which carries the wheel. The upper plate is hexagonal to receive a key-wrench to turn its screw-shank into the leg.

180,853.

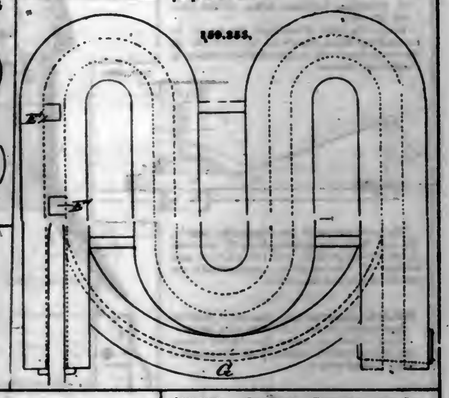
The combination of a loosely-revolving guard-frame, G, provided with vertical grooves *a* from top to bottom, so as to hold the journals of friction-rollers, with the beveled polygonal plate E and its screw F, the beveled wheel-supporting plate C, and its pin D, and with the conical friction-rollers H, substantially as described.

180,854. SETTLIGHT-BARS. Andrew J. Post, Jersey City, N. J. [Filed Jan. 8, 1875.]

Brief.—The gutters for conveying the water, and the folds for holding the glass and putty down on the bar, are made of one piece of sheet metal, which is saddled on a metallic bar. Angle-irons are then bolted to each side of the bar, on which the glass is supported.

1. The combination of the folded sheet metal E' E' with the bar A, glass D, supporting-bars B, and cement or putty C, as and for the purposes specified.

2. The drip-gutters E' E', formed, as specified, in a single continuous sheet of metal, E E' E', and arranged to serve, in combination with the main bar A, glass-supports B, rivets *b*, glass D, and putty C, as and for the purposes herein specified.



180,855. AIR-GUN DARTS. H. M. Quackenbush, Herkimer, N. Y. [Filed Nov. 11, 1874.]

Brief.—The cross-bar is not driven through perforations in the shell, but forced in transversely behind the feather or fibers of the dart.

An air-gun dart provided with a tuft secured in the tube at the rear end of the dart by a plug or core driven in said tube, as shown and set forth.

180,855.

180,856. COMBINED FLUTING AND SAD IRONS. Chas. Raymond Rand, San Francisco, Cal. [Filed Dec. 5, 1874.]

Brief.—A sad-iron having three faces, two with sharp edges, and one with curved edges, for polishing purposes, and with triangular-shaped burner, and front and rear air-holes. The rear part is locked by legs and spring-latch to the sides, the whole capable of turning on the fluid-conveying pipe. The fluting-irons are attached, by means of rear legs, pivoted front wire, and spring hooking device, into a side recess at each corner of the sad-iron.

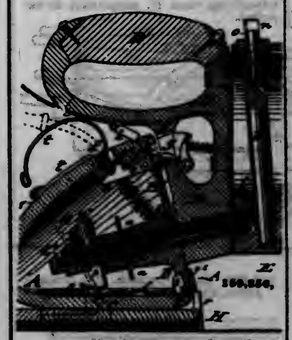
1. The combination of revolving three-faced sad-iron with detachable rear or end part, handle-stock, oil-receptacle, communicating oil-supply pipe, with distributing burner and flat fluting-irons, attached by suitable spring locking devices, all being arranged and applied substantially in the manner and for the purposes set forth.

2. The triangular sad-iron, provided with front and corner air-holes *f*, in combination with the perforated rear or end plate for admitting air-supply to heating-flame, as described.

3. The triangular sad-iron A, having projecting legs or shoulders *b'* at one side and a shoulder, *c'*, at opposite sides, in combination with end plate B, locking thereon by corresponding hooks *b* and pivoted spring-latch *c*, substantially as set forth.

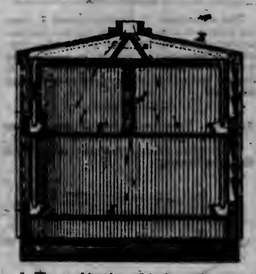
4. The end plate B, having recesses *g'* and turning on connecting supply-pipe C, in combination with spring-latch *g* of the handle-stock, for being locked thereto, and admitting consecutive use of each side, as specified.

5. The handle D', having pivoted supplementary latch *h*, in combination with corner recesses *h'* of sad-iron A, for forming additional steadying locking device of sad-iron to handle-stock, substantially as set forth.



6. The faucet F, having oil-admitting hole *n* and vent-hole *o'*, in combination with closing-stopper *o*, provided with vent-groove *o*, substantially for the purposes set forth.

7. The combination of oil-supply pipe C, provided with pivoted perforated cap or end pipe C' in the interior of sad iron, with flame-distributing burner G, substantially as described.

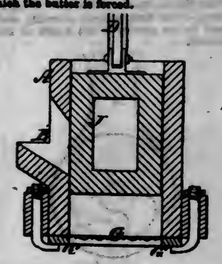


2. The combination of the flame-distributing burner G, having curved side flanges and partly-open shorter corner flanges for throwing flame to inner surface of sad iron, as shown and described.

3. The combination, with the side air-holes *f* of the sad-iron, of fluting iron H, provided with rear and side legs *r r'* and pivoted spring-wire *s* and spring hooking device *t*, for applying fluting-irons to each heated side of sad iron, substantially in the manner specified.

180,856.

180,857. STOCK-CARS. Saml. W. Bonsor, Salem, Mass. [Filed Dec. 9, 1874.]



1. The combination, with the roof or side of a stock-car, provided with openings, of an inclined way or inclined ways, for scattering feed on the floor of the car, as set forth.

2. The combination, with the roof of the stock-car, provided with openings D, of the inclined pipes, for scattering feed on the lower floor, as set forth.

180,858. BUTTER-WORKERS. J. C. Rorick, Wauseon, Ohio. [Filed Sept. 19, 1874.]

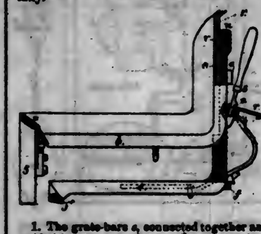
Brief.—A hollow follower worked vertically by a lever in a box, the bottom of said follower ascending above an inclined side feeder. A woven-wire bottom to side box, through which the butter is forced.

In combination with the box A, having a feed-opening, B, in its side, and a vertically-movable plunger, J, the horizontal screen O, confined by hooks *c' c'*, and the long supporting-bars F F, as described and shown.

180,859. LEVELS. Christian C. Schwarzer, Winterset, Iowa. [Filed Dec. 12, 1874.]

The combination, with pendulum C and longitudinally-slotted pointer E, of the pins G H and set-screw I, as and for the purpose specified.

180,860. GRATES FOR STOVES. J. D. Stichter, Reading, Pa. [Filed Dec. 16, 1873.]

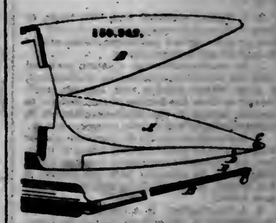


Brief.—The hooks on the rear ends of the movable grate-bars rest upon the rounded cross-bar that unites the rear ends of the stationary grate-bars.

The bar *f*, uniting the back ends of the grate-bars *a*, and nearly round, in combination with the intermediate bars *e*, that are made with hooks *a'* at their back ends, passing over the bars *f*, as and for the purposes set forth.

180,861. GRATES. J. D. Stichter, Reading, Pa. [Filed Oct. 3, 1874.]

Brief.—The alternate bars can be raised vertically, and the whole grate shaken horizontally.



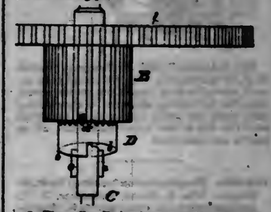
1. The grate-bars *a*, connected together and guided by the vertical bars *d* in the bearings *e*, in combination with the shaft *h* and arms *i*, substantially as set forth.

2. The bars *a*, actuated by the arms *i* and shaft *h*, in combination with the bars *b*, plate *r*, and supports *o w* and *o*, substantially as specified, whereby the entire grate can be moved endwise or the bars *a* lowered, for the purposes and as set forth.

180,862. SHEEP-SHEARS. James L. Smith, Tuscola, Ill. [Filed Jan. 4, 1875.]

Brief.—An ordinary pair of sheep-shears are provided with a guard or bridle in the shape of a small knob or bolt, riveted on the inside of one blade near the extreme point. The other blade is shortened a little, and extra rivet-holes provided for adjustable plaque of piece of the latter when the blades become worn, the construction serving to shield the skin of the animal, and to guide the shears in sheep-shearing.

180,863.



1. A guard near the point of one of the blades of shears for shearing animals, substantially as seen at C, for the purposes specified.

2. One or more holes, D, in one of the blades of the shears above described, for the purposes set forth.

3. In combination with the guard C, the short blade B, as and for the purposes described.

180,864. CENTER-WHEELS FOR WAGONS. Martin C. Smith, Rantville, Ill. [Filed Dec. 27, 1873.]

Brief.—In a safety-wheel a collar having on one end serrations to mesh with serrated pinion, and on the other end double-inclined planes, acting in combination with feathers formed on the axling-post.

1. The collar D, having serrations *d'* on its upper end, and double inclined planes *b b* on the lower end, in combination with the center-pinion E, provided with radial serrations *e*, and the feathers *a a* of post C, substantially as shown and described.

2. The post C, having diametrically opposite each other the feathers *a*, and their upper ends beveled to correspond to the inclined planes *b*, as specified.

180,865. CISTERNS. John S. Snider, Lancaster, Ohio. [Filed Aug. 3, 1874.]

Brief.—A cistern composed of two or more separate and independent compartments, the partition-walls of which are provided with adjustable openings, placed in such a relation to filtering material that water, in passing through one chamber into another, shall be acted upon by said filtering substance.

1. A cistern composed of two, three, or more separate and independent compartments or chambers, provided in their partition-walls with adjustable openings or connections, placed in such a relation to filtering material that water or other fluid passing through one chamber into the other through said opening or connection between them shall be acted upon by said filtering substance, substantially as and for the purposes set forth.

2. A cistern provided with two, three, or more independent compartments, divided by one or more arched partitions, substantially as and for the purpose shown.

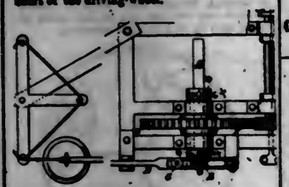
3. In combination with a cistern provided with two or more compartments, as described, a filter whose outside wall extends sufficiently up from the bottom of said cistern to provide around it the sediment-chamber B, substantially as and for the purpose shown.

4. In combination with the partition wall or walls of two or more compartments of a cistern, an adjustable connection between them, adapted to be operated from the outside of the cistern, substantially as and for the purpose shown.

5. A combination, in a cistern or filter, of the reservoir A, two or more independent compartments, B and C, and filters B' and C', said filters connected by an adjustable opening, substantially as and for the purpose shown.

160,265. FASTENINGS FOR MORTISE-RAILS OF SASHES. Chester Jos. Shoup, San Francisco, Cal. [Filed July 17, 1874.]

Brief.—The bed-plate, secured upon one of the meeting-rails of the sash, has divergent locking-grooves, in which corresponding projections upon the under side of the turn-button register. A coil-spring upon the pivotal bearing forces the projections into the grooves, and secures the button against being turned by burglars from the outside.

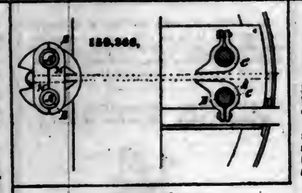


The bed-plate C, with its divergent grooves H H, in combination with the turn-button A, with corresponding projections on the under side, the coil-spring arranged in a projecting tube upon the same, and the lip *l*, that slips into the slot of the upper sash-plate, all as shown and described.

160,266. PROCESSES FOR TANNING PICKLED SKINS. Wm. R. Stace, Rochester, N. Y., assignor of one-half his right to N. Wilkinson, same place. [Filed July 17, 1874.]

The process herein described for tanning pickled skins by the use of liquid hydrocarbons or their alcohols, in conjunction with the hydrates of alkalies.

160,267. MACHINES FOR COILING METAL RODS. Philander H. Standish, Jefferson City, Mo. [Filed Sept. 26, 1874.]

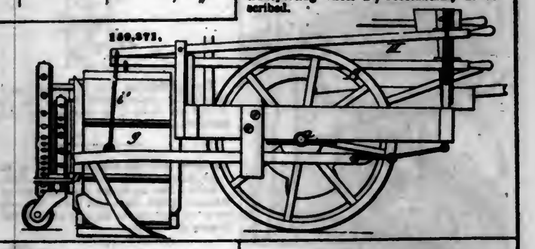


Brief.—An adjustable guide and a detachable bending-roll are placed in the slotted end of a lever, which is weighted for the purpose of pressing the grooved bending-roll down upon the rod being coiled. The mandrel is a plain flat bar of steel formed with a tapering point, and is fixed adjustably in the hollow shaft of the driving-wheel.

The combination, substantially as herein shown and described, of the slotted lever D, adjustable guide C, bending-roll B, tapered mandrel A, wheel F, and collars G G, provided with set-screws H H.

160,268. MOTOR-BOXES. Peter Stephen and Wm. G. Stephen, New Brunswick, N. J. [Filed June 27, 1874.]

Brief.—The saw is adjusted to the work by means of adjustable cams, carrying guides, a clamp, a spring-pressure, and an adjustable stop. The box is also provided with adjustable holders for exerting spring-pressure.



160,269.

1. In a road ditching and grading machine, the combination of a plow, which is suspended as described, with the elevator *g* and carrier *F*, substantially as specified.

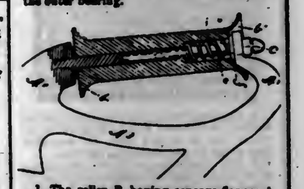
2. In combination with a plow which is suspended by means of links *i i*, the lever H, and the elevator *g*, and carrier *F*, substantially as described.

3. The carrier F and elevator *g*, movable about the driving-shaft C, in combination with a plow, a draft-frame, and the driving and transporting wheel B', substantially as described.

160,271.

1. A pair of stationary posts, A, with guide-tubes B, having saw-guides D C, and a clamp, H, combined to form the guide-post of a mitering machine, substantially as specified.

2. The combination of an adjustable pressure-spring, E, and collar F, with a tube, B, and post A, substantially as specified.



160,272. CAR-COUPLINGS. J. B. Winters, Adrian, Mich. [Filed Dec. 10, 1874.]

The elbow-lever I, platform-stand K, having holes J L to receive a locking-pin, the connecting-rod H and the lever F, extending horizontally beneath the platform, in combination with the pivoted link A, having the stud G and the spring D, all constructed as shown and described.

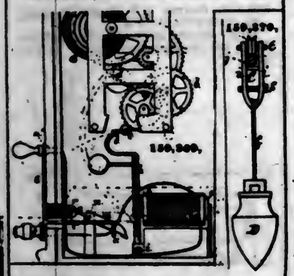
160,273. VEHICLE CHAFING-IRONS. Arthur Wright, Bath, Me. [Filed Dec. 10, 1874.]

Brief.—The roller is recessed and protects the outer bearing.

1. The roller *B*, having concave flanges *b*, cavity *b'*, and enlarged bore *b''*, as and for the purpose described and shown.

2. The frame A, roller B, bolt C, screw *d*, spring *e*, and washer *f*, all combined to operate substantially as and for the purpose specified.

160,274. HOOKS. Andrew H. Alverson, New Haven, Conn. [Filed Dec. 26, 1874.]

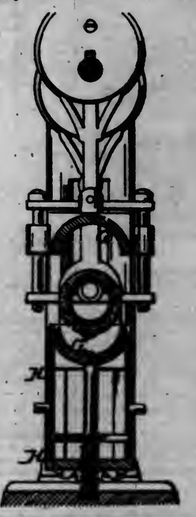


Brief.—The hook is open normally, and is closed by the gravity of the article or thing attached.

160,269. LEVEL AND SLOPE INDICATORS. Ogden S. Wiley, Keokuk, Iowa. [Filed Nov. 23, 1874.]

Brief.—The clamp and screw to hold the plumb-line, and allow of its adjustment, are suspended on a friction-roller.

In a level and slope indicator, the graduated arc *b* and inwardly-curved overhanging arm *c*, provided at its outer end with the aperture *c'*, in combination with the suspended plumb-weight D, anti-friction wheel *d*, and clamp *e*, having set-screw *e'*, substantially as and for the purpose set forth.



160,270.

160,271. DITCHING-MACHINES. Jacob F. Williamson and James H. Savoy, Harlem Township, Clay County, Ill. [Filed Dec. 26, 1874.]

Brief.—The earth excavated by the plow is raised by a short inclined endless elevator, and carried away laterally by an endless conveyor. Both are adjustable to inequalities of surface.

The body A, having the hook C and eye B as a part thereof, combined with the eccentric disk E, pivoted thereto, and constructed with the recess F and opening *f*, substantially as described.

160,276. GORE-FORMING MACHINES. Wm. C. Amish, Hainesport, N. J. [Filed Nov. 9, 1874.]

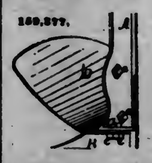
1. The formers G and G', one or both of which have sharp edges, in combination with the box H', containing the lower former, and having a movement independent of the said lower former, all as set forth.

2. The combination of the two formers G G' with movable pins *m m'*, for supporting the core when the said formers are caused to recede from each other.

3. The combination of the plate H, spring-catches *i*, and box H' with springs adapted to the catches, as described.

160,278. ROCK-DRILLING MACHINES. Geo. Atkinson, San Francisco, Cal. [Filed Nov. 10, 1874.]

Brief.—A pinion-shaft, worked by a crank, has on it two cams, one raising, the other rotating, the drill, which is limited in its vertical motion by a sleeve with an arm attached, adjusted by a set-screw.



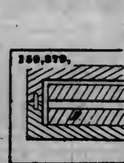
1. The drill B, lifting and guiding arm Q, and rotating ratchet-plate S, in combination with the cams C and D upon the shaft E, substantially as and for the purpose herein described.

2. The frame A, provided with the movable adjustable cross-beams H and G with their clamping-levers I and K, latches J and L, and guide O, substantially as and for the purpose herein described.

160,277. PLOWS. Silas S. Anghe, Dayton, Ohio. [Filed Dec. 2, 1874.]

Brief.—The share and land-side made in one piece, the mold-board bolted to a hollow standard, and the whole connected by inside bolts.

160,277.



The combination of the standard A *a*, share B *b*, and mold-board D by means of the bolts E and F passing horizontally through said standard and mold-board, and the bolts C and C passing vertically through said standard and share, substantially as and for the purpose specified.

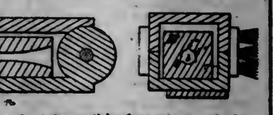
160,279. METHODS OF FASTENING COTTON-BALES. Augustine Baldwin, New York, N. Y., assignor to Compressing Company, same place. [Filed July 22, 1874.]

Brief.—The platens of a press are provided with blocks, outwardly inclined from the bottom upward, having beveled corners at the point of union with the platen, and laterally and longitudinally adjustable, to apply the fastening devices to the bale while under compression.

160,279.

1. The described method of applying the fastening devices to cotton or other bales, consisting, broadly, in the employment of the power used to compress the bale to apply the covering parts of the fastening devices thereto, substantially as described.

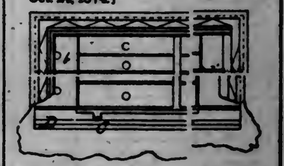
2. A press-platen adapted for operation as a die, substantially as described, for the purpose of shaping the fastening devices to the bale, and holding the same in proper position to be secured.



3. The platens described, provided with beveled or rounded edged blocks or bars *a a*, as described.

4. The combination of the smooth-faced platens with the bars or blocks *a a*, and means for adjusting them, substantially as described.

160,280. HAT-IRONS. Chas. H. Bell, Philadelphia, Pa. [Filed Sept. 15, 1874.]



Brief.—Is made in two sections, hinged together at one end, and centrally curved out to receive a heater-bar. Three sides form, respectively, an iron, brush, and smoother. The side to which the brush is attached and the opposite one, being covered with wood, form suitable grasping-surfaces during manipulation.

160,280.

As a new article of manufacture the hat-iron and smoother herein described consisting of a hinged metallic case, having wood on two sides, and iron and velvet respectively on the other two sides, and holding a gas-heating core, substantially as and for the purpose described.

160,282. MOVABLE CABINETS FOR SAFES. William J. Barnes, Pittsburg, Pa. [Filed Oct. 24, 1874.]

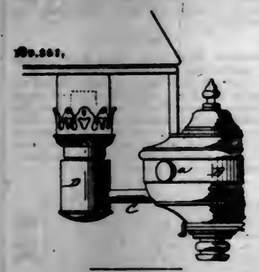
1. In combination with a safe having a door in front, a cabinet constructed and adapted to move laterally in a right line, substantially as and for the purpose described.

2. The combination, with movable safe-cabinets, of drop-shelves arranged at the sides or middle, substantially as shown and described.

3. The novel arrangement, for safes, of movable cabinet B, drop-shelves *b' b'*, and railway D, all as shown, and for the purposes set forth.

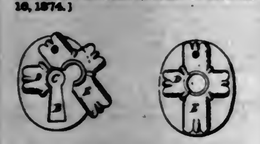
160,281. LAMPS. Andrew M. Blake, Canton, Ohio. [Filed Jan. 16, 1875.]

Brief.—The lamp is designed for burning crude oil. Only that small portion of oil in the wick-chamber is affected by the heat of the flame. The reservoir is turned down on its hinge and filled through the opening in the side, the lower wick-chamber, when two are used, being tightly closed by a cap. For burning animal oils the wick-chamber is lowered, so that the connecting-tube from the reservoir enters at a point near the flame.



1. A lamp-reservoir closed at its top, having a wick-chamber connected to but removed therefrom, and having a side opening for filling independent of the opening in the wick-chamber, and hinged to a standard, for the purposes set forth.

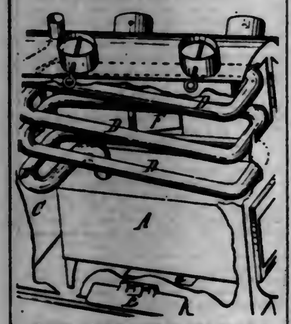
2. In combination with the reservoir B and pipe C, a removable and adjustable wick-chamber, D, substantially as and for the purposes herein set forth.



3. In combination with the reservoir B, hinged to the standard, and having an opening, *a*, on its side, and two or more wick-chambers, D, the closed cap E upon the wick-chamber, substantially as and for the purposes herein set forth.

4. The combination of the standard A, the reservoir B, hinged to the standard, and having an opening, *a*, in its side, one or more pipes, C, and one or more wick-chambers, D, all substantially as and for the purposes herein set forth.

No. 160,881.

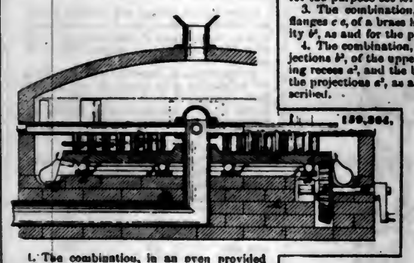


160,882. KEY-HOLE ESCUTCHEONS. Henry T. Blake, New Haven, Conn. [Filed Dec. 16, 1874.]

A key-escutcheon the cover of which is perforated to correspond with the key-spindle, and divided at said perforation, making two parts, D E, the one part, D, permanent on the escutcheon, the other part, E, pivoted to the escutcheon, substantially as described.

160,883. HOT-AIR FURNACES. Baldwin L. Bradley, Woodstock, Canada, assignor to himself and J. H. Fletcher, Alpena, Mich. [Filed Oct. 21, 1874.]

Brief.—Cold air is admitted through the opening in the bottom of the casing, and the several doors or dampers in the sides of the casing regulate the draft of air entering the hot-air pipes.



In a hot-air furnace, the combination, with the shell C, of the stove A, coil of pipe D, opening *a*, doors, dampers, or registers E F, and hot-air pipes G, all as and for the purpose set forth.

160,884. DESULPHURIZING-OVENS. John C. Brewster, New York, N. Y. [Filed Jan. 2, 1875.]

Brief.—An immovable central air-tube has radial horizontal arms, from which depend branches, which act as air-conveyers to and agitators of the ore, and conveyers of the ore off from the revolving hearth.

No. 160,884.

1. The combination, in an oven provided with a revolving table, of an air-pipe extending up through the center of the table, and supporting and communicating with a series of stationary radiating tubular arms, which have their ends embedded in the walls of the oven, and communicating with the external air, substantially as described.

2. The combination, with an oven containing a revolving table, of one or more air-pipes situated above said table, and provided with tubular fingers or nipples extending close down to the surface of the table, substantially as and for the purpose set forth.

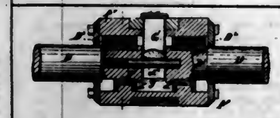
3. The series of fixed radiating tubular arms, supported at their inner ends by the central air-pipe, and at their outer ends by the walls of the oven, in combination with the flat agitators and depending nipples, and the revolving table, substantially as described.

1. The combination, with a brass or bearing, B, having recesses b^1 b^1, of the two part box A A^1, the upper part having lugs a^1 a^1, as and for the purpose described.

2. The combination, with an axle-box having central opening *a*, of the centrally-perforated brass B and the superposed truck-bar D, having detachably-capped hole *d*, as and for the purpose set forth.

3. The combination, with the journal end flanges *c c*, of a brass having the circular cavity b^2, as and for the purpose specified.

4. The combination, with the brass end projections b^2, of the upper body section A, having recess a^2, and the box ends A^2 A^2, having the projections a^2, as and for the purpose described.



5. The hollow cotton-filled plug F, having side apertures *f*, and applied as a spacer and lubricator for two journals, in the manner set forth.

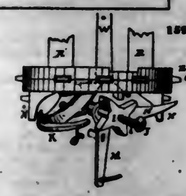
6. The combination, with bottom brasses B^2 B^2 and the plug F, of the hollow uprights A^2 A^2 on the bottom and inside of axle, as shown and described.

160,887. HARVESTER-RAKES. J. R. Buckwater, near Buyerstown, Pa. [Filed July 3, 1874.]

Brief.—A projection on the rake-arms moves the star-wheel, which once in its revolution strikes a switch to open it, so as to cause one beater to act as a rake to sweep the platform.

No. 160,885.

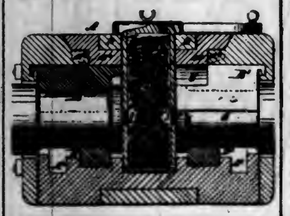
160,885. CAR-TRUCKS. John M. Brosius, Richmond, Va. [Filed July 1, 1874.]



Brief.—To adapt the truck to tracks of different gage.

1. The plates H, having prongs A A and shoulder A^1, combined with axles D D and car-wheels B, to adapt them to minimum gages of road.

2. The combination, with middle box, F, and end-recessed journals, of the diametrically-perforated vertical plug G, and horizontal pin passing therethrough, as and for the purpose specified.



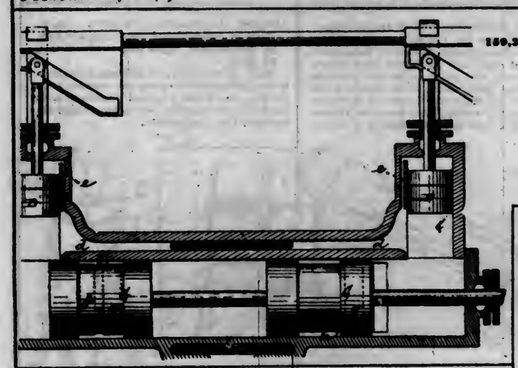
3. The combination, with the subjacently-grooved middle box or bearing, F, of the extended longitudinal bars I I^1 K K^1 L L^1 and the cross-bars J J^1, all bolted together, as and for the purpose set forth.

No. 160,887.

160,886. RAILWAY-CAR AXLE-BOXES. John M. Brosius, Richmond, Va. [Filed Sept. 16, 1874.]

Brief.—A central axle-box for changeable-gage trucks.

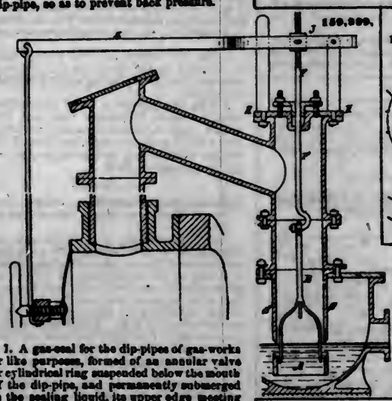
1. The combined conic-hubbed chain-wheel E F G, provided at two points with open slots, the rake-holders R, having elbowed heads M, with a projection, *o*, mounted on a standard, D D^1 D^2, with its cams P H K, all arranged and operated substantially in the manner and for the purpose specified.



2. In combination with the vibrating cam K and projection *o* on the heads M, the star-wheel I, lever M, and spring *i*, all arranged substantially, and operated in the manner and for the purpose set forth.

160,888. VALVES FOR ENGINES. Jas. Balcer, Jr., Williamsburg, Brooklyn, N. Y. [Filed Dec. 30, 1874.]

Brief.—The quantity of steam admitted to the steam-chest is governed by the piston-valves, which control the ports leading thereto.

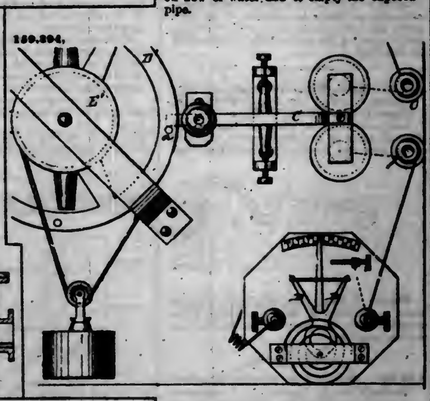


The combination, with the double-piston main valve G G, of the regulating piston-valves D D and the steam-passages *d d*, with their branches *e e*, all for operation, in relation with each other and with the parts controlled by the main valves, substantially as shown and described.

No. 160,886.

160,889. APPARATUS FOR SEALING AND UNSEALING DIP-PIPES IN GAS HYDRAULIC MAINS. Robt. M. Caffall and Albt. Thomas, London, England. [Filed June 24, 1874.]

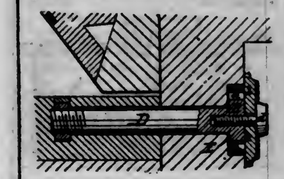
Brief.—The rod passing through the dip-pipe has attached to its lower end the annular seal-valve, and its upper end has a screw-thread cut upon it where it passes through a pivoted nut. The weighted end of the lever, upon falling, draws up the annular seal-valve into conjunction with the lower end of the dip-pipe, so as to prevent back pressure.



1. A gas-seal for the dip-pipes of gas-works or like purposes, formed of an annular valve or cylindrical ring suspended below the mouth of the dip-pipe, and permanently submerged in the sealing liquid, its upper edge meeting with the edge of the dip-pipe to effect the sealing thereof, substantially as herein shown and described.

2. In a gas-seal, in combination with the valve A, dip-pipe J S, and weighted lever K, the threaded operating rod B F, and pivoted nut J, substantially as set forth.

The ornamental removable shield-plate b, having a central opening for a fastening-screw, *d*, in combination with a bolt, D, having a central opening in its head E, to receive the fastening-screw *d*, and socket-holes *a* to receive a spanner-wrench, substantially as described, for holding the side rail of a billiard-table to its bed, as set forth.



No. 160,890.

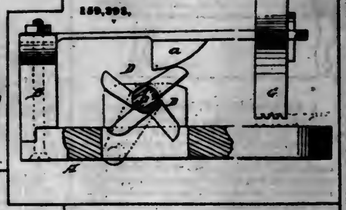
1. In a gas-seal, in combination with the valve A, dip-pipe J S, and weighted lever K, the threaded operating rod B F, and pivoted nut J, substantially as set forth.

160,890. BOLTS FOR BILLIARD-TABLES. J. B. Came, Boston, Mass. [Filed Sept. 14, 1874.]

Brief.—Two holes, to receive a spanner-wrench, are sunk in the bolt-head, which is also formed with a tapped central opening for the screw that fastens the ornamental shield-plate.

160,891. HEMMERS FOR SEWING-MACHINES. Asa F. Colby, Bath, Me., assignor to the Colby Adjustable Hemmer Company, same place. [Filed Jan. 22, 1875.]

Brief.—The lower portion of the adjustable folding-plate presses the fabric against the smooth bearing-plate, producing the requisite amount of friction to enable the hem to be turned smoothly and fed evenly.

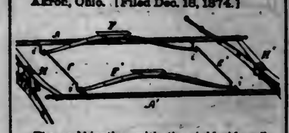


1. In combination with the adjustable folding-plates and main supporting-arm, the bearing-plate J, substantially as described.

2. The bearing-plate J, in combination with the open scroll B, main arm A, and adjustable spring folding plates, substantially as described, for the purpose specified.

160,892. MEAT-TENDERERS. J. A. Cornish, Marshfield, Mo. [Filed Dec. 21, 1874.]

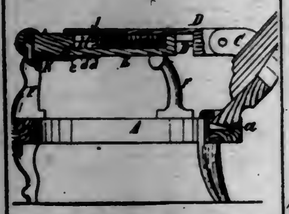
No. 160,894.



160,894. APPARATUS FOR CONTROLLING WAY-COCKS OF WATER-PIPES BY ELECTRICITY. W. A. Crawford, Terre Haute, Ind. [Filed May 6, 1874.]

Brief.—Fall in temperature to freezing-point causes thermostat to close circuit to electro-magnet, controlling devices acting both to cut off flow of water and to empty the exposed pipe.

No. 160,894.



The combination, with the plug of a way-cock, and means for rotating the same, of a metallic thermometer, a galvanic battery, an electro-magnet, wheel, lever, and stops, all constructed and arranged to operate substantially as and for the purpose set forth.

160,895. SIDE-BAR WAGONS. C. A. Collins, Akron, Ohio. [Filed Dec. 16, 1874.]

The combination, with the rigid side rails A A', connected at their ends to the end springs H H', carried by the axles of the transverse rods U U', having the cranks *i i*, and journaled in the side rails for connecting the latter together, and the side springs F F', connected at each end to the cranks *i* of the connecting-rods, all substantially as shown and described.

159,394. RECLINING-CHAIRS. John Damm, New York, N. Y. [Filed Nov. 13, 1874.]

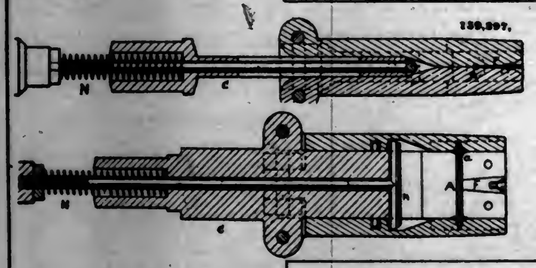
1. The elbow-lever K, having its short arm provided with a sliding exterior push-button, *k*, and its long arm with pin *c c*, in combination with the perforated strap or sleeve G, recessed guide-piece E, arm-piece D, having an abutment, J, fitting within in the recess in the guide-piece, and a coiled spring arranged within the latter, substantially as herein described.

2. The combination, with the arm-piece D, recessed guide-piece E, and coiled spring I, of the strap or sleeve G, secured to the arm-piece, and embracing the guide-piece, and provided with a series of openings, *d*, for the reception of a locking-pin, substantially as described, for the object specified.

3. The guide-piece E, having at one end a cavity, L, provided with an elbow-lever, K, carrying an exterior push-button, M, in combination with the arm-piece D, coiled spring I, and strap or sleeve G, secured to the arm-piece, and having a series of perforations, *d*, and embracing the guide-piece, substantially as described.

159,395. DROP-WIRES FOR STOPPING MECHANISM. Lemira Dimock, Northampton, Mass. [Filed Dec. 20, 1874.]

Brief.—The eye is made as shown and claimed, so as to be durable, easily attached to the wire, and readily detached when worn out.

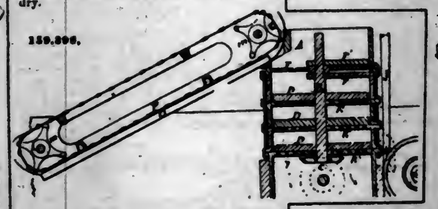


The eye B, constructed of a single piece of sheet metal, with the barrel or socket *b'* for attachment to the drop-wire, substantially as herein described

---

159,397. MOLDS FOR CASTING BOBBINS. Martial Dimock, Newark, N. J., assignor to the Clark Thread Company, same place. [Filed Aug. 18, 1873.]

Brief.—The hinged sections are separated by the spring-rod acting on their inner inclined surfaces.



In combination with a mold, as described, a handle, D, cam K, spring E, and spring N, as and for the purposes set forth.

159,396. PEAT-MACHINES. Franklin Dodge, Union Grove, Ill. [Filed Dec. 14, 1874.]

Brief.—The cylinder has within its interior a series of graduated perforated diaphragms, knives, bars, and grinders, for the purpose of grinding peat, which, upon reaching the bottom of the reservoir, is agitated in water, converted into a semi-plastic mass, and thence pumped out into troughs, where it is left to dry.

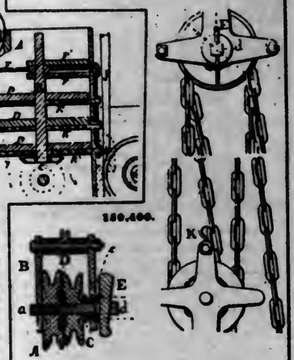
159,398.

1. The process of treating peat herein described, consisting, first, in grinding it by passing it through a series of graduated perforated disks, and kneading the peat in the peculiar manner described, then mixing the peat thus ground with water until it is taken up by the water, and then pumping the mixture away to the drying-grounds, where it is allowed to settle and condense, drawing off the water, and hardening the peat, as described, and finally storing in curing-cribs to finish the process.

2. The revolving grinders D, in combination with the graduated perforated diaphragms E, E', &c., substantially as described, and for the purposes specified.

3. The employment of a pump and conductor, in combination with the reservoir I, in which the peat is liquefied and mixed, for conveying the liquid compound automatically to the drying-grounds, as specified.

4. The combination, substantially as before set forth, of the hopper A, revolving knives F, and bars F', grinders D, perforated diaphragm E, gearing *g*, feed-water pipe H, reservoir I, and pump J, for the purposes specified.



159,399. CAR-COUPLINGS. V. Erbeck, Ryde Park, Pa. [Filed Sept. 8, 1874.]

The draw-head A, having the slots B, B' and grooves *g g'*, in combination with the curved hook C and securing-pin *p*, substantially as and for the purpose set forth.

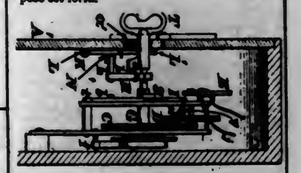
159,400. DIFFERENTIAL PULLEYS. Jos. T. Fowkes, Philadelphia, Pa., assignor to J. H. Armbruster, same place. [Filed Oct. 31, 1874.]

Brief.—Two pulleys of different diameters, with a spring between them, are mounted upon a frame, which has a lateral projection holding a key, by means of which the pulleys are connected or disconnected.

1. The combination, with the two pulleys A C, of the rising-and-falling locking-piece E, fitted to the extension-piece *d* of the frame B, substantially as and for the purpose set forth.

2. The two pulleys A C and sliding head F, mounted on the same axis *a*, in combination with the lock E, having a rising-and-falling motion.

3. The two pulleys A C, in combination with the spring D between them, and with sliding head F, having laterally-extending pins *a*, which project through the frame B, for contact with the lock E, substantially as and for the purpose set forth.



159,401. FIRE-ALARM SIGNAL-BOXES. Geo. Floyd, Cincinnati, Ohio. [Filed Nov. 21, 1874.]

Brief.—A swinging guard-plate upon the inside of the cover is normally held away from the key-hole by a pin projecting from an arm attached to the winding-arbor. When the arbor is turned the pin is withdrawn from contact with the guard-plate, and the withdrawal of the key allows the guard-plate to swing and cover the key-hole. Key cannot be again inserted until the signal has been sent, and the arm and pin return to their normal position, thus pushing away the guard-plate.

1. The combination of master-wheel C, stop-wheel D *d'*, arbor G *g*, arm H *h'*, brake I *i* V, spring *k*, and any suitable clock-work and circuit-wheel, when adapted to be set in motion with a key, T, or its equivalent device applied through an opening, *a'*, in the cap, cover, or door of the box, substantially as herein explained.

2. The guard-plate L', pivoted to the inner side of the door or lid of a fire-alarm signal-box, and adapted to close the key-hole of the box, being operated and to uncloss the same by the return of the mechanism to its normal position, substantially as herein explained and illustrated.

3. The combination of arm H *h*, attached to arbor G of the signaling mechanism, projection K, and bell-crank L L', pivoted to the inner side of the box-door A', for the purpose set forth.

159,402. CONVERTING IRON INTO STEEL. Mark S. Foote and Greenbury R. Henry, Burlington, Iowa. [Filed Nov. 7, 1874.]

Brief.—Melts the flux patented November 10, 1873, No. 145,536, with scrap iron or steel, and the resulting bath is used to immerse iron articles in, which becomes thereby superficially converted into steel.

The within-described solution or bath, composed of the above-named flux, made by heat alone, and composed of iron ore, coke, limestone, and fire-clay or broken crockery, wrought-iron, cast-iron, and scrap-steel, in the proportions substantially as described, and for the purposes specified.

159,403. SNAP-HOOKS. John T. Foster, Jersey City, N. J., assignor to F. C. Nye, New York city. [Filed July 31, 1874.]

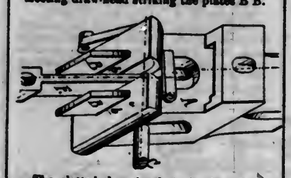
1. The swell in the sides of a snap-hook, in combination with the loop in a different plane, substantially as described.

2. The improved snap-hook composed of the loop and eye in one piece, and the swell standing out of said plane, and having the arms locked together on both sides of the swell, substantially as described.

159,404. CARTRIDGE FEED-CASES FOR MACHINE-GUNS. William B. Franklin, Hartford, Conn., assignor to Colt's Patent Fire-Arms Manufacturing Company, same place. [Filed Sept. 16, 1874.]

In combination with the feed-case A of a machine-gun the spring G and head H, extending over the mouth or open end of the case, substantially as described, and for the purpose of supporting the cartridges directly thereon.

159,405. COFFEE-ROASTERS. Michael W. Fry, Guyandotte, W. Va. [Filed Jan. 4, 1875.]



Brief.—The projecting air-chamber is interposed between the coffee and that portion of the cylinder immediately over the fire, to prevent excessive burning. The ledges and extension-plate on each side arrest the revolution of the cylinder midway, and the coffee is thereby impelled up the inclined sides of the air-chamber.

159,406.

159,407. CAR-COUPLINGS. James Graham, Detroit, Mich. [Filed Aug. 24, 1874.]

Brief.—When the link is raised ready for coupling, it rests in the slot against the top of the draw-head, and is thrown down by the meeting draw-head striking the plates B B.

The slotted draw-head A, having the recesses *b b*, slots *c c*, bumper-plates B B, rock-shaft C, and link E, all combined substantially as and for the purpose set forth.

159,408. BEDSTEAD-FASTENINGS. Alexander Grillet, Philadelphia, Pa. [Filed June 18, 1874.]

Brief.—A bedstead-fastening consisting of a plate having inclined bearings pivoted in a recess in the post, and a plate fitted in a recess in the end of the rail, and secured therein by transverse pins, and provided with inclined projections, which rest upon the bearings of the plate in the post. One of the parts has a limited play to insure a close joint between the rail and post, and all are locked in position by a cam attached to the post and bearing on the top of the rail.

159,409.

159,410.

1. The projecting air-chamber F, in combination with a rotary coffee-roaster, substantially as and for the purpose described.

2. The combination of the projecting air-chamber F, the extension-plate G, and the ledges or flanges *b b*, substantially as and for the purpose described.

159,406. ASH-SIFTERS FOR STOVES. John H. Goodfellow, Troy, N. Y. [Filed Dec. 30, 1874.]

Brief.—The fingers in the end walls prevent the contents from falling off the sifting-bottom at that point.

159,406.

1. The grate E, composed of parallel corrugated bars divided by longitudinal spaces, in combination with, and adapted to reciprocate between and beyond, the lower edges of the end walls of the grate-chamber, whereby the coals resting upon the grate are, by the corrugations thereon, caused to lift and fall during the reciprocation thereof, substantially as and for the purpose described.

2. In combination with the end walls C C', the corrugated sliding or reciprocating sifting-grate E and clearing-fingers *e*, substantially as and for the purpose set forth.

159,409.

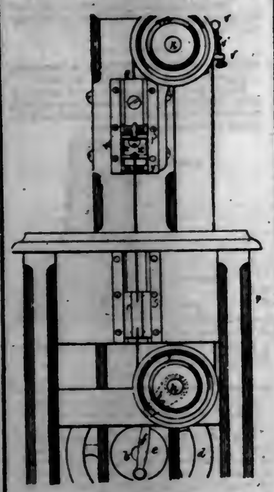
A broom made from broom-corn, colored by dyeing, as set forth.

159,410. MANUFACTURE OF HORSESHOE-NAIL PLATES. Daniel J. Harrington, Cork, Ireland, assignor to Jos. M. Laughlin, Boston, Mass. [Filed Apr. 7, 1874.]

Brief.—The plate should be of a width equal to the length of two nails, and have thickened edges for the heads, while the intervening portion from the edge to the middle of the plate has the varying thickness of the body of the nail proper, and along this middle line is made the groove by cold-rolling.

As an improvement in the art of making ribbed plates from which to cut horseshoe-nails, subjecting the plate when cold to the action of rolls that shall produce upon it, midway between the two ribs, a groove of such shape as will secure to the points of the nails that may be cut therefrom the necessary and usual bevel, as set forth.

159,411. CALL-BELLS. Westel B. Hawkins and Gurdon W. Hull, Wallingford, Conn. [Filed Jan. 7, 1875.]

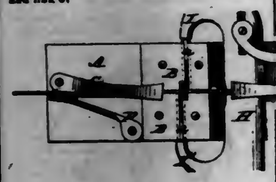


1. The combination, with a fixed bell, of one or more hammers, C, arranged to swing in a plane substantially at right angles with the plane of the rim of the bell, a lever, D, the the axis of which is substantially parallel to the axis of the hammer, and in connection with the hub of the hammer, and an arm of said lever below the bell turned to one side of the axial line of said lever, these elements operating substantially as described.

2. The combination of a fixed bell, one or more hammers, C, the lever D, in connection with the hub of the hammer, substantially as described, and a stop to arrest the turning of the hub of the hammer before the hammer strikes the bell, substantially as described.

159,412. JIG-SAWS. Charles M. Hayden, Hanover, Mass. [Filed Aug. 29, 1874.]

Brief.—The saw receives its reciprocating motion through two straps attached to pulleys, which have a partial rotation upon their axis.

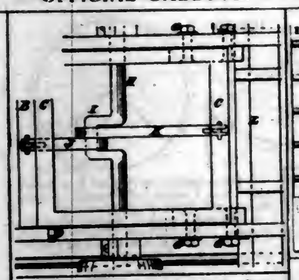


1. The combination, with the saw and the slide-head *p*, of the sliding frame *w* and cam-lever *s*, substantially as and for the purpose set forth.

2. Also, in combination with the saw and with the rocking wheels *j m* and strap-connections, the adjusting-clamp *o o' o²*, substantially as and for the purpose set forth.

159,413. SAW-SETS. Hermann Heinicke, Newark, N. J. [Filed July 29, 1874.]

Brief.—The pivoted lever H operates the dies *c c*, which set adjoining teeth to opposite sides, the saw being fed forward, two teeth at a time, by means of the pawl L, lever K, and link J.

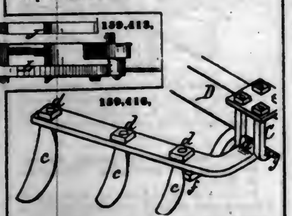


1. In combination with the bed A, provided with suitable adjusting-screws and supports, the guides B, spring-dogs *a a*, and lever H, substantially as and for the purpose set forth.

2. In combination with a suitable bed or support and the lever H, the pitman J and pawl L for producing the feed, substantially as described.

3. The combination and arrangement, with the guide-block B and bed A, of the set-screws D D, post E, and springs G F, for holding the blade in the proper position while being operated upon, as set forth.

159,414. GRAIN-SEPARATORS. T. J. Hubbell, Troutsville, Col., assignor to J. Bateman and T. J. Hubbell. [Filed Sept. 15, 1874.]

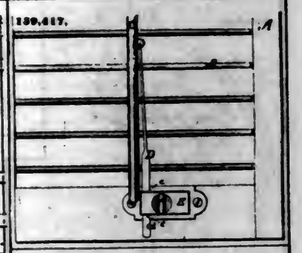


The combination of the riddle-frames B and C, the intermediate pitmen J K, operated by the same crank I in such manner as to move the screens in the same direction simultaneously.

The combination of the frame A, sections *d* and *c*, and spring *h*, as and for the purpose set forth.

159,415. HARROW ATTACHMENTS FOR PLOWS. P. Jacobus and D. R. Ambrose, Romulus, N. Y. [Filed Nov. 2, 1874.]

Brief.—The bar carrying the harrow-teeth is attached to the handle, and hinged or pivoted. The pivot-bolt has a square shoulder in the clamp to prevent its turning, and an arm extended at a right angle as a rest or stop for the bar.



The harrow attachment to a plow, consisting of the backwardly-curved hinged bar A and key-stop B, in combination with the clamp C and handle D, all constructed as herein shown and described.

159,417. BLIND-STOPS. John D. Jones, Omaha, Nebr. [Filed Jan. 4, 1875.]

Brief.—An incased spring-bolt, with projecting thumb-piece, engages with the notched end of a metal rod, which is pivoted to the connecting-bar of the slats, and passes down through slots in the box or case, the bolt or catch thus locking the device in desired position.

The box E, having slots *a a*, and provided with a spring-catch, F, having thumb-piece *f*, in combination with a rod, D, pivoted to a slat-bar, C, and having notches *d*, as and for the purpose specified.

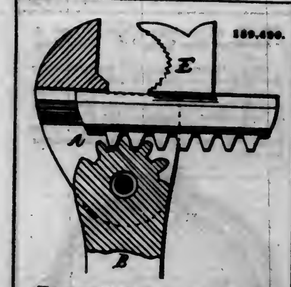
159,418. METHODS OF ORNAMENTING GLASS. Thos. Jones, New York, N. Y. [Filed Dec. 3, 1874.]

1. The described process of ornamenting glass plates, dishes, and other glass articles, consisting essentially of first obtaining or producing a deadened surface to render them non-transparent, then cutting or otherwise engraving any desired design upon the previously ground or roughened surfaces thereof, then polishing the depressed or sunken portions produced by such engraving, and, finally, silvering or gilding all over the roughened and engraved surfaces, substantially as and for the purpose set forth.

2. A glass panel, having its under or inner side roughened, cut, polished, and silvered, substantially as described and shown.

159,419. WATER-METERS. Nathaniel W. Knowlton, Nevada City, Cal. [Filed Nov. 6, 1874.]

Brief.—When the water is flowing, the carrot upward lifts the cylinder until a cross-bar on the inner end of the valve-spindle strikes the lower end of the discharge-pipe and forces the valve open; the cylinder then settles down and fills, to be forced upward again. In settling down the cylinder strikes the arm of registering mechanism.



The upright case A, with its water-pipes *b a*, having the pipe *b* passing through its upper end, and terminating near its middle, in combination with the cylinder F, with its valve H, said valve having the spindle *i* and cross-bar *j*, the whole combined and arranged to operate in connection with a register, L, substantially as and for the purpose above described.

159,420. PIPE AND NUT WRENCHES. Friedrich, Kohler, Allegheny, Pa., assignor of one-half his right to Henry Zimmerman, same place. [Filed Aug. 6, 1874.]

Brief.—The movable jaw is formed with a double face, and may be removed and reversed, for use as a pipe or nut wrench.

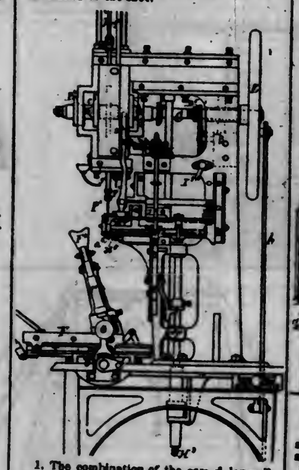
159,420.

The reversible sliding nut and pipe wrench E, when combined with the head A and segment-handle B, the whole constructed and arranged as herein described.

159,421. CLASPS FOR SCARF-SLIDES. Albt. Kompp, New York, N. Y. [Filed Dec. 17, 1874.]

A clasp constructed of an elastic central blade, *a*, and of two elastic blades, *c c*, connected to the central blade, *a*, substantially as shown, while the outer ends of said side blades form spring-catches *d d*, all constructed and operating substantially in the manner herein shown and described.

159,422. NECK-TIE SHIELDS. O. Kueppers, Philadelphia, Pa. [Filed Dec. 16, 1874.]



1. In a neck-tie shield, the covering and back plate clamped to each other, substantially as and for the purpose set forth.

2. A neck-tie shield the body or frame of which is formed of a flanged metallic shell, B, substantially as and for the purpose set forth.

3. The neck-tie shield consisting of a covering, A, back plate C, and an interposed shell, B, clamping the edges of said covering and back plate, substantially as and for the purpose set forth.

159,423. PEGGING-MACHINES. Henry Kuhlmann, Hamburg, Germany. [Filed Dec. 23, 1874.]

Brief.—Improvement on Patent No. 130,301, of August 6, 1872. The awl and driving rod, moving independent of each other, are actuated by a double-armed cam. By means of a reciprocating sole-guide two rows of pegs are inserted by a single set of devices, without changing the feed mechanism, and with one revolution of the shoe.

1. The combination of the cam c^3, lever d^3, nut f^3, and rod H^2, substantially as and for the purposes shown and described.

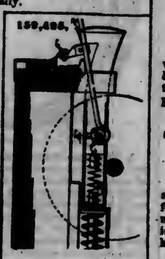
2. The combination, with the frame E^2 and rod J^3, of mechanism whereby said frame E^2 is raised to allow the work to be moved forward without obstruction, substantially as shown and described.

3. The combination of the slide C^2 and rod J^3 and attached mechanism for feeding the wood-strip, substantially as shown and described.

4. The combination of the slide C^2, lever I^2, and lever a^4, for operating the knife, substantially as shown and described.

5. In combination with the awl-rod I^1 and hammer-rod I^2, moving independently of each other, the double-armed cam or lifter Q, arranged to operate alternately on said awl-rod and hammer-rod, substantially as shown and described.

6. The combination of the wheel B^2 on the shaft C, the wheel C^2 having the cam-surface c^3, the lever F^2, slide G^2, and sole-guide H^2, whereby the pegs may be placed in the sole in a zigzag or double row, substantially as shown and described.

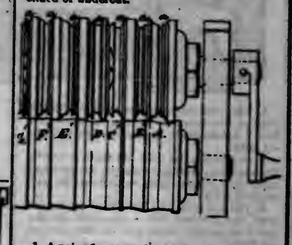


159,424. CURTAIN-FIXTURES. E. B. Lake, Tom's River, N. J. [Filed June 15, 1874.]

Brief.—A dog or catch is combined with the operating-cord, so as to engage with a notched disk on the end of the roller-shaft, thereby holding the curtain-roller at any desired position vertically.

159,424.

159,425.



The combination, with the adjustable roller B and notched plate D, of the pivoted dog F and drawing-cord E, said cord and dog being connected together and relatively arranged substantially as described, to serve the double purpose of controlling the dog and raising the curtain, as set forth.

159,426. CAR-COUPLINGS. A. Longuellier, Concord, N. H. [Filed Apr. 3, 1874.]

The sliding block C, in combination with the pin B, spiral spring D, and link A, to operate as and for the purposes set forth.

159,427. ROLLS FOR ROLLING HORSESHOE-BLANK BARS. William W. Lewis, Cincinnati, Ohio. [Filed July 31, 1874.]

Brief.—The bottoms of the grooves in the lower roll are inclined upward toward the creasers in the grooves of the upper roll, so that the crease formed in the bar will be inclined or undercut.

1. A pair of improved rolls for rolling horse-shoe-blanks, of which one is grooved, and has a creaser in the groove, and the other has an inclined face opposite the creaser in the groove of the first, for producing a blank with an undercut crease, &c., as described.

2. A pair of improved rolls for rolling horse-shoe-blanks, of which one has a groove in it, with a beveled or rounded side and a creaser in the groove, and next to the beveled or rounded side, for producing a horseshoe with a beveled or rounded edge, so that the horse will not cut himself when he lots. firm.

159,427. PORTABLE STEAM-OVENS. James H. Lockwood, Chillicothe, Mo. [Filed July 13, 1874.]

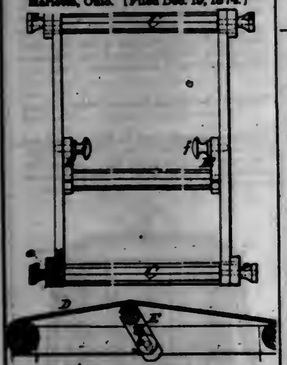
Brief.—An outer and an inner vessel are combined, the outer having an annular reservoir near its upper edge, with holes for the admission of steam therein, and external tubes to conduct the water of condensation back.

In a portable steam-oven, the vessel A, provided with the reservoir *a*, the steam-holes *b*, and the return-tubes *c*, in combination with the vessel B, substantially as and for the purpose specified.

159,428. SLEEPING-CARS. Christian E. Lucas, Atlanta, Ga., assignor of one-half his right to John F. Devine, Wilmington, N. C. [Filed Dec. 11, 1874.]

Brief.—Every second seat is adjustable along the side of the car, so as to leave room for a mattress, which is stiffened by longitudinal slats. There is also a locker sunk partly in the floor under each stationary seat, for holding various articles.

No. 159,426.



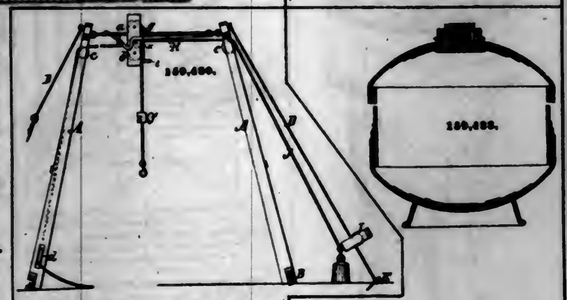
1. The combination of the seats C with the parallel link-hinges c, catch b, staples c, and bolt e, substantially as and for the purpose set forth.

2. In combination with the seats B and C, the mattress, provided with the longitudinal supports f, substantially as and for the purpose set forth.

3. The recess E, extending through the car floor, and provided with a removable galvanized-iron bottom, G, as and for the purpose set forth.

4. In a railway-car, a car-seat attached to the side of the car by means of parallel link-hinges, as and for the purpose set forth.

159,429. QUILTING-FRAMES. T. C. Marin, Marietta, Ohio. [Filed Dec. 19, 1874.]

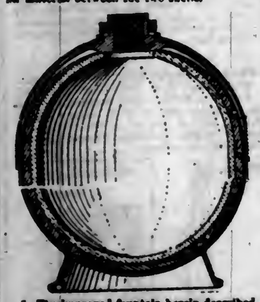


1. The combination, with a quilting-frame, of the tension-roller F, vertically adjustable by means of slotted arms E and set-screws f, substantially as specified.

2. The combination, with a vertically adjustable tension-roller, F, of the winding and unwinding rollers C, prevented from rotation by clamping set-screws c, substantially as specified.

159,430. HAY-ELEVATORS. Geo. W. Martin and Jas. C. Moor, Brookston, Ind. [Filed Dec. 7, 1874.]

Brief.—A rope stretched over triangular frames and pinned to the ground has suspended from and rolling on it a carriage, through which the hauling-rope is passed. The load, at its proper height, strikes and releases a catch, and is then drawn along over the desired place. A weighted sheave on a line carries the haul-rope back.



No. 159,430.

1. The combination of the catch H with the wire-cable, and the frame F, having sheaves a and b, and the pins c, substantially as and for the purpose described.

2. The combination, with the guy-rope D, of the weighted pulley I and rope J, attached to frame F, substantially as and for the purpose described.

159,431. SODA-FOUNTAINS. J. Matthews, New York, N. Y. [Filed Aug. 7, 1874.]

Brief.—The outer shell is of steel, the inner shell of glass, with a packing of cork or similar material between the two shells.

1. The improved fountain herein described, for containing aerated beverages, consisting of shell of steel or other strong metal and an inner vessel of glass, with a packing, substantially such as herein described, between all, as and for the purpose set forth.

2. The washers or extra thickness at the bung, in combination with the shell, so as to strengthen and support the shell, as set forth.

159,432. FOUNTAINS FOR SODA-WATER. J. Matthews, New York, N. Y. [Filed Aug. 7, 1874.]

Brief.—The outer shell is of steel, the inner shell of glass, covered with a sheet-metal envelope. Between the glass vessel and the steel shell an elastic non-compressible filling, such as india-rubber, is arranged, the filling serving to transmit the pressure of the gas to the metal shell, and thus prevent the bursting of the glass.

A reservoir or fountain for aerated liquids, composed of a steel or other strong metallic shell, a glass vessel with a sheet-metal envelope, and an elastic non-compressible filling or packing between, substantially as described.

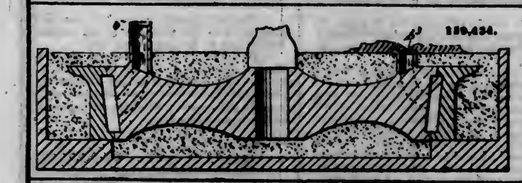
No. 159,433.

159,434. VESSELS FOR CONTAINING GASES AND LIQUIDS UNDER PRESSURE. J. Matthews, New York, N. Y. [Filed Aug. 7, 1874.]

Brief.—Strong vessels to contain liquefied carbonic acid, nitrous oxide, and similar gases which require great pressure, are made with the walls two, three, or more thicknesses of steel plates, thinned and united together.

1. The method herein described for forming strong vessels to contain gases and liquids under high pressure, consisting in coating a sheet of steel or other tough metal with tin or other soldering-metal, coiling into a volute or spiral, and then swedging the parts together, substantially as set forth.

2. The method of forming caps or ends for strong vessels, consisting in sweating together a number of steel or other tough-metal caps coated with a soldering-metal, as set forth.

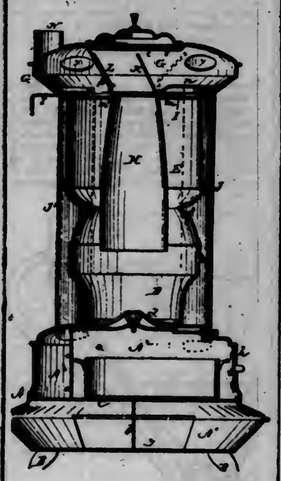


3. A lamellar vessel for containing liquids and gases under great pressure, having the several plies united by tin or soldering-metal, as described.

4. A lamellar cap or end for strong vessels, composed of a number of caps united by soldering-metal, as set forth.

5. The combination of the re-enforcing washers d with the end or body of the vessel, so as to re-enforce the parts weakened by apertures, as set forth.

159,435. CASTING CAR-WHEELS. W. A. Miles, Cayuga Iron-Works, N. Y. [Filed Sept. 16, 1874.]



The described process of constructing car-wheels consisting, essentially, first, in making the tire and central portions separately; second, heating those parts; third, introducing between them a stream of molten metal; fourth, causing the same to flow continuously until the adjacent parts are fused, substantially as described.

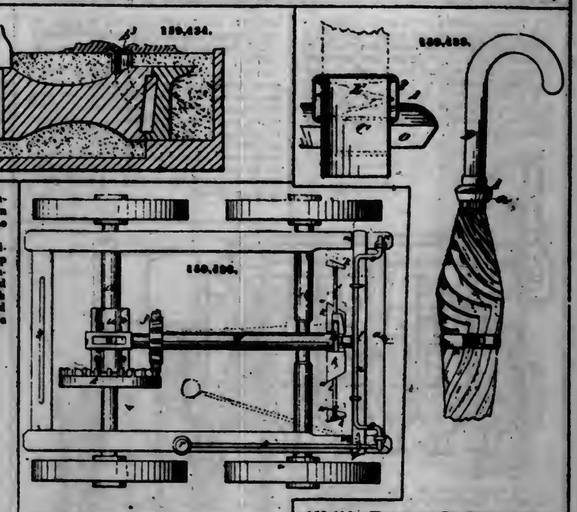
No. 159,434.

159,435. BROOMS. Geo. C. Milgate, Council Bluffs, Iowa, assignor to himself, Calvin A. Beebe, and Lawrence Kinahan, same place. [Filed Dec. 7, 1874.]

Brief.—The smoke may be made to pass directly through the rear fire-columns, or up through the cylinder which incloses the magazine, down through the front columns and base, and up the rear columns, or up through the cylinder at the front of the magazine, and back across its upper surface through the partition to the exit.

1. The stove-base A, divided by partitions into a lower chamber, A^1, an ash-chamber, A^2, and a chamber, A^3, surrounding the ash-chamber, the chambers A^1 and A^3 being divided into front and back compartments, all substantially as herein set forth.

2. The combination of the stove-base A, having chambers A^1 A^2 A^3, as described, the fire-pot D, drum E, cap G, magazine H, and front and rear columns J J and J' J', all constructed substantially as and for the purposes herein set forth.



3. The combination, in a magazine-stove, of the cylinder E, magazine H, front and rear openings m m', the double damper I, and cap G, having a partition therein, all substantially as set forth.

4. In combination with the magazine H, cap G, and the front columns, J J, the hinged magazine-cover K and column-checkers, arranged upon a single rod and operating together, all substantially as set forth.

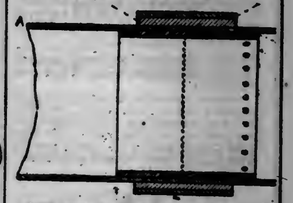
5. The combination, with the cap G and the front and rear columns J J and J' J', of the partition p with damper L, substantially as and for the purposes herein set forth.

159,436. COTTON-CHOPPERS. J. D. Mitchell, Dry Creek, Ala. [Filed Aug. 12, 1874.]

Brief.—The front end of the chopper-shaft rests in a sliding bar operated by a lever and crank, which gives vertical and lateral adjustment to the hoes. The rear boxes of the two shafts are pivoted crosswise to each, which allows the described movement.

No. 159,436.

159,437. DOLLS. Ansil W. Monroe, Rahway, N. J. [Filed Nov. 9, 1874.]



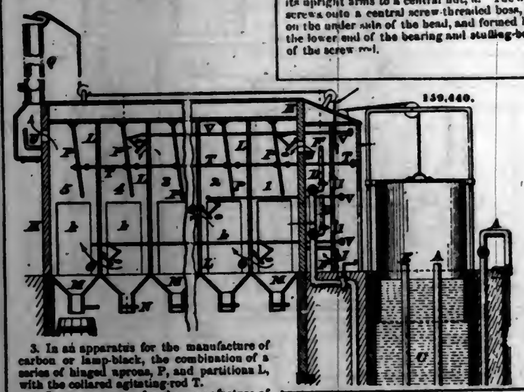
A doll's head of hard rubber or other material, provided with the rounded neck portion and secured to the trunk by the elastic band B, button C, and pin D, substantially as described and shown.

159,438. UMBRELLA-TIP RETAINERS. V. Montalbetti, Milan, Italy, assignor to L. G. Marini, Washington, D. C. [Filed Nov. 20, 1874.]

An umbrella-tip retainer consisting of a beveled cap, A a, and flanged thimble B, constructed in one piece, the spring E, and flanged thimble C, all constructed and arranged as and for the purpose specified.

159,439. JOINTS FOR SHEET-METAL PIPES. Joseph Moore, San Francisco, Cal. [Filed July 8, 1874.]

Brief.—A strengthening-ring is secured by rivets to the inner side of one section of sheet-metal pipe, and then passed into the adjoining section, a band or hoop having first been slipped over the end of the pipe. Lead packing is then tamped into the space between the band and the adjoining ends of the pipes, thereby forming a water-tight joint.



In a sheet-iron water-pipe, the internal strengthening ring or flange C, secured to one of the two sections of pipe A B, and combined with the opposite section, the outer band, E, and the packing D of lead, the latter being tamped firmly into the space between the parts A, B, and E, so as to afford a continuous lead covering over the joint and to some distance on each side, strengthened by an iron hoop outside, substantially as and for the purpose set forth.

159,440. APPARATUS FOR THE MANUFACTURE OF CARBON OR LAMP-BLACK. Peter Neff, Gambier, and Lovi S. Fales, Cincinnati, Ohio, assignors to the Kokosing Oil Company of Ohio. [Filed Jan. 6, 1875.]

Brief.—A rod provided with collars passes through the partitions of the rooms, and through the swinging aprons, for the purpose of shaking down the carbon or lamp-black into the hopper-shaped bottoms of the rooms. Valves in the different rooms and in the smoke-stack regulate the draft.

1. In an apparatus for the manufacture of carbon or lamp-black, the series of rooms 1 2 3 5, communicating by openings or flues O, alternately in or near the top and bottom of partition-walls K, and finally with smoke-stack or chimney Q.

2. In an apparatus for the manufacture of carbon or lamp-black, the suspended hinged apron or aprons P, for intercepting and collecting the soot.

3. In an apparatus for the manufacture of carbon or lamp-black, the combination of a series of hinged aprons, P, and partitions L, with the collared agitating-rod T.

4. In an apparatus for the manufacture of carbon or lamp-black, the combination of a series of partitions, L, with the collared agitating-rod T.

5. In an apparatus for the manufacture of carbon or lamp-black, the combination of a series of hinged aprons, P, with the collared agitating-rod T.

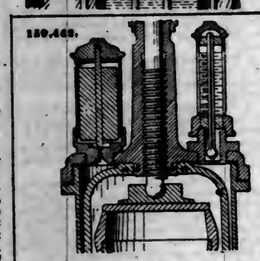
6. In an apparatus for the manufacture of carbon or lamp-black, a series of rooms provided with partitions, and having the hopper-formed bottoms M, with traps or doors N.

7. In an apparatus for the manufacture of carbon or lamp-black, the combination, substantially as described, of oven F, in which a smoldering combustion takes place from a series of burners, D, and from which the smoke passes by a devious course through rooms 1 2 3 5 into the smoke-stack, with said rooms 1 2 3 5, in the manner substantially as set forth.

8. In an apparatus for the manufacture of carbon or lamp black, the smoke-stack Q, having one or more dampers, E 5, and a grate or fire-place, U, for the purposes designated.

159,441. MOSQUITO-CANOPIES. Isaac E. Palmer, Middletown, Conn. [Filed Aug. 15, 1874.]

Brief.—A frame with the net secured at its top, with a hook for its suspension, over which the net is extended and held in place by a hoop with an adjusting-clamp. The hoop passes through loops in the band or heading woven in it, by which it is held in position.

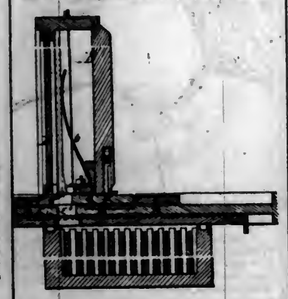


1. The combination, with the head-sustaining hoop of a mosquito-canopy, of a screw-clamp adapted to embrace both ends of the hoop, whereby the said hoop may be adjusted to compensate for the shrinkage of the net, as herein described.

2. A mosquito-canopy provided with a pocket or series of pockets woven in the heading, which serves as a trimming at the junction of the head and the skirt, in combination with a hoop passing through said woven pocket or pockets, in the manner and for the purpose described.

159,442. DENTAL FLASKS FOR RUBBER. S. D. Palmer, Toledo, Ohio, assignor to John R. B. Ransom, same place. [Filed Jan. 12, 1875.]

Brief.—The mold-closing clamp E passes down through a central bearing, F, on the boiler-head B. Fixed to and suspended from the under side of this boiler-head B is the stirrup or mold-carrying frame G. This frame is attached to the boiler-head by connecting its upright arms to a central nut, *a*. The nut screws onto a central screw-threaded boss, *b*, on the under side of the head, and formed by the lower end of the bearing and stuffing-box of the screw-rod.



159,443.

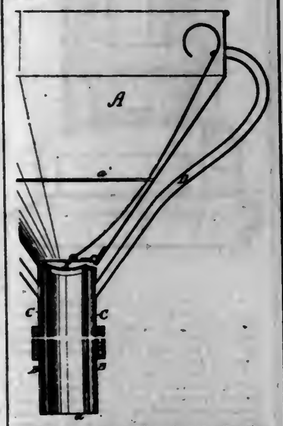
In a flask or boiler for making dental plates, the combination, with the boiler-head and mold-closing clamp working through the same, of a mold-carrying stirrup or frame, fixed to the under side of said boiler-head at or near the point where the mold-closing clamp takes its bearing in the same, and raised above and out of contact with the bottom of the boiler, substantially as and for the purposes shown and set forth.

159,445. CAMERA ATTACHMENTS. George W. Parker, Bainbridge, N. Y. [Filed June 17, 1874.]

Brief.—Relates to cameras for outdoor work, and consists essentially in providing a receptacle for a large number of prepared plates.

1. The transferring device C G', provided with plate G', all arranged in the manner shown, and for the purpose set forth.

2. In a photographic camera, the combination of plate-holder B, slide D, aperture *a'*, slide *a*, and spring *b*, with the transferring devices G G', constructed as described, aperture E', and grooved plate G', all combined and arranged as set forth.



159,446. CAR-COUPLINGS. Manasseh Pettengill, Minneapolis, Minn., assignor of one-half his right to W. A. Merriam, same place. [Filed Aug. 12, 1874.]

The head *b*, having the vertical concavity in its face, and the series of horizontal semi-circular grooves *d*, with beveled intermediate ribs, as shown and described.

159,447. FUNNELS. August Pfort, Baltimore, Md. [Filed Jan. 4, 1875.]

Brief.—The lower end of the nozzle has a jacket that is laterally apertured and forms a chamber, and connects the tubes at the upper part of the funnel, thereby causing the liquid to rise and indicate to the operator that no more liquid is needed. The hanged valve is interposed between the filter and discharge-nozzle.

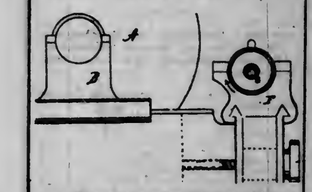
The combination of funnel A *a*, having filter, and the chamber C, having tubes D D, with a hanged valve, E *e*, situated between the filter and discharge *a*, as and for the purpose specified.

159,448. MANUFACTURING MILK OF MAGNESIA. Chas. H. Phillips, New York, N. Y. [Filed Aug. 21, 1874.]

Brief.—Precipitates hydrate of magnesia from a solution of any soluble salt of the same by ammonia-water, draws off the ammoniacal salt, and washes the precipitate.

The process herein described of preparing the hydrate of magnesia, termed milk of magnesia, to wit, by subjecting a soluble salt of magnesia to the action of ammonia, in the manner substantially as set forth.

159,447. ICE-CREEPERS. Saml. R. Phillips, Philadelphia, Pa., assignor to himself, C. L. Phillips, and A. J. R. Phillips, same place. [Filed Jan. 30, 1875.]



159,449.

1. The plate A, having a series of spurs, B, connected thereto, in combination with the retaining straps C D, secured thereto by means of said spurs B, substantially as and for the purpose set forth.

2. The extended straps D, projecting from the plate A in the longitudinal direction thereof, and of sufficient length to pass along the sides of the feet to the rear of the ankle and around the same, substantially as and for the purpose set forth.

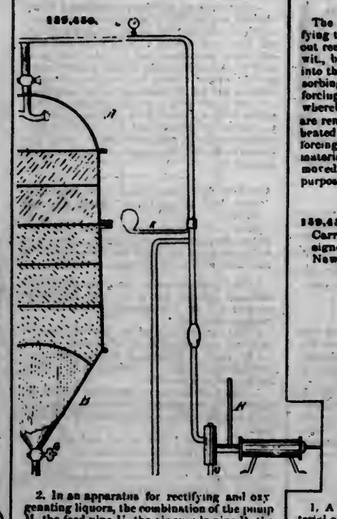
159,448. MACHINES FOR CUTTING OFF BARS, TUBES, CYLINDERS, &c. Jacob Rosse, Pittsburg, Pa. [Filed Aug. 7, 1874.]

1. The rotating cutting-disk A of mild steel or iron, having a smooth periphery and mounted in bearings B, moving in guides, in combination with the hollow mandrels H, provided with chucks, and mounted in bearings F, moving in guides at right angles to the guides of the cutting-disk, substantially as and for the purpose specified.

2. As an improvement in the art of cutting off metallic bars, tubes, cylinders, &c., that are herein described, namely, subjecting the metal to be cut to the action of a rotating disk of mild steel or iron, said disk having a smooth periphery, the metal to be cut being caused, by suitable mechanism, to revolve at a lower rate of speed than the cutting-disk, substantially as specified.

159,449. BALE-TIES. John L. Reese, Galveston, Tex. [Filed Jan. 23, 1875.]

1. The bale-tie *a*, having a broadened end, *b*, slot *c*, and slit *d*, forming strip *f*, whether the same be used as shown on Fig. 1, or folded as shown in Figs. 3 and 4, substantially as specified.

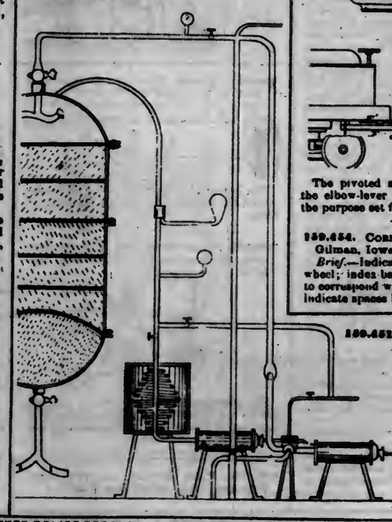


2. In a bale-tie, the loop *e*, formed on one end of a binder, the open-ended slot *c*, and strip *f* on the broadened end of the binder, substantially as specified.

159,450. RECTIFYING AND OXYGENATING APPARATUS. Jos. W. Reford, New York, N. Y., assignor of one-half his right to Jas. T. Waters, same place. [Filed Oct. 1, 1874.]

Brief.—Forces air and liquor conjointly through a revolving sprayer into a cylinder containing, in separate compartments, first, charcoal or other clarifier; second, peroxide of manganese and chloride of lime, or other oxygenators; third, marble-dust or other clarifier.

1. The process of filtering and oxygenating liquors, by forcing them, in combination with atmospheric air under pressure, through purifying and oxygenating substances, as and for the purpose described.



159,450.

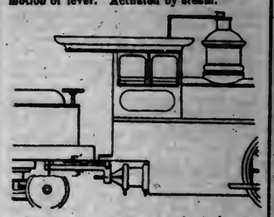
2. In an apparatus for rectifying and oxygenating liquors, the combination of the pump M, the feed-pipe U, the air-supply pipe R, the pipes H and E, provided with pressure-gage and safety-valve, and the cylinder A, having partitions or screens *a b c d e f*, whereby liquor and air are separately drawn into the air-cylinder of the pump, and are together forced through the filtering-vessel, substantially as described, for the purpose specified.

3. In a liquor rectifying and oxygenating apparatus, the centrifugal distributer F, combined with the cylinder A, containing the horizontal screens, substantially as described, for the purpose specified.

159,451. PURIFICATION OF FILTERING AND OXYGENATING SUBSTANCES WHILE WITHIN THE RECTIFYING-CYLINDER. Joseph W. Reford, New York, N. Y., assignor of one-half his right to Wm. Watt, Jr., same place. [Filed Sept. 25, 1874.]

The improved process of renewing or purifying the packing or absorbing material without removing the same from the cylinder, to wit, by first introducing suitable chemicals into the cylinder A, upon the packing or absorbing material that is to be renewed, and forcing the same through by steam pressure, whereby the grosser and valuable deposits are removed, and by them introducing superheated steam into the top of the cylinder, and forcing it through the packing or absorbing material, whereby the finer impurities are removed, substantially as described, and for the purpose specified.

159,452. NON-CONDUCTING COVERINGS. Carroll L. Riker, Rochelle Park, N. J., assignor to the Vegetable Felting Company, New York city. [Filed May 29, 1874.]

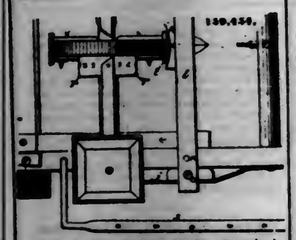


1. A felting or non-conducting covering material or lining for excluding or retaining heat or cold, made from the head of the cat-tail or reed-mace, substantially as and for the purposes specified.

2. In combination with a felting or non-conducting covering made from the head of the cat-tail or reed-mace, hair or such similar material, for sustaining in felting or otherwise, as specified.

159,453. DEVICES FOR INCREASING TRACTION OF LOCOMOTIVES. Lewis A. Sites, Grey Court, N. Y. [Filed Nov. 23, 1874.]

Brief.—Weight of tender thrown on traction-wheels by elbow-lever pivoted to a plate connecting the two trucks, permitting lateral motion of lever. Actuated by steam.



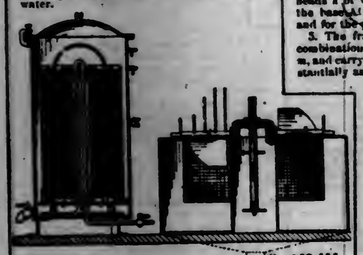
The pivoted arm F', in combination with the elbow-lever F, substantially as and for the purpose set forth.

159,454. CORN-PLANTERS. Amos Roark, Gilman, Iowa. [Filed June 30, 1874.]

Brief.—Indicator-wheel on side of dropping-wheel; index bar with numbers on upper side to correspond with numbers on wheel, and to indicate spaces between hills.

159,451.

159,434.



1. In combination with the dropping-wheel of a planter, an index-wheel, *r*, and bar *o*, substantially as and for the purpose set forth.

2. The bars *j*, rods *o*, bar *l*, and guides *n*, in combination with the inner frame *c*, substantially as shown and described

---

159,435. PROCESSES AND APPARATUS FOR SEPARATING AND COLLECTING TUFTED FIBER FROM COTTON-SEED HULLS. Adolphe Rock, New Orleans, La. [Filed Jan. 4, 1875.]

Brief.—Tufted fiber is separated and collected from cotton-coated hulls by means of heat and steam, alkali and steam, and a subsequent washing, by slowly-moving agitators, of the decomposed hulls and fiber in a perforated receptacle, which is submerged in water.

159,435.

1. The process herein described of separating the fibers in tufts from cotton-coated fragments of seed-hulls, which consists of the following operations, to wit: the digesting of said coated fragments of hulls while immovably confined in a suitable receptacle, by means of water applied in a percolating apparatus and steam under pressure; a continuance of the same digesting operation, in a similar receptacle and under like conditions, by means of water and an alkali, also applied in the percolating apparatus, and the subsequent washing of said tufts in water, which is agitated sufficiently to enable it to hold said tufts of fiber and the lighter particles of hull in suspension, substantially as described, whereby the original tufted characteristics of the fiber on the hull are retained, and the separation of the hull effected without injury to the fiber, as set forth.

2. The digester, composed of a steam-tight tank, a vomiting-tube, and a movable basket surrounding the tube for containing the matter to be digested, in combination, substantially as described, whereby said basket may may be readily removed from the tank and discharged or filled, as set forth.

3. The combination, with the digesting-tank of the vomiting-tube and the central steam-pipe, which is located within the tube and discharges steam at the bottom of the tank, substantially as described, whereby the fluid in the vomiting-tube is maintained at a high degree of temperature, and a rapid and voluminous discharge effected, as set forth.

4. The combination, with a steam-tight tank, a perforated false bottom, a vomiting-tube, a central steam-pipe within said tube, and a detachable basket, of one or more free vertical water-spaces communicating with the water-space beneath the false bottom, substantially as described, whereby an upward current is induced in the vomiting-tube and free downward currents induced in said water spaces or spaces, as set forth.

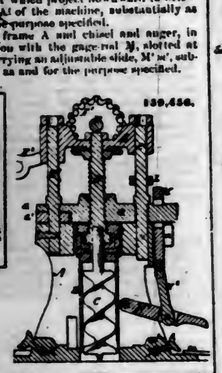
5. The washing apparatus, composed of an exterior water tank, a stationary interior receiver surrounded by an open water-space in the tank, and having its side walls and bottom finely perforated, and provided with paddles which mechanically induce a continuous gentle current within the receiver, substantially as and for the purposes herein described.

6. As a new article of manufacture, tufted cotton fiber detached from fragments of cotton-coated seed-hulls, and having the tufted characteristics it possessed before being detached from said fragments, substantially as described

---

159,436. MORTISING-MACHINES. Sven Rydbeck, Red Wing, Minn. [Filed Aug. 26, 1874.]

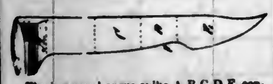
Brief.—A hollow chisel of the same section as the proposed mortise contains an auger, which removes the wood from the interior of the chisel as it is forced into the timber.



1. The combination of the screw-spindle D, sectional pivoted nut G G', and adjustable yoke H A A B', substantially as and for the purpose specified.

2. The combination of the screw-spindle D, sectional pivoted nut G G', adjustable yoke H A A B', shaft F, gearing F' D', spur-wheel I', and adjustable rack I, substantially as and for the purpose specified.

3. The combination of the screw-spindle D, auger C, rigidly secured thereto, chisel D, and parts *b* and *b'*, all united substantially as specified.



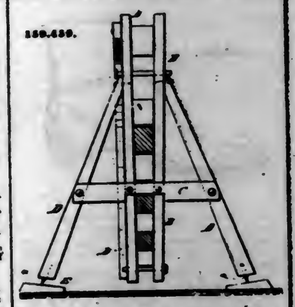
4. The frame A and chisel and auger, in combination with the gage-rods K *k k'*, the heads *k* of which project above and rest below the base A of the machine, substantially as and for the purpose specified.

5. The frame A and chisel and auger, in combination with the gage-rod M, slotted at *m*, and carrying an adjustable slide, M' *m'*, substantially as and for the purpose specified.

159,436.

159,437. SPIKES. George N. Sanders, New York, N. Y. [Filed May 12, 1874.]

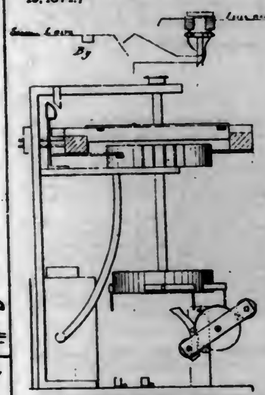
The improved screw spike A B C D E, constructed as shown, as and for the purposes set forth.



159,438. STRAW-STACKERS. Gerome Sanders, Martinsville, Ill. [Filed Aug. 28, 1874.]

159,438.

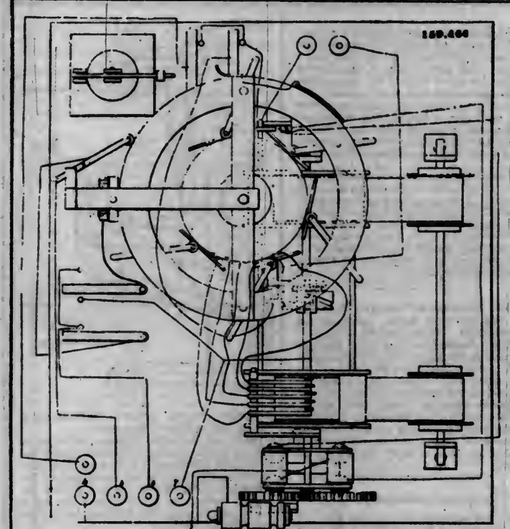
The combination of the poles A A, with pulleys *a a*, ground pulleys *b b'*, endless rope B, and rake C, all substantially as and for the purposes herein set forth.



159,439. FARM-FENCES. David Sattler, Napoleon, Ohio. [Filed Dec. 7, 1874.]

159,439.

The vertical bars B B B' B', secured together by pins near their top and bottom, to form a wedge-shaped space for the overlapping base rails, in combination with the cross-bars C C and the inclined braces D D, having metal pins *a a*, resting on inclined ground-posts E E, all constructed as and for the purpose set forth.



159,440. AUTOMATIC AND AUTOGRAPHIC TELEGRAPHS AND CIRCUITS. William E. Sawyer, Washington, D. C. [Filed Oct. 19, 1874.]

1. The combination, with a main line, of a series of transmitting-styles, a commutator, by which the transmitting-styles are brought into circuit *serially*, and one recording-style, substantially as set forth.

2. The combination of a main line, a series of transmitting-styles, a commutator, and one recording-style.

2½. In a chemical telegraph, the combination, with transmitting apparatus, comprising a series of transmitting-styles and a commutator, of a receiving apparatus having but one recording-style, which distributes the impulses gathered into circuit by the commutator.

159,466

2½. The method of signaling and recording signals, consisting of concentrating into the line at the transmitting end, by means of a commutator, the impulses proceeding through a series of transmitting-styles, points, or rollers in certain relative positions, and distributing said impulses at the receiving end by relatively changing the positions of the receiving or marking style or styles during the passage of said impulses, so as to deposit an impulse at the same relative point upon the receiving-paper as the transmitting-style from which such impulse proceeded occupied upon the message transmitted, by which means the commutator and recording-styles at the receiving end corresponding to the transmitting commutator and styles are avoided.

3. The combination of a main line, a series of transmitting-styles, a commutator consisting of a series of contact pieces or rollers in groups or divisions, a function of which series, groups, or divisions is to place the transmitting-styles in circuit *serially*, and one recording-style for each such series, group, or division, substantially as shown and described.

4. The combination, with a line of a receiving apparatus in which the recording style or stylus pass across the sheet, strip, or roll of receiving-paper, each style moving in one direction, instead of vibrating back and forth, thus drawing actual or imaginary lines across the sheet, strip, or roll of paper, instead of lengthwise of it, substantially as set forth.

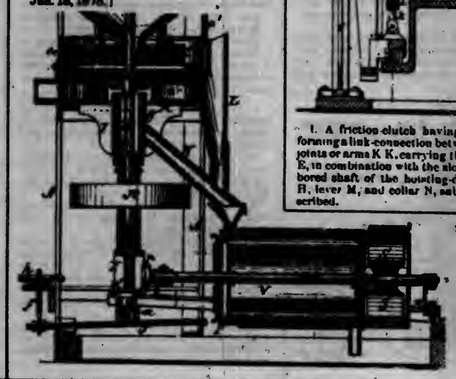
5. The combination, in a receiving apparatus with one or more recording-styles, of mechanism for giving the style or styles a continuous motion, or a motion in one direction transversely of the paper upon which the message is recorded, substantially as set forth.

6. The combination, with mechanism for imparting motion to transmitting or receiving apparatus, of an air-receptacle and valvular passages for the purpose, first, of driving the mechanism, and then of checking or bringing it to a stop, substantially as shown and described.

7. The combination, with the metallic drums and their shaft, of a cam for producing a longitudinal reciprocation of the drums, as set forth.

8. The combination, with the metallic drums, of the rocking frame, the electro-magnets, and circuit-connections, for giving a reciprocating rotary motion to the drums, as set forth.

9. The combination, with the metallic drums and their shaft, of the rocking frame, the electro-magnets, and circuit-connections, and a cam for giving a simultaneously longitudinal reciprocating and reciprocating rotary movement to the drums.



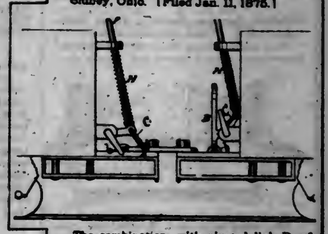
10. The combination, with a main line and its battery, of an induction or an electro-magneto electric apparatus, the current induced by which serves to electrically bridge a break or lessen a resistance in the circuit in which it flows, as set forth.

11. In a chemical or copying telegraph, the method of obtaining an insulating writing-surface upon a metallic surface, consisting of transferring the lines of writing first formed in a prepared ink upon paper to a metallic surface lithographically, or by fixing the paper to the metallic surface, and washing off from the metallic surface either that portion of the message-paper which is blank, or that portion which is covered by the lines of writing, as set forth.

12. The method of treating the received message, consisting of subjecting the paper to a bath, and thus removing any discoloration excepting the electrolytic discolorations, as set forth.

13. The combination of a line with an induction coil or coils and a mechanical circuit-changer, for the purpose of clearing a line of tailings independently of the transmitting apparatus or process, substantially as shown and described.

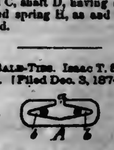
159,461. MACHINES FOR HULLING GRAIN. Charles Schaschne, Rondout, N. Y. [Filed Jan. 12, 1875.]



159,461.

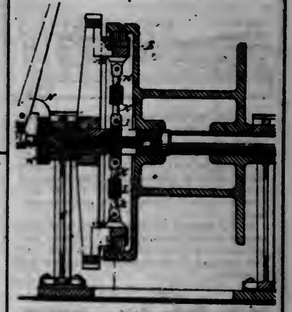
1. The combination of the shaft E, stone D, case H, curb C, and vertically sliding frame I, operated by means of the lever J, screw-rod *f*, and hand wheel A, substantially as and for the purposes herein set forth.

2. The combination, with stones C D, wings *e*, curb C, and case H, of the conductor L, tube N, jacket O, polisher consisting of cylinder P V, and fan S, all as and for the purposes set forth.



3. The combination of the adjustable cylinder P, with screen-roof *i*, shaft *m*, interior wire screen *k*, fan S, and cylinder V, with ribs or wings *p*, all substantially as and for the purpose herein set forth.

159,462. CAR-COUPLINGS. Benj. Skinner, Sidney, Ohio. [Filed Jan. 11, 1875.]



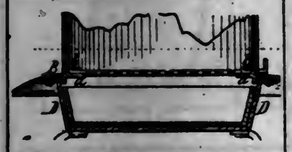
The combination, with pivoted link B, of the bent rod C, shaft D, having arm *d*, vertical rod F, and spring H, as and for the purpose specified.

159,463. BALE-TIES. Isaac T. Smith, Richmond, Va. [Filed Dec. 3, 1874.]

The double-hook tie A, having central top opening, *a*, and V-shaped recesses *b b*, substantially as and for the purposes herein set forth.

159,464. FRICTION-CLUTCHES. G. H. Sterbuck, Troy, N. Y. [Filed Jan. 18, 1875.]

1. A friction-clutch having a cross-key, I, forming a link-connection between the knuckle-joints or arms K K, carrying the friction blocks E, in combination with the slotted and axially-bored shaft of the hoisting-drum, sliding rod H, lever M, and collar N, substantially as described.

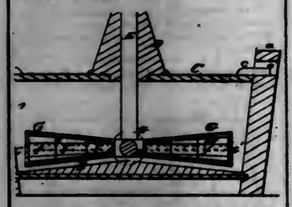


2. The hoisting drum C, having friction rim D and a slotted and axially-bored shaft, in combination with a gear-wheel, B, having the guided G, and with friction-blocks E, sliding rod, and a lever connected therewith, substantially as described.

3. The driving-wheel constructed with guides G and stops X, for guiding and limiting the motion of the clutch and friction blocks as the clutch mechanism is brought in and out of gear, substantially as described.

4. In combination with the hoisting-drum and slotted and axially-bored shaft, the lever M, pivoted upon the divided collar through its yoke, and connected with the end of the sliding rod, for operating the arms carrying the friction-blocks, substantially as described.

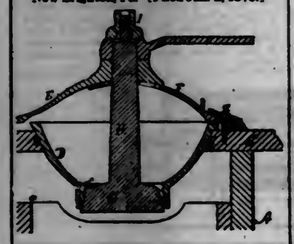
159,465. STOVES. David L. Stiles, Rochester, N. Y. (Filed June 20, 1874.)



Brief.—The flanged base-ring is interposed between the fire-pot section and the ash-pit.

The combination, in a stove, of the base-ring B, having the inwardly-projecting flange a, with lugs b thereon, to secure the journals of the grate, and vertically-projecting flanges to secure the casing A and base D, as and for the purpose described.

159,466. WASHING-MACHINES. Abraham Stout and David Stevenson, Philadelphia, Pa. (Filed Oct. 10, 1874.)



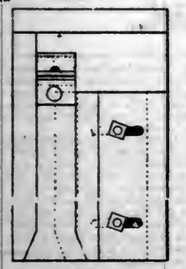
Brief.—Radial conical rollers in sections, operated by a vertical shaft and handle over a conical ridged bottom.

1. The improved washing-machine consisting of the tub A, conical bottom B, made in ridged sections, as shown, lid C, pedestal D, rotary shaft E, adjustable collars H I, spring K, conical rollers G, and band G', said rollers being made in independent frustum-shaped sections, fluted and recessed at g g', all combined to operate as and for the purpose specified.

2. The conical fluted rollers G, consisting each of several frustum-shaped sections journaled upon a single shaft radiating from a rotary upright, E, substantially as shown and described.

159,467. COFFEE-MILLS. T. Strobridge, New Brighton, Pa. (Filed Jan. 2, 1875.)

1. The hopper and grinding-shell D, provided with points or projections c on its outer surface, in combination with cover E, projecting so as to rest upon the top of the box and bind upon the upper edge of the hopper, substantially as and for the purpose specified.



2. In coffee or spice mills, the combination of box A, having a top, C, with the hopper D, suspended within the box by means of lugs or projections, which rest upon or take into top C and a cover, substantially as specified.

3. The combination of the hopper and grinding-shell D, grinding-nut G, having shank H, and cover E, having a sliding gate or door, F, substantially as and for the purpose specified.

4. The combination of cover E and grinding-shell or hopper D, the latter provided with lugs or a flange, so that two parts may be secured to the box by a single set of screws, substantially as specified.

159,468. DEVICES FOR WELDING TOGETHER THE FAG-ENDS OF BARS. Jacob Sutter, Pittsburg, Pa. (Filed Aug. 10, 1874.)

Brief.—A rectangular bed-plate having a permanent raised flange at one end and side. On the plate is fastened adjustably a slide, which, in conjunction with the fixed side, forms the groove for the reception of the heated fag-end, against which the heated bar is struck. One of the limbs of an adjustable L-shaped plate situated in the end of the groove serves to preserve the guide notch or cut formed in the end of nut-bars, as a gage for cutting the next nut.

1. As an improvement in the method of preparing the fag-ends of bar-iron, for use in the arts, bringing said fag-ends to a welding-heat, and welding them together, end to end, or to the end of a similarly-heated bar, by successively forcing one against the other while confined in a straight groove, substantially as described.

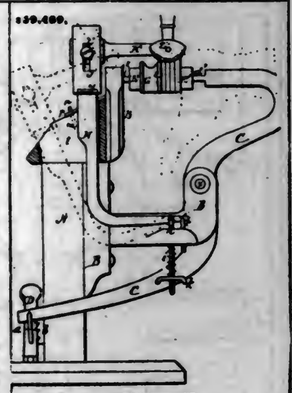
2. The combination of the bed-plate, the fixed and movable sides, and the adjustable knife or gage, substantially as and for the purpose specified.

159,469. MACHINES FOR BURNISHING BOOT AND SHOE HEELS. Alexander Swallow, Beloit, Wis. (Filed Dec. 31, 1874.)

Brief.—The burnisher is loosely pivoted to a horizontal arm held in a slotted plate, which is hinged to a vertically-adjustable lever, providing vertical, horizontal, and lateral movement to the burnishing-tool.

1. The combination of the burnisher I., adjustable holder K, and the slotted plate J, hinged to the lever H, substantially as and for the purposes herein set forth.

2. The rod h, spiral spring i, and thumb-nut k, in combination with the lever H, carrying the burnishing-tool, substantially as and for the purposes herein set forth.



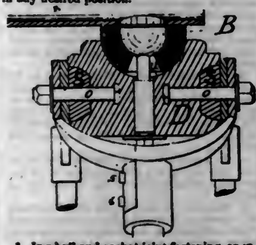
3. The heel-rest G, constructed as described, with a deep groove to form a lip, e, for the purposes herein set forth.

4. The combination of the stud d with the swiveled plate E, and the hinged lever C with the stud d' and swiveled plate E', the lever being operated by means of the rod or strap a, treadle D, and ratchet-bar b, all constructed substantially as and for the purposes herein set forth.

5. In combination with the lever H the pivoted hook F, with spring m and thumb-lever e, substantially as and for the purposes herein set forth.

159,470. PUMPS. Cyrus O. Sylvester, Attica, Ind. (Filed July 3, 1874.)

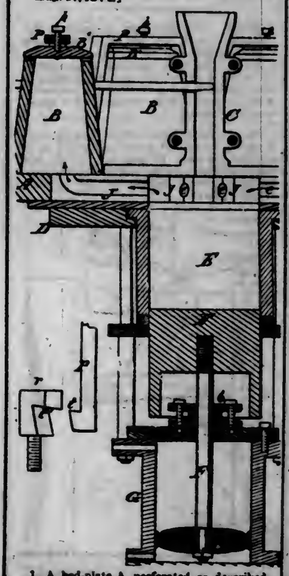
Brief.—A perforated disk on the bottom of the valve gives it additional strength and durability, and affords an even bearing all around for it to strike against the lower part of the valve-seat. Packing is inserted around the piston, between an upper flanged disk and a lower one, bolts passing between the flanges to hold it in place.



1. The plunger herein described, consisting of the cup J', having flange s, with slots r r, the cup J with flange r', the packing p between the cups, and the short bolts t t, which unite the parts, all constructed substantially as shown and described, for the purposes set forth.

2. The rib-valve D, provided with the bottom perforated flange c, top metal washer i, rubber or leather washer f, outer plate h, and bolt k, all substantially as and for the purposes herein set forth.

159,471. BALL-AND-SOCKET-JOINT FASTENINGS. Wm. F. Tallman, Mineville, N. Y., and Jas. H. Mandeville, Washington, D. C. (Filed Jan. 23, 1875.)

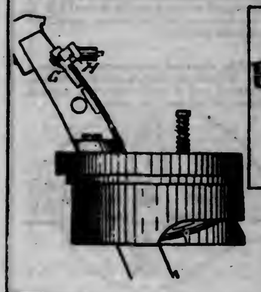


Brief.—The semi-spherical cup, forming part of the universal joint, rests within a correspondingly-shaped socket held together by a bolt passing through both. The cup has several slits thereon, by the adjustment of which the object connected therewith is held rigidly in any desired position.

1. In a ball-and-socket-joint fastening, an interposed cup made with slits upon its bowl or bottom, for the purpose of gaining an increased binding power by the yielding and wedging of the cup into the socket when the ball is bound upon it.

2. The combination of the ball C and nut m, with the yielding and wedging cup, and the socket d, when constructed substantially as herein shown and described.

159,472. APPARATUS FOR CASTING INGOTS. John Blake Tarr, Fairhaven, Mass. (Filed Aug. 17, 1874.)



1. A bed-plate A, perforated as described, for a cluster of mold boxes, B, a pouring-sprue, c, provided with gate N, a surplus metal chamber, E, arranged beneath the plate A, communicating with the mold boxes and a pressing-head, F, a piston, G, arranged beneath the pressing-head F, all combined and constructed in the manner and for the purpose described.

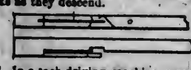
2. The bails P, hooked as described, and provided with the set-screws p, in combination with the hooks r, rigidly secured to the bed A, and the mold-boxes B B', substantially as described.

159,473. TACK-DRIVING MACHINES FOR BOOTS AND SHOES. Henry G. Thompson and Charles Luke, Milford, Conn.; said Luke assignee to said Thompson. (Filed Jan. 16, 1875.)

Brief.—The roadway does which the tack slides is covered to prevent their displacement, and is provided with a trap or receiver, to arrest their downward movement, from which they are taken singly by a laterally-reciprocating slide-bar, and carried to the delivery chute.

1. In a tack-driving machine, a vibrating inclined roadway or passage provided with a guard or cover outside of the cylinder, substantially as shown, and for the purpose described.

2. A diaphragm, in combination with the stationary head of a revolving feeding-cylinder, for the purposes herein set forth.



3. A diaphragm, fastened to the inside of a stationary head of a revolving feed-cylinder, and provided with a bearer and a spring, by means of which the diaphragm may be given a reciprocating movement, substantially as shown and described.

4. In a tack-driving machine, a roadway provided with a trap or receiver forming a curve or segment of a circle, for the purpose described.

5. The receiver or trap G in the roadway of a tack driving machine, in combination with the slide-bar H having an opening or trap beneath, for the purposes set forth.

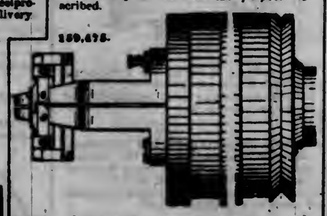
159,474. TACK-DRIVING MACHINES FOR BOOTS AND SHOES. Henry G. Thompson and Charles Luke, Milford, Conn.; said Luke assignor to said Thompson. (Filed Jan. 16, 1875.)

Brief.—The tack-roadway, having a continuous tapering longitudinal slot, extends up through the stationary head of a revolving cylinder, and is provided with a guard within the cylinder, to regulate the passage of the tacks as they descend.

1. In a tack-driving machine, a continuous straight roadway extending through the head of the cylinder, provided with a push-bar and separator, all arranged to arrest the downward movement of tacks and separate them, so that each may be moved forward singly.

2. A guard attached to the inside of the stationary cylinder-head immediately above the roadway, as shown, for the purposes herein set forth.

3. The roadway e, extending through the stationary cylinder-head, provided with a continuous longitudinal slot, wider below than at the top, and closed at the bottom, substantially as and for the purpose described.



159,475. TACK-DRIVING MACHINES FOR BOOTS AND SHOES. Henry G. Thompson and Charles Luke, Milford, Conn.; said Luke assignor to said Thompson. (Filed Jan. 19, 1875.)

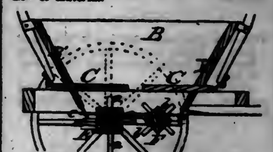
Brief.—The roadway is provided with a removable trap, through which a sliding push-bar laterally vibrates. The push-bar is covered to prevent displacement of tacks as they are carried singly forward to the delivery chute or passage.

1. In a tack-driving machine, a roadway provided with a push-bar, constructed substantially as shown and described, for acting upon the tail or side of each tack singly, substantially as set forth.

2. In a tack-driving machine the push-bar, with its operating-lever and spring, in combination with a roadway extending through the stationary head of a revolving cylinder, substantially as and for the purpose described.

159,476.

3. A push-bar, constructed with a guard to cover the head of each tack when taken from the roadway or trap, as set forth.



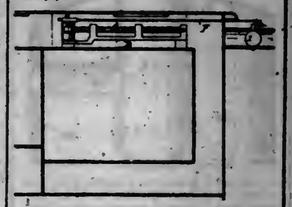
4. A push-bar, constructed with an opening at the bottom to receive the tail of each successive tack, in combination with the trap, substantially as and for the purposes set forth.

5. A push-bar, constructed to receive simultaneously upon one tack at a time, provided with a guard above and an opening at the bottom, substantially as and for the purposes herein set forth.

6. A push-bar acting upon each successive tack separately, provided with a guard above and an opening beneath, in combination with the vibrating inclined roadway of a tack-driving machine, substantially as and for the purposes herein set forth.

159,476. MANURE-DISTRIBUTERS. N. Tomlinson, Clinton, Ill. (Filed Oct. 10, 1874.)

Brief.—At the bottom of a hopper whose sides are inclined are journaled two spurred shafts, revolving in opposite directions, and through projections on the bottom of the sides. The hopper-bottom is made in two parts, which are adjustable to graduate the flow of material.



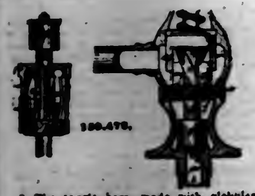
1. The inclined hopper sides B' B', provided with projections c at their lower ends, in combination with the spurred shafts E and F, revolving in opposite directions, substantially as and for the purpose set forth.

2. The inclined hopper sides B' B', provided with spurs c at their lower ends, in combination with the sliding bottom-boards C C, levers G G, axle E, provided with spurs a, and shaft E, provided with spurs b, substantially as and for the purpose set forth.

159,477. AUTOMATIC DAMPER-REGULATORS. Ralph Tomlinson, Boston, and Jos. Smith, Somerville, Mass. (Filed Sept. 14, 1874.)

Brief.—The damper is automatically opened and closed by the expansion and contraction of the metallic rod A. The frame which carries the expanding rod is arranged within the top sheet-flue of the stove, and the damper conveniently located within the horizontal exit-pipe.

The combination, with the metallic bar A, supported within the frame B, of the crank-arm C and the pitman-rod F, attached at one end to the crank-arm, and at its other end to the crank G, connected with the damper, the whole being constructed and arranged for operation as herein shown and described

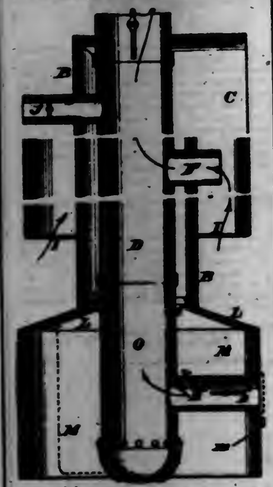


---

159,478. SELF-CLOSING FAUCETS. John W. Trafton, Springfield, Mass. (Filed Mar 27, 1874.)

Brief.—Upon turning the valve-stem, the toggle-bars are raised in a vertical position between the fixed bearing and the disk upon the stem, thereby raising the valve against the stress of the spring.

1. The toggle-bars placed within the barrel of the cock or faucet between the valve and the gland g, so as to be lubricated by the liquid flowing through the cock, and acting between a fixed abutment or toggle-base and a bearing or disk upon the valve-stem, in combination with the valve-spring and valve-seat, substantially as set forth.

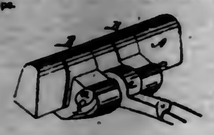


2. The projections m and m' upon the toggle-base f and disk k, respectively, in combination with the toggle-bars and valve, substantially as set forth.

3. The toggle-bars, made with globular ends and entering recesses in the toggle-base and disk on the valve-stem, so as to allow the toggle-bars to turn in their bearings as the valve-stem is partially rotated in combination with the valve stem and spring, as specified.

160,479. HEATING. Sterling D. Tuttle and Benj. F. Lorah, Baton, Ohio, assignors to Sterling D. Tuttle, same place. [Filed Jan 6, 1875.]

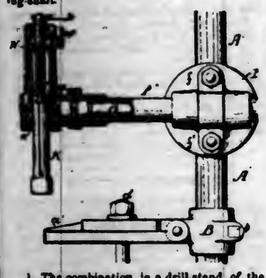
Brief.—Smoke circulates through the dome and pipe. Air to be heated circulates through the interior pipe and exterior drum.



1. In combination with a heating stove, the central air-heating chamber, D, within the smoke-pipe B, having one or more tubular supports, F, forming communication with a drum, G, surrounding the smoke-pipe, said chamber and drum having suitable inlets and outlets, as and for the purpose set forth.

2. The dome I, i, having supporting-flange m, and forming chamber M, and supplemental pipe O, having inlet H' h', in combination with chamber D, stove-pipe B, supporting-tubes F, and drum G, for attachment to a heating stove, as and for the purpose specified.

160,480. THILL-COUPLINGS. Hiram Tyler, Geneseo, N. Y., assignor of one-half his right to Phil Teed, same place. [Filed June 16, 1874.]



Brief.—The shaft-iron is provided with an enlargement, with an arm on either side, which fits neatly between the hooked portions of the clips.

The combination of the two hooked portions C C of the clips with the shaft-iron D, having central enlargement *c* and side arms, *a a*, with longitudinal grooves *x x*, all substantially as set forth.

160,481. METAL-DRILLING MACHINES. C. Van Haagen, Philadelphia, Pa., assignor to himself and Anthony Van Haagen, same place. [Filed June 1, 1874.]

Brief.—A split collar provided with a slotted clamping plate embraces the tubular post, which is formed with a slotted foot or base. A disk provided with an undercut groove is secured to the post, and to said disk is attached, by T bolts, another disk, provided on its face with a split collar, which receives the tubular rod that incloses the drill spindle. The upper portion of the shaft N serves as a nut for the feed screw, while the lower end is formed with teeth adapted to a worm on a spindle that derives its motion from the driving-shaft.

1. The combination, in a drill-stand, of the post A, its foot *a*, and a clamping-plate, *a'*, hinged to an adjustable collar, B, on the post, all substantially as set forth.

2. The combination of the post A and its clamping-disk D with the tubular drill-carrying bar F, and its clamping-disk E, the two disks being secured and otherwise adapted to each other, substantially as and for the purpose set forth.

3. The combination of the movable clamping-disk E, the tubular bar F, and its casing H, the driving-shaft G, and drill-spindle K, operated from the said shaft, all substantially as specified.

4. The combination, substantially as described, of the disk D, its undercut groove *g*, and flanged plug *e*, with the disk E, and headed bolts *f* and *f'*.

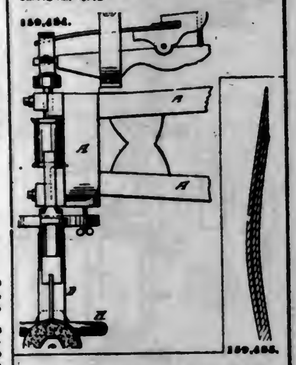
160,482. LAMP-BURNERS. A. C. Vaughan, Rainsburg, Pa. [Filed Dec. 26, 1874.]

Brief.—The supplemental piece is provided with projections and a slot coinciding with that in the deflector.

The deflector B, having top slot *b*, oval side holes *b'*, and pieces *b*, having the opposite blunt projecting ends *c c*, combined as and for the purpose described.

160,483. RELIEF-VALVES FOR CYLINDERS. Edmund Walters, Tamaqua, Pa., assignor of one-half his right to Henry Walters, same place. [Filed Jan. 6, 1875.]

Brief.—The valve is forced against pressure of steam by a regulating-screw.



1. The combination of the shell *a*, valve-stem *c d e*, collar *g*, spring *i*, cap *p*, and regulating-screw *o*, substantially as shown.

2. The screw *o*, in combination with the valve-stem, whereby the valve can be kept open for the steam to blow through, substantially as described.

160,484. CUTTING AND POLISHING MACHINES. A. S. Walters and C. Saunders, Philadelphia, Pa. [Filed Jan. 2, 1875.]

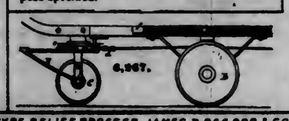
Brief.—The tool is mounted in an adjustable bracket on the end of a swinging arm. The tool-shaft, being horizontal, is connected with the driving-shaft by means of a bevel-wheel connection.

The adjustable bracket D, carrying the shaft *b*, provided with the tool I and pulley *d*, in combination with the arm A, shaft B, and wheel H, all constructed and arranged to operate substantially as and for the purposes herein set forth.

160,485. SHAFT-STIFFENERS FOR BOOTS, &c. Jeremiah M. Watson, Sharon, Mass. [Filed Dec. 30, 1874.]

An improved shank-stiffener for boots or shoes, composed of two or more layers or springs of wood, combined with an intermediate integral layer or spring of metal, as shown, for the purpose specified.

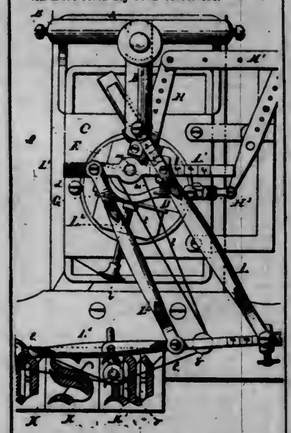
160,486. DOOR-KNOB FASTENINGS. Jerome B. Wells, Rochester, N. Y. [Filed Nov. 26, 1874.]



The combination, with the lock-case E and cam F, of the slide H, resting in the groove *a* of the knob-shank C, and provided with a bit, *c*, which strikes into a slot, *f*, formed half in the lock-case and half in the cam, as and for the purpose specified.

160,487. BEATERS FOR COTTON-OPENERS, &c. William B. Whitehead, Mills Plattin, England, and Abel T. Atherton, Lowell, Mass. [Filed July 23, 1873.]

1. The combination, in a pressure-regulator, of a flexible diaphragm, E, a balanced valve, D, and a lever, O, constructed and operating substantially as described.



2. In a steam-pressure regulator which is constructed of a flexible diaphragm, E, a balanced valve, D, and a lever, O, in combination with the guide 5 and stem *d* of the valve D, constructed and applied in the water-well *f*, substantially as described, and all for the purpose specified.

in a machine for opening and cleaning cotton and other fibrous material, whippers I I, having extended surfaces or edges parallel, or nearly parallel, with the feed-rolls C C, and swinging freely in circles at sufficient distances from one another, and from the shaft of the revolving reels or spiders B B, on which they are mounted, to be severally independent and unobstructed in their swinging motions, and to yield within the full pathway of their revolution when an unusual or matted quantity of cotton is fed to them, substantially as herein specified.

160,488. ENGRAVING-MACHINES. Wm. S. Wight, Chardon, Ohio. [Filed June 30, 1874.]

Brief.—The novelty involved in this invention relates to the special construction of the operative parts, and sufficiently indicated in the claim, whereby the process of engraving is simplified, and the desired results attained with more certainty than heretofore.

1. The vertically-adjustable slide B', to which the pantograph is connected, adjusted by means of screw *k*, and held in position by set-screw *k'*, as specified.

2. In combination with a pantograph, the mortised revolving shafts N N, in which the arms of the pantograph are adjustable, as shown and specified.

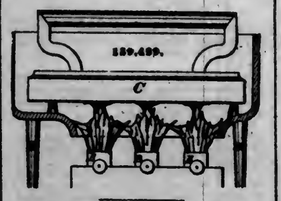
3. The graver-stock *m*, having its lower end bent on an incline to allow the attachment of the graver in an inclined position, as specified.

4. The rotary plate E, carrying the clamps G G, and arranged on the table D, in combination with the set-screws *d d*, as specified.

5. The combination, with the rotary table E and pantograph, of the arm H, bar H', lever H', bar H', and arm H', all as shown and specified.

6. The adjustable block *f*, in combination with one of the jaws of the clamp G, for the purposes herein set forth.

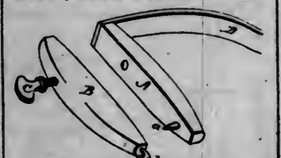
7. The combination, with the base A, bed C, and tracing-table J J', of the pivoted lever I and knob I', as specified.



8. The plates K K', bearing the tracing-letters, provided with vertical central flanges *i*, as shown and specified.

9. The pulley S, provided with extended socket S', in combination with the spring S', tracing-bar M, and its bearings formed on the pantograph-arm L', as shown and specified.

160,489. FLAT-IRON HEATERS. B. Willmot, Dallas, Tex. [Filed July 23, 1874.]

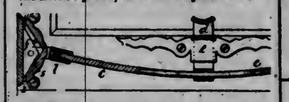


Brief.—The air is admitted freely from below to the burners, which heat directly nearly the whole face of the iron.

The metallic case D, having wide bottom opening, legs E, projections F, and burners B, combined and constructed substantially as and for the purpose set forth.

160,490. COW-TAIL HOLDERS. James M. Worden, East Randolph, N. Y. [Filed Nov. 21, 1874.]

Brief.—A strap surrounding the animal's thigh sustains a clamp, which holds the tail of the cow by means of a set-screw.



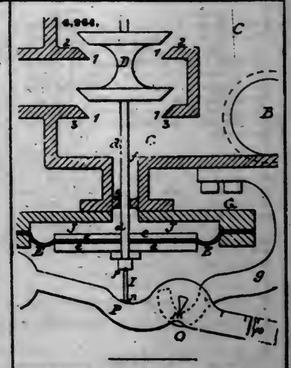
The combination of the clamp A B, thumb-screw C, strap D, and hook *b*, constructed and used substantially as and for the purposes herein set forth.

REISSUES.

6,963. SASH-HOLDERS. Loring J. Baker, Boston, Mass., assignor to H. Bradford. Patent No. 151,529, dated June 2, 1874. [Filed Nov. 3, 1874.]

Brief.—A single spring-rod extends across the lower part of the sash, and is connected at each end by screw-shackles and link-joints to friction-plates. These plates have double inclines, extending backward into a case with corresponding recesses. The spring-rod is depressed at its center by a thumb-slide, in order to relieve the sash from the pressure of the friction-plates, so that it may be raised.

1. The spring *e* and shackle *l*, united by a joint to the friction-clamp *f*, in combination with the slide *d* and lifter *c*, substantially as set forth.



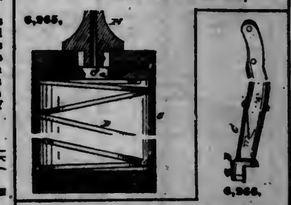
2. The combination of the slide *d*, lifter *c*, curved rod *e*, double inclined friction-clamp *f*, and case, substantially as set forth.

6,964. SELF-REGULATING PRESSURE-VALVES. Augustine Campbell, Metuchen, N. J., assignor to N. C. Locke, Salem, Mass. Patent No. 43,823, dated Aug. 16, 1864; antedated Sept. 22, 1862. [Filed Dec. 9, 1874.]

Brief.—A flexible diaphragm secured to the lower part of steam-chamber serves to confine the steam within its chest, and also support the valve-rod in position.

1. The combination, in a pressure-regulator, of a flexible diaphragm, E, a balanced valve, D, and a lever, O, constructed and operating substantially as described.

2. In a steam-pressure regulator which is constructed of a flexible diaphragm, E, a balanced valve, D, and a lever, O, in combination with the guide 5 and stem *d* of the valve D, constructed and applied in the water-well *f*, substantially as described, and all for the purpose specified.



6,965. INJECTORS FOR INSECT-POWDER. Charles Chinnock, Brooklyn, N. Y., assignor, by mesne assignments, to Charles N. Crittenton, New York city. Patent No. 93,597, dated Aug. 10, 1869. [Filed Dec. 29, 1874.]

Brief.—The flexible portion of the bellows is distended by the spiral spring, which keeps the end disks of the bellows apart.

1. In a powder-injector, the combination of a flexible covering, C, with a distending-spring, D, substantially as and for the purpose described.

2. As a new article of manufacture, a powder-injector consisting of the combination of a removable nozzle, E, the air-passages *b*, flexible covering C, and spring D, substantially as and for the purposes described.

6,966. SPADING AND OTHER FORKS. Elon O. Denio and Geo. K. Babcock, New Hartford, N. Y. Patent No. 92,709, dated July 20, 1869. [Filed Jan. 12, 1875.]

Brief.—A supplemental ferrule on the end of the main ferrule. A raised projection upon the back or resisting part of the fork.

1. The handle A and tool B, in combination with the ferrule C, extending entirely around the handle, and the supplemental ferrule D, substantially as and for the purpose set forth.

2. The raised projection upon the back or resisting part of a fork or other tool, substantially as and for the purpose specified.

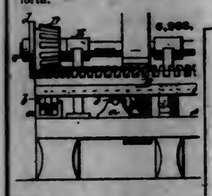
3. The combination of the handle A, ferrule C, supplemental ferrule D, with projection *a*, and the tool-head with projection *b*, all substantially as and for the purposes herein set forth.

6,967. HAND-TRUCKS. Leonard Gilson, Boston, Mass. Patent No. 134,537, dated Jan. 7, 1873. [Filed Dec. 9, 1874.]

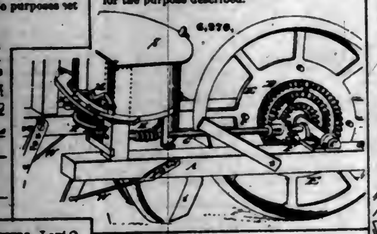
1. In a hand-truck, the combination, with central primary wheels, of end wheels, adjustable in altitude with respect to one another and the floor or platform of the truck, substantially as and for the purposes set forth.

2. In combination with the central primary wheels of a hand-truck, end wheels adjustable vertically and swiveled to turn on a vertical axis, substantially as and for the purposes set forth.

3. In a hand-truck, the combination, with a primary or main wheel or wheels, of a swiveled end wheel or wheels, substantially as and for the purposes set forth.



6,969. Hoses-Powers. John S. Schofield, Macon, Ga., assignor of one-half interest to J. R. Schofield. Patent No. 150,111, dated Sept. 15, 1874. [Filed Jan. 20, 1875.]



Brief.—An armless wheel having a circular groove upon its bottom, and revolving upon friction-rollers, has a central shaft provided with a pinion upon each end—one being loose, the other fast. The central shaft carries the band-wheel.

1. The combination of the master-wheel B, the single central shaft C, with a pinion, D, secured on one end thereof, and a pinion, D', placed loosely upon the other end, and said pinions provided with flanges *d d*, all substantially as and for the purposes herein set forth.

2. The combination of the master-wheel B, the flanges *d d*, cast with the pinions D D', and the friction guide-rollers *i i*, secured to the adjustable bearings mounted upon the base A, all as and for the purposes set forth.

3. The combination of the base A, the rollers *h* and *i*, the grooved master-wheel B, the shaft C, and the pinions D D', with flanges *d d*, all substantially as and for the purposes set forth.

6,970. Seed-Planters. James Campbell, for himself and Jas. A. Campbell, (administrator of William Campbell, deceased, assignee of one-half interest,) Harrison, Ohio. Patent No. 96,546, dated Nov. 9, 1869. [Filed July 16, 1874.]

Brief.—The frame is rectangular, the forward end of which is supported upon a single pilot-wheel, the rim of which is V-shaped. A set of concentric cog-gear, removable at pleasure, occupies the central portion of the wheel, and from which motion is given to the feeding devices. An opener, seed-spout, and coverers complete the planting devices. Handles like those of a plow or cultivator project in the rear, by which the machine is governed.

1. A seed tooth corn-drill, mounted upon a single front driving and pilot wheel, its flange or rim being V-shaped, so as to act as a cutter guide and marker, substantially as herein set forth.

2. In a corn-drill, in combination with the front ground driving wheel, the curved fender T, arranged between the grain-spout R, and tread E of the drive wheel.

3. The gear-disk D, forming the center or hub of the ground or drive wheel, and separable therefrom, as shown and described, for the purpose set forth.

4. The rearward extension *s* of the lid or top S of the seed-hopper, for the purpose of protecting certain operative parts of the seeding mechanism, and the upper end of the seed-spout, as set forth.

5. The pivoted gravitating forwarder or drop-finger M *m m' m'' m'''*, constructed and having its pivot arranged relatively to the seed-slide, as represented and described, for the purpose set forth.

6. The reversible gage-plate K *k k'*, as and for the purpose described.

6,971. Drawing-Books. Arthur Forbriger, Cincinnati, Ohio. Patent No. 151,905, dated June 16, 1874. [Filed Oct. 14, 1874.]

1. As a new article of manufacture, a drawing book or tablet, composed of layers or sheets, having progressive studies for copy upon them, all pasted or secured on two or more sides at the edges in any manner, so that no study except the one in use can be seen by the pupil, as set forth.

2. A drawing book or tablet, composed, respectively, of blank sheets and sheets with subjects for copy upon them, each copy-sheet being arranged to alternate with one or more blank sheets, and the whole book or tablet pasted or otherwise secured together at two or more of its edges, substantially as and for the purpose specified.

6,972. Sewing-Machine Casters. Levi O. Allen, Gardiner, Me., assignor to James P. Almy and Jefferson B. Brackett, Salem, Mass. Patent No. 81,454, dated Aug. 25, 1868. (Filed Apr. 10, 1874.)

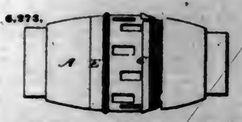
Brief.—The casters are attached to the ends of S-shaped levers, which are pivoted to the frame, and worked at their inner ends by means of an axial pin passing through slots in both the levers. The axial pin is rigidly attached at right angles to a link, which is pivoted to that part of the treadle-lever which embraces the cross-shaft. The outer part of the treadle, when pressed down, rotates this cross-shaft, and through its connection operates the four casters.

1. The combination, with the frame, of the casters E and levers A, pivoted to the frame, said levers being guided at their inner ends by a common axis and moved by a lever, and arranged together as described, so that the pivots B form the only connection between the casters and the frame.

2. The combination, with the frame, the casters E, and the levers A, pivoted to the frame, of the connections F G and cross-shaft H, all arranged together substantially as described, so that the whole set of casters is operated by moving the single treadle-lever, as specified.

3. The combination of the treadle-lever D G, pin B', and frame, when arranged together substantially as described, so that the treadle-lever may be held or released, when depressed, by moving it laterally, as specified.

6,973. Repairing Pavements. H. W. Gould, Cleveland, Ohio. Patent No. 146,447, dated Jan. 13, 1874. [Filed Jan. 15, 1873.]



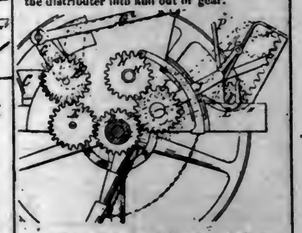
Brief.—Repairs the uneven surface of a wood pavement by placing thereon a coating of concrete, or asphaltum, sand, gravel, hydraulic cement, &c., with or without strips of wood secured in the deep ruts to hold the coating.

1. In combination with the worn-out or uneven superstructure A of a wood pavement, the coating C, substantially as and for the purpose described.

2. In combination with the worn-out or uneven pavement A and superstructure C, the strips D E, substantially as and for the purpose described.

6,974. Hubs for Vehicle-Wheels. C. H. Guard, Tippecanoe City, Ohio, assignor of one-half interest to J. W. Ford, same place. Patent No. 146,260, dated Jan. 6, 1874. [Filed May 21, 1874.]

1. The combination of wooden hub A, having grooves B near the point where the spokes enter the hub, with wire D, wound in the grooves and soldered together, so as to form a solid mass, as described.



2. The wooden hub A, with one or more annular grooves, B, near the point where the spokes enter, in combination with plate-bands C and wire D, filling said grooves, substantially as described.

3. The combination of a metallic band composed of wire and solder with a wooden hub containing annular grooves, as shown and described.

4. The combination of a grooved wooden hub and a metallic band, when said band is wholly or partially held in place, and finished by the application of melted metal, as set forth.

6,975. Grain-Drills. C. B. Fabris, Springfield, Ohio. Patent No. 95,472, dated Dec. 29, 1868. [Filed Jan. 9, 1875.]

Brief.—A grass-seed hopper reversible to front or rear of main hopper. Grain-spouts adjustable to different ranks of drill teeth. A traveling roller for raising the drag-bars. An adjusting device for the lever which throws the distributer into and out of gear.

1. The combination of the lever which supports the intermediate gear-wheel, through which motion is communicated to the distributer-wheels, with the lifting-roller, which raises the drill-teeth, substantially as described, whereby the distributer-wheels are thrown out of action in advance of the raising of the drill-teeth out of the ground.

2. The combination, in a seeding-machine, of the drill-teeth and the devices controlling the delivery of the seed with a traveling lifting-roller, substantially as described.

3. The slipping arm or lever which supports the intermediate gear-wheel, made adjustable for permitting a change of gears, in combination with the lifting-roller, substantially as described, whereby, under any adjustment of speed of the distributers, said distributers will be thrown out of action when the drill-teeth are raised, and into action whenever the said teeth are lowered into operative position.

4. The traveling roller, in combination with a chain or cord, O, arranged and operating substantially as described.

5. The combination, with a grain-drill or seeding-machine, of a removable grass-seed hopper, adapted to be applied either in front or in rear of the main hopper or grain-box, for discharging the grass-seed in front or in rear thereof, as described.

6. A reversible grass-seed hopper, or one adapted to be applied either in front or in rear of the main hopper or grain-box, in combination with mechanism for operating the grass-seed agitator under either arrangement, substantially as described.

7. The combination, with a grain-drill or seeding-machine, of adjustable grain-spouts, constructed substantially as described, and adapted to deliver the grain to the drill-teeth, arranged either in the same transverse line, or each alternate one in rear of the others, as set forth.

8. The eccentric rotating bearings G, in combination with the arm G^1, shaft F, and shaft G^2, for throwing the pinion E into and out of gear.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 7.—NO. 6. TUESDAY, FEBRUARY 9, 1875. PRICE { $5,00 per year—single. / $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1875 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

COMMISSIONER'S DECISIONS.

CRANE *vs.* WHITEHEAD AND ATHERTON.—*Interference.*

[*Appeal from the decision of the Board of Examiners-in-Chief in the matter of the interference between the applications for patent of John E. Crane, filed November 6, 1873, and Whitehead and Atherton, filed July 23, 1873, for* "IMPROVEMENT IN COTTON-OPENERS."—*Decided January 25, 1875.*]

The parties who first embodied an invention in a machine which they kept in operation afterward for actual use, besides manufacturing and selling other machines, are *prima facie* entitled to the patent.

In order to overcome their title their competitor must show that he had not only conceived the invention before them, but had exercised reasonable diligence in perfecting it, and had continued to do so until he had reduced the invention to practice.

The mere filing in the Patent Office of an application for a patent describing the invention, will not be considered a reduction of it to practice for that purpose, nor, it seems, for any other.

THACHER, *Commissioner:*

The facts in this case are not disputed. Whitehead and Atherton had some conversation respecting the invention the last of July or the first of August, 1871. On the 13th of September following they consulted further, and Whitehead drew a sketch of the device which is filed as an exhibit. No further steps were taken until March, 1873, when they commenced the model accompanying their application. About the same time they began the construction of a full-sized machine embodying the invention, which was completed in June, 1873, was put into operation immediately, and has been running ever since. Up to the time of the taking of their testimony thirty additional machines had been built and put into operation. They filed their application for patent July 23, 1873.

The idea of the invention appears to have originated with Crane in 1862. But all that he has done toward the practical development of the idea is to be found in four models filed as exhibits A, B, C, and D, and the model accompanying his application for patent. Exhibits B and D are simply short round pieces of wood, with one or more small swinging beaters attached; those on exhibit D, however, differ from the construction of the beater in controversy. Exhibit C is simply one of the old beater-blades which has been broken. Exhibit A is the only exhibit-model showing any attempt to illustrate a working machine. With these so-called models Crane made some few experiments, but they were of the crudest nature possible, and entirely insufficient to demonstrate the practical utility of the invention. His first attempts consisted in nothing more than putting the bits of wood already mentioned in a foot-lathe, and while operating the lathe feeding a little cotton with the hand over a bar to the revolving beaters. Exhibit A was tried in 1863; it was not in its present condition, however, and consisted simply of a short shaft with four beaters attached. At subsequent periods some additions were made to this model; but it was not until 1873 that it assumed its present form. Experiments were also made with this model by feeding a little cotton to the revolving beaters, but, according to Crane's own statement, with no practical and definite result. The latter part of October, 1873, the model filed with his application for patent was completed, and on the 6th of November following was received in the Patent Office. This is all that Crane has done up to date. Since 1862, when the invention was conceived by him, all that has been accomplished is the production of models more or less complete. The so-called experiments during this period have been very justly characterized by the Examiners-in-Chief as nothing more than laborious trifling.

Now, the law, as construed by the courts, gives the right to an invention to him who first reduces it to practical form by embodying it in a machine in use, or at least ready for use, unless a prior inventor is at the time using due diligence in adapting and perfecting the same invention. (*Russell & Erwin Manufacturing Company* vs. *Mallory*, 2 OFFICIAL GAZETTE, 495; *Coffin* vs. *Ogden*, 5 OFFICIAL GAZETTE, 270.) But before this prior inventor can have any standing in court, he must be able to show that he has also perfected the inven-

tion and made it ready for use; until he has done this he cannot successfully challenge the right of his competitor to the invention which the latter has embodied in operative machinery.

Under the most liberal construction, nothing done by Crane prior to the filing of his application in the Patent Office can seriously be regarded as "reduction to practice." All his models and crude tests may be summarily dismissed as trifling experiments. The only question demanding examination is whether the filing of an application for patent constitutes "reduction to practice?" I am aware that the theory has obtained in the Patent Office that the filing of a complete application for patent is evidence of "reduction to practice," and the Office practice has conformed thereto. I am satisfied, however, that this practice must be modified to accord with the recent decision of the United States Supreme Court in *Brown* vs. *Guild*, (6 OFFICIAL GAZETTE, 392.) In the decision of that case, the court distinctly asserts that a mere application is not a bar to the grant of a patent. It must follow, then, as a logical sequence, that a mere application for patent is not a "reduction to practice;" otherwise it must of necessity bar the grant of a patent to a subsequent applicant. That this is the opinion of the court must be evident from the fact that evidence of actual use of the invention described in an application is demanded to defeat the right of a subsequent inventor who has put the invention into use.

As I understand the decision cited, Crane has not even yet reduced his invention to practice. The condition of the model filed with his application is an indication of the correctness of this view. It has the appearance of being an experimental model only; some dozen or more beaters are shown upon the same shaft, differing materially in construction, so that the best model this applicant has ever made furnishes proof that he has not yet determined what is the proper construction of a beater for actual use—in other words, that the invention, so far as he is concerned, is still in the region of theory.

It is not necessary to examine the question of Crane's diligence, for, as already intimated, that question cannot become material until he has reduced the invention to practice, and in this respect stands upon an equal footing with his competitor. There may be rare instances in which this ruling should be relaxed—for instance, when the nature of the invention is such that the inventor cannot possibly make a practical test of it himself. There is an attempt to show that, in the present instance, it was impossible for Crane to embody his invention in a working machine.

The main plea is poverty; and the force of the argument depends upon the assertion that it would cost not less than $5,000 to make the experiment. On the contrary, it is proved beyond question by Whitehead and Atherton that the test could be and was actually made by them at an expense not exceeding $25, the substitution of the swinging beater for those in common use on the shafts of well-known cotton-openers being all that was required for a practical experiment. There is no doubt that Crane could have found an opportunity to make such an experiment without much difficulty, for he was acquainted with both makers and users of this kind of machine, and he was never so poor as to be unable to make this cheap test. It does not appear, therefore, that this is an exceptional case.

In my opinion, Whitehead and Atherton have the superior right to the invention, and are entitled to a patent therefor.

The decision of the Examiners-in-Chief is reversed.

ROTHSCHILD.—*Appeal; trade-mark.*

[*Appeal from the Principal Examiner in the matter of the application of John W. Rothschild, for registration of a trade-mark.—Decided February* 13, 1875.]

The expressions in the statute "intend to adopt" and "intended to be applied and used," held to authorize the registration of a trade-mark which has been devised and is intended to be used. The right under the statute to adopt and register—distinguished from the common-law right acquired by use.

SPEAR, *Acting Commissioner:*

This is an appeal from the refusal of the Examiner to register a trade-mark. The Examiner refuses this registration by reason of applicant's representation that he has not used, but only intends to use, the trade-mark described in the application. The statute prescribes—

that any person or firm domiciled in the United States and any corporation created by the authority of the United States, or of any State or Territory thereof, and any person, firm, or corporation resident of or located in any foreign country which, by treaty or convention, affords similar privileges to citizens of the United States, and who are entitled to the exclusive use of any lawful trade-mark, or who intend to adopt and use any trade-mark for exclusive use within the United States, may obtain protection, &c.

Further, among the requirements, compliance with which is made necessary to the registration, are—

a description of the trade-mark itself, with fac-similes thereof, and the mode in which it has been or is intended to be applied and used.

Also—

the length of time, *if any*, during which the trade-mark has been used.

This application is made in the precise words of the statute. Applicant does not place himself in the class of those who are entitled to the exclusive use of a trade-mark under the common law, but among those who "intend to adopt and use." The language of the statute is made so plain that it would seem impossible for any one to err therein. Yet this plain language the Examiner assumes to criticise as loose, and interprets it exactly contrary to the obvious meaning by an altogether unnecessary inference drawn from the seventh clause of the section, which requires a declaration under oath "to the effect that the party claiming protection for the trade-mark has a right to the use of the same."

Nothing can be clearer, in my judgment, than that the purpose of the law is to give the protection of registration not only to those who are entitled to the exclusive use of any lawful trade-mark—that is, to those who have acquired title by use under the common law—but also to those who have devised a mark which they may lawfully use, and to which they may acquire the right of exclusive use.

The Examiner confounds the right to adopt and register with the right acquired by use. The right to registration is founded on the adoption of a proper trade-mark, not the property of another party, and the declared intention to use such trade-mark. It was undoubtedly an inadvertence on the part of the Examiner to advise applicant to change his sworn statement from "intends to use" to "commenced to use." It must be presumed that the statement was deliberately made in accordance with the facts; the change, therefore, which the Examiner suggests would have been simply a misstatement.

I see no reason whatever to support the Examiner's decision, and must therefore reverse it.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, DISTRICT OF MASSACHUSETTS.

UNION PAPER-COLLAR COMPANY *vs.* EMERSON LELAND.

[*In equity.—Before* CLIFFORD *and* LOWELL, *Judges.—October*, 1874.]

Where the original patent related to *ornamented* paper collars and cuffs, but the description pointed out that the *surface* of the linen or other textile fabric would be imitated as well as the ornaments—

Held, that the patent was lawfully reissued so as to claim the imitated *surface* as well as the imitated *ornaments*.

Collars and cuffs made of paper being known, and paper embossed in various modes, some of which were imitations of the surface of textile fabrics, being known, there existed no patentable novelty in the application of paper embossed in imitation of linen to the making of collars and cuffs.

The reissued patent of W. E. Lockwood, January 28, 1873, (original dated April 26, 1859,) for ladies' cuffs and collars, the claim of which is for "a collar having a paper surface imitative of the textile face and fiber of a dressed-linen collar, as set forth," held, in view of the state of the art, not to cover patentable subject-matter.

[*W. G. Russell*, for complainant.
A. J. Robinson, for defendant.]

LOWELL, *J.*:

This suit is brought to restrain the infringement of the second reissue of W. E. Lockwood's patent of 1859, the reissue being granted in 1873.

The specification declares the invention to consist of a collar or cuff having a paper surface imitative of the textile surface of a collar or cuff of textile fabric; that in carrying out his invention Lockwood uses a fabric composed of paper and muslin, or equivalent fabric, having a smooth white, polished, or enameled paper surface to represent that of starched linen. It then describes one mode of making the imitation of a linen or muslin surface, by dies, but does not claim nor limit the invention to any particular appliances or machinery for embossing the fabric. The claim is for a collar having a paper surface imitative of the textile face and fiber of a dressed-linen collar, as set forth.

1. The first objection taken is that the reissue is for a different invention from that described in the original patent. The patent appears to have been intended to apply to ornamented collars and cuffs, especially those for ladies' use; but the description of the mode of obtaining the result points out that the surface of the linen or other textile fabric will be imitated as well as the ornaments, and we see no reason why the patent might not lawfully be reissued so as to claim, as it now does, the imitated surface instead of the imitated ornaments, and collars generally as well as those to be worn by ladies. There is no repugnancy nor any introduction of a new invention.

2. The case turns on the question of novelty. It appears by the case brought by this plaintiff against Van Deuzen (reported in 4 Fisher, 597, and 10 Blatchf., 109) that the claim of the first reissue of this patent was for an embossed collar or cuff made of a fabric composed of paper and muslin, or an equivalent fabric. This was held to be no patentable novelty. Judge Blatchford says—

But, as like embossing had been done on starched linen, the result of producing such embossing on a smooth white, polished, or enameled surface representing that of starched linen, cannot be patented as an invention when nothing is claimed as new in the appliance, machinery, or process for producing the embossing. A starched-lined collar with its surface embossed existed before. There was nothing of patentable novelty in the idea that the imitative surface being provided, it would be well to emboss it. The patent does not claim the invention of the imitative surface, or of any means of producing it.

It will be seen that the present form of the patent follows the suggestion, if it be one, of the court, and does lay claim to the imitative surface itself, as used for making collars, and thus avoids, as is contended, the reasoning of that case. But the evidence in the case at bar discloses that paper as well as linen was embossed in various modes, and for many uses, before the date of Lockwood's patent. There is the English patent of De La Rue, taken out in 1834, for embossing paper in parallel lines; and one granted to John Evans, in 1854, for ornamenting paper with an imitation of the patterns of textile fabrics. It may be doubted whether Evans produced upon his paper the surface as well as the ornaments of textile fabrics; but there is proof that paper made in imitation of such fabrics, including linen, was well known and in use for paper-hangings and some other purposes. Samples are produced from papers actually made before 1859, which are of this character. It is said that these imitations are not very well done; but they appear to have been accepted as good enough for the purposes for which they were used, and the patent is not for any improvement in the imitation or in the mode of producing it.

Collars and similar articles made of paper were patented to Walter Hunt in 1854 as a new manufacture; and Lockwood was the owner of this patent when he made the improvement now in controversy.

In this state of the art, collars and cuffs made of paper being known, and paper embossed in various modes, some of which were imitations of the surface of textile fabrics, being known, we are of opinion that there was in 1859 no patentable novelty in the application of paper embossed in imitation of linen to the making of collars and cuffs. (*Hotchkiss* vs. *Greenwood*, 11 How., 248.)

The evidence in the record goes even beyond what we have already mentioned, and renders it probable that paper embossed in imitation of a linen surface was used for collars and cuffs long before the date of the alleged invention, and that such articles were offered for sale in New York and known to several persons. It is true that they were not found to be acceptable to the trade, and they had very probably been forgotten; but they were imitations of linen, and the reasons which operated to prevent their general use were of a commercial and economical character.

Bill dismissed with costs.

EXTENSIONS GRANTED.

31,147.—Improvement in Steamboat-Staging.—Granted to A. JOHN BELL, January 22, 1861.

Claim.—The arrangement of staging C, power-windlass E F G H I, and supporting apparatus J K L, the whole being constructed and operating together, substantially as and for the objects set forth.

31,152.—Improvement in Evaporator for Hot-Air Pipes.—Granted to GEO. F. J. COLBURN, January 22, 1861; reissue No. 1 165, dated April 2, 1861.

Claim.—1. The arrangement of the reflector C, in combination with the evaporating-vessel A and hot-air pipe B, as described, for the purpose of facilitating the evaporation, and to prevent the dust rising into the apartment.

2. Making the evaporating-vessel A, or a portion of the same, of unglazed earthenware, or some other porous material, substantially as and for the purpose specified.

3. Constructing the vessel A of two parts, *a* and *b*, the part *a* to be made of porous material, and the part *b* to contain a lamp-wick or its equivalent, substantially as and for the purpose set forth.

31,153.—Improvement in Needles.—Granted to GEORGE COOPER, January 22, 1861; reissue No. 4, 884, dated April 30, 1872.

Claim.—1. A sewing-needle having the contour or outline of the common sewing-needle, but with a passage extending diagonally toward the needle-point through the metal on one side of the eye to admit the thread into the eye, substantially as described.

2. A sewing-needle having the contour or outline of the common sewing-needle, but formed with a spring lap-joint in the side of the eye to admit a thread past the edge into the eye of the needle, when the spring part of the needle presses by its elasticity up against the under side of the standing part to close and keep closed the eye after the thread has been inserted, substantially as described.

3. A sewing-needle having the longitudinal axis of the eye on one side of the longitudinal axis of the needle, and with a passage extending diagonally through the metal on one side of the eye to admit the thread into the eye, substantially as described.

4. A sewing-needle having the longitudinal axis of the eye on one side of the longitudinal axis of the needle, and with a spring-joint in the side of the eye, so that the thread may be inserted by depressing the spring part of the needle, the elasticity of which part causes it to close up the joint after the thread has passed into the eye, substantially as described.

Disclaimer filed January 16, 1875.

Disclaims the first and third clauses of claim, as above set forth.

31,168.—Improvement in Gas-Regulators.—Granted to C. L. HERRING, January 22, 1861.

Claim.—The application of the curved plates *a a* to the flexible diaphragm C, substantially as described, for the purpose specified.

31,179.—Improvement in Plows.—Granted to WILLIAM JARRALL, January 22, 1861.

Claim.—The combination of the land-side B, sockets *d* and *f*, bolt *e*, and nut *g*, constructed, arranged, and operating in the manner and for the purposes set forth.

31,182.—Improvement in Wood-Bending Machine.—Granted to HIRAM MCDONALD, January 22, 1861; reissue No. 4,548, dated September 12, 1871; reissue No. 4,614; dated October 31, 1871.

Claim.—1. The eccentrics *l m*, sliding plates *o p*, slides *t u*, and keys *r s*, arranged at the outer parts of the lever-beds, as described, to form an improved mode of upsetting the ends of the stripe when under the bending operation.

2. A rigid and non-elastic bed-lever, F, holding the blank straight at every point not intended to be bent, connected by strap J with the former C, and provided with free ends that shift the fulcrum of the lever at every point of its movement, as shown and described, and for the purpose specified.

3. A pivoted clamp, E, with friction-roll *f* between the forks thereof, combined, as described, with a rigid bed-lever, F, as and for the purpose specified.

4. The former-plates D, having hooked and slotted ears *b b'*, and the lever-plates *g g*, having hooks *h* on the lower end, combined with straps J, having a transverse eye for a removable key at each end thereof, for the purpose of fastening said straps in the manner as shown and described.

31,211.—Improvement in Sewing-Machines.—Granted to LEANDER W. LANGDON, January 22, 1861.

Claim.—I claim the combination of the ribbed or corrugated back with the air-chamber and registers, as shown in the accompanying drawings, substantially as described, and for the purposes set forth.

31,214.—Improvement in Sewing-Machines.—Granted to QUARTUS RICE, January 22, 1861; reissue No. No. 5,045, dated August 27, 1872.

Claim.—The combination, substantially as described, of a stitch-forming mechanism, a feed mechanism, and a guide mechanism, relatively arranged, and operating to continuously form, from a flat strip, a tube with edges united by a row or rows of stitches.

34,203.—Improvement in Mechanism for Boot and Shoe Sewing-Machine.—Granted to FRANCIS D. BALLOU, January 22, 1861; reissue No. 2,906, dated March 31, 1868.

Claim.—1. The foot-piece C, when constructed and arranged and used as a guard, or guard and gage, substantially as and for the purposes described.

2. The lip or standard *c*, when constructed, arranged, and used as a guard or gage or support for the shoe, substantially as described.

3. The combination of a guide or guard, substantially as described, with an opener for opening the channel for the action of the needle, substantially as set forth.

4. The presser D, in combination with the adjustable foot-pieces C and C', substantially as described.

5. The bearing-plate B and lip or standard *c*, in combination with the presser-bar, substantially as described.

6. The projecting perpendicular plate B with standard *c*, substantially as and for the purposes described.

7. The combination of the bearing-plate or table E with the lip or standard *c*, substantially as described.

8. The combination of the standard *c* with the foot-piece C, arranged substantially as described, and for the purposes set forth.

9. The supporting, guarding or guiding, and channel-opening mechanism, when combined and arranged, in relation to each other, substantially as and for the purposes set forth.

10. The projecting horizontal table-plate A, provided at its outer edge with a projecting standard, *c*, and arranged so that an opening is formed between the two for the needle, substantially as and for the purposes described.

Disclaimer filed January 12, 1875.

Disclaims the fourth, seventh, and ninth clauses of claim, as above set forth.

39,199.—Improvement in Curry-Combs.—Granted to SARAH JANE WHEELER, January 22, 1861.

Claim.—I claim the combination of single sheet-metal bars, of curry-combs, having concave back edges of a sufficient degree of curvature to give the necessary firmness and strength without the assistance of side projections or supports, but having rivet projections thereon, with a back of corresponding curvature, so as to fit the concave back edges of said bars, and either made of a single piece, so as to be close, or of separate pieces, so as to be open and unobstructed between all the bars, substantially in the manner and for the purposes herein specified.

DISCLAIMERS FILED.

31,172.—Improvement in Needles.—GEORGE COOPER, Thompsonville, Conn.—Patented January 22, 1861; No. 4,884, dated April 30, 1872.—Disclaimer filed January 16, 1875.—Disclaims:

"The first and third clauses of the claim, in the following words, to wit:

"'1. A sewing-needle having the contour or outline of the common sewing-needle, but with a passage extending diagonally toward the needle-point through the metal on one side of the eye to admit the thread into the eye, substantially as described.

3. A sewing-needle having the longitudinal axis of the eye on one side of the longitudinal axis of the needle, and with a passage extending diagonally through the metal on one side of the eye to admit the thread into the eye, substantially as described.'"

34,203.—Improvement in Mechanism for Boot and Shoe Sewing-Machines.—FRANCIS D. BALLOU, Abington, Mass.—Patented January 22, 1861; reissue No. 2,906, dated March 31, 1868.—Disclaimer filed January 12, 1875.—Disclaims:

"The fourth, seventh, and ninth clauses of claim, in the following words, to wit:

"'4. The presser D, in combination with the adjustable foot-pieces C and C', substantially as described.

7. The combination of the bearing plate or table E, with the lip or standard *c*, substantially as described.

9. The supporting, guarding or guiding, and channel-opening mechanism, when combined and arranged in relation to each other, substantially as and for the purposes set forth.'"

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date February 9, 1875.]

8,045 and 8,046.—Carpets.—ROBERT ALLAN, Yonkers, N. Y., assignor to ALEXANDER SMITH & SONS CARPET COMPANY, same place. Applications filed January 29, 1875. Term of patents 3½ years.

8,047.—Agricultural Boiler.—WILLIAM C. DAVIS, Cincinnati, Ohio, assignor to himself, WILLIAM K. BOAL, and SAMUEL P. CHESELDINE. Application filed January 21, 1875. Term of patent 7 years.

8,048.—Carburetors for Gas-Burners.—MICHAEL B. DYOTT, Philadelphia, Pa. Application filed December 16, 1874. Term of patent 7 years.

8,049.—Pocket-Book Frame.—JOSEPH C. HACKER, Brooklyn, N. Y. Application filed January 20, 1875. Term of patent 3½ years.

8,050.—Oil-Cloth.—CHARLES T. MEYER and VICTOR E. MEYER, Bergen, N. J., assignors to EDWARD C. SAMPSON, New York, N. Y. Application filed January 22, 1875. Term of patent 3½ years.

8,051.—Glove-Boxes.—MICHAEL D. MURRAY, ZALMON GILBERT, and LOT OSTROM, Johnstown, N. Y.; said OSTROM assignor to said MURRAY and GILBERT.—Case A. Application filed December 11, 1874. Term of patent 3½ years.

8,052.—Fancy Cassimeres.—FREDERICK S. BOSWORTH, Providence, R. I., assignor to THE WESTBOSSET MILLS, same place. Application filed January 18, 1875. Term of patent 3½ years.

8,053.—Bracket-Cup for Chandeliers.—JOSEPH KINTZ, West Meriden, Conn., assignor to himself and P. J. CLARK, same place. Application filed January 4, 1875. Term of patent 14 years.

8,054 and 8,055.—Lounge.—JOHN B. ROHRER, Philadelphia, Pa., assignor to SAMUEL COOPER, JOHN HALL, and JOSEPH B. COOPER, same place.—Cases C and D. Applications filed November 2, 1874. Term of patents 3½ years.

8,056.—Coffin-Plate.—WILLIAM M. SMITH, West Meriden, Conn., assignor to MERIDEN BRITANNIA COMPANY, same place. Application filed January 18, 1875. Term of patent 14 years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each certificate bearing date February 9, 1875.]

,213.—Spool-Cotton.—J. & P. COATS, Paisley, Scotland. Application filed January 25, 1875.

"a central label of paper formed of concentric circles of black on a light ground, containing on one of the light bands the words 'J. & P. Coats' 'Best six cord,' and on the central black circle the figures and letters '200 yds.,' and a numeral."

2,214.—Kid Gloves.—HARRIS BROTHERS, New York, N. Y. Application filed January 25, 1875.

"a stamp, brand, or design composed of two elliptical lines, one within the other, between which, on each end of the transverse axis, is a small star; between the inner and outer lines, and upon the upper side, the words and letters 'Gant Josephine Bte. S. G. O. G.,' and between the same, on the lower side, the words 'Medailles-Paris-Londres,' and within the inner line the word or name 'Rouillon.' Beneath the whole, and within a line following the line of the lower circle, the words 'or Harris' Seamless,' with a small star at each end."

2,215.—Stoves and Ranges.—MARCH, BROWNBACK & CO., Limerick Station, Pa. Application filed January 26, 1875.

"76."

2,216.—Textile Fabrics.—E. R. MUDGE, SAWYER & CO., Boston, Mass., and New York, N. Y. Application filed January 30, 1875.

"two human figures, one male and the other female, arranged upon a pedestal within a Gothic arch supported upon pillars."

Engine, steam, W. C. Wilcox	150	159,733
Equalizer, draft, E. A. Beers	31	159,558
Equalizer, spring, T. L. Guest	31	159,572
Evaporating pan, J. F. Ferguson	155	159,661
Feed rack, A. V. Mitchell	144	159,601
Fence, wire, J. A. Little	52	159,691
Fifth wheel for vehicles, L. Blair	31	159,492
Fire arm, magazine, E. A. Prescott	18	159,609
Fire arms, reversible firing pin for breech loading, J. M. Marlin	18	159,592
Fire escape, Fuchslocher and Schmid	30	159,571
Flame regulator, G. M. Hopkins	64	159,677
Floral stand for windows, G. Hills	63	159,676
Flour dressing machine, M. Martin	57	159,694
Fowls, apparatus for feeding, A. DeGaris	116	159,649
Furnace for smelting lead ores, J. A. Hamilton	99	159,669
Furnace, quicksilver, C. A. Luckhardt	99	159,692
Furnaces, door for feeding straw to, W. F. Morgan	149	159,524
Furniture drawer, J. J. Fox	62	159,570
Gas generator, carbonic acid, O. Zwietusch, (reissue)	1	6,287
Gas light governor, N. Tufts	64	159,721
Gas regulator, F. W. Wiesebrock	64	159,731
Gas regulator, F. W. Wiesebrock	64	159,732
Gas, treating hydrocarbons for making, H. H. Edgerton	47	159,655
Gate, automatic, H. N. Burnham	52	159,641
Gate, farm, S. S. Davis	52	159,648
Glass plates, apparatus for beveling, J. V. Laurent	68	159,518
Glassware, covered, T. B. Atterbury	68	159,628
Glassware, hollow pressed, W. Leighton, Jr	68	159,519
Gold, extracting, F. W. Dähne	99	159 647
Goods in bulk, apparatus for transferring, L. Dathis	122	159,566
Grading apparatus, J. McGavin	51	159,594
Grain binder, M. L. Gorham	74	159,506
Grain drill, W. Brown	133	159,638
Grinding apparatus, C. Van Haagen	70	159,723
Hair holder, E. J. Ineely	161	159,578
Harness hanging frame, X. Whiting	144	159,730
Harrow, riding, E. E. Leach	73	159 690
Harvester, C. K. Myers	74	159,604
Hay gatherer, C. T. Noell	77	159,605
Heater, feed water, R. Wetherill	148	159,728
Heating device, water, E. R. Stilwell, (reissue)	147	6,286
Hinge, J. Kaufman	24	159,682
Holdback, adjustable, S. R. Rood	31	159,711
Hood, Brugger, and Christophe	39	159,497
Horse check, Sugden and Gaffney	31	159,529
Horse feeding support, A. H. Spencer	144	159,617
Ice pick and strainer, combined, T. Hagerty	88	159,545
Injectors, attachment for, D. Lees	148	159,587
Inkstand cover, Wallis and Harback	146	159,724
Iron and steel, manufacture of, C. W. Siemens	85	159,712
Journal box, Ives and Leary	87	159,579
Knife and nippers, combined oyster, R. T. Megee	88	159,598
Knob, door, J. W. Haines	93	159,509
Ladder, D. Argerbright	30	159,627
Ladder, extension, J. B. Mahony	30	159 521
Lamp, H. G. Moehring	90	159,700
Lamp extinguisher, A. Umbolts	90	159,621
Lamp globe holder, R. B. Perkins	90	159,606
Lamp support, L. M. Kent	31	159,683
Latches and locks, case for reversible, J. Kinzer, (reissue)	93	6,282
Lath bolting machine, J. C. Mackey	174	159,591
Loom, J. Dornan	95	159,653
Loom yarn beam, L. J. Knowles	95	159,686
Matches, manufacture of, Andrews and Tucker, (reissue)	174	6,276
Mill, fanning, A. Y. Felton	159	159 569
Mill spindle, W. Elliot	57	159,567
Millstones, tool for dressing, J. Norman, (reissue)	153	6,283
Miter box, H. Hempel	29	159 573
Mitering machine, U. P. Poinier	29	159,552
Mowing machine, P. W. Brownback	74	159,496
Nut lock, J. J. Gray	14	159,508
Nut lock, B. J. Noonan	14	159,706
Nut or collar lock, E. Barrowclough	14	159,491
Organ pneumatic action, R. Nicholls	106	159,705
Organ reed board, J. R. Lomas	106	159,590
Oven, desulphurizing, J. C. Brewster, (reissue)	99	6,278
Packing, piston, J. W. Hill	151	159,675
Paint oil compound and process of preparing same, D. S. Robineon	107	159,710
Paint package, J. T. Hunt	107	159,680
Pants and other garments, G. R. Eager, (reissue)	38	6,280
Paper bag machine, C. H. Kellogg	109	159,582
Paper box, L. A. Kettle	109	159,684
Paper, figured writing, La Monte and Hall	146	159,516
Paper, ornamenting writing, La Monte and Hall	108	159,515
Pavement, wood, C. H. Miller	110	159,699
Pen and pencil case, J. Holland	146	159,513
Photographic plate holder, E. L. Bergstreaser	111	159,537
Picture and similar frames, compound for the manufacture of, A. N. Atwood	54	159,629
Picture frames, compound for, Wilson and Gerry	54	159,555
Planter, corn, A. Staley	133	159,618
Plow, sulky, J. C. Carns	114	159,642
Power, obtaining motive, C. Faivre	67	159,660
Press, cotton, Brooks and Lavender	7	159,637
Press, hay, H. E. Skillin	7	159,713
Press, hay and cotton, W. A. Wright	7	159,736
Press, punching, W. E. Brooke	119	159,495
Printing spools, machine for, I. and G. Dimock	117	159,651
Pulley, N. H. Borgfeldt	87	159,633
Pump, G. W. Hooper	118	159,576
Pump, pneumatic, G. Westinghouse, Jr	12	159,533
Pumps, float for suction pipes of, Meitzler and Haase	118	159,509
Purifier, middlings, W. J. Fender	57	159,505
Railway rail chair, J. L. Stewart	190	159,715
Refrigerator floor, J. Tiffany	58	159,718
Retorts, lid for, Herzog and Koch	66	159,671
Rolling pin, P. Cavalier	88	159,643
Safe, G. Damen	128	159,565
Sandpapering machine, V. Hepp	173	159,574
Sash fastener, W. Horbort	24	159 678
Saw borring tool, F. J. Martin	131	159,593
Saw filing machine, F. W. Benjamin	131	159,631
Saw frame, W. Clemson	131	159 564
Saw mill, C. Lindner	130	159,589
Separator, grain, M. D. Judkins	159	159,581
Sewing machine, E. S. Hill	134	159 673
Sewing machine, Hirons and Moore	134	159,575
Sewing machine balance wheels, anti-rattling journal for, P. L. Reese, (reissue)	134	6,284
Shawl strap bar, R. Speer	162	159,616
Shelf, folding store, M. P. Key	62	159,583
Shingle bands, machine for cutting, Britton and Chamberlin	174	159,493
Shirt, C. E. Sutphen	38	159 554
Shoe, C. F. Hill, (reissue)	16	6 281
Shoe, G. D. Hill	16	159 674
Shoe blacking case, W. H. Morse	22	159,602
Shoe shanks, machine for making metal, J. Hyslop, Jr	16	159,577
Shoe shave, T. Harrington	16	159,548
Shoes, Die for forming spring shanks for, E. Briner	16	159,559
Sifter, ash, J. H. Goodfellow	154	159,666
Sifter, ash, J. H. Goodfellow	154	159,668
Sifter for stoves, ash, G. G. Wolfe	154	159,735
Sifting device, ash, J. H. Goodfellow	154	159,667
Sign, illuminated, F. McLewee	146	159,596
Sign, street, G. B. King	146	159,550
Size compound, T. Ende	71	159,504
Slate frame, J. W. and C. M. Hyatt	146	159 681
Sled, bob, J. Wampach	31	159,623
Soap compound, B. F. Burke	35	159 640
Soldering machine, G. W. Fisher	136	159 512
Spike, G. N. Sanders	103	159,611
Spindles, apparatus for oiling, Buttrick and Flanders	87	159,499
Staves, machine for crozing, A. B. Kingsbury	40	159,551
Steam and air brake, W. M. Henderson	122	159 512
Steel plates, tempering, Disston and Shoemaker	85	159 652
Stencil plate, G. E. Warren	54	159,725
Stereotype matrices, stretcher for, Mayall and Hartnett	164	159,606
Stool, folding camp, E. Ducker	62	159,654
Stove, cooking, J. H. Wentworth	154	159,727
Stove, heating, G. W. Herrick	154	159,670
Stove pipe shelf, J. Emmert	154	159,657
Stove platform, W. Evans	154	159,659
Stoves, ash sifter for, G. G. Wolfe	154	159,735
Stoves, grate for heating, C. G. Marshall	154	159,693
Street sprinkler, J. N. Buchanan	167	159,498

	Class No.	No. of Patent.
Sugar, manufacture of, J. S. Oliver	155	159,525
Table, folding, H. York	92	159,737
Table, ironing, A. Larkin	91	159,688
Tanning apparatus, E. C. Haserick	92	159,510
Teeth, composition for filling, E. Erienmeyer	46	159,568
Telegraph apparatus, M. Gally	50	159,664
Thill coupling, E. Soper	31	159,615
Thrashing machines, band cutting feeder for, D. Frost	159	159,663
Tire upsetter, Reimold and Stoddard	60	159,708
Tobacco cutter, W. Smith	160	159,714
Tool, combined, A. Button	29	159,561
Toy gun, B. De Long	143	159,502
Track clearer, Blackford and McMullen	122	159,632
Umbrella rib, H. Winter	165	159,624
Valve seat, slide, J. Wheelock	159	159,729
Vehicle brake, W. Fletcher	31	159,543
Vehicle poles, iron tip for, J. A. Ellis	31	159,503
Vehicle running gear, J. Becker, Jr	31	159,630
Vehicle running gear, J. Stirk	31	159,528
Vehicle wheel, S. B. Fuller	31	159 544
Vehicles, fifth wheel for, L. Blair	31	159,492
Velocipede, Crother and Bergernon	31	159,564
Velocipede, W. Knight	31	159,584
Vessels, fender for, Wood and Wentworth	137	159,535
Wagon jack, J. B. Webster	79	159,726
Washing machine, F. M. Myers	91	159,603
Washing machine, S. W. Shanks	91	159,613
Water wheel, J. W. Ross, (reissue)	168	6,285
Water wheel, A. N. Wolf	168	159,734
Weather board gage, D. M. Mefford	29	159,597
Wire, manufacture of, W. L. Reynolds	163	159,610
Wood molding machine, H. A. Holt	173	159 514
Wringing machine, J. Allender, (reissue)	91	6,288
Wringing machine, J. Allender, (reissue)	91	6,289

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED FEBRUARY 9, 1875.

	Patent No.
Albright, A., assignee, (reissue)	6,279
Allender, J., Wringing machine, (reissue) 6,288,	6,289
American Invention Company, assignee	159,597
Ames Iron Works, assignee	159,524
Anderson, H., and J. F. Houghton, Broom machine, (reissue)	6,275
Andrews, E., and W. Tucker, Manufacture of matches, (reissue)	6,276
Ansart, C. B., Dental engines tooth polishing attachment	159,626
Argerbright, D., Ladder	159,627
Atterbury, T. B., Covered glassware	159,628
Atwood, A. N., Compound for the manufacture of picture and other frames	159,629
Bailey Washing and Wringing Machine Company, assignee, (reissue) 6,288,	6,289
Ball, C. E., and S. L. Wiegand, Argand gas burner	159,557
Barbour, P., assignee	159,648
Barckhan, J. E. G., assignee	159,678
Barrowclough, E., Nut or collar lock	159,491
Baxter, W. H., assignee	159,556
Becker, J., Jr., Vehicle running gear	159,630
Beers, E. A., Draft equalizer	159,558
Benjamin, F. W., Saw filing machine	159,631
Bergernon and Crother	159,564
Bergstresser, S. L., Camera	159,536
Bergstresser, S. L., Photographic plate holder	159,537
Blackford, A., and G. McMullen, Track clearer	159,632
Blair, L., Fifth wheel for vehicles	159,492
Bodine, J. H., assignee	159 619
Borgfeldt, N. H., Pulley	159,633
Bovey, G. C., Brick machine	159,634
Bowler, J. A., Argand burner	159,635
Boyden, W. A., Car coupling	159,636
Brackett, S. A., and W. W. Whitcomb, Seam for boots, &c., (reissue)	6,277
Brewster, J. C., Desulphurizing oven, (reissue)	6,278
Briner, E., Die for forming spring shanks for shoes	159,559
Britton, J. W., and F. L. Chamberlin, Machine for cutting shingle bands	159,493
Brock, S. O., Manufacture of cornices	159,494
Brooke, W. E., Punching press	159 495
Brooks, R. M. and J. M., and J. S. Lavender, Cotton press	159,637
Brower, G. S., G. W., and E. A., Wheel cultivator	159,560
Brown, W., Grain drill	159,638
Brownback, P. W., Mowing machine	159,496
Brugger, J., and S. Christophe, Hood	159,497
Buchanan, J. N., Street sprinkler	159,498
Burger, T. W., and J. A. Graff, Canister	159 538
Burgess, D. F., Baby jumper	159,639
Burke, B. F., Soap compound	159,640
Burnham, H. N., Automatic gate	159,641
Burnham, W. H., assignee	159,724
Burns, S. E., Corset	159,539
Button, A., Combined tool	159,561
Buttrick, C. G., and T. B. Flanders, Apparatus for oiling spindles	159,499
Byrn, E. W., Coal hod	159,540
Carns, J. C., Sulky plow	159,642
Carson, J. W., assignee	159,557
Cavalier, P., Rolling pin	159,643
Chaffee, C. S., assignee	159,509
Chalfant, F. and J., Device for warming and ventilating railway cars	159,541
Chamberlin and Britton	159,493
Children, E., Cultivator	159,500
Christophe and Brugger	159,497
Clemson, W., Saw frame	159,562
Cochran, W. J., Car wheel	159,644
Cogswell, T., Cabinet for dentists' use	159,501
Collins, J. W., End gate fastening	159 563
Corse, S., Car starter	159,645
Crother, E., and M. Bergernon, Velocipede	159,564
Daby, A. W., Child's carriage	159,646
Dahne, F. W., Extracting gold	159,647
Damen, G., Safe	159,565
Dathis, L., Apparatus for transferring goods in bulk	159 566
Davis, S. S., Farm gate	159,648
Dean, W. B., assignee	159,610
De Garis, A., Apparatus for feeding fowl	159,649
De Long, B., Toy gun	159,502
Dent, W., assignee	159,551
Dickson, J. R., Bee hive	159,650
Dimock, I. and G., Machine for printing spools	159,651
Diston, H., and C. T. Shoemaker, Tempering steel plates	159,652
Dornan, J., Loom	159,653
Dorrington, W. J., assignee	159,550
Dougherty, W. E., assignee	159,636
Ducker, E., Folding camp stool	159,654
Durham, R. C., Rubber coated buckle and ring, (reissue)	6,279
Eager, G. R., Pants and other garments, (reissue)	6,280
Edgerton, H. H., Treating hydrocarbons for making gas	159,655
Elliot, W., Mill spindle	159,567
Ellis, J. A., Iron tip for vehicle poles	159,503
Emery, C. B. and S. W., Anti-friction device for car wheels	159,656
Emmert, J., Stove pipe shelf	159,657
Ende, T., Size compound	159,504
Erienmeyer, E., Composition for filling teeth	159,568
Eustace, M. and J., and T. Kennan, Machine for thinning and spacing crops	159,658
Evans, W., Stove platform	159,659
Faivre, C., Obtaining motive power	159,660
Felton, A. Y., Fanning mill	159,569
Fender, W. J., Middlings purifier	159,505
Ferguson, J. F., Evaporating pan	159,661
Fisher, G. W., Soldering machine	159,542
Flanders and Buttrick	159,499
Fletcher, W., Vehicle brake	159,543
Foss, C. H., Clevis	159,662
Fox, J. J., Drawer for furniture	159,570
Frost, D., Band cutting feeder for thrashing machines	159,663
Fry, A., & Co., assignees	159,534
Fuchslocher, C. A., and F. A. Schmid, Fire escape	159,571
Fuller, S. B., Vehicle wheel	159,544
Gaffney and Sugden	159,529
Gally, M., Telegraph apparatus	159,664
Ganthey, M. M. E., Metallic cartridge	159,665
Gerry and Wilson	159,555
Gisainger and Johnston	159,580
Goodfellow, J. H., Ash sifter	159,666
Goodfellow, J. H., Ash sifting device	159,667
Goodfellow, J. H., Ash sifter	159,668
Gorham, M. L., Grain binder	159,506
Gorham, M. L., Cultivator	159,507
Graff and Burger	159,538
Gray, J. J., Nut lock	159,508
Griffith, U., assignee	159,605
Guest, T. L., Spring equalizer	159,573
Haase and Meitzler	159,509
Hagerty, T., Combined ice pick and strainer	159,545
Haight, E., assignee	159,699
Haines, J. W., Door knob	159 509
Hall and La Monte 159,515,	159,516
Hamilton, J. A., Furnace for smelting lead ores	159,669
Hanmore, J. W., Boiler covering	159,546
Harbach and Wallis	159,724
Harlow, W. C., Animal shearing machine	159,547
Harrington, T., Shoe shave	159,548
Harriott and Mayall	159,696
Harvey, E. O., Clevis	159,549
Harwood, J. A. and N., assignees	159,606
Haserick, E. C., Tanning apparatus	159,510
Haskell, C., assignee	159,610
Hatch, J. H., assignee	159,709
Hay, A., assignee	159,598
Hempel, H., Miter box	159,573
Henderson, W. M., Hydraulic car brake	159,511
Henderson, W. M., Steam and air brake	159,512
Hepp, V., Sandpapering machine	159,574
Herrick, G. W., Heating stove	159,670
Herrman and Herchelrode Manufacturing Company, assignee	159,675
Herzog, L. and R. Koch, Lid for retorts	159,671
Higgins, W. S., Carriage spring	159,672
Hill, C. F., Shoe, (reissue)	6,281
Hill, E. S., Sewing machine	159,673
Hill, G. D., Shoe	159,674
Hill, J. W., Piston packing	159,675
Hills, G., Floral stand for windows	159,676
Himrod, P., assignee, (reissue)	6,278
Hirons, W., and J. D. Moore, Sewing machine	159,575

	Patent No.
Holland, J., Pen and pencil case	159,513
Holt, H. A., Wood molding machine	159,514
Hooper, G. W., Pump	159,576
Hopkins, G. M., Flame regulator	159,677
Horbors, W., Sash fastener	159,678
Houghton and Anderson, (reissue)	6,275
Howard, F. A., assignee	159,559
Hunt, F. R., Combined car coupling, heater joint, and brake pipe	159 679
Hunt, J. T., Package for paints	159,680
Hunt, J. W., assignee, (reissue)	6,285
Hyatt, J. W. and C. M., Slate frame	159,681
Hyslop, J., Jr., Machine for making metal shoe shanks	159,577
Inesley, E. J., Hair holder	159,578
Ives, L. J., and J. Leary, Journal box	159,579
Jenkins, H. H. and G. O., assignees	159,577
Johnston, A. M., and S. Gissinger, Safety valve for steam boilers	159 580
Johnston and Stephen, assignees	159,554
Jordan, J. C., assignee, (reissue)	6,276
Judkins, M. D., Grain separator	159 581
Kauffman, J., Hinge	159,682
Kellogg, C. H., Paper bag machine	159,582
Kennan and Eustace,	159,658
Kent, L. M., Lamp support	159,683
Kettle, L. A., Paper box	159,684
Key, M. P., Folding store shelf	159 583
King, G. B., Street sign	159 550
King, M. D. and L. B., assignees	159 726
Kingsbury, A. B., Stove grating machine	159,551
Kinzer, J., Case for reversible latches and locks, (reissue)	6,282
Kittoe, E. F., Spud for dredging machines	159,685
Kivett and Parker	159,607
Knight, W., Velocipede	159 584
Knowles, L. J., Yarn beam for looms	159,686
Koch and Hersog	159 671
Kurz, C., Carriage curtain fastener	159 585
Lamb, D. M., Dental plate	159,687
La Monte, G., and J. H. Hall, Ornamenting writing paper	159,515
La Monte, G., and J. H. Hall, Figured writing paper	159,516
Lane, W. J., Coffee mill	159,517
Lane, Z. M., Awning hook	159,586
Larkin, A., Ironing table	159,688
Laurent, J. V., Apparatus for beveling glass plates	159,518
Lavender and Brooks, assignees	159,637
Leach, E. E., Wheel cultivator	159,689
Leach, E. E., Riding harrow	159,690
Leary and Ives	159,579
Lees, D., Attachment for injectors	159,587
Leighton, W., Jr., Hollow pressed glass ware	159,519
Lewis, J. M., Child's carriage	159,588
Lindner, C., Saw mill	159,589
Little, J. A., Wire fence	159,691
Lomas, J. R., Organ reed board	159,590
Luckhardt, C. A., Quicksilver furnace	159 692
Lyon, E. D., Rotary engine	159,520
Mackey, J. C., Lath bolting machine	159,591
Mahony, J. B., Extension ladder	159,521
Marlin, J. M., Reversible firing pin for breech loading fire arms	159,592
Marshall, C. G., Grate for heating stoves	159,693
Martin, F. J., Saw burring tool	159,593
Martin, M., Flour dressing machine	159,694
Massing, W., assignee	159,699
Mathewson, T. A., Tap for casks	159,522
Matteson, L. and W., Car coupling	159,695
Mayall Power Printing Press Company, assignee	159,696
Mayall, T. J., and R. W. Hartnett, Stretcher for stereotypematrices	159,696
McGavin, J., Grading apparatus	159,594
McGill, G. W., Corset steel	159,595
McLean, W. H., Car replacer	159,697
McLewee, F., Illuminated sign	159,596
McMullen and Blackford	159,632
Mefford, D. M., Weather board gage	159 597
Megee, R. F., Combined oyster knife and nippers	159,598
Meltzler, C., and G. H. Haase, Float for suction pipes of pumps	159,599
Merrill, R. S., W. B., and J., assignees	159,700, 159,701
Meyer, A., Churn	159,600
Miller, C. H., Wood pavement	159,699
Miller, E., & Co., assignees	159,608
Milne, J. O., Cultivator	159,523
Milne, J. O., Bag tie	159,698
Mitchell, A. V., Feed rack	159,601
Moehring, H. G., Lamp	159,700
Moehring, H. G., Lamp burner	159,701
Moffit, J. R., Machine for making boot and shoe counters	159,702
Moore and Hirons	159,575
Morgan, W. F., Door for feeding straw to furnaces	159,524
Morse, W. H., Shoe blacking case	159,602
Myers, C. K., Harvester	159,604
Myers, F. M., Washing machine	159,603
Nellis, A. J., Machine for painting bale ties	159,703
Nellis, A. J., Bale tie	159,704
Newberry and Verbryck	159,622

TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED FEBRUARY 9, 1875.

159,491. NUT OR COLLAR LOCKS. Edward Barrowclough, Chester, Pa. [Filed Jan. 8, 1875.]

The split nut or collar consisting of two parts recessed on their opposite exterior edges, in combination with the clamp *f* or side bolts, the strap or straps *g*, and the devices for fastening each strap or straps, substantially as set forth.

159,492. FIFTH-WHEELS FOR VEHICLES. La Fayette Blair, Painesville, Ohio. [Filed Oct. 30, 1874.]

Brief.—The upper segment is secured to the reach and the head-block, and the lower segment to the axle. The lower segment is provided with a slot, through which the king-bolt passes, permitting side movement. The whole forms a spherical joint.

1. The plate or bearing C, provided with inner and outer spherical surfaces and means for attachment to the axle, substantially as and for the purposes described.

2. The combination, with the plate C, of the king-bolt K and the elongated slot *i*, substantially as and for the purposes described.

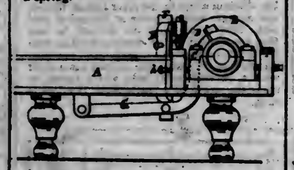
3. The combination, with the plate C, of the box A, substantially as and for the purposes described.

4. The combination, with the plate C and box A, of the plate C' and clips *b*, substantially as and for the purposes described.

5. The combination, with a hollow spherical bearing-plate, C, of the spherical cap-plate B and king-bolt K, the said king-bolt starting from the under side of the plate C, substantially as and for the purposes described.

6. The combination, with the spherical cap B, of the reach box G, substantially as and for the purposes described.

7. The combination, with the plate C' and the reach-box G, of the brace H, attached rigidly to the said plate and hinged to the reach-box, substantially as and for the purposes set forth.

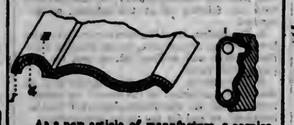


8. The combination, with the plates C and B and king-bolt K, of the head-block D and shoulder *h*, substantially as and for the purpose described.

9. The combination, with the plates C and B, head-block D, and spring E, of the king-bolt K, starting from the under side of the plate B, and the nut *c*, as set forth.

10. The combination of box A, plates C and B, reach-box G, head-block D, king-bolt K, and elongated slot *i*, substantially as and for the purposes described.

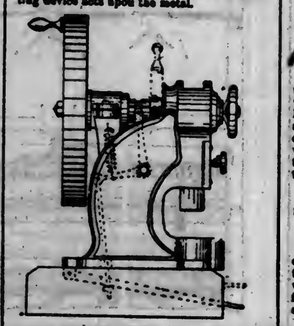
159,493. MACHINES FOR CUTTING SHINGLE-BANDS. Jos. W. Britton and Franklin L. Chamberlin, Cleveland, Ohio. [Filed Nov. 10, 1874.]



Brief.—The revolving cutter D projects spirally from the roll B. The punches are carried by a cross-bar of a gig, C, hinged to the frame at E, which is alternately depressed by pins *d* in the ends of the roll, and elevated by a spring.

1. The gig-frame F, arms G G, spring C, punches *a*, punch-plate *c*, and table A, in combination with the roller B and pins *d*, substantially in the manner as described, and for the purpose specified.

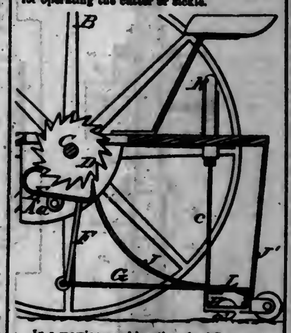
2. The adjustable roller B and blade D, in combination with the edge *e* of the table A, frame F, arms G, spring C, punches *a*, and the table A, substantially in the manner as described, and for the purpose set forth.



159,494. MANUFACTURE OF CORNICES. S. O. Brock, Watertown, Mass. [Filed Jan. 5, 1875.]

As a new article of manufacture, a cornice composed of the veneer H, paper I, and veneer G, the grains of the veneers being arranged in opposite directions, and cemented to the paper, and the whole molded or formed in a heated matrix, substantially as and for the purpose specified.

159,495. PUNCHING-PRESSES. William B. Brooks, Trenton, N. J. [Filed Feb. 20, 1874.]



Brief.—The bottom line of the thread is at right angles to the axis of the bolt, its side vertical, and its upper part inclined inward; the thread of the nut being similarly formed to coincide therewith. The improved construction gives a broader and stronger base to the thread of both nut and screw, to meet the great resistance at the time when the cutting device acts upon the metal.

The construction of these parts, and the arrangement of them in relation to each other, as hereinbefore described and shown, the stock being an integral solid block of metal, having a rectangular mortise entirely through it, and the nut and its screw connection having threads of the form shown and described, and the nut fitting closely between the upper and lower walls of the mortise.

159,496. MOWING-MACHINES. Penrose W. Brownback, Limerick, Pa. [Filed Sept. 12, 1874.]

Brief.—Arrangement of devices as claimed for operating the cutter or sickle.

In a mowing-machine, the wheel D on axle C, in combination with lever E, rods F G, lever L, rod *r*, and sickle H, substantially as described.

159,497. HOODS. John Brugger and Sebastian Christophe, Manchester, N. H. [Filed Dec. 5, 1874.]

As a new and improved article of manufacture, a knit hood composed of woolen yarn, worsted, &c., constructed with the sections C D, for covering the face, and the sections E and F, for protecting the neck, shoulders, and chest, the article being open in front, and provided with means for keeping it closed over the face, neck, and chest when worn, substantially as described and specified.

159,498. STREET-SPRINKLERS. James N. Buchanan, Chicago, Ill. [Filed Nov. 9, 1874.]

Brief.—The sprinkler-head is divided into compartments by means of horizontal partition-plates. Water-supply pipes communicate with each compartment. The water issues from one or more compartments, as may be desired.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

160,499.

A street-sprinkler divided into two or more compartments formed by horizontal plates or partitions, in combination with a sufficient number of supply-pipes, wherein one or more of the compartments may be used as described, and for the purpose specified.

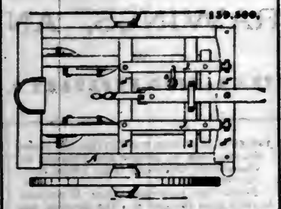
160,499. APPARATUS FOR OILING SPINDLES. Charles C. Batcrick and Timothy B. Flanders, Holyoke, Mass. [Filed Oct. 9, 1874.]

Brief.—The oil supplied at a point above descends through ducts provided for the purpose, to lubricate successively the bolster, whirl, cap, and step, and be received in a reservoir beneath.

1. The combination, with the live spindle of a spinning-frame, of the bolster B, whirl W, sleeve F, cap C, step A, bearing G, and reservoir E, all constructed, arranged, and operating substantially in the manner described.

2. The bolster B, having an oil cup or chamber in its upper end, communicating by a suitable orifice with its bore, the bolster being so prolonged as to extend down through the bolster-rail into the top of the whirl, as specified.

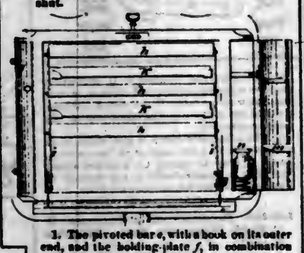
3. In combination with the cap C, the sleeve F, provided with a cup at its upper end, and with the holes a a at its lower end, for the purpose of conducting the oil from the whirl to the cup, as described.



4. The cap or lower bearing G, constructed as described, and provided with the wings w, holes c, and notched bottom disk, as and for the purpose set forth.

160,500. CULTIVATORS. Edwin Childress, Dunleith, Ill. [Filed Oct. 9, 1874.]

Brief.—The tongue is pivoted near its center, and, together with the front end of the plow-beams, attached to a laterally-vibrating frame operated by a lever.



The combination of the pivoted draft-pole C and lever E with the swing-arms J J, provided at their forward ends with rollers i i, resting upon the front timber S' of the cultivator-frame, the said swing-arms being pivoted at the center beam S and to the plow-beams, supporting sway-beam H, and connected by a link, c, to the draft-pole, substantially as specified.

160,500.

160,501. CABINETS FOR DENTISTS' USE. T. Cogswell, Boston, Mass. [Filed Oct. 10, 1874.]

Brief.—The hook on the end of the pivoted bar slides in a slot in the inner face of the lid and engages with the plate at the end of said slot. Shelves or trays are pivoted to bars that are pivoted to the cabinet, so that such trays can be kept in a horizontal position. The door at the end of the cabinet has a shelf with a beveled under side, which serves to cover the mouth of a bottle when the door is shut.

1. The pivoted bar e, with a hook on its outer end, and the holding-plate f, in combination with the folding lid of the cabinet, as described.

2. The shelves h and the bars i, pivoted to the lower part of the cabinet, in combination with the cabinet and folding lid, as and for the purpose set forth.

3. The shelf m, beveled on its under side, as shown, and attached to the door l, in combination with an elastically-supported bottle-inkstand, as and for the purpose described.

4. A cabinet or case constructed with the movable shelves h and bars i, the shelves h, and the folding lid d, all as and for the purpose set forth.

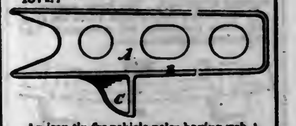
160,502. TOY GUNS. Baltis De Long, Washington, D. C. [Filed Feb. 5, 1874.]

Brief.—Avoids the use of a barrel, which, with different-sized missiles, carries variably, by a sliding carrier that rides on a guide-piece, and is propelled by a spring.

160,502.

1. In a toy gun, the combination of the sliding carrier and the ball or missile holder, removable therefrom, substantially as described.

2. In a toy gun provided with a guide and carrier sliding thereon, a whistle attached to or forming a part of said carrier, for the purpose set forth.



3. The combination, in a toy gun, of a missile-carrier, holder, and guide, the carrier embracing the guide, and having the holder secured to said carrier, substantially as described.

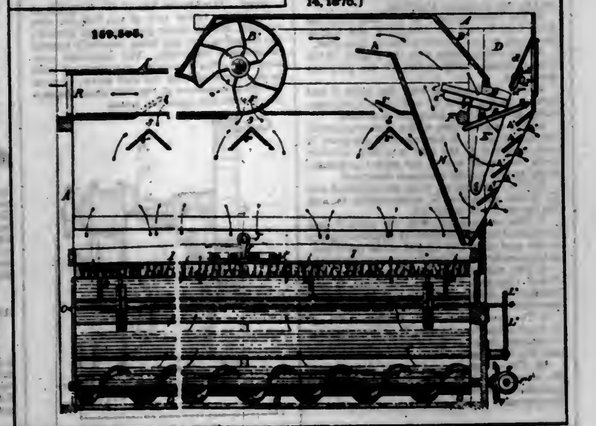
4. The combination, in a toy gun, of a guide and missile-carrier, the carrier embracing and sliding upon the guide, when propelled by spring-power arranged to limit the forward movement of the carrier, substantially as described.

5. In combination with a toy gun, the removable guide B, substantially as described.

6. In a toy gun, the grooved rammer K, substantially as described.

160,503. IRON TIPS FOR VEHICLE-POLES. J. Alder Ellis, Chicago, Ill. [Filed Dec. 24, 1874.]

An iron tip for vehicle-poles having web A, flange B, and projection C, substantially as and for the purposes specified.



160,504. SEED COMPOUNDS. Thomas Rado, New York, N. Y. [Filed Dec. 15, 1874.]

Brief.—Irish moss dissolved in water and boiled. Solution of gum-arabic, solution of chloride of potash, and carbolic acid are then added and thoroughly mixed while warm; then strain to remove impurities.

A size composed of Irish moss, gum-arabic, chlorate of potash, and carbolic acid, substantially as described.

160,505. MISCELLANEOUS PURPOSES. William J. Fender, Minneapolis, Minn. [Filed Jan. 14, 1875.]

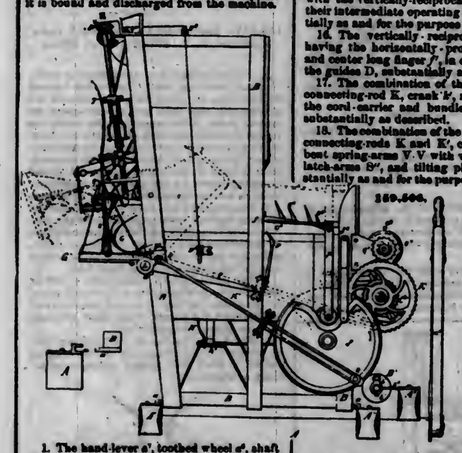
160,505.

1. The feeding-device composed of the vibrating bottom E, pivoted arms E', arms e', adjustable connection e'', and distributer G, in combination with the devices that actuate them, substantially as described.

2. The inclined gathering-strips h' and openings h'' between them, to admit air that is made to impinge upon the meal and separate the light particles from the middlings before the middlings fall into the shaker, in combination with the distributer G, substantially as described.

3. The combination, with the eccentric b', of the yoke b'', the yielding connecting-rod f'', and rod J, rigidly connected to yoke b'', whereby motion is given to a vibrating feed device and a reciprocating shaker from the same shaft, substantially as described.

4. The combination of the rock-shaft J', arm j', and adjustable lugs j'' j'', with the shaker I, constructed and operating substantially as described.



5. The combination of the revolving worm-gear wheel c''', toothed wheel K, connecting-rod L, segmental gear L', pinion L'', shaft O, pulleys O', band o', and guides p' with the brush P, substantially as described.

6. The projections p p on the under side of the shaker-frame I, in combination with the reciprocating brush P for cleaning it, substantially as described.

7. In a machine for purifying middlings, the transversely-reciprocating brush P, arranged to be carried across the entire width of the bolt-cloth of the shaker, and returning its movement off of the cloth, and returning in the opposite direction in the same plane, substantially as and for the purpose described.

160,506. GRAIN-BINDERS. Marquis L. Gorham, Rockford, Ill. [Filed Sept. 12, 1874.]

Brief.—The cut grain is delivered into the receiver, and is carried from there by vibrating segments to the binding-receptacle, where it is bound and discharged from the machine.

1. The hand-lever a', toothed wheel a'', shaft a''', gear-wheel a'', and rack a''', in combination with the frame B of a grain-binder, constructed substantially as and for the purpose described.

2. The revolving crank-shaft O', having cranks o o, in combination with the segments C', having the feed-teeth c'' and their intermediate operating parts, substantially as described.

3. The reciprocating segments C', having the feed-teeth c', in combination with the guides D, as and for the purpose specified.

4. The curved guides c' on either side of the feeding-teeth c'', and parallel with their motion, in combination with the center guide, c', reciprocating segment C', feed-teeth c', and binding-receptacle G, as and for the purpose specified.

5. The revolving tension and take-up arm c' having eye c'', through which the binding-cord passes, in combination with a non-revolving curl-spool, c''', that contains the binding-cord, constructed substantially as and for the purpose described.

6. The combination of the cord-spool c''', revolving arm c', having eye c'', and guide-arm c'' with the curved and grooved cord carrier L', substantially as and for the purpose described.

7. The curved and slit cord-carrier L', and grooved on its outer edge, having eye l' transversely through the outer end, where the cord is delivered onto the knot-tying hook and cord holding device O, substantially as and for the purposes described.

8. The cord-carrier and bundle-compressor L', in combination with the curved holder G' and cord-holding device O, constructed and arranged to produce sufficient slack in the cord for tying the knot, substantially as described.

9. The shields S attached to frame M, and S' to guide D, constructed and arranged with relation to each other and the knot-tying device, and for the purpose described.

10. The flexible strap g, arranged in receptacle G to operate trip-lever H, in the manner substantially as and for the purposes described.

11. The combination of the binding strap and cord g with the bundle-receptacle G and tooth-feeding segments C', substantially as and for the purposes described.

12. The combination of the trip-lever H, horizontal lever I, shaft O', and gear-wheel U and their intermediate devices, constructed substantially as and for the purpose described.

13. The combination of the cam j on lever I, cam on arm j', sliding sleeve i' with arms j'', dogs j'' and j''', and slotted arm j'' with the ratchet-teeth j' on wheel C, substantially as described.

14. The arms j', with dogs j'' and j''', to form a clutch-connection with the ratchet-teeth on wheel C, substantially as described.

15. The revolving cams J J, in combination with the vertically-reciprocating rack F' and their intermediate operating devices, substantially as and for the purpose described.

16. The vertically-reciprocating rack F', having the horizontally-projecting fingers f and center long finger f', in combination with the guides D, substantially as described.

17. The combination of the cam J, slotted connecting-rod K, crank k', rock-shaft L with the cord-carrier and bundle-compressor L', substantially as described.

18. The combination of the cams J J, slotted connecting-rods K and K', cranks k' and k'', bent spring-arms V V with vertical levers T, latch-arms S'', and tilting platform G'', substantially as and for the purposes described.

160,506.

19. The combination of the segmental gear-teeth k' on cam J, train of gear, and their shafts k', k'', k', k', k'', and k' with the knot-tying shaft K'', substantially as described.

20. The combination of shafts k' k'' and knot-tying shaft K'', and their driving-gears, with crank 1, spring-arm 2, and stop 3, as and for the purpose described.

21. The combination of the sliding sleeve N, having pendent arms n n sliding in slotted arm n', grasping-jaws n'', and spring n''', and actuating devices, with the reciprocating cord-hook spindle n', that slides in the knot-tying shaft K'', as described.

22. The yielding and bent cord latch-arm P with latch p'', and bent in the form substantially as and for the purposes described.

23. The combination of the arm Q on shaft K'' with the arm p' on latch-arm P, substantially as and for the purpose described.

24. The combination of the arm Q on shaft K'' with arm k' and bent arm R' on rock-shaft R, and carrying the cord-cutting knife r', substantially as described.

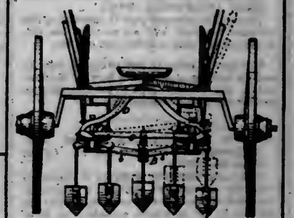
25. The combination of arm Q on shaft K'' with arm R' and bent arm R'' on rock-shaft R, and carrying the projecting cord-arm r''', to force the cord from the knot-tying device, substantially as described.

26. The combination of arm Q on shaft K'' with arm R' and bent arm R'' on rock-shaft R, carrying the knife r' for cutting the cord, and arm r''' for forcing the cord off the hook, substantially as described.

27. The combination, with the tilting platform G'', of the discharging-hooks U U, as and for the purpose described.

28. The combination of the grooved elastic-faced wheel o'' on fixed axle with the toothed disk wheel o', between which the binding-cord is held, substantially as described.

29. The combination of the cord-carrier and bundle-compressor L' with the tilting device O', having pivoted pawl o', feed o'', ratchet-wheel o', and cord-carrying wheel o', substantially as and for the purpose described.



30. The upwardly-projecting hook z, having groove z' therein, in combination with the cord-hook on spindle n', substantially as and for the purpose described.

31. The combination of the falling rack F' with the inclined recesses in cam J, for the purpose of continuing the rotation of shaft to replace the lever I in position with lever H to make a succeeding operation, substantially as described.

32. The vertically-rising holding-rack F' and its dividing-finger f'', so arranged, with relation to the feed-dogs c', as to part the unbound grain and make an open space, through which the cord-carrier L' passes, substantially as and for the purpose described.

160,507. CULTIVATORS. Marquis L. Gorham, Rockford, Ill. [Filed Sept. 21, 1874.]

Brief.—A removable center-beam is hinged loosely to a cross supporting-bar, which is hung loosely to the two drag-bars. An arched sway-bar connects the drag-bars by means of peculiarly-shaped sockets.

1. The removable center-beam B, with its plow b, hinged to yoke C by the swivel-joint formed by eyebolts c and c', and attached loosely to drag-bars A by the yoke C and eyebolts c, combined and operating substantially as and for the purposes described.

2. The free sway-bar D, with its terminal ends d, in combination with the sockets d' d'', constructed as described, and adjustable on drag-bars A of a cultivator, substantially as and for the purposes described.

160,508.

160,508. NUT-LOCKS. John Joseph Gray, Baltimore, Md., assignor of one-half his right to Geo. S. Norris, same place. [Filed Jan. 16, 1875.]

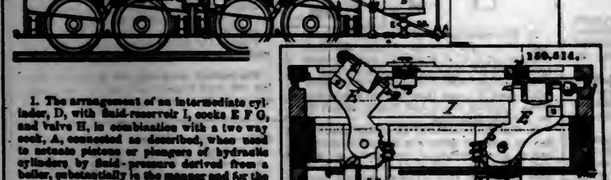
Brief.—The spring locking-ring is provided with teeth that engage with the bolt.

The toothed open-ring check-piece A, having the teeth b and c, and applied to a bolt, substantially as shown and described.

160,509. DOOR-KNOBS. John W. Haines, Cambridge, assignor of one-half his right to Charles S. Chaffee, Somerville, Mass. [Filed Jan. 6, 1875.]

The improved door-knob described, the same consisting of the shank H, provided with the projection G, the plate B, or medallion D, provided with lugs *a a*, and the porcelain or vitreous body A, provided with the cavity F and recess *c c*, the whole being united by cement, substantially in the manner and for the purpose specified.

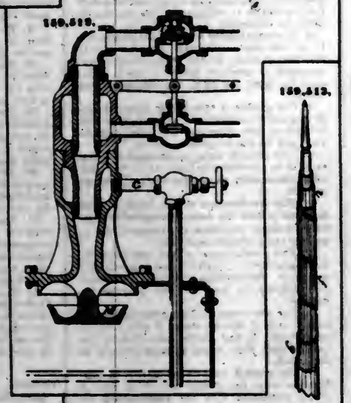
160,510. TANNING APPARATUS. Ernest C. Hesserick, Maynard, assignor of one-half his right to George W. Williams, Boston, Mass. [Filed Feb. 2, 1874.]



Brief.—The pressure-pipe D, connecting the elevated reservoir with an air-tight tan-vat, is surrounded with a steam pipe or case.

The combination of the auxiliary pipe D and its heating pipe or case E, with the tan-vat A and pressure-pipe B, substantially as and for the purpose herein specified.

160,511. HYDRAULIC CAR-BRAKES. Wm. M. Henderson, Philadelphia, Pa. [Filed Sept. 22, 1873.]



Brief.—A hydraulic cylinder is combined with an intermediate cylinder, a fluid reservoir, and a two-way cock, so as to actuate the pistons of the hydraulic cylinders by fluid-pressure derived from the boiler. The fluid, after having performed its duty, returns to the intermediate cylinder. An air-vessel is arranged close to the brake-cylinder, which forms a cushion of air to relieve concussion.

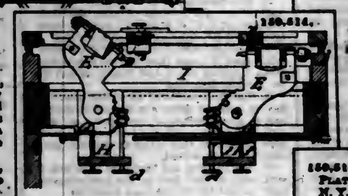
1. The arrangement of an intermediate cylinder, D, with fluid-reservoir I, cocks E F G, and valve H, in combination with a two-way cock, A, connected as described, when used to actuate pistons or plungers of hydraulic cylinders by fluid-pressure derived from a boiler, substantially in the manner and for the purpose shown and described.

2. The combination of the two-way cock A, the hydraulic-pressure cylinder B, with the air-vessel E, in the manner and for the purpose set forth and described.

160,512. PEN AND PENCIL CASES. John Holland, Cincinnati, Ohio. [Filed Nov. 21, 1874.]

In a pen and pencil case, the combination of the externally-fluted and spirally-slotted tube *f*, fluted collar *g*, attached to handle B, tubes *h* and *j*, the latter having pin *k* attached thereto, and collars *i* and *l*, for protruding and retracting the pencil-tip, substantially as shown and described.

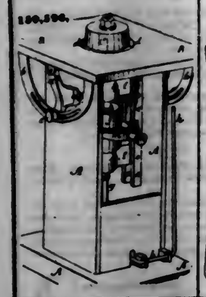
160,513. WOOD-MOLDING MACHINES. H. A. Holt, Wilton, N. H. [Filed Aug. 20, 1874.]



Brief.—The cutter-heads are made independently adjustable by means of worm-gears acting upon their supporting-frames.

1. The combination of the arbor-blocks E E, bearings G G, carriers H H, and girders or cross-ways I I, all constructed and operated substantially as and for the purpose herein specified.

2. In combination with the arbor-blocks E E, bearings G G, carriers H H, and girders I I, constructed and operated as described, the carriage provided with the laterally-movable bar r, arranged substantially as and for the purpose herein specified.



3. In combination with the laterally-movable bar r and arbor-blocks, the sliding rest p, arranged substantially as and for the purpose herein specified.

160,514. STEAM AND AIR BRAKES. Wm. M. Henderson, Philadelphia, Pa. [Filed Dec. 7, 1874.]

1. The combination of the vertical cylinder A, the piston B, the valve-chamber C, the valve D, the pipes E and F, the valve-chamber G, the valve H, the pipe I, the valve-chamber J, the valve K, the pipe L, the valve-chamber M, the valve N, the pipe O, the valve-chamber P, the valve Q, the pipe R, the valve-chamber S, the valve T, the pipe U, the valve-chamber V, the valve W, the pipe X, the valve-chamber Y, the valve Z, the pipe a, the valve-chamber b, the valve c, the pipe d, the valve-chamber e, the valve f, the pipe g, the valve-chamber h, the valve i, the pipe j, the valve-chamber k, 160,526.

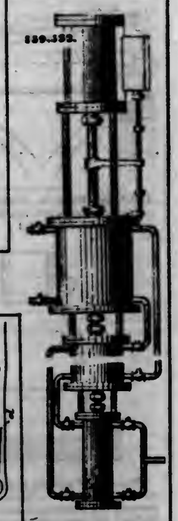
160,531.

159,530. CAR-WHEELS. John B. Tarr, Fairhaven, Mass. (Filed Aug. 10, 1873.)

Brief.—The wheel can be bored out for the axle readily, and the bushing remain firmly in place.

A car-wheel, having a hard metal rim, web, and hub in one piece, with a comparatively soft metal bush, combined therewith by projections and recesses *a* and *b*, substantially as described, and for the purpose set forth.

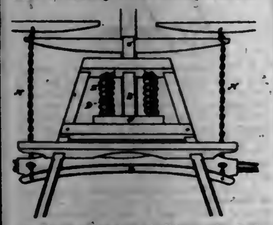


160,531. COTTON-BALE TIES. J. Thayer, New Orleans, La. (Filed July 2, 1874.)

The bale-tie consisting of the band A, having the L-shaped and outward-bulging lips B punched into each end thereof, and adapted to be locked together, substantially as specified.

160,534.

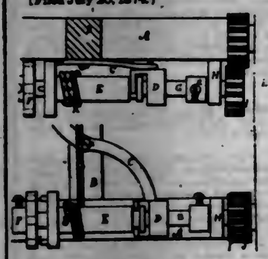
160,535.



160,527. BRIDLE-BITS. Nathan F. Stevens, Hopkinton, N. H. (Filed Oct. 14, 1874.)

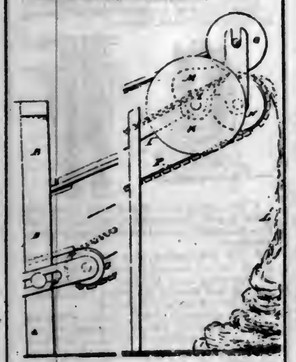
In the jawed bit, the tubular cushions D D, combined and arranged with the prongs C C' of the hinged bars A A', all as shown and described.

160,528. RUNNING-GEAR FOR VEHICLES. Jacob Stirk, Lancaster Township, (City P. O.,) Lancaster County, Pa. (Filed Nov. 13, 1874.)



Brief.—Spring draft-connection to lessen shock on starting or encountering obstacles.

1. The combination of sliding yoke B C, springs E, and guide-rods D, substantially as and for the purpose set forth.

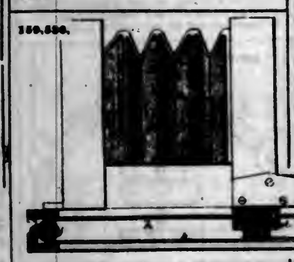


2. The combination of sliding yoke B C, springs E, guide-rods D, semi-elliptical spring L, stay-chains N, and double-tree F, substantially as and for the purpose set forth.

160,529. HORSE-CHECKS. John Sugden and James P. Gaffney, Lawrence, Mass. (Filed July 20, 1874.)

The combination of foot-lever C, clutch-block D, drum E, flange-head and pins F, hangers H H, shaft G, gears I and J, and wheel L, as and for the purpose specified.

159,532. COTTON-CONDENSERS FOR COTTON-GINS. Edward Van Winkle, Atlanta, Ga. (Filed Sept. 15, 1874.)



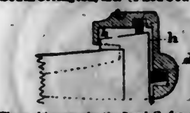
The cotton-gin condenser herein described, consisting of the positively moving endless and adjustable slatted apron or carrier H F, arranged in connection with the lint-box E, for detachable connection with cotton-gin, as set forth.

160,533. PNEUMATIC PUMPS. Geo. Westinghouse, Jr., Pittsburg, Pa. (Filed Oct. 20, 1874.)

Brief.—A series of double-acting compressing air-pumps communicating one with another, fitted with pistons of different areas, and each pistons arranged to receive a simultaneous motion in either direction, substantially as set forth.

A series of double-acting compressing air-pumps, communicating one with another, fitted with pistons of different areas, and each pistons arranged to receive a simultaneous motion in either direction, substantially as set forth.

160,536.



160,534. TUG-BUCKLES. John Weston, Sulphur Springs, Ohio, assignor of one-half his right to A. Fry & Co., same place. (Filed Jan. 5, 1875.)

Brief.—The buckle consists of two parts or loops, both of which are pivoted to the tug, and which interlock on the outside of the trace.

Having described my invention, I claim—

A buckle consisting of the pivoted frame A, having the loop *d e f* and tongue *g*, in combination with the pivoted loop B, substantially as and for the purpose set forth.

160,536. FENDERS FOR VESSELS. Fraser Wood, Bangor, and Chas. H. Wentworth, South Orrington, Me. (Filed Oct. 2, 1874.)

The rubber or elastic hood C, formed with cavities *h h h*, adapting it to fit loosely on the stem of the boat, and provided with recesses and spiral springs within such recesses, substantially as and for the purpose set forth.

160,537. CAMERAS. Stewart L. Bergstresser, Lauralton, assignor to J. B. Bergstresser, Renovo, and R. L. Bergstresser, Hublersburg, Pa. (Filed Sept. 19, 1874.)

Brief.—An endless belt and rollers take the place of the ordinary screw and rack and pinion, for adjusting the movable part of the camera-box.

1. In a camera, the combination of the movable part *b*, base *c*, rollers *f*, and belts *h*, whereby the camera is opened and closed, substantially as set forth.

2. The movable part of the camera *b* and frame *c*, in combination with the clamping-block or brace and set-screw, whereby the part *b* is held in any desired position, and the central strip or guide dispensed with, substantially as shown.

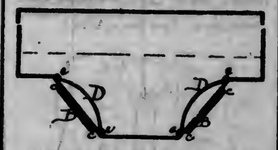
160,538.

160,539. PHOTOGRAPHIC-PLATE HOLDERS. Stewart L. Bergstresser, Lauralton, assignor to J. B. Bergstresser, Renovo, and R. L. Bergstresser, Hublersburg, Pa. (Filed Aug. 3, 1874.)

1. A plate-holder having a rim or flange formed around its edges, so as to catch over the rear end of the camera, and prevent the admission of light to the plate, substantially as specified.

2. A plate-holder provided with a flexible screen, substantially as shown and described.

3. A plate-holder closed on all sides except the one where the picture is inserted, substantially as set forth.



4. A plate-holder closed upon all sides except one, and provided with a flexible screen, substantially as described.

5. A zinc box for holding the silver-box, the said zinc box being made adjustable up and down, substantially as specified.

6. A plate-holder provided with a flexible screen and rollers, around which the screen passes, substantially as set forth.

7. The spring absorbent pad 9, substantially as specified.

160,540. CANISTERS. Theodore W. Burgw and J. A. Graff, New York, N. Y. (Filed Apr. 20, 1874.)

A tea-canister, provided on the interior with the concavo-convex guards D, fitted under flanges *c*, in combination with the mirrors B, placed directly upon the canister-body, and secured thereon by the surrounding beads *e*, as herein shown and described, for the purpose specified.

160,541. DEVICES FOR WARMING AND VENTILATING RAILROAD-CARS. Franklin Chalfant, Lancaster, Pa., and J. Chalfant, Kingsmeadow, Ill. (Filed Aug. 18, 1874.)

Brief.—By means of the valve in the air inlet pipe, the blast can be discharged in the open air when not required in the cars. The combination of the ventilating and the hot-air pipes afford means of controlling the relative amount of cool and warm air admitted to cars.

1. The combination of the said conducting-pipe C and appliances V R S W, with a fan or blower, A, said fan being provided with axle pipes or cars B, the whole constructed substantially as and for the purpose set forth.

2. In combination with a fan or blower, A, placed on top of the boiler, and the connecting pipes C H, the intermediate valve-chamber D, with its appliances V, R, S, and W, constructed and operated substantially as and for the purpose mentioned.

3. In combination with a main conducting-pipe, H', along the top of a passenger-car, the diverging branch pipes K, united to and opening into a vertical pipe, L, connected with a horizontal pipe, M, the latter being independent in its action, and the hot-air pipes, the whole arranged substantially in the manner and for the purpose set forth.

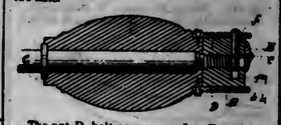
160,542. SOLDERING-MACHINES. George W. Fisher, Baltimore, Md. (Filed Nov. 11, 1874.)

1. The adjustable sliding device for holding the soldering copper F, consisting of the frame A, supported on the piston-rod *c*, the slide *g*, set-screw *f*, adjusting-screw *h*, and projecting stud *f'*, for holding the gas-burner *e* in position for the flame to impinge against the copper F, for heating the same, substantially as herein set forth.

2. The steam-chamber C, pipe P, stop-cock *n*, and drain-pipe *s*, in combination with the flexible pipe *r* and burner *e*, as and for the purpose herein specified.

3. The combination of the steam-cylinder B and piston *a* with the soldering mechanism, operating as described, for the purpose of lifting and supporting said mechanism while the cans are being adjusted in and removed from the machine.

4. The vertical tube *j*, terminating in the cap-holder J, and connected by tubes *w s m* with the chamber C, and provided with valve R, for the purpose of causing a jet of steam to impinge on the seam to chill the solder, substantially as described.



160,543. BRAKES FOR VEHICLES. William Fletcher, Boston, Mass. (Filed Nov. 20, 1874.)

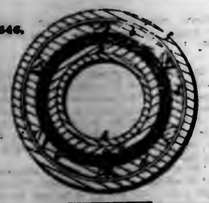
The dog C, in combination with body A, eye-bolts B, cord *d*, hook F, sheave E, and guides *e e*, substantially as and for the purpose set forth.

160,544. WHEELS FOR VEHICLES. Saml. R. Fuller, Irving, Mass. (Filed Dec. 4, 1874.)

Brief.—For securely fastening the wheel to the axle.

The nut D, bolt *g*, screw *c*, plate E, and the band B, provided with the apertures *f*, constructed and combined with axle C, to operate substantially as and for the purpose specified.

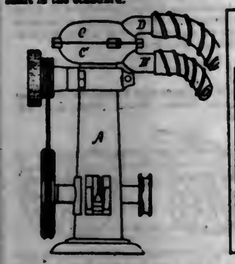
160,545. COMBINED ICE PICKS AND STRAINERS. Thomas Hagerty, New York, N. Y. (Filed Nov. 26, 1874.)



As an improved article of manufacture, the device herein described, consisting of a handle, B, spoon-shaped dish A, with perforations *a*, and picks D, substantially as and for the purpose set forth.

160,546. BOILER-COVERINGS. J. W. Hammore, Newburg, N. Y. (Filed Jan. 5, 1875.)

Brief.—By means of the dovetail strips the plastic material is prevented from being displaced circumferentially.



In a non-conducting covering for boilers, pipes, &c., the plastic material B, fibrous coating C, strips D, netting E, and outer coating F, all combined and arranged for the purpose and in the manner substantially as herein set forth.

160,546.

160,547. ANIMAL-SHEARING MACHINE. Wm. C. Harlow, Medford, Mass. [Filed Dec. 7, 1874.]

Brief.—A diaphragm-pump is situated horizontally upon a standard, and forces air through flexible tubes, to operate a pair of shears. The piston is operated by a crank shaft in the standard.

In an animal-shearing machine, the combination of the standard A, having at its upper end the chamber C C', outlets D D', diaphragm L, and rod M, all constructed and arranged substantially as described.

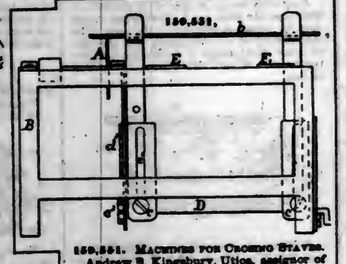
160,548. SHOE-SHAVE. T. Harrington, Southbridge, Mass. [Filed Jan. 5, 1875.]

The shoe-shave described, consisting of the haft and handles A, slotted nearly throughout their entire length, knife E, and set-screws O C, for drawing together the sides of the haft, substantially as and for the purpose set forth.

160,549. CLEVISES. Ethel G. Harvey, Lebec, Me. [Filed Jan. 18, 1875.]

Brief.—The front end of the plow-beam has a series of deep vertical notches, into which fits a notched oval bar or bolt pivoted in the clevis. The bolt-hole is extended to the rear in a narrower slot, and grooves cut in the bolt allow, when properly turned, the clevis to slide forward, releasing the pivoted bar, and allowing both adjustments to be made. The draft is secured by pushing back the clevis and turning the bolt.

The clevis D, provided with the hole E, slot *a*, and pivoted oval notched bolt G, in combination with the bolt F, provided with the slots *s s*, constructed and arranged to operate in combination with the beam A, provided with the apertures *d d*, substantially as and for the purpose specified.



160,550. STREET-SIGNS. George B. King, Lawrence, Mass., assignor of one-half his right to Wm. J. Derrington, same place. [Filed Jan. 18, 1875.]

The signs F G, having the indexes *m m*, and provided with the clamp collet C, substantially as and for the purpose specified.

160,551. MACHINES FOR CROZING STAVES. Andrew B. Kingsbury, Utica, assignor of two-thirds his right to W. Dent, Mohawk, and Edwin L. Kingsbury, Hamilton, N. Y. [Filed Dec. 19, 1874.]

Brief.—The stave is placed upon an oscillating holder, by which it is carried over the revolving crozing-tool.

1. In combination with a crozing-saw, the adjustable arms C C' C², arranged to oscillate on a central adjustable shaft or bar, substantially as and for the purposes described.

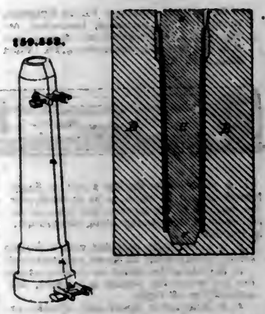
2. The combination of arms C C', movable holder *b'*, and spring *d* on holder *d'*, substantially as and for the purpose described.

3. In combination with arms C C' C², the adjustable bar D, shaft F, pinions *c' c²*, toothed plates *d'*, *d²*, and G, substantially as and for the purposes described.

4. In combination with arms C C' C², the adjustable plates E E, having slots *e e*, substantially as and for the purpose described.

In testimony that I claim the foregoing as my own invention I affix my signature in presence of two witnesses.

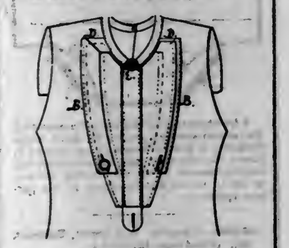
160,552. MITERING-MACHINES. Charles P. Poinier, Boston, Mass., assignor to F. A. Howard and H. M. A. Poor, Belfast, Me. [Filed June 10, 1874.]



Brief.—The fences *a a* can be adjusted in different holes to support the work of various thicknesses.

The combination of the adjustable rest *a*, provided with stems *b b*, with the uprights *c c*, having a series of holes, and the set-screws *d d*, substantially as and for the purpose described.

160,553. CASTING TUBULAR ARTICLES. L. P. Rider, Pittsburg, Pa. [Filed July 14, 1874.]



Brief.—The core is formed with an enlarged portion or cap, to close the upper part of the mold and center the core. The pouring-gates are formed in the cap. The core-box is formed in one piece, with a longitudinal opening, which allows the box to spring open sufficiently to release the core.

1. The cope or base of the core formed in one piece with the core, to facilitate centering the same, and having the pouring-gates formed therein, so that the pouring may be done through the cope without disturbing the relative position of the core and mold, substantially as specified.

2. A metal core-flask or core box tapered to form the core-prints, cut longitudinally, and provided with devices for springing the box to release the core, substantially as specified.

160,554. SHIRTS. Carlyle E. Sutphen, Newark, N. J., assignor to Johnston & Sutphen, same place. [Filed Dec. 8, 1874.]

The dress shirt constructed with the welts or stripe B D, arranged to confine and hold in place a separate and removable bosom, substantially as and for the purposes specified.

160,555. COMPOUNDS FOR PICTURE-FRAMES. Charles D. Wilcox and Edson Getty, Elmwood, Ill. [Filed Nov. 24, 1874.]

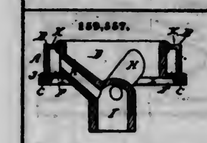
The compound described for frames, moldings, &c., consisting of straw pulp mixed with gum-shellac, alcohol, glue, molasses, glycerine, and a solution of copper in about the proportions substantially as and for the purpose specified.

160,556. BATH-TUB ATTACHMENTS. Thos. D. Woolsey, San Francisco, Cal., assignor of one-half his right to William H. Baxter, same place. [Filed Nov. 2, 1874.]

Brief.—This bath-tub attachment is so arranged that the bather may readily scrub the back or other portions of the body by means of a brush, which is operated by an upright frame provided with lever-beam and connecting-rods, for actuating vertically up and down a spring brush-carrier within grooved recesses or dovetailed slides.

160,556.

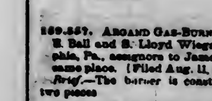
1. The brush-carrier C, consisting of the beveled sliding piece N, curved piece *i*, hinged thereto by a hinge, *e*, and resting on the spring *t*, with the india-rubber spring *o*, secured by the brush-holder D *d b*, in combination with the slide-bars *s s'*, or their equivalents, rods *r r'*, and lever E, fitted to the bracket B of the upright frame F F, substantially as and for the purposes herein set forth and specified.



2. The india-rubber ring-spring *o*, fitted between the disk D (which holds the brush G by the catches *j j*) and the curved hinged piece *i* A, forming part of the brush-carrier C, substantially as and for the purposes herein set forth and specified.

3. The frame F F, hinged by parallel bent rods L L' to the wall K K, and provided with the bracket B, dovetailed slide-bars *s s'*, adjustable brush-carrier C, and mechanism for actuating the same, viz., the rods *r r'* and lever E, in combination with the bath-tub T, substantially as and for the purposes herein set forth and specified.

4. The parallel bent rod-hinges L L', fitted to open *s s'* in the wall K K, and the frame F F, for adjusting this frame, with its attachments, to the bath-tub T, as described, substantially as and for the purposes herein set forth and specified.

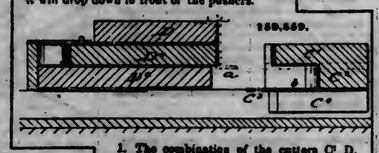


The combination of the rod E, collars F F and M, tongue D, evener G, lever I, chain K, and whiffletrees H H and P, substantially as and for the purposes described.

160,557.

160,557. ARGAND GAS-BURNERS. Charles H. Ball and S. Lloyd Wiegand, Philadelphia, Pa., assignors to James W. Carson, same place. [Filed Aug. 11, 1874.]

Brief.—The burner is constructed of but two pieces.

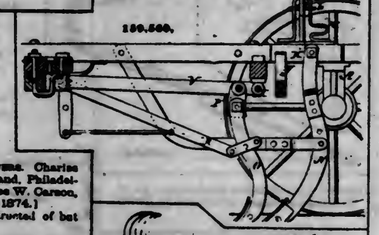


Ball's Argand burner formed of an external wrought-metal shell, A, and a metal body, D, cast in one piece with the branched tubes H and pillar I, a lower conical flange, C, formed on the shell A, locked to the groove G, turned in the flange F by the flange J, compressed against the flange C.

160,558. DRAFT-EQUALIZERS. R. A. Beers, De Kalb, Ill. [Filed Dec. 28, 1874.]

160,559. DIES FOR FORMING SPRING-SHANKS FOR SHOES. Emil Brisor, New York, N. Y. [Filed Dec. 12, 1874.]

Brief.—The stationary die consists of an upper plate or shear, D, a spring presser or ejector, D^1, and a male bending-die, D^2. The movable die consists of a slightly-concave setter, C^1, opposite ejector D^1, a female die, C^2, and two bars, C', that push the finished shanks out under the stationary die in regular order as they are formed and drop from the die. There are also provided guide and gage plates *a* at each end, upon which the plate rests, and a plate, *b*, under the forming-die, provided with a curved slot, so situated relative to the die that the springing back of the shank, after being pressed, will bring it over the slot, and it will drop down in front of the pushers.

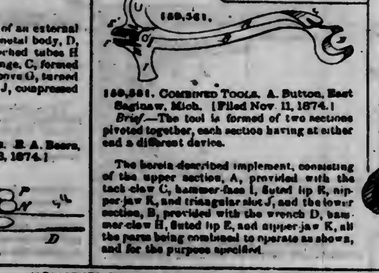


1. The combination of the cutters C^1 D, spring-follower D^1, supports *a*, and shaping-dies C^2 D^2, in the manner and for the purpose specified.

2. The combination, with plunger C, of the subjacent pushers C^2 C^3 and casing A, having passage below the die D^2, as and for the purpose set forth.

160,560. WHEEL-CULTIVATORS. George S. Brower, G. W. Brower, and E. A. Brower, Crawfordsville, Ind. [Filed Nov. 14, 1874.]

Brief.—The draft and cultivating devices are attached to an independent frame, pivoted to the front end of the carriage-frame. The latter may be slid back upon the axles to equalize the driver's weight. The inner aborels are attached to a pivoted frame oscillated laterally by crooked foot-levers.

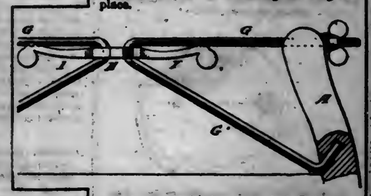


1. The slotted frame-pieces B, having curved rear sockets, E, in combination with the seat-bar F, short axles A, and bolts C, as and for the purpose specified.

2. The combination of yokes I M with the cross-bar J and pins L L, arranged as and for the purpose specified.

3. The combination of braces R, stay-rods T, and hangers U with rod Q, to support the plow-standards, as set forth.

160,561. COMBINED TOOLS. A. Button, East Saginaw, Mich. [Filed Nov. 11, 1874.]



Brief.—The tool is formed of two sections pivoted together, each section having at either end a different device.

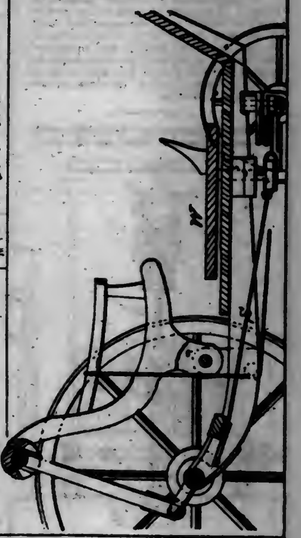
The herein-described implement, consisting of the upper section, A, provided with the tack-claw C, hammer-face I, fluted lip E, upper jaw K, and triangular slot J, and the lower section, B, provided with the wrench D, hammer-claw H, fluted lip E, and upper jaw K, all the parts being combined to operate as shown, and for the purpose specified.

160,562. SAW-FRAMES. William Clemens, Middletown, N. Y. [Filed Jan. 16, 1875.]

Brief.—The saw is strained by means of two horizontal rods bent to form inclined braces, which are secured in position by an oval ring having two arms, each of which is provided upon its upper side, near the outer end, with a groove for locking the ring in place.

A saw-frame, having parts A A C, in combination with rods and braces G G', and the tightening and locking lever, consisting of oval ring H, provided with arms I I, arranged to bind on rods G, substantially as and for the purpose herein specified.

160,563. BED-GATE FASTENINGS. John W. Collins, Chicago, Ill. [Filed Nov. 9, 1873.]



Brief.—The movement of the lever from right to left fastens the gate, and vice versa, the eccentric being thrown beyond the center, and there held by the strain.

1. The combination of the eccentric C, the lever E, and the clevis *d d*, substantially as and for the purpose set forth.

2. Hooks or knobs with notched or corrugated surfaces, in combination with staples notched or corrugated in a similar manner, as and for the purpose set forth.

160,564. VELOCIPEDES. Edwin Crother and Michel Bergeron, Hackensack, N. J. [Filed Dec. 19, 1874.]

The combination of foot-board W, foot-pieces X X, cross-bar U, connections a a, rods S S, bell-cranks Q Q, springs O O, and connections P P, substantially as and for the purposes described.

160,565. SAFES. Geo. De ..en, Brooklyn, N. Y. [Filed Jan. 18, 1875.]

1. In safe or vaults, a safe-section with pigeon-holes arranged equidistant from each other, and in a circle from a central spindle, in connection with a revolving closing face-plate or disk with one or more corresponding apertures, being adjustable to the pigeon-holes for giving access to the same, substantially as shown, and for the purposes set forth.

2. In a safe or vault, a pigeon-hole section, having pigeon-holes arranged at intervices somewhat larger than their diameter, and in a circle around a common center, substantially as shown and described.

3. The combination of the revolving face-disk, having rear holes or recesses, with a spring-bolt or other locking device, arranged in such a manner that it locks the disk rigidly until withdrawn, and causes the automatic locking when turning the disk, substantially as described.

1. The combination, with the runner E, of the adjustable suspension-rod E, the swivel-connection f^1 f^2, the intermediate shaft D', having forked lower end, the recessed sleeve d, cross-pin d^2, and the spindle D, as and for the purpose specified.

2. The swivel-joint, for connecting the rotary intermediate shaft D' with the adjustable suspension-rod E, composed of inner cup f, bent to pivoted cross-rod h, and outer cup f^1, for lubricating the washer g, constructed substantially as described.

3. The combination of forked end of shaft D' with recessed sleeve d, cross-pin d^2, and stone-spindle B, for transferring weight of stone from spindle and wheel-shaft to top suspension-rod, as set forth

---

160,566. COMPOSITIONS FOR FILLING TEETH. Erwin Erlenmeyer, Houston, Tex. [Filed Dec. 19, 1874.]

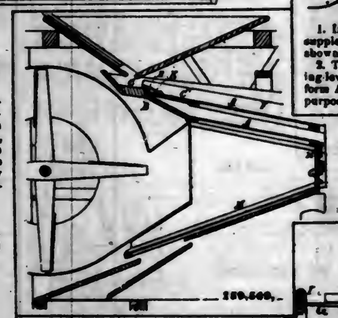
Brief.—The following composition is pulverized and made into a ball for the cavity of a tooth: phosphoric acid, 26.35 parts; lime, 13.72 parts; magnesia, 5.00 parts; fluoride of calcium, 6.00 parts; potash, 8.33 parts; silica, 5.00 parts; oxide of zinc, 34.00 parts.

The above composition for filling teeth, substantially as set forth

---

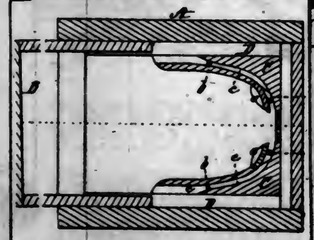
160,567. FANNING-MILLS. Asa Y. Felton, Plain View, Minn. [Filed July 11, 1874.]

1. The sieve A, having all its holes of the same size but cut farthest apart on the upper portion and gradually coming nearer together as they approach the lower end, as and for the purpose described.



2. The sieve-supports F, jointed to the head-board at B, the vertically-adjustable board G, with the fastening-bolts K and the shaker, combined and arranged substantially as specified.

160,568.

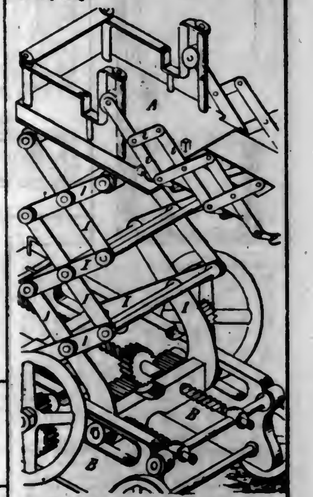


160,569. APPARATUS FOR TRANSFERRING GOODS IN BULK. L. Dubbs, Paris, France. [Filed Oct. 6, 1874.]

The combination of elevated transferring-wharf C, broad-gage car-track A, and narrow-gage car-track B, each bearing railway-tracks of the same gage with the wheeled crates X, for the purpose of running such crates from the rails on the broad-gage track, across the transferring-wharf, upon the rails carried by the narrow-gage track, or vice versa, all substantially as set forth.

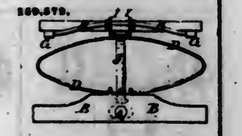
160,569.

160,570. DRAWERS FOR FURNITURE. Jno. J. Fox, Boston, Mass. [Filed Dec. 21, 1874.]



1. The flaps a a, pivoted to the rear end of a drawer, and provided with pins b b moving in grooves c c, in combination with suitable stops for limiting the motion of the drawer, operating substantially in the manner set forth.

2. The spring-latch e, in combination with the grooved block C, substantially as and for the purpose described.



160,571. FIRE-ESCAPES. C. A. Fuchstocher and F. A. Schmid, Erie, Pa. [Filed Sept. 14, 1874.]

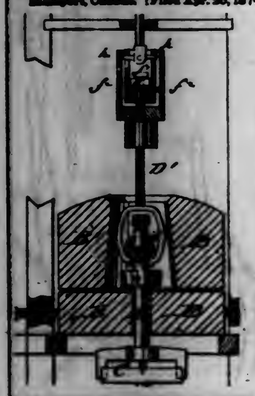
Brief.—The escape is provided on top with an extensible platform, operated by a system of lazy-tongs.

1. In combination with the platform A, the supplemental platforms A' and levers i i, as shown, and for the purpose set forth.

2. The combination of the trunk H, elevating-levers I, platform A, supplemental platform A', and levers i i, as shown, and for the purposes mentioned.

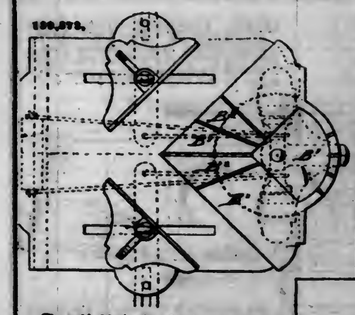
160,572.

160,573. SPRING-BALANCES. Thomas L. Guest, Pottstown, Pa. [Filed Dec. 28, 1874.]



The combination of the cross-bars H, the bearings I, the side bars G, and the pivoted stay-rod J with the springs D E, the carriage-body, and the axle, as and for the purpose described.

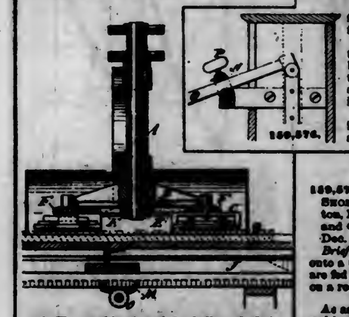
160,574. MITRE-BOXES. Herman Kempel, Syracuse, N. Y. [Filed June 27, 1874.]



Brief.—The rotary block B has its front edge at right angles with slits for the saw, and the curved back with corresponding slits to guide the saw.

160,574.

160,567. MILL-STONES. Wm. Elliot, Williamsport, Canada. [Filed Apr. 26, 1874.]



160,575.

The guide-block of a miter-box, constructed with a rotary base-plate, B', and sectional blocks B^2, made right-angled in front and formed circular in the rear, as and for the purpose specified.

160,576. SANDPAPERING-MACHINES. V. Hopp, Chicago, Ill. [Filed Dec. 12, 1874.]

Brief.—The disks which carry the sand-paper rotate upon their own axis while revolving around a common center.

1. The main shaft carries a double cam, which, through spring-pieces, actuates the feeding-feet vertically, and also the cam, which in turn moves the feet laterally

---

160,577. PUMPS. G. W. Hooper, Greene, Me. [Filed Nov. 14, 1874.]

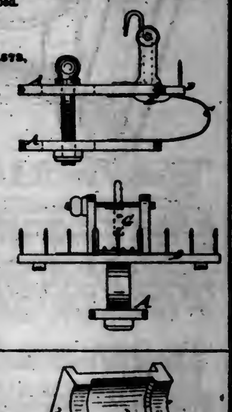
Brief.—The piston-rod is packed by a metal thimble, supported with some freedom to move by a flexible diaphragm. The valves are secured to their seats by passing the flexible end of the elastic face of the valve through a slot in the casting, and fastening it by a pin or rod. The lever is adjustable to the depth of the well or strength of the operator by adjustment to or fro in a pivoted block.

1. The packing-thimble E, supported by a flexible diaphragm, G, substantially as specified.

2. The herein-described means for fastening the valves to the seats, consisting of the flexible facing a, of leather, in combination with the slotted end pieces, S, and a pin or other suitable devices for fastening the same therein, substantially as described.

3. The pump-handle O, arranged adjustably in the pivot N, and provided with a binding-screw, substantially as specified.

160,576.



160,578. HAIR-HOLDERS. Edwin J. Beasly, New York, N. Y. [Filed Nov. 20, 1874.]

Brief.—The jaws are clamped upon the edge of a bureau-top or other convenient place, and the end of a hair-switch held under the swing-gate, and a friseur held upon the pins while being combed and dressed.

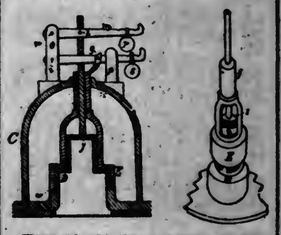
1. In a hair-holder, the adjustable clamping-jaws A A, in combination with the swing-gate C, constructed to operate substantially as and for the purpose described.

2. The adjustable clamping-jaws A A, in combination with the pin-plate D, constructed to operate substantially as and for the purpose described.

160,578.

160,579. JOURNAL-BOXES. Lewis J. Ives and J. Leary, Medina, N. Y. [Filed May 26, 1874.]

Brief.—The bearing has end flanges to secure it on a supporting-box. It contains the shaft at its ends only, the portion between being sunk for the reception of oil.

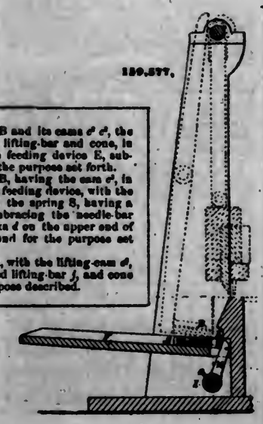


The combination, with the interior box or casing A having the notched seats a a, of the bearing C adapted to said seats, and constructed with the end flanges b b, overlapping the seats a, and with the depressed oil-chamber d formed in the bottom of the bearing, all substantially as herein shown and described.

160,579.

160,580. SAFETY-VALVES FOR STEAM-BOILERS. Alex. M. Johnston and S. Gieringer, Pittsburg, Pa. [Filed Aug. 17, 1874.]

Brief.—Surplus of steam raises the smaller valve from its seat, allowing the escape thereof. When said smaller valve is inadequate for this purpose, the larger valve is raised, and the steam escapes freely.



The combination of the double seat D, valves E and f, levers h m, weights r and s, standard o, and dome C, constructed, arranged, and operating, with relation to each other substantially as herein described, and for the purpose set forth.

160,581. MACHINES FOR MAKING METAL SHOE-SHANKS. John Hyslop, Jr., Abington, Mass., assignor to Hiram H. Jenkins and Geo. O. Jenkins, same place. [Filed Dec. 19, 1874.]

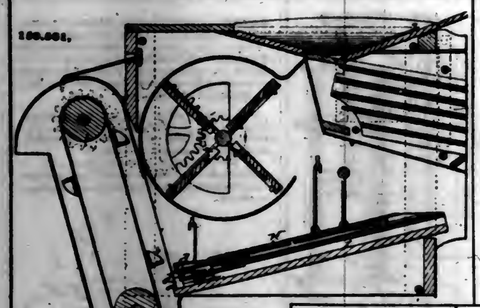
Brief.—The blanks, as they are pressed, drop onto a table provided with raised sides, and are fed forward in regular order by two arms on a rock-shaft.

As an improvement in machines for cutting and bending metallic shoe-shanks, the combination, with the forming-die E, of flanged table F and vibrating arms H, fastened to a shaft, I, oscillated by mechanism, substantially as described, as and for the purpose set forth.

160,577.

160,575. SEWING-MACHINES. Wm. Hirons and Jas. D. Moore, Grinnell, Iowa. [Filed June 27, 1874.]

Brief.—The main shaft carries a double cam, which, through spring-pieces, actuates the feeding-feet vertically, and also the cam, which in turn moves the feet laterally



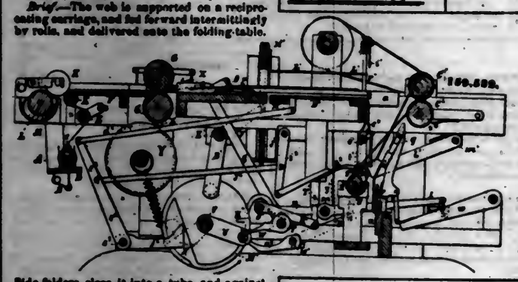
160,575.

1. The main shaft B and its cams c^1 c^2, the spring S a, and the lifting-bar and cone, in combination with the feeding device E, substantially as and for the purpose set forth.

2. The main shaft B, having the cam c^2, in combination with the feeding device, with the forked portion d, and the spring S, having a forked portion, s, embracing the needle-bar between the two forks d on the upper end of the feed-bar E, as and for the purpose set forth.

3. The combination, with the lifting-cam c^2, of the spring s, slotted lifting-bar j, and cone F, as and for the purpose described.

160,681.



160,681. GRAIN-SEPARATORS. M. D. Judkins, Glenwood, Minn. [Filed Jan. 15, 1875.]

Brief.—Endless-belt bucket-elevator in compartments to receive and deliver separately the discharge from the several screens and chute-board of the lower shoe of a fanning-mill.

In a fanning-mill, the combination of two or more sieves, H H, having separate discharge-spouts *d d d*, and an elevator having separate deliveries for each sieve, substantially as and for the purpose specified.

160,682. PAPER-BAG MACHINES. Charles M. Kellogg, East Leverett, Mass. [Filed May 9, 1874.]

Brief.—The web is supported on a reciprocating carriage, and fed forward intermittingly by rolls, and delivered onto the folding-table.

160,682.

Side-folders close it into a tube, and against the ends of these side-folders the end is formed into a square bottom.

1. The combination of the feed-rolls G, carrier O P, and the folding-table, substantially as specified.

2. The combination of belts X, pulleys Z, ratchets O' B', pulleys Y, and spring A' with the feed-rolls and the carrier, substantially as specified.

3. The combination of the body-folders I, bottom spreaders *e*, and bottom folders C' with the folding table, substantially as specified.

4. The bottom spreaders *e*, having a springhinge, the slides *d*, and their rigid projecting arms *c*, in combination with the fixed studs *f*, as shown and described.

5. The upper folder C', jointed to the crosshead and provided with a spring, *g'*, and the projections *f'*, in combination with studs *h'* on the folders I, to swing it outward in the manner described, to prevent cutting the paper.

6. The pusher *q* pivoted on a vertical slide, *n*, and operating in the manner described, in combination with the folding-table and bottom folders, substantially as specified.

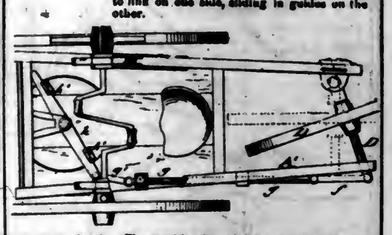
160,683. FOLDING STORE-SHELVES. Minter P. Kay, Waxahachie, Tex. [Filed Oct. 21, 1874.]

Brief.—The sections of shelves are made in three parts, hinged together, arranged one above another, and adapted to fold together.

1. Sections of shelving made in three parts, A B C, hinged to each other, substantially as herein shown and described, to adapt them to fold together without changing the lower and upper parts from their ordinary vertical position, as set forth.

2. In a store-shelving, the combination, with parts B C, of the counter-board S, hinged to the front edge of the counter, the rabbeted front edge of the part C folding against the corresponding portion of board B, while the counter-board S lies in a vertical position against the front of shelving when folded, as shown and described.

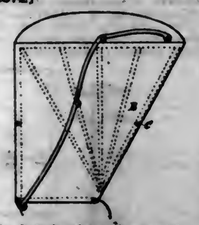
3. The middle part, B, provided with the inclosed recesses H to receive the wheels G of the upper part, U, when the section of shelving A B C is unfolded for use, and to protect the goods from said wheels, substantially as herein shown and described.



4. The hinged counter-board S, and the hinged cornice-board U, provided with hinged end boards V, in combination with the hinged parts A B C of a section of shelving, substantially as herein shown and described.

5. The combination of the staples I, hooks J, sliding bar K, pivoted lever L, beveled projection M, and spring N with the drawers D and the lower and middle parts, A B, of the section A B C of shelving, substantially as herein shown and described.

6. The combination of the catches O and the spring-lever latches P Q with the parts A B U of the section of shelving, substantially as herein shown and described.



160,684. VELOCIPEDES. Walter Knight, San Andreas, Cal. [Filed Oct. 17, 1874.]

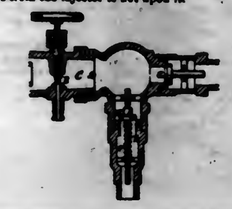
Brief.—Guided by foot operating through links and levers; rear wheel on axle, pivoted to link on one side, sliding in guides on the other.

The combination of foot-lever *b b'*, links *f* and *f'*, sliding rod *g*, pivoted and guided axle *D'*, and rear steering-wheel D, substantially as set forth.

160,685. CARRIAGE-CURTAIN FASTENERS. Carl Kurz, New York, N. Y. [Filed Dec. 28, 1874.]

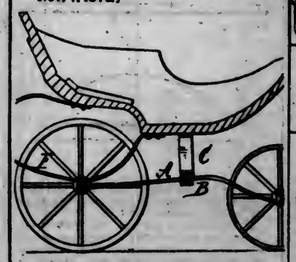
1. The fastening for carriage curtains and aprons, consisting of T-headed buttons A, in combination with the curtain or apron, and slotted and outwardly-swelled plates D, and the bows, substantially as specified.

2. The button-hole plate for the top of the curtain, having the slot for the button widened at the upper end, and also having the locking-tongue H, in combination with the beat T-headed button A, substantially as specified.



160,686. AWNING-HOOKS. Lemas M. Lane, Rockland, Mass. [Filed Dec. 26, 1874.]

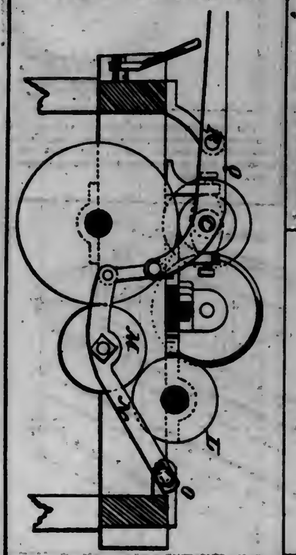
The combination, with the awning-hook, of the hook-closing rod or bar, substantially as and for the purpose set forth.



160,687. ATTACHMENTS FOR INJECTORS. David Lees, Birmingham, assignor to himself and S. O. Stewart, Tyrone Forges, Pa. [Filed Oct. 10, 1874.]

Brief.—Between the nozzle and the boiler check-valve of an injector is interposed an overflow-chamber, from the lowest point of which the water drains off through a valve kept always open by a spring when the pressure from the injector is not upon it.

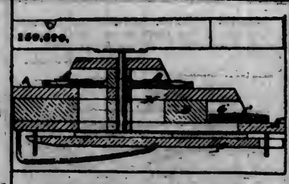
In an overflow and delivery attachment for injectors, the inwardly-opening spring-pressed valve E, in combination with the outwardly-opening valve C, as and for the purpose specified.



160,688. CHILDREN'S CARRIAGES. J. Manvill Lewis, North Springfield, Vt. [Filed Nov. 7, 1874.]

1. A reach for a child's carriage, composed of one or more bars, A, of malleable iron, and a spring, C, near the middle thereof, for supporting the front portion of the body, in combination with springs F, connecting the body to the hind axle, substantially as specified.

2. The combination of the diagonal reach-bars A, crossing each other, a spring-seat, E, at the junction of the bars, and a spring, C, for supporting the body attached to the seat, all substantially as specified.



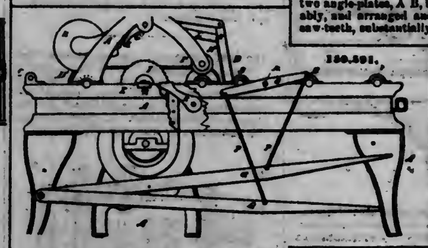
160,689. SAW-MILLS. Charles Lindner, Rockdale, Tex. [Filed Sept. 19, 1874.]

The combination, with a wheel, M, that gears with a wheel, L, on the saw-shaft, of the lever E, slotted and pivoted on fixed pin O, and the link-connected lever Q that forms a bearing for the shaft G, and is pivoted at E, all substantially as and for the purpose specified.

160,690. ORGAN REED-BOARDS. John B. Lomas, New Haven, Conn., assignor to B. Shoninger, same place. [Filed Nov. 30, 1874.]

160,690.

The combination, with a double reed-board mounted upon the sounding-board A, of the partial set of reeds C, inserted below said sounding-board, all constructed and arranged as and for the purpose specified.



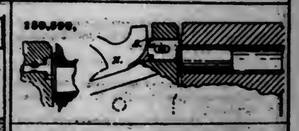
160,691. LATH-BOLTING MACHINES. John C. Mackey, Chicago, Ill. [Filed Nov. 16, 1874.]

Brief.—The slabs from which the belts are cut are retained in their proper position upon the bed of the machine by means of self-adjusting rolls, which conform to the uneven surface of the slab.

1. The combination, in a bolting-machine, of the independently-yielding rollers or belt-pressers H H, the rocking or tilting piece I, and the treadle mechanism, substantially as and for the purposes specified.

2. The adjustable tilting-piece or steady-block K, set to receive the several saws of a gang of bolting-saws, and mounted on the frame, substantially as and for the purposes specified.

3. In combination, the treadles Q Q, connecting-rods P P, crank-shaft O M M', connecting-arms N F, crank-shafts G G', roller F, piece I, and rollers H H, all substantially as and for the purposes specified.



160,691.

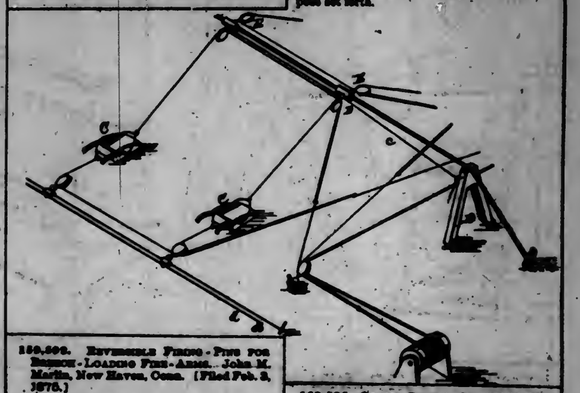
160,692. SAW-SETTING TOOLS. Franklin J. Martin, Williamsport, Pa. [Filed Dec. 12, 1874.]

Brief.—The saw-blade is held perpendicularly between the angle-pieces A B, properly adjusted, and the tool lightly struck with a hammer, thus burring the points of the teeth.

The improved saw-burring tool, consisting of two angle-plates, A B, bolted together adjustably, and arranged and adapted for burring saw-teeth, substantially as specified.

160,692.

160,693.



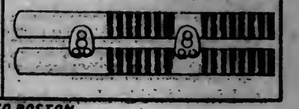
160,694. GRADING APPARATUS. John McGavin, New York, N. Y. [Filed Dec. 16, 1874.]

Brief.—A series of scrapers operated by ropes, pulley-blocks, and a windlass. The pulley-blocks are attached to thimbles, which slide upon a central main rope secured at each end to stakes, and supported by standards.

1. The combination of the thimbles D D, pulley-blocks E E, ropes *a a*, pulley-block F, rope A, derricks B B, and scrapers C, as herein shown and described, for the purpose set forth.

2. The combination of thimbles I I, pulley-blocks H H and F, ropes *b b* and J, and scrapers C, as herein shown and described, for the purpose set forth.

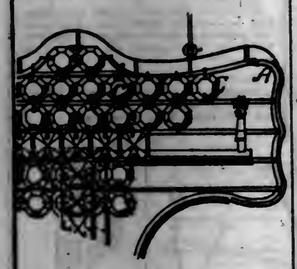
3. The combination and arrangement, herein shown and described, of the thimbles D D and I I, and adjusting-ropes *c* and *d*, for the purpose set forth.



160,693. REVERSIBLE FIRING-PINS FOR BREECH-LOADING FIRE-ARMS. John M. Marlin, New Haven, Conn. [Filed Feb. 3, 1875.]

1. A breech-loading fire-arm, provided with a reversible firing-pin, substantially as and for the purpose set forth.

2. The breech-block A, provided with the slot B and screw G, in combination with the reversible firing-pin D, having the slot E and point F, substantially as and for the purpose set forth.



160,694. CORSET-STEELS. Geo. W. McGill, New York, N. Y. [Filed Dec. 2, 1874.]

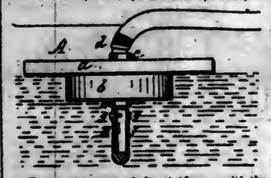
A corset-steel or busk corrugated or grooved transversely, as herein shown and described, for the purposes specified.

159,596. ILLUMINATED SIGNS. Frederick McLewee, New York, N. Y. [Filed Jan. 27, 1875.]

Brief.—Letters have gas-burners inside for illumination at night.

An illuminated letter, composed of the wire-frame A, plate D, gate or gates *b*, and translucent crystals or pieces C C, substantially as herein shown and specified.

159,597. WEATHER-BOARD GAGES. David M. Medford, Toledo, Ohio, assignor to the American Invention Company. [Filed Jan. 20, 1875.]

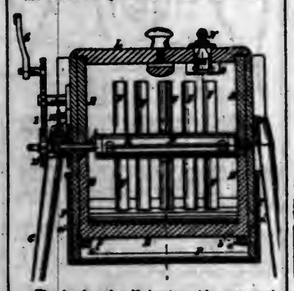


Brief.—A weather-board gage is provided with a graduated slotted spring, for holding the gage firmly to its place, and adjusting the blocks, which form the body of the gage.

The graduated spring A, in combination with block, spur, and thumb-screw, substantially as herein before specified.

159,598. COMBINED OYSTER KNIVES AND NIPPERS. Robt. F. Magee, Washington, D. C., assignor of one-half his right to A. May, New York city. [Filed Dec. 23, 1874.]

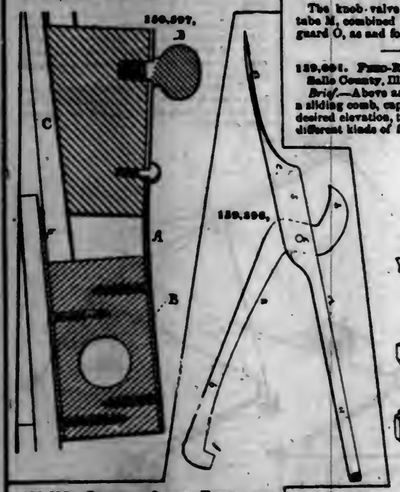
In a combined oyster knife and nippers, an open slot in the lower jaw of the nippers, into which the upper jaw will close down, said slot being large enough to let the chips fall through without weighing or clogging, substantially as shown and described.



159,599. FLOATS FOR SUCTION-PIPES OF PUMPS. Chas. Meitzler and G. H. Hamm, Rochester, N. Y. [Filed Oct. 9, 1874.]

The combination of the platform *a* with the floating block *b* and nozzle B, for the purpose of supporting the flexible pipe above water, as herein described.

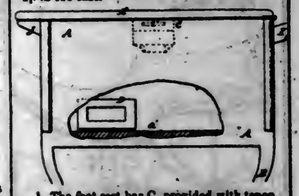
159,600. CHURNS. August Meyer, Port Washington, Wis. [Filed Oct. 10, 1874.]



Brief.—To ventilate the churn raise the knob-valve, and air will enter through side openings near the upper end of the tube, which is open at its lower end. A guard prevents the milk from spattering through the vent.

The knob-valve N, having side apertures M, combined with a churn-cover having guard O, as and for the purpose set forth.

159,601. FEED-RACKS. A. V. Mitchell, La Salle County, Ill. [Filed Dec. 19, 1874.]

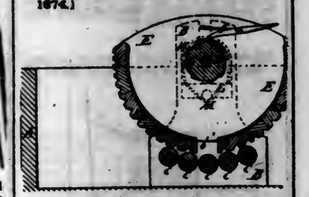


Brief.—Above an elevated exterior table is a sliding comb, capable of adjustment at any desired elevation, to regulate the flow of the different kinds of food from the rack.

A feed rack for cattle and horses, constructed as described, and consisting essentially of the exterior table C, in combination with the inclined rack, provided with the spring-catches *f f*, and the comb E, having the notches *g g*, substantially as described.

159,602. SHOE-BLACKING CASES. William H. Morse, East New York, N. Y. [Filed Nov. 14, 1874.]

Brief.—The support for the foot can be attached to the edge of the box by the particular tenon, and hold the blacking-box holder upon the ledge of the box at the opposite side. These parts are removable, and can be shut up in the case.

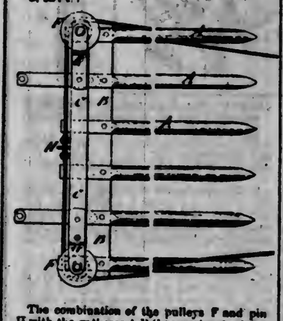


1. The foot-rest bar C, provided with tenon C', and ends fitting into recesses of box A, as and for the purpose described.

2. The holder D, having transverse recess E near one end to receive the edge of box A, and a longitudinal aperture leading into said recess to receive one end of bar C, as and for the purpose specified.

3. The case A, provided with cleat I, to serve as handle to box and support to cover, as and for the purpose specified.

159,603. WASHING-MACHINES. Francis M. Myers, Windsor, Mo. [Filed Nov. 30, 1874.]

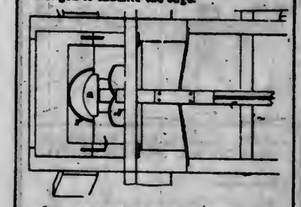


The combination, with the roller-bed C, of the semi-cylindrical rubber E, having slot *b*, the crank-roller G, loop J, and pawl and ratchet I H, as shown and described, to operate as specified.

159,604. HARVESTERS. Charles K. Myers, Pekin, Ill. [Filed Oct. 24, 1874.]

1. The revolvible boxes J J seated in standard flanges *h'*, as and for the purpose specified.

2. The combination, with lever O, pivoted to arm R on the front bar of main frame, of the vertical pivoted bars N N and T, the former supported on tongue-bar M and the latter on the pivoted tongue itself, as and for the purpose described.

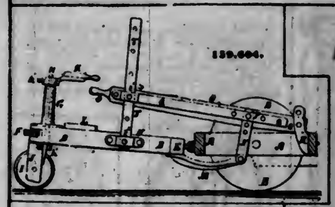


159,605. HAT-GATHERERS. Chesley Theo. Neell, Clarksville, Mo., assignor to himself and Uriel Griffith, same place. [Filed Dec. 5, 1874.]

The combination of the pulleys F and pin H with the gatherer A B C to receive the drag-ropes, substantially as herein shown and described.

159,606. MACHINES FOR SEWING COUNTER-STIFFENERS FOR BOOTS AND SHOES. Chas. H. Orcutt, Leominster, assignor to Jos. A. Harwood, Littleton, and Nahum Harwood, Leominster, Mass. [Filed Jan. 23, 1875.]

Brief.—The counter-blank pressed into a former by a die-plate is brought under a knife arranged to chamfer the edge.

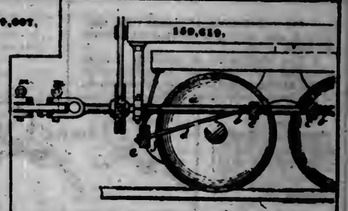


In a machine for forming and skiving boot-stiffeners or counters for boots or shoes, the concave former F, counter-die G, and knife M, in combination with mechanism for depressing the counter-die into the former, and for moving both die and former underneath the knife, or the latter over both former and counter-die, substantially as and for the purpose described.

159,607. AXLE-LUBRICATORS. Christopher C. Parker and John Elvett, Sullivan, Ind. [Filed July 6, 1874.]

Brief.—The cone is embedded in the hub. The lubricant is supplied through the tube on lifting the valve-stem, which is held in place, when not in use, by springs.

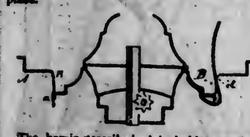
1. The case A, having the discharge-tube *a* filled by the valve B, the stem of which extends up through the disk C, against the lower side of which bears a spring, D, attached to the said stem, all combined substantially as and for the purposes set forth.



2. The spring E, lodged in the cover F of the case A, and pressing against the valve-stem, for assisting in retaining the valve B in its seat, all combined substantially as and for the purpose specified.

159,608.

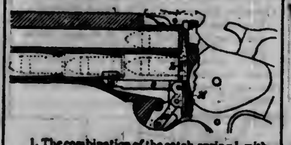
159,609.



159,610. CAR-BRAKES. Jas. C. Scott, St. Thomas, Canada. [Filed July 13, 1874.]

1. A brake composed of shaft *a c*, provided with right and left screw-threads *b b*, in boxes *c c*, in combination with arms *d d* and cross-pieces *e e*, to act as friction-blocks *f f*, all constructed to operate substantially as and for the purpose set forth.

2. The shaft *a c*, provided at one or both ends with the double-joint coupling apparatus *m*, constructed to operate substantially as and for the purpose set forth.



159,611. GLOBE-HOLDERS FOR LAMPS. R. E. Perkins, Meriden, Conn., assignor to E. Miller & Co., same place. [Filed Dec. 10, 1874.]

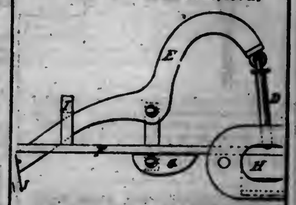
Brief.—The inner ring is provided with notches, to enable the spring to come in contact with the chimney to hold the same in place.

The herein-described globe-holder, consisting of the outer ring or globe-rest, A, and the inner ring, B, provided with the tongues *a* upon its lower edge, and the notches *d* upon its upper edge, substantially as specified.

159,612. MAGAZINE FIRE-ARMS. Edwin A. Prescott, Hatfield, Mass., assignor to Prescott Pistol Company, same place. [Filed Mar. 28, 1874.]

1. The combination of the catch-spring L with the groove in the stock for the head of the cartridge, to hold it until raised into the grooves E, substantially as specified.

2. The combination of arm I, connecting-rod M, and slide H, as described, whereby the slide is moved accurately, made cheaply, and worked without play or lost motion.



3. The rod O, jointed to the slide H, as described, and provided with the cam or point N, substantially as specified.

159,613. MANUFACTURE OF WIRE. Wm. L. Reynolds, St. Louis, Mo., assignor of two-thirds his right to C. Haskell and Wm. B. Dean, same place. [Filed Nov. 21, 1874.]

Brief.—Wet clay is used as a lubricant to facilitate the passage of the wire through the drawing-dies.

The use of clay in the manufacture of wire as a coating during the process of drawing, substantially as set forth.

159,614. CAR-COUPLINGS. E. J. Simmons, Blackshear, Ga. [Filed Dec. 26, 1874.]

1. The pivoted horizontal lever F, having grooved plate H, in combination with the link C, provided with a projection, *c'*, as and for the purpose described.

2. The combination of the pivoted lever F, the pivoting-block O, the plate H, and the catch-arm I with the lever E and the coupling-pin D, substantially as shown and described.

3. The combination of the notched hanging bar J with the levers E F and the grooved plate H, substantially as shown and described.

159,615. TELL-TALE COUPLINGS. H. Sayer, Brooklyn, N. Y. [Filed Dec. 28, 1874.]

Brief.—Parts locked by cam-lever held in locking position by strap detachably connected to axle.

159,616. WASHING-MACHINES. Simon W. Stanley, Benton Harbor, Mich. [Filed Dec. 28, 1874.]

Brief.—A roller with spurs drives an endless band, with hinged cleats on the surface, under a frame of rollers attached by springs to the lower frame.

1. The combination of the vertically-movable roller-frame J K and springs L, connected thereto at both sides, with the standards C and apron C F, as and for the purpose described.

2. The combination of the slats G, the flexible connecting-bands F, the spurred roller D, and wheels H, with the frame B C and roller-frame J K, as and for the purpose described.

1. The combination of clamps C D, can-lever E, and strap I, as and for the purpose set forth.

2. The combination of conically headed screw-bolt F M, conical nut N, grooved cush hion G, having collars O O, and the ears L L, as and for the purpose set forth.

160,624.

160,616. SHAWL-STRAP BAR. R. Speer, Newark, N. J. (Filed May 10, 1874.)

Brief.—The bar is formed of one piece of metal, slotted at each end to admit the strap, and so as to leave the cross-pieces and bridges of a buckle, to which a tongue is properly fitted.

A shawl-strap bar, in which the part *d* forms the pivot for the tongue *c*, and the middle rib, *f*, serves for the front of the buckle, which is formed in the bar A, substantially as herein-before described and set forth.

160,617. PORTABLE HORSE-FEEDING SUPPORTS. Albert H. Spencer, Boston, Mass. (Filed Jan. 11, 1875.)

1. A feed-basket adapted to be superseded from the animal's neck, and transioned near its upper part to a bifurcated support, substantially as and for the purpose described.

2. The detachable support C *e e*, constructed as and for the purpose specified.

160,618. COMB-PLASTERS. Abram Staley, Morris, Mich., assignor to himself and J. L. Staley, same place. (Filed Dec. 12, 1874.)

Brief.—To the pivoted blade is fastened a curved leg, the upper end of which passes through the seed-chamber, and rests against a pivoted retracting spring, to which one end of the clamping and curved slides are respectively attached. When the blades of the planter are placed in the earth and rocked, the spring is forced back by the leg, carrying with it the slides.

The combination of the spring I, slides G H, and leg F with the seed-holder A C, as shown and described, so that the spring and slides will all be simultaneously operated by the same leg, while the slides, together with the leg, will all be simultaneously retracted by the same spring.

160,619. DIES FOR MAKING CHAIN-SWIVELS. Philander H. Standish, Jefferson City, Mo., assignor to himself and J. H. Bodine, same place. (Filed Oct. 10, 1874.)

Brief.—The neck of the eye D is placed between the overlapping ends of the link-blank, the upper die brought down, and the welding completed.

The corresponding dies E F, having circular cavity *a* and straight one *b*, the two cavities crossing each other, as and for the purpose specified.

160,620. BLIND-STOPS. Charles E. Stoller, Milwaukee, Wis. (Filed Dec. 12, 1874.)

Brief.—A cam-bottom, shouldered corner-plate, and extension upon it are arranged to operate the slats, and to hold them at any required angle.

A blind-stop consisting of the cam-bottom i A and corner-plate *j*, having shoulder *k* and extension *l*, applied in connection with frame *a*, bar *b*, and slats *c*, as shown and described.

160,621. LAMP-EXTINGUISHERS. Augustus Umbdstn, Tremont, Pa. (Filed Jan. 16, 1875.)

Brief.—The extinguisher has a frictional connection with the stem of the wick-raiser, and is operated thereby. The slots in the extinguisher-plate allow access of air to the flame when the plate is withdrawn.

1. The combination, with the wick-stem D, of the extinguisher F, the same being connected by arm G, as shown and described, to admit of simultaneous operation.

2. The extinguisher F G, provided with openings or slots *f* in the flanged top portion, as and for the purpose specified.

160,622. CAR-AXLE BOXES. Benjamin K. Verbryck and Thos. Newberry, Chicago, Ill. (Filed Jan. 19, 1875.)

Brief.—On closing cover the latch is thrown into engagement and slightly catches. It is then turned by hand, so as to lock tightly.

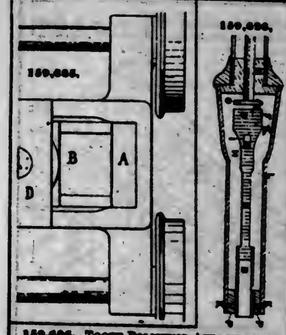
1. The combination of hinged lid B, having side groove *a*, and cam *b*, axle-box and pivoted latch piece B', having on its recessed lower side *b* shaft-cam for locking the lid, substantially in the manner and for the purpose set forth.

2. The segment cam-piece *b* of the lid, having its lower corner obliquely cut away, in combination with the radial cam end *d* of the latch, for causing the same to lock on closing the lid, substantially as set forth.

160,623. BOB-SLEDS. John Wannamaker, Shakopee, Minn. (Filed Dec. 10, 1874.)

1. The tongue-roller pivots B, combined with and to vibrate in the ends of the tongue-roller, as and for the purpose specified.

2. The bounds L and connecting-bars M, in combination with the bind beam and the reach, substantially as specified.



160,624. UMBRELLA-RIBS. Henry Winter, Jersey City, N. J. (Filed Nov. 24, 1874.)

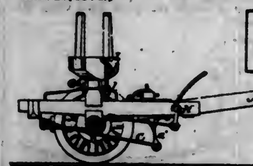
The clip at the end of the umbrella or parasol rib, made of a strip of sheet metal folded to form the eye, and bent to conform to the shape of the rib and soldered thereto, as set forth.

160,625. CAR-TRUCKS. Benson C. Wright, Philadelphia, Pa. (Filed Dec. 9, 1874.)

Brief.—Permits lateral motion of car-body, following curve of groove, but causes friction equal on both sections of latter.

The combination of the grooved block A and bridge B, substantially as and for the purpose set forth.

160,626.



160,626.

The metallic covers *a*, in combination with a glass dish, having a pressed-glass partition and handle, said handle and partition being formed with pivots or pintles so that the metallic covers may be hinged directly thereto, substantially as and for the purpose specified.

160,627. COMPOUNDS FOR THE MANUFACTURE OF PICTURE AND SIMILAR FRAMES. Alex. N. Atwood, Philadelphia, Pa. (Filed Apr. 28, 1874.)

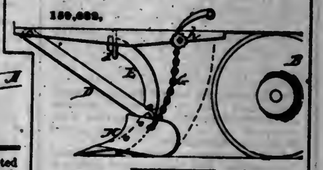
The described composition for the manufacture of picture and similar ornamental frames and mouldings, consisting, essentially, of asbestos, silica, soapstone, and asphaltum, combined in the manner and in about the proportions set forth.

160,628. RUNNING-GEARS FOR VEHICLES. Jacob Becker, Jr., Seymour, Ind. (Filed Nov. 27, 1874.)

1. The combination, with tongue A, pivoted at *a*, and having arms *a'*, connected by pin *a''*, of the rod C, connecting with brake-bar, as and for the purpose specified.

2. The combination, with pivoted tongue A, of bars F F and sliding bar E, as and for the purpose described.

3. The combination of plate K and the double-tree J, pivoted over hounds, as and for the purpose set forth.



4. The loops *f* and plate M, combined with a king-bolt, reach, sand-board, bolster, and front axle, as and for the purpose specified.

5. The combination of a bolster, L, to turn on a pivot, L', of the hook N, to work in a circular iron, O, as and for the purpose described.

160,629. SAW-FILING MACHINES. Fred. W. Benjamin, Jefferson, assignor of one-half his right to Abram Shearo, Sheffield, Ohio. (Filed July 30, 1874.)

Brief.—Within the arch of the carriage is suspended a yoke, capable of horizontal adjustment, and provided with a rear arm. Within the yoke is a guide for the file-carrier, and from the end of the arm is suspended an adjustable hanger. The former is for adjusting the pitch of the teeth, the latter for the relative length of them.

160,630. GUARDS FOR PLOW-POINTS. Nicholas H. Borgfeld, New York, N. Y. (Filed Oct. 9, 1874.)

A pulley, formed in sections, the rims of which are composed of layers of wood placed one upon the other, and bent to the required shape, in combination with a dimetrical brace made in sections, and adapted to be fastened together, substantially as described.

160,631. BRICK-MACHINES. Geo. C. Bovey, Chillicothe, Ohio. (Filed Jan. 6, 1875.)

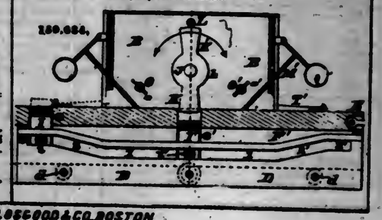
Brief.—A mold-slide reciprocated by a pitman carries a rack to rotate the spindles in a hopper above it. The bricks are ejected at each end, and their removal effected by lateral guards, operated by a peculiar cam-disk.

1. A brick-machine consisting essentially of the frame A A', hopper B, slotted plate D 1 2 2 3 3', reciprocating two-mold carriage E *e e'*, plungers I I F F', and reciprocating rotary press-wheel J K K', motion being communicated from said carriage to the press-wheel by the racks *f f'* and spur-wheels *f g*, or their equivalents, substantially as described.

2. The slotted plate D 1 2 2 3 3', located beneath the reciprocating carriage E, for operating the plungers I I F F', and provided with rollers L, for supporting the flanges F F of said carriage, substantially as explained.

3. The guard S, pivoted timber-lever T t U u, and eccentric V W X *s* Y *y*, as and for the purpose set forth.

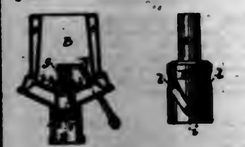
160,632. LADDERS. Daniel Argerbright, Troy, Ohio. (Filed Aug. 12, 1874.)



In a ladder, the combination of the stiles A A', steps B B' B'', clip-castings C H, cut-side clips H', and tie-rod E, all constructed and arranged as herein set forth, for the purpose specified.

160,633. COVERED GLASSWARE. Thomas B. Atterbury, Pittsburg, Pa. (Filed Sept. 1, 1874.)

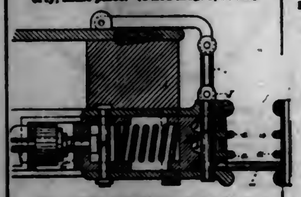
Brief.—The metallic covers are hinged directly to the pressed-glass septum of the glass dish.



160,634.

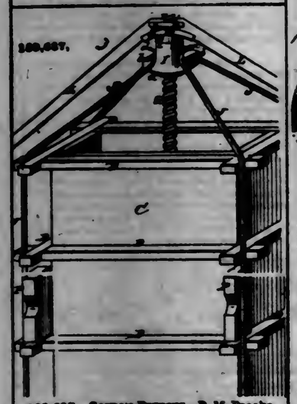
160,635. ARGAND-BURNERS. J. A. Bowler, New York, N. Y. [Filed Jan. 12, 1875.]

Brief.—A hollow valve-plug with apertures and spiral grooves communicating with the tubular arms, said apertures and the mouth of the valve-plug being guarded by wire-gauze.



1. The combination, with an ordinary argand-burner, constructed with tubular arms, and an annular chamber, *c*, of the hollow valve-plug E, constructed with the grooves *i*, running in opposite directions from the transverse passage *i* in the valve, and each communicating with one of the arms *b*, substantially as and for the purpose described.

2. The combination, with an ordinary argand-burner, constructed with tubular arms *b b* and annular chamber *c*, of the hollow valve-plug E, having the vertical stem *e*, grooves *i*, and opening *i*, and the lever-arm H, attached to the stem of the valve, and projecting to the exterior of the burner, substantially as and for the purpose described.

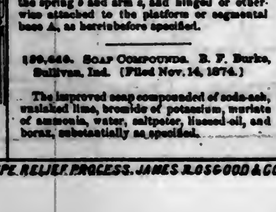


3. The combination, with hollow plug-valve E, constructed with the transverse opening or passage *i* and grooves *i* in the outer surface of the valve, communicating with said passage, of the wire-gauze screen J, arranged upon the inner periphery of the hollow valve, and covering the transverse opening *i*, substantially as and for the purpose described.

160,636. CAR-COUPLINGS. Wm. A. Boyden, Harrisburg, Pa., assignor to W. R. Dougherty, same place. [Filed Aug. 5, 1874.]

The combination of the angle-iron E, pin F, draw-head B, follower G, and the spring-rod I, for holding the draw-head in its forward position, substantially as described.

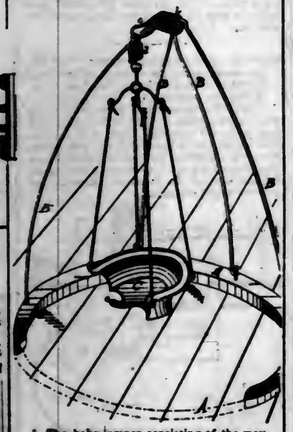
160,637. COTTON-PLANTERS. R. M. Brooks, J. M. Brooks, and J. S. Lavender, Barnesville, Ga. [Filed Oct. 27, 1874.]



1. The metallic head-block I, surrounding the nut H and screw G, and provided with upward-projecting flanges *b b*, into which are looped the continuous rods J J, substantially as and for the purposes herein set forth.

2. The nut H, provided with circumferential flange *a* at its base, in combination with the flanged head-block I, as and for the purposes herein set forth.

3. The combination of the elongated nut H, flanged driver K, fastened thereto by pins *c c*, and the levers L L, provided with pins *i i*, and connected by links *k k*, all substantially as and for the purposes herein set forth.

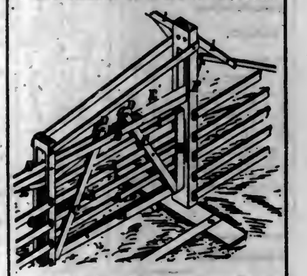


160,638. GRAIN-DRILLS. William Brown, La Fayette, Ill. [Filed Feb. 9, 1874.]

Brief.—The tube is provided at the front with a plate, having two sets of holes for attaching the drag-bar. The rear end of the drag-bar is vertically adjustable in the rear set of holes, while the front set is to gage the depth to which the point shall enter the ground.

A grain-drill shoe, A, having a plate, B, with the two series of holes *b* and *b'*, arranged as described, for vertical and angular adjustment of the shoe, as set forth.

160,639. BABY-JUMPERS. D. F. Burgess, Lockport, N. Y. [Filed Nov. 21, 1874.]



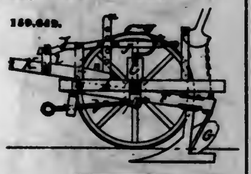
1. The baby-jumper consisting of the movable base A, supports B B, with spring *b* and arm *c*, side braces B' B', and suspended chair C, all constructed and arranged substantially as hereinbefore specified.

2. In combination with the suspended chair C, the supports B B, formed at the top into the spring *b* and arm *c*, and hinged or otherwise attached to the platform or segmental base A, as hereinbefore specified.

160,640. SOAP COMPOUNDS. B. F. Burke, Sullivan, Ind. [Filed Nov. 14, 1874.]

The improved soap compounded of soda-ash, vaslaked lime, bromide of potassium, muriate of ammonia, water, saltpeter, linseed-oil, and borax, substantially as specified.

160,641. AUTOMATIC GATES. H. N. Burnham, Bushnell, Ill. [Filed Nov. 18, 1874.]



In combination with the gate A, A, B, and B, provided with the hangers C, C, D, and D, the pivoted oscillating beam E, E, and E', the inner rail of which, E', is at its upper edge formed upon a double incline that is lowest at its center and curved at its ends, and furnishes a bearing for said hangers, substantially as and for the purpose specified.

160,642. SULEY-PLOWS. James C. Cress, Millbrook, Ill. [Filed Jan. 12, 1875.]

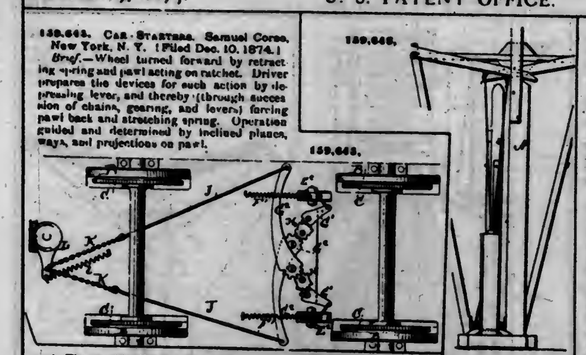
Brief.—The plow-beam has an enlarged broad front, which is pivoted between the bars of the frame, and is raised and lowered in the arch of the axle between guides. The tongue passes between posts on the beam, and is loosely pivoted to its center. A lever is attached to the tongue and fulcrumed on the plow-beam, which raises or lowers the front of the plow-beam, moving with it the frame and axle. Another lever raises the rear end of the plow-beam independently.

The combination, with the frame A, arched axle B, plow-beam F, and pole K, constructed as described, of the lever J, catch m, perforated guide n, and lever Q, all constructed and operating as shown and described.

160,643.

160,644. ROLLING-PINS. Peter Cavalier, Yankton, Dak. [Filed July 29, 1874.]

As an article of manufacture, a hollow rolling-pin, formed of a single piece of glass, with its two ends open, and contracted to form handles B B, as and for the purposes set forth.



160,645. CAR-WHEELS. Wm. J. Cochran, Baltimore, Md. [Filed Jan. 9, 1875.]

A car-wheel having the chilled bearing-bosses D D projecting from each side, cell-cavity C, and perforation, in combination with the chilled bearing F, substantially as and for the purpose described.

160,646. CAR-STARTERS. Samuel Corse, New York, N. Y. [Filed Dec. 10, 1874.]

Brief.—Wheel turned forward by retracting spring and pawl acting on ratchet. Driver prepares the devices for each action by depressing lever, and thereby (through succession of chains, gearing, and levers) forcing pawl back and stretching spring. Operation guided and determined by inclined planes, ways, and projections on pawl.

1. The combination of the ratchets C, attached to the wheels B, and the pawls D, connected with the levers E', provided with the springs F', for imparting the forward motion to the wheels, as shown and described.

2. The combination of the inclined-edged plates N and the ways or guides *e e* with the pawls D, provided with the lateral projections *d d*, as shown and described.

3. The combination, with the pawls D, of the levers E' F' and springs F' F', as shown and described.

4. The combination, with the levers E', of the levers G' G' and toothed double sectors H, as shown and described.

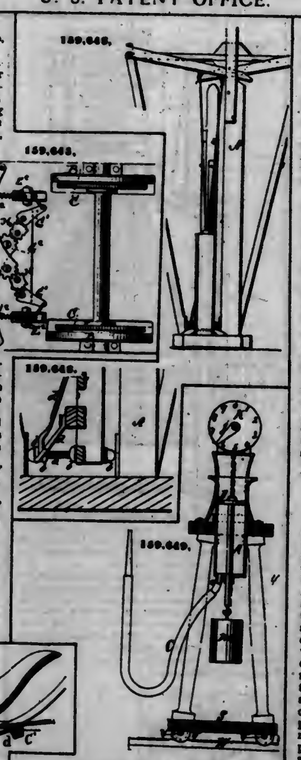
5. The combination of the levers G', rods J, chains K, and arm L, as shown and described.

6. The combination of the arm L, toothed lever M, and foot lever P, as and for the purpose specified.

7. In combination with the pawls D, the cranks R, to operate as and for the purpose specified.

160,647. EXTRACTING GOLD. Frederick William Dahne, Swansea, Great Britain. [Filed Nov. 27, 1874.]

Brief.—Dissolves the gold in the form of chloride by treating the ore, regulus, &c., by hypochlorite of lime and hydrochloric acid. After removing the excess of chlorine by steam, the gold is precipitated by sulphurous acid.



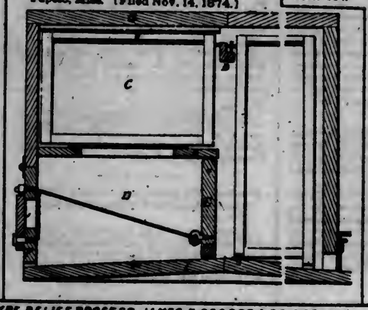
The described process of extracting gold, consisting essentially in the treatment of auriferous material with an aqueous solution of chloride of lime and hydrochloric acid, and precipitating the gold from the solution thus obtained by sulphurous acid, substantially as described.

160,648. FARM-GATES. Stephen S. Davis, Chicago, Ill., assignor to Pollock Barbour, Louisville, Ky. [Filed July 23, 1874.]

Brief.—Improvement on Patent No. 83,046. The bolt on which the gate tilts is threaded, and provided with nuts for adjusting the gate when it sags.

The gate pivotal on the screw-rod *a*, between the post and brace A C, in combination with the adjusting-nuts *b b* and braces *d d*, all substantially as set forth.

160,649.



160,649. APPARATUS FOR FEEDING FOWLS. Alfred de Caris, New York, N. Y. [Filed Oct. 20, 1874.]

Brief.—A cylinder vertically suspended in a frame; a discharge-tube and hose proceeding laterally from its base; a follower having a descending rod passing centrally through the bottom cylinder-head and weighted below; an ascending chain passing around a cylinder carrying a registering-disk at its end, and operated by a crank to lift the follower out.

1. The cylinder A, weighted and suspended piston B, and tube C, arranged substantially as and for the purpose set forth.

2. The cylinder A, piston B, tube C, and registering device K, as and for the purpose set forth.

160,650. BEE-HIVES. Joseph R. Dickson, Tupelo, Miss. [Filed Nov. 14, 1874.]

Brief.—Two equal parallel divisions, the right end of one swinging outward upon hinges, so as to close against the left, which is stationary, and each frame within this brood-chamber swinging in the same direction; the left division having a horizontal woven-wire partition, above which are the honey-frames, and beneath a chamber useful as an offal-receptacle, a moth-trap, and a poison, into which to drive the entire family for temporary purposes, the lower central wall being movable by means of a cord passing to the outside.

1. The horizontal hive herein described, having in one end the brood-chamber A and its frames, and in the other end the honey-box C and secluding-chamber D, arranged the one over the other, and divided by an open partition covered with wire-cloth, substantially as specified.

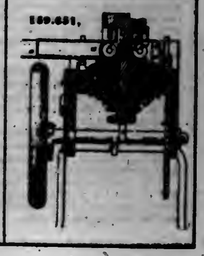
2. The secluding-chamber D, herein described, arranged under the honey-box, and at the side of the brood-chamber, and provided with the horizontally-hinged inner and outer doors E F, the latter having a light-opening and a perforation for the operating-cord attached to the former, substantially as specified.

3. The combination, with the horizontal hive, having the brood-chamber and the honey-box arranged side by side, of the transverse partition-beam B, supporting the inner ends of the frames of each chamber, and the sectional covers G, divided above said beam, as specified.

160,651. MACHINES FOR PRINTING SPOOLS. Ira Dimock, Boston, and George Dimock, Leeds, Mass. [Filed May 14, 1872.]

Brief.—The spools are agitated by reciprocating rods, and guided through conduit into a race, from which the forward one is discharged, by a flexibly-driven plunger, into one of duplicate receivers, in which it is held by a reciprocating holder. During this movement the duplicate printing-dies, having been inked while at rest, move forward, are tipped into horizontal position by cams, and, moving against the spool, print its opposite ends in different colors, and, retreating, are raised into vertical position to be inked, while the rear spool-holder, rising, liberates its spool, and the receivers, making half a revolution, discharge the rear spool by its contact with a discharge-arm, and move into position to receive another spool, when the former operation is repeated, and the printed spool carried to the rear and the new one received are again printed, the former receiving a new impression in a contrasting color.

1. The reciprocating filler G, in combination with the hopper B and tubular duct C, substantially as specified.



2. The reciprocating agitator H, in combination with the reciprocating filler G, the hopper B, and the duct C.

3. The combination, with the spool tube or duct C, of the shuttle-race D and the shuttle E, when arranged in relation with each other substantially as and for the purpose herein set forth.

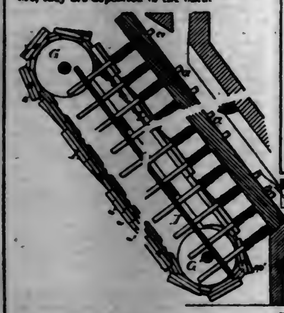
4. The combination of a yielding shuttle-driver with the shuttle E, the shuttle-race D, and the spool-duct C, essentially as specified.

5. The combination of the shuttle E with the intermittently-revolving compound spool-receiver F F', in which the spools lie parallel, or thereabout, with the planes of revolution, substantially as and for the purpose herein described.

160,651.

6. The combination of the intermittently revolving compound spool-receiver F F', in which the spools lie parallel, or thereabout, with the planes of revolution and the printing-slides M M' or stampers, the whole arranged substantially as herein described, whereby the ends of the spools are alternately presented in one direction to receive the impression.

7. The combination of the rising and falling spool-holders E E', and intermittently revolving compound spool-receiver F F', substantially as herein described.



8. The clearer U, in combination with the rising and falling spool-holders E E' and intermittently revolving compound spool-receiver F F', substantially as specified.

9. The turning stampers N N' b' N', in combination with the spring followers O' O' and the slides M M', essentially as described.

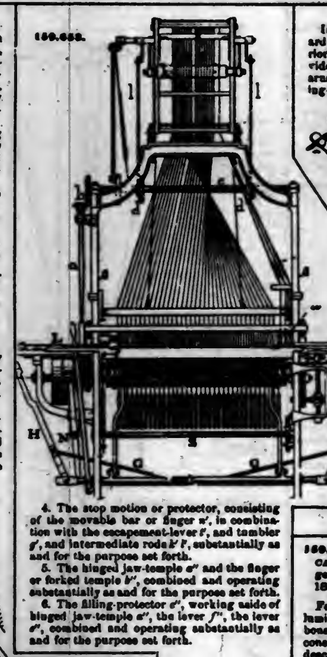
10. The combination of the shafts w w' of the spool-holders E E' and sleeve L of the compound spool-receiver F F', when arranged in relation with each other as described.

159,653. TEMPERING STEEL PLATES. Henry Disston and Chas. T. Shoemaker, Philadelphia, Pa., assignors to Henry Disston, H. Disston, and A. E. Disston, same place. [Filed Dec. 30, 1874.]

Brief.—The plates are placed in a flue between the chimney and fire-bed, and are suffered to slide step by step by the withdrawal of pins actuated by springs and beviled joints of an endless chain, until, having reached the fire, they are deposited in the bath.

1. The flue B, communicating at one end with a chimney and at the other end with a furnace, in combination with retaining and releasing rods a a, caused to project into and to recede from the flue, all substantially as set forth.

2. The combination of the inclined flue B, the spring-rods a, and the endless chain with its ribbed plates m and e.



159,654. LOOMS. John Dornan, Philadelphia, Pa. [Filed Jan. 27, 1875.]

Brief.—The weft is laid by a carrier and brush, which meet at the center of the shed, and it is knit in at the selvage by a latch needle. A forked temple is combined with the jaw-temple, and a finger extending over the lay holds the several weft-threads in position. The lay operates the let-off and take-up, and the connection with the lay is controlled by a pivoted piece. The jacquard has a counterpoise motion, having one top board and two trap-boards. The journals are operated by hooked bars placed in and out of gear with the slides which support the trap boards.

1. The lever N, the swivel-rod I, the oscillating lever F, the connecting-rods G, and the picking-sticks H, in combination with the carrier K and receiving-hook L, substantially for the purpose set forth.

2. The bar b', with semicircular device c''', and latch-needle x'', in combination with the lever c' and sliding bar d', substantially as and for the purpose set forth.

3. The combination, with the needle-bar b' and sliding bar d', of the lever c', formed of parts jointed to each other, substantially as and for the purpose set forth.

4. The stop motion or protector, consisting of the movable bar or finger n', in combination with the escapement-lever f', and tambler g', and intermediate rods h' F, substantially as and for the purpose set forth.

5. The hinged jaw-temple o'' and the finger or forked temple b'', combined and operating substantially as and for the purpose set forth.

6. The filling-protector c'', working aside of hinged jaw-temple o'', the lever f''', the lever c''', combined and operating substantially as and for the purpose set forth.

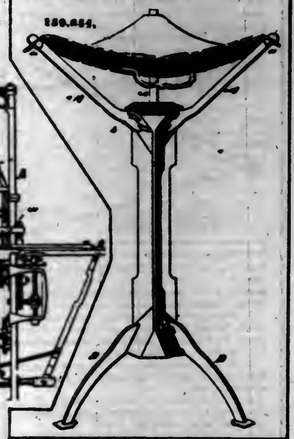
7. The spring connection r' between the mails and jacquard, substantially as and for the purpose set forth.

8. The mail or filling guides u, with pins y', the box x', and the friction device s', combined and operating substantially for the purpose set forth.

9. The combination, with the lathe, of the rod Z, connecting the let-off and take-up, and having a hinged pin, o', and operating substantially as set forth.

10. The combination, with the top board, t t, and lifting-boards S' S''', of the series of treadles n n'' n''', and connecting-rods l l m, and with the same d q, substantially as and for the purpose set forth.

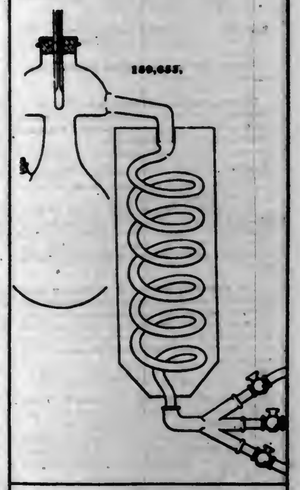
11. In combination with the pattern-cylinder, the journal-needle r with the pins D' D'' D''' D''', substantially as and for the purpose set forth.



12. The sliding journal-bars A' A'' A''' A''', with hooks B' B'' B''' B''' jointed thereto, in combination with the springs E' E'' E''' E''', bearing against the hooks and attached to the bars, substantially as and for the purpose set forth.

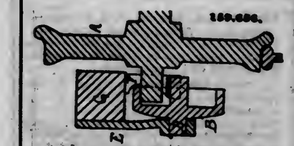
13. The trap-board slides s s''', with one or more pins, in combination with the journal-bars A' A'' A''' A''', hooks B' B'' B''' B''', and springs E' E'' E''' E''', substantially as and for the purpose set forth.

159,656. FOLDING CAMP-STOOLS. Edward Dunbar, Springfield, Mass. [Filed Sept. 10, 1874.]



Brief.—The ends of the metallic standard are formed with lugs and openings, to afford exterior and interior bearing-surfaces to the arms and legs, which are provided with locking buttons and shoulders.

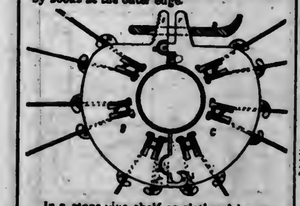
In combination with the cast-metallic standard B, having the ends formed to afford interior and exterior bearing-surfaces, and provided with the lugs A A A, and openings a, the arms A A A, and legs D D D, with their locking-buttons d and shoulders, as set forth.



159,655. PROCESSES OF TREATING HYDROCARBONS FOR MAKING GAS. Henry H. Edgerton, Fort Wayne, Ind. [Filed Jan. 14, 1875.]

For use in the process of manufacturing illuminating-gas from gas-producing hydrocarbons by presenting hydrocarbons of the same constitution in the retort at the same time, as described, the method of preparing said hydrocarbons, by separating the same into liquid subdivisions whose respective constituents have substantially identical decomposing points, as set forth, whereby any one of said subdivisions is available in liquid form for gas-making purposes, independently of the others.

159,657. ANTI-FRICTION DEVICES FOR CAR-WHEELS. Chas. B. Emery, Boston, Mass., and F. W. Emery, Portland, Me. [Filed Dec. 11, 1874.]



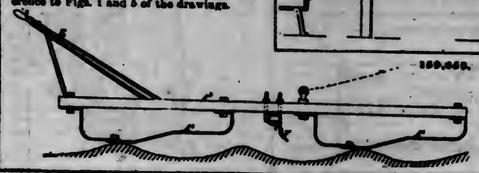
1. The combination of the truck-frame C, bearings and stays E and F, axle D, secondary wheel, B, axle C, and supporting-wheel A, substantially as and for the purpose set forth.

2. The wheel B, to revolve upon an independent axle, D, said axle being supported by suitable pedestals to a frame, G, combined with axle C and supporting-wheel A, substantially as and for the purpose set forth.

3. The combination of the journal of the supporting-wheel A with hollow friction-wheel B, the spindles of which are vertically below the said journal of the supporting-wheel, the pedestal E F, and truck-frame G, the flange of wheel B resting on the journal of wheel A, substantially as and for the purpose set forth.

159,647. STOVE-PIPE SHELVES. John Emmert, Lanark, Ill., assignor of one-half his right to A. B. Thayer, same place. [Filed July 22, 1873.]

Brief.—Two semicircular cast-iron plates to fit around a stove-pipe have legs and clamps to hold them in position. Forked rods pass through openings in the plates, and are held by hooks at the outer edge.

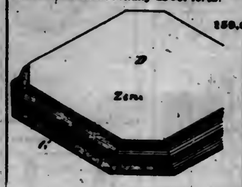


In a stove-pipe shelf or clothes-drier, constructed of the two parts B C, hinged together by the hooks I J, and being provided with the forked rods P, arranged in connection with the slots O and hooks M, as described, the combination, with the notched projections E F, of the clamp D, as and for the purposes specified.

159,648. MACHINES FOR TRIMMING OR PEELING CROPS. M. Bustace, Highfield, Drumcondra, and Jas. Keenan and T. Keenan, Dublin, Ireland. [Filed Dec. 6, 1873.]

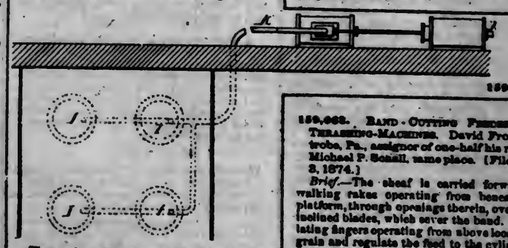
Brief.—A series of longitudinal slotted bars carrying a runner or guide at each end, and a box with side cutters in the center. Two cross-bars adjustably connect the whole, being fastened firmly to two, and loosely to the others. The machine is driven across the rows, and the curved guides allow the bars to strike the ridge of plants, and then raise them to deposit the earth and plants in the furrow. The guides may be adjusted as to length and the bars as to height.

1. The combination of two guide-frames, II and IV, fixed to transverse bars B B, with other frames, I, III, and V, connected to the transverse bars by guides I and springs, chains, or links K, so as to be capable of independent vertical motion, substantially as herein described in reference to Figs. 5, 6, and 7 of the drawings.



2. The guides A^1 A^2, formed of metal bars, and secured so that they can be adjusted in length and position to suit drills of different widths, substantially as described with reference to Figs. 1 and 5 of the drawings.

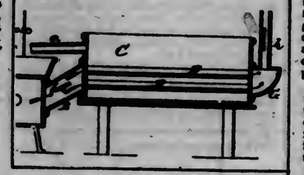
159,649. STOVE-PLATFORMS. Wm. Evans, Chicago, Ill. [Filed Jan. 20, 1875.]



Brief.—The outer wooden molding conceals any sharp and ragged edges on the down-turned portion of the zinc.

The combination, of the wood platform and frame A B with understays C C, the zinc covering D, with its edges bent downward, and the wooden molding G, secured by nails or screws c, which pass through the wooden molding, bent edges of the zinc, and into the part B, all substantially as set forth.

159,650. MODES OF OBTAINING MOTIVE POWER. Charles Faivre, Paris, France. [Filed Nov. 24, 1874.]



Brief.—To the under side of a yielding platform pistons are attached, which work in air-cylinders with suitable valves. The passing of vehicles, &c., over the platform depresses it, working the air-pumps, which are connected by pipes to a reservoir or engines.

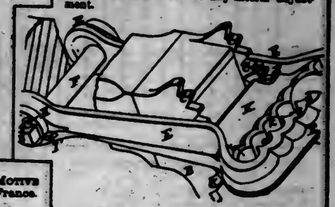
The combination of the yielding platform F, cylinders I, and pipe K, communicating with the cylinders and with an engine or reservoir, as set forth.

159,651. EVAPORATING-PANS. J. F. Ferguson, Essex, Vt. [Filed Jan. 9, 1875.]

Brief.—An open multi-tubular boiler is connected to a fire-box by a movable flue. A "sirening-off" pan situated on the fire-box receives the juice from the multi-tubular boiler, to complete the process of evaporation. By means of the movable flue the parts are detachable.

159,659.

---



1. The inclined movable flue E, connecting the fire-box A with the pan C, substantially as and for the purposes herein set forth.

2. The combination of the fire-box A, pan B, pan C, with flues D, and the movable inclined flue E, substantially as and for the purposes herein set forth.

3. The combination of the fire-box A, pan B, inclined flue E, with damper b, pan C, with pipe a and flues D, fire-box G, and smoke-pipe h, all constructed substantially as and for the purposes set forth.

159,660. CLEVISES. Chas. H. Foss, Orange, Ill. [Filed Jan. 16, 1875.]

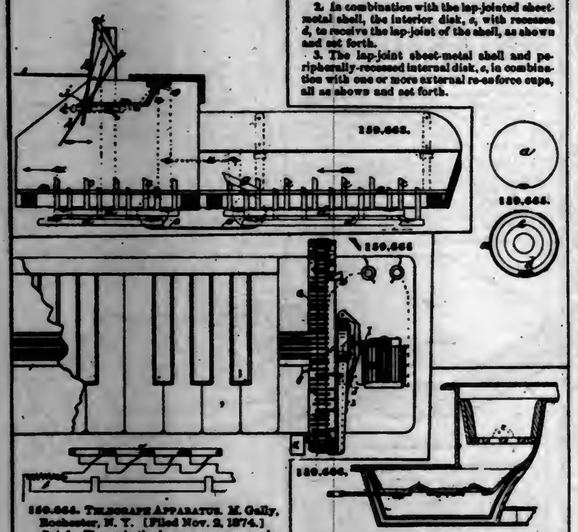
Brief.—The clevis-bolt has eccentric bearings in the clevis-iron. It is provided with a handle to turn the bolt which slides the clevis forward, releasing it from the notched plates, or backward, securing it rigidly at any vertical adjustment. A notched pivoted drop-plate retains the draft-link at any lateral adjustment.

1. The combination of clevis-iron E, lugs D, notched jaws C, and cam-bolt F, all substantially as set forth.

2. In combination with the clevis-iron E, the drop-plate K, substantially as and for the purpose set forth.

159,662. BAND-CUTTING FEEDERS FOR THRASHING-MACHINES. David Frost, Latrobe, Pa., assignor of one-half his right to Michael P. Scanil, same place. [Filed Dec. 3, 1874.]

Brief.—The sheaf is carried forward by walking rakes operating from beneath the platform, through openings therein, over fixed inclined blades, which sever the band. Oscillating fingers operating from above loosen the grain and regulate the feed to the cylinder.



1. The combination, with the longitudinally-reciprocating rising and falling teeth e of a platform grain-feeder, of the fixed blades p, arranged between the feeding-teeth openings, to cut the sheaf-band, substantially as herein set forth.

2. The combination, with the longitudinally-reciprocating raising and falling teeth e of a platform grain-feeder, of fingers h, having rising, falling, and vibrating movements, in order to dive down, enter the grain, and retard, and thereby regulate, its feed to the cylinder.

3. The combination, in a feeder for thrashing-machines having a slotted platform and longitudinally-reciprocating rising and falling teeth e, of the regulating-fingers h, and their guide-bar k, with the operating double crank-shaft i, whereby the fingers are operated in sets, in connection with the feeding movement of the teeth, substantially as and for the purpose herein set forth.

4. The combination, with the regulating-fingers h, their operating crank-shaft i, and their guide-bar k, of the slotted link q, and crank-rod o, connecting with the guide-bar k, for effecting the adjustment of the latter to increase or diminish the retarding action of the fingers upon the grain.

5. The within-described grain-feeder, made in sections A B, having separate operating shafts s s, and provided with socket-supports t, securing-hooks u, and connecting-hooks x, whereby the receiving-section A of the platform may be held in normal position, or separated and suspended to and beneath the section carried by the thrasher, to render the machine more compact and convenient.

2. In combination with the lap-jointed sheet-metal shell, the interior disk, *c*, with recesses *d*, to receive the lap-joint of the shell, as shown and set forth.

3. The lap-joint sheet-metal shell and peripherally-recessed internal disk, *c*, in combination with one or more external re-enforce cups, all as shown and set forth.

160,664. TELEGRAPH APPARATUS. M. Gally, Rochester, N. Y. [Filed Nov. 2, 1874.]

Brief.—Through the keys messages can be set up on the wheel G ready for transmission.

1. In a telegraphic instrument, a number of electrical conductors or contact-points, adjustably attached to a suitable revolving or otherwise moving base, and capable of being arranged and rearranged to represent different letters, words, or collections of words for automatic transmission, in combination with a circuit closing or breaking device, substantially as and for the purpose specified.

2. The combination, with the adjustable conductors G, of manipulating-keys, each key making by its action an arrangement of a sufficient number of the conductors to produce the letter represented by each key.

3. An accumulation of arranged conductors, representing an accumulation of message matter to be thereafter transmitted, the same conductors consisting of a rearrangement for other message matter, substantially as specified.

4. The combination, with the adjustable conductors G, of the stop C, to prevent the wheel M from turning, except at such times as the conductors are moved out of contact, substantially as specified.

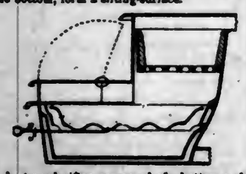
5. The wheel M, provided with adjustable conductors, in combination with propelling-weight K, substantially as and for the purpose specified.

6. The connector F, having a detent, J, in combination with magnet H, operated by means of a reversed current, causing the movement of the connector at any desired time after message matter is accumulated by the arrangement of the conductors upon which it is to act, substantially as specified.

7. The connector F, constructed with connecting-faces of different dimensions, for producing a variety of signals, when connecting with conducting-points arranged in different positions in its track, substantially as specified.

160,665. METALLIC CARTRIDGES. Marc M. E. Gastbey, Paris, France. [Filed Oct. 19, 1874.]

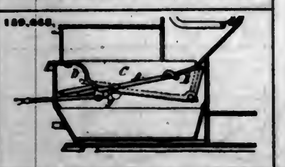
1. A metallic cartridge the shell of which consists of a sheet of brass of the thickness required for the walls of the shell, formed into a cylinder or case by a lap-joint extending longitudinally of the cartridge, as shown and set forth.



160,666. ASH-SIFTERS. J. H. Goodfellow, Troy, N. Y. [Filed Dec. 20, 1874.]

Brief.—The obtuse or knuckle-shaped agitators impart a vertical as well as a lateral motion to the contents of the sifter.

A sifter and agitator adapted to be located beneath a grate, and composed of a suitable frame provided with longitudinal obtuse-angular bars extending between and above the top surface of the grate, whereby the coals, &c., resting thereon are agitated, and the spaces between are cleared by the vibration of the sifter-frame, substantially as hereinbefore set forth.



160,667. ASH-SIFTING DEVICES. J. H. Goodfellow, Troy, N. Y. [Filed Jan. 6, 1875.]

Brief.—The open swinging ends, as well as the bottom, form a sifting-surface.

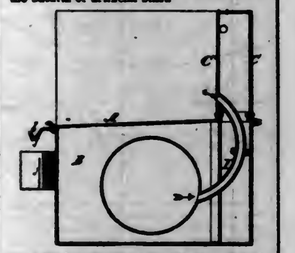
1. An ash-sifter, composed of a bottom and two ends hinged together and adapted to be hung or pivoted within the chamber of a stove or pan, substantially as described, so that when vibrated the ends shall alternately form an extension of the bottom and induce to the agitation or tumbling of the body of coal, &c., resting thereon, substantially as herein before set forth.

2. In combination, with an ash-sifter hung as described, so that its bottom shall swing upon pivoted end walls, the handle D, provided with a lug, *v*, for holding the sifter in an elevated position, substantially as described.

160,668. ASH-SIFTING DEVICES. J. H. Goodfellow, Troy, N. Y. [Filed Dec. 20, 1874.]

Brief.—The sifting-grate has at the rear a swinging support from above, while at the front it rests on a fixed support.

1. The reciprocating sifting-grate A, suspended to the swinging back-piece B, and supported at the front, as described, so that when reciprocated the front and rear ends thereof are alternately elevated and depressed, substantially as and for the purpose herein before described and set forth.



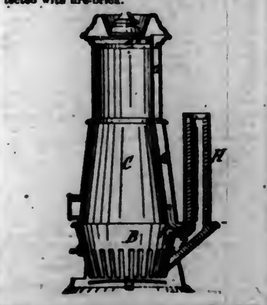
2. The swinging back-piece B, to support the rear of a swinging and sliding grate, and in combination therewith, substantially as herein before described and set forth.

3. The plate D, forming the front of the cinder-pan or hearth-pit, having the fingers *r* projecting between the bars *s* of the swinging and sliding grate A, to clear the same of cinders, &c., in combination with the grate A, substantially as herein before described and set forth.

4. A cinder-pan or hearth-pit, provided with the stationary side walls, C, and front wall, D, the swinging back-piece B, and swinging and sliding grate A, in combination with the fire-chamber and ash-pit, substantially as herein before described and set forth.

160,669. FURNACES FOR SMELTING LEAD ORES. Jos. A. Hamilton, Joplin City, Mo., assignor of one-half his right to D. K. Worcrich, same place. [Filed Dec. 26, 1874.]

Brief.—The hearth, back, and sides are protected by water, which, when heated, heats the natural or artificial blast.



1. The hearth A upon which to smelt lead ore and from which to discharge the same as fast as melted, in combination with the water-chamber B below the hearth, and the hollow back and side water-circulating walls C C above the hearth, substantially as and for the purpose described.

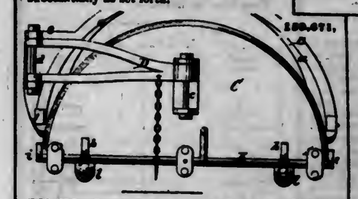
2. A hot-air drum having pipes leading to the lead-ore-smelting hearth A, in combination with the water-chamber B, the top of which is formed by the hearth, substantially as and for the purpose described.

160,670. HEATING-STOVES. G. W. Herrick, Detroit, Mich., assignor to the Detroit Stove-Works, same place. [Filed Oct. 1, 1874.]

Brief.—The gas-flue conducts gases from the upper section of the stove to the exit-flue, where they are burned. The exit-flue is protected with fire-brick.

1. The combination, with the conical magazine C and fire-pot B, of the gas-flue G extending downward from the top of the magazine to or near the opening *e* into the flue F, and apertures *d*, for the purpose set forth.

2. The continuous conical magazine C and fire-pot B, in combination with bricked flue F, gas-flue G, and bricked pipe-section H, substantially as and for the purpose set forth.

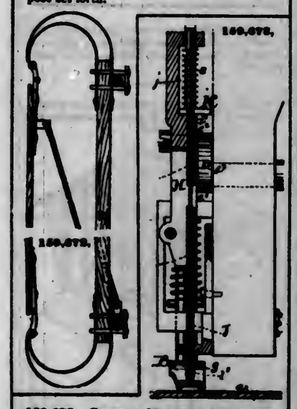


160,671. LINE FOR REPORTS. Ignatz Herzog and Richd. Kook, New York, N. Y. [Filed Oct. 26, 1874.]

Brief.—The rock-shaft secured to the lid, when rotated in one direction, forces the edge of said lid into the groove on the retort, and when rotated in the opposite direction releases it, so that it may be swung back on its hinge.

1. The rock-shaft E, provided with lifting-toes *h*, in combination with the lid C of a retort, and with the groove *c* and arms *i* on the said retort, substantially as set forth.

2. The combination of the swinging lever D, sliding pin *c*, lid C, retort A, grooved frame B, rock-shaft E, lifting-toes *h*, and arms *i*, all constructed and operating substantially as shown and described.



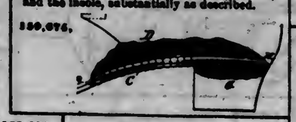
3. The combination of the rock-shaft E and arms *i i* with the lid C, groove *c*, and lugs *j j*, substantially as set forth.

160,672. GARTER-SPRINGS. Wm. S. Higgins, Oroville, Cal. [Filed Nov. 10, 1874.]

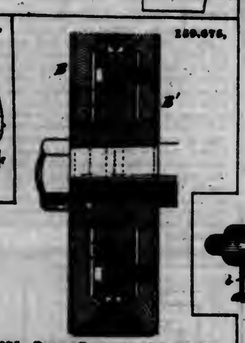
Brief.—To secure strength and even elastic motion.

The compound C-springs, composed of two flat pieces of metal bent in different curves, secured to and in combination with the body and side bars, substantially as and for the purpose set forth.

160,673. SEWING-MACHINES. H. S. Hill, Waterbury, Conn. [Filed Nov. 2, 1874.]



Brief.—The barbed needle descends through the cloth, and takes the thread from the thread-guide beneath. On its ascent it passes in the needle clasp the barb just before it reaches the cloth, and holds the thread till the needle again enters the cloth on its downward movement. The needle-bar is placed eccentrically on the cam on the main shaft, and receives, besides its usual motion, an oscillatory movement that feeds the cloth. The piston is operated by the cam and a spring on its upper end.



The vibrating needle-bar H, pivoted directly to the face of the cam D, and provided with a tubular needle, G, and upper and lower guides, *f f*, in combination with the barb-closer *j*, provided with the saddle K, and passing through the tubular needle, and the spring *g*, arranged between the saddle and the upper guide of the needle-bar, all substantially as herein described.

160,674. SOCCER. Geo. D. Hill, Baltimore, Md., assignor to himself and Chas. F. Hill, same place. [Filed Jan. 27, 1874.]

Brief.—The nails used in lasting cannot penetrate the insole to injure the foot or soil the stocking.

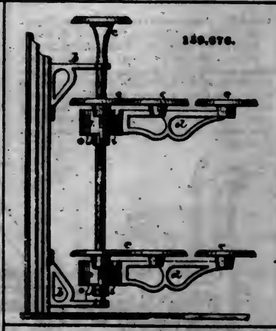
A boot or shoe having its soles united by a line or lines of stitches passing, at the heel portion, through outer and middle soles only, and from the breast of the heel around the toe, passing through the outer, the middle, and the insole, substantially as described.

160,675. PISTON-PACKINGS. John W. Hill, Dayton, Ohio, assignor of one-half his right to Herrman & Herchelrode Manufacturing Company, same place. [Filed Jan. 6, 1875.]

Brief.—The packing is adjusted automatically by pressure of steam upon the outer surface of the follower, which work loosely upon the bolts by which they are secured to the core.

A piston composed of a core, A, automatically-wedging followers B and B', and split rings C and D, substantially as and for the purpose specified.

160,676. FLORAL STANDS FOR WINDOWS. Geo. Hills, Plainville, Conn. [Filed Jan. 7, 1875.]



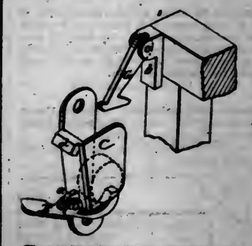
Brief.—Two brackets, one above the other, are secured to the window-casing, and support a round standard or rod, upon which are placed adjustable hubs, fitted with flanges and slots for the reception of arms that support the flower-pots. These arms can be adjusted vertically or swung around upon their vertical axis.

1. The combination of the brackets *b*, standard A, vertically-adjustable rotating collars *g*, rings *i a*, arms *d*, and pans *e*, substantially as shown and described.

2. The collar *g*, provided with the horizontal flange 1, under which the end of the arm catch, and the notched flange 2 6, substantially as shown and described.

3. The arms *d*, provided with sockets for receiving the pans, and having the shoulders 4, for catching behind the flange 2 on the collar, substantially as specified.

4. The combination of the arms *d*, having sockets to receive the pans, and the shoulders 4, in combination with the collar *g*, having the two flanges 1 2, placed at right angles to each other, the flange 2 having the notches 6, substantially as set forth.

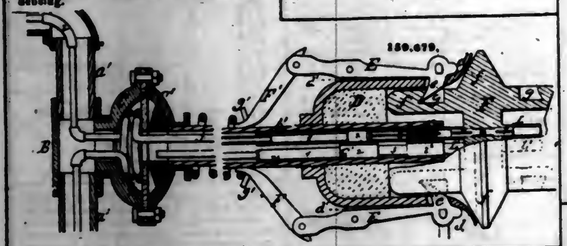


1. The combination of the lever E, slide D, wick-tube C, lever G, and diaphragm F, substantially as shown and described.

2. The combination of the lever G, diaphragm F, and elastic tube *l*, substantially as shown and described.

3. The combination of the clock I, rim *g*, spring A, wire *i*, and elastic tube *l*, as above set forth.

160,678. SASH-FASTENERS. William Horbert, Madison, Wis., assignor of one-third his right to J. R. G. Barnhisel, same place. [Filed Dec. 31, 1874.]



Brief.—A tapering box or case, carrying the ordinary friction-ball, has at its upper edge a projecting flange, and is provided near the bottom with a pivoted lever to lift the ball. There is also a pivoted hook or grapple secured to the edge of the meeting-rail, which, when projecting downward, engages with the flange of the box, and locks the device.

The combination of the inclined box C, having flange *d*, and containing the ball D, with the pivoted lever E, and the pivoted hook G, all constructed substantially as set forth.

159,679. COMBINED CAR-COUPLING, HEATER-JOINTS, AND BRAKE-PIPES. F. R. Hunt, Leavenworth, Kans. [Filed Jan. 19, 1875.]

Brief.—Within a tubular draw-head and pipes leading to a heating-furnace are arranged pipes for operating steam-brakes, the draw-head being adapted to engage automatically with similar pipes similarly arranged within the draw-bar and pipes of another car. The steam is thereby prevented from condensing.

159,679.

1. In a car coupler, the combination, with a tubular draw-head and the pipes leading to a hot-air furnace, of the steam-brake pipes, arranged within the same, substantially as specified.

2. The combination, with the cup-shaped draw-heads D, having levers E with hooks e, of the tubular cylindrical coupling devices F, having flange f and notches g, substantially as specified.

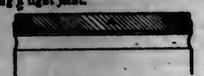
3. The combination, with pipes 3 of draw-heads D, of the pipes L L' of couplings F, substantially as specified.

4. The combination, with pipes 3, having valve O with valve-stem i, of the pipes L L', having detaching-slides r, substantially as specified.

5. The combination, with hooked levers E and rods F', having pins g' of the spring S, substantially as specified.

6. The combination, with the coils of steam-brake pipes I, of the cushions k k', substantially as specified.

7. The combination, with the ball b of ball-and-socket joint U C' b, of the steel tubular coils of pipes I, substantially as specified.

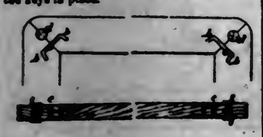


8. The ball-and-socket joint C C' b, in combination with a tubular draw-head and pipes leading to hot-air furnace, substantially as specified.

9. The combination, with the valves O of steam-pipes 3, of the detaching devices r of pipes L L', substantially as specified.

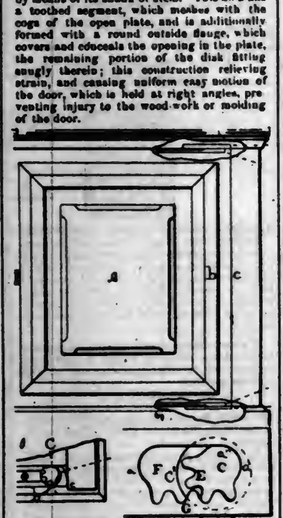
10. The combination, with the hooked vibrating levers E, of the curved rods h h' and actuating-lever J, substantially as specified.

159,680. PACKAGES FOR PAINT. J. T. Hunt, Cleveland, Ohio. [Filed Aug. 28, 1874.]



Brief.—The edges of the sheet-metal body are forced into grooves in the wooden heads, forming a tight joint.

In cans for paint, &c., the combination of the grooved heads A B, the tongue or tenon d of the can, shoulder c, and body C, constructed and arranged in relation to each other in the manner substantially as described, and for the purpose set forth.

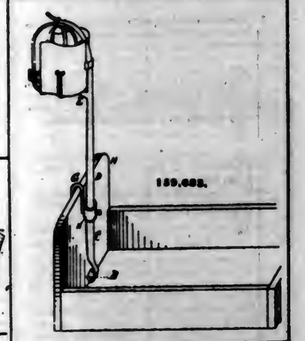


159,681. SLATE-FRAMES. John W. Hyatt, Newark, N. J., and C. M. Hyatt, Albany, N. Y. [Filed Dec. 9, 1874.]

Brief.—The elastic filling combines to keep the keys in place.

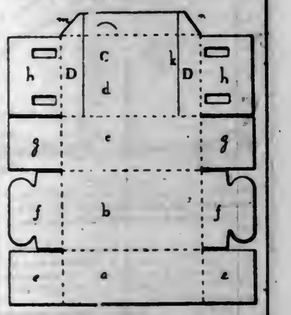
159,682. HINGES. Joseph Kauffman, Philadelphia, Pa. [Filed Jan. 8, 1875.]

Brief.—Secured to the top and bottom of the frame or casing of a warehouse door, as hinged connections, there are arranged open plates, having at one side of the opening a series of cogged teeth, and to the top and bottom of the door a peculiar disk is attached by means of its shank or stem. This disk has a toothed segment, which meshes with the cogs of the open plate, and is additionally formed with a round outside flange, which covers and edocesals the opening in the plate, the remaining portion of the disk fitting snugly thereis; this construction relieving strain, and causing uniform easy motion of the door, which is held at right angles, preventing injury to the wood-work or molding of the door.



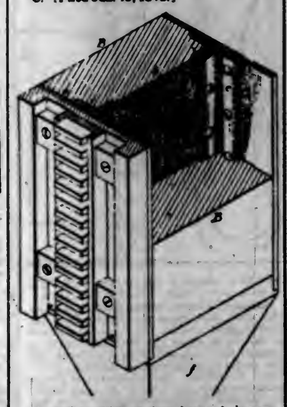
1. The plate D with opening F, rack G, and swells a a', in combination with the disk C, having segment e'', and toothed segment E, substantially as and for the purpose set forth.

2. The disk C, having flange C', shank or stem C'', and toothed segment E, in combination with the open plate D having rack G, substantially as and for the purpose set forth.



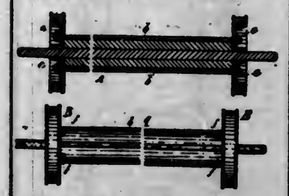
159,683. LAMP-SUPPORTS. L. M. Kent, St. Johnsbury, Vt. [Filed Dec. 4, 1874.]

The lamp attachment, consisting of the step B, upright C, sleeve H, bent arm G, and standard D, provided with a lamp-rest and reflector at its upper end, all constructed to operate substantially as and for the purpose specified.



159,683.

159,684. PAPER BOXES. Louis A. Kettle, Philadelphia, Pa., assignor of one-half his right to Rupert Kettle, Merridale, England. [Filed Nov. 16, 1874.]

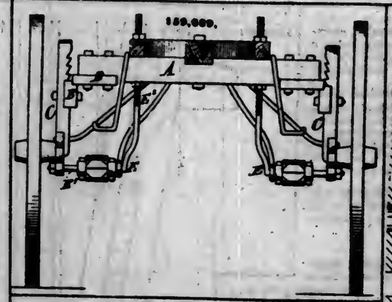


The paper box constructed of the folds a b c, end flaps e g f h, the lid-fold d C, and side strips D, substantially as and for the purpose set forth.

159,685. STUDS FOR DRESSING-MACHINES. Edmund Frederick Kittoe, Charleston, S. C. [Filed Jan. 19, 1875.]

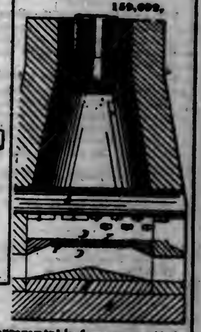
A stud in which an iron beam, A, is combined with wooden pieces B B, and with a pointed shoe, f, as set forth.

159,686. YARN-BEAMS FOR LOOMS. Lucius J. Knowles, Worcester, Mass. [Filed Jan. 26, 1870.]

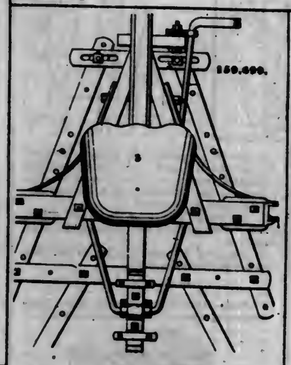


The combination, with the body part A and heads B, of the longitudinal head-holding and yarn-supporting rods b, head-holding and yarn-supporting projections f, and holding and tightening nuts e, substantially as and for the purposes set forth.

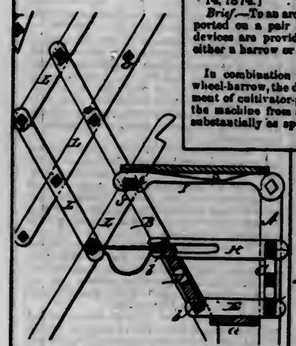
159,687. DENTAL PLATES. Danl. M. Lamb, London, Canada. [Filed Nov. 17, 1874.]



A dental plate constructed of the inspissated juice of milkweed, vulcanized either alone or in combination with india-rubber or other vulcanizable gum.



159,688. IRONING-TABLES. Albt. Larkin, Almond, N. Y. [Filed July 10, 1874.]

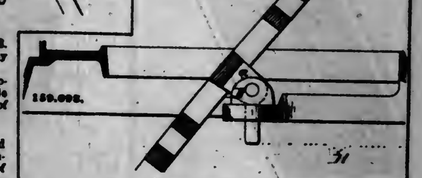


159,688.

159,689.

The combination of the legs A B, front C, back D, cross-bars E, bottom G, arms H I, and the system of arms L, and bars J, and with or without the table K to form the various articles, substantially as shown and described.

159,690. WIRE-CULTIVATORS. Edwin R. Leach, Cedar Rapids, Iowa. [Filed Oct. 17, 1874.]



Brief.—The plow-beams in fixed relation to the wheels in height from the ground, whether the axle and frame be raised or lowered.

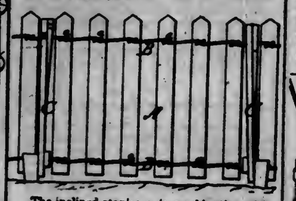
The combination of the elevated vertically-adjustable part A of the axle-tree, standards C, and combined supporting or draft bars and braces E E' E'', substantially as and for the purpose specified.

159,691. REDING-HARROWS. Edwin R. Leach, Cedar Rapids, Iowa. [Filed July 14, 1874.]

Brief.—To an arched or raised axle-tree, supported on a pair of wheels, interchangeable devices are provided for the attachment of either a harrow or cultivators.

In combination with the herein-described wheel-barrow, the draft-bars h h, for the attachment of cultivator-plows, to the conversion of the machine from a barrow into a cultivator, substantially as specified.

159,691.



159,692. GRATES FOR HEATING-STOVES. Charles G. Marshall, Philadelphia, Pa., assignor to Chas. Noble, M. D., Chas. Noble, and F. P. Nicholson, same place. [Filed Oct. 7, 1874.]

Brief.—The means of support allow rotation in a horizontal plane, and also of tilting.

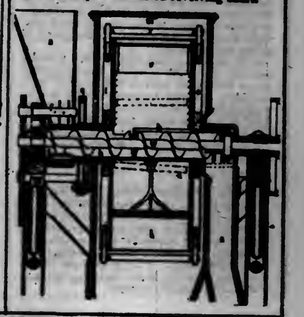
The combination of the grate B, its stem a, and pendent lugs c, and the pivot D, hinged to the said lugs, and turning in a projection, H, on the ring A, all as set forth.

159,693. WIRE FENCES. Jas. A. Little, Cartersburg, Ind. [Filed July 13, 1874.]

Brief.—By inclining the staples through which the horizontal tie-wires pass, depressions are formed in said wires, when they are drawn taut, and thereby hold the pickets in their proper places.

The inclined staples a, in combination with the pickets A and wire stringers B, as and for the purpose specified.

159,694. QUICKSILVER-FURNACES. Conrad A. Luckhardt, San Francisco, Cal. [Filed Aug. 6, 1874.]



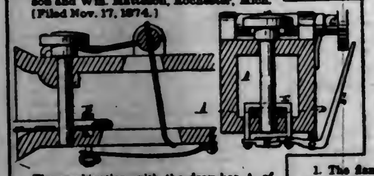
Brief.—The ore is fed into cylinder K and P. On pulling up P, the ore is discharged toward the sides of the furnace by the conical bowl H, and is continuously roasted and distilled by the central fire.

1. As an improvement in furnaces provided with a centrally-arranged fire-place, for the extraction of mercury from its ores by a continuous operation, end supports, b, as a means of keeping the fire-bars F out of contact with the furnace-walls, to avoid heating the latter, substantially as set forth.

2. In combination with the fire-place D of a quicksilver-furnace, the flue G, open to the air at both ends, for the purpose set forth.

159,695. PLOUR-DRESSING MACHINES. M. Martin, Bitterfeld, Prussia. [Filed Dec. 16, 1874.]

Brief.—Bolting-cloth stretched taut by the stays and adjustable disk. Devices as claimed for feeding the material to the dressing-cylinder. Bran removed from dressing-cylinder by revolving sweep or shovel, which delivers it into revolving tube, and is removed therefrom by the worm on revolving shaft.



1. The combination of the disks *a l*, carrying the dressing-cloth and adjusting-stays *r r*, each having a right-hand thread on one end, and a left-hand thread on the other, all as set forth.

2. The rakes or stirrers *i*, inclined alternately right and left, and revolving within, and in close proximity to, the cylindrical dressing-cylinder, as and for the purpose set forth.

3. The combination of the hollow perforated tube *b* and the scoop or shovel *c*, extending radially from the shaft, as and for the purpose set forth.

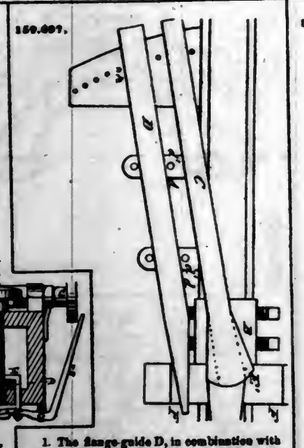
4. The combination of the revolving tube *b*, and the worm on the shaft *w*, with the dressing-cylinder, as and for the purpose described.

159,696. CAR-COUPLINGS. Leland Matteson and Wm. Matteson, Rochester, Mich. [Filed Nov. 17, 1874.]

The combination, with the draw-bar A, of the stirrup B, spring F, and bell-crank G, as and for the purpose set forth.

159,697. STEREOTYPE-MATRICES. Thos. J. Mayall and Richard W. Hartnett, Boston, Mass., assignors to Mayall Power Printing-Press Company, New York city. [Filed Nov. 23, 1874.]

Brief.—To spread and hold a paper matrix while drying.



1. In stretchers for the matrices of stereotype-plates, the combination of a metallic skeleton frame or margin, which registers with the unimpressed margin of the matrix, and a wire-gauze or net sheet, which is set back from the plane of said frame or margin a distance to correspond with the increased thickness of the raised or type-impressed part of the matrix, and constitutes the surface against which said type-impressed part rests, substantially as shown and set forth.

2. A stretcher, composed of two metallic skeleton frames or margins, with wire-gauze or net fillings, set back of the plane of their respective margins to accommodate the increased thickness of the raised or type-impressed portions of the matrix, as described, said frames being hinged, and provided with a device for clamping them together when closed, as shown and set forth.

159,698. CAR-REPLACERS. W. H. McLean, Moberly, Mo. [Filed Jan. 11, 1875.]

Brief.—A car-replacer in which the bridge-clamp is provided with lateral projections, which serve as supports for the vibrating guard-rail. The clamp is also provided with inner angle-brace. A flange-guide for wheels is arranged parallel to the replacing-rail, and is adjustable relative thereto.

159,699.

1. The flange-guide D, in combination with the switch-rail C, said guide being adjustable in relation to said switch-rail, and the latter pivoted to the rail-bridge of a car-replacer, substantially as described.

2. The bridge B, having the lateral extensions F and angle-braces *f*, substantially as described.

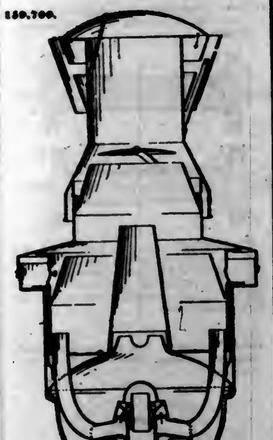
3. The ties *d d*, connecting the switch-rails and flange-guides, as shown.

159,699. BAG-TIES. John O. Milne, Minneapolis, Minn. [Filed Dec. 14, 1874.]

The tie *k*, made of a single piece of wire bent to form the hoop *c*, loop *d*, and tongue *h* extending over the hook, in combination with the cord A, substantially as and for the purpose herein set forth.

159,699. WOOD PAVEMENTS. Charles H. Miller, Buffalo, N. Y., assignor of one-half his right to Wm. Manning and B. Haight, same place. [Filed Dec. 31, 1874.]

Brief.—The blocks are grooved centrally on the under side to receive the supporting-sleepers. The latter extend a little below the bottom of the blocks, affording a recess into which the packing may be consolidated to form a key.



A wooden pavement consisting of blocks A, recessed at their lower end centrally, in combination with supporting sleepers or rails *b*, extending below the plane of the bottom of the block, whereby the filling of the spaces forms a key, substantially as and for the purpose set forth.

159,700. LAMPS. H. G. Moehring, Philadelphia, Pa., assignor of one-half his right to R. S. Merrill, W. B. Merrill, and J. Merrill, Boston, Mass. [Filed Dec. 16, 1874.]

Brief.—A lamp for railway cars or other apartments, having three independent air-chambers—an air-supply chamber, a chamber in which the lamp is suspended, and the air-chamber proper of the lamp, the last communicating with the first through ducts for supplying air to the burner and flame.

159,700.

1. A lamp having a surrounding air-chamber and air-ducts conveying air to the burner and flame from an upper and independent air chamber or reservoir located within the body of the lamp-structure, substantially as shown and described.

2. The combination of a lamp surrounding air-chamber composed of an upper reflector and a lower transparent shade with air-supply tubes arranged to convey air to the lamp, for the combustion of the oil, from without the said air-chamber, substantially as shown and described.

3. The combination, with an oil-lamp of otherwise ordinary or suitable construction, of a double or divided air-chamber and air-ducts, conveying the air from one through the other, and into a third separate and distinct air-chamber, whence the air is discharged against the flame under the deflector or chimney, substantially as shown and described.

4. The combination, with the air-supply chamber and the air-chamber proper of the lamp, of an intermediate air-chamber, under the arrangement and for operation as shown and described, so that while the air for the combustion of the lamp is supplied from without the lamp burns in a perfectly still and undisturbed atmospheric medium, substantially as set forth.

5. In a railroad-car lamp or lamp intended to be used by being inserted through an opening in the roof or ceiling of a room or compartment, the air-supply chamber, constructed as a superstructure, and provided with internal air-deflecting flanges or surfaces overhanging the tubes conveying the air to the burner, substantially as set forth.

6. The combination, with a lamp suspended within a transparent shade, and provided with a reflector, of a partition dividing the air-chamber into two separate air-chambers and air-ducts passing through said partition, substantially as shown and described.

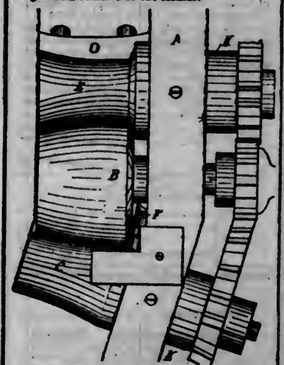
7. The combination, with a lamp suspended within a transparent shade, of a reflector which divides the air-chamber into two separate air-chambers, as described, and air-ducts passing through said reflector, substantially as set forth.

8. The combination, with a lamp suspended within a transparent shade, and partition dividing the air-chamber, as described, of a flange constituting a chimney cowl or gallery and a removable chimney, substantially as specified.

9. The combination, with a lamp suspended within a transparent shade, of the three air-chambers, specified air-ducts, and a lamp-chimney, all substantially as shown and set forth.

159,701. LAMP-BURNERS. H. G. Moehring, Philadelphia, Pa., assignor of one-half his right to R. S. Merrill, W. B. Merrill, and J. Merrill, Boston, Mass. [Filed Dec. 16, 1874.]

Brief.—A stiffened tip resting upon the stop, taking oil from the feed-wick.



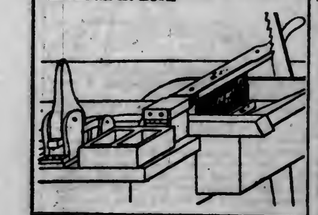
159,701.

In lamp-burners for use in connection with wicks, as described, a stop in the wick-tube, which prevents the ascent of the one wick and the descent of the other, and insures contact of the two wicks at a fixed point in the wick-tube, substantially as set forth.

159,702. MACHINES FOR MAKING COUNTERS FOR BOOTS AND SHOES. John R. Moffitt, Chelsea, Mass. [Filed Jan. 28, 1875.]

Brief.—The revolving "former" is located between two pressure-rolls—one above, the other below, with a third roll directly in the rear—so that the counter-blank is closely pressed around the former. The heel-seat is formed by means of a roll held in bearings at nearly right angles to the axis of the former, which serves as a guide, also, to flange the counter-blank. The pressure-rolls are supported in eccentric sleeves, rendering them adjustable relative to the former.

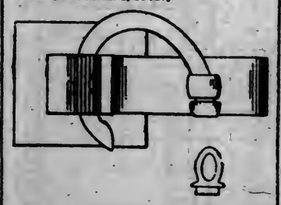
1. In combination with the former-roller, a flanging-roller, F, located, substantially as shown and described, relatively to the former, and serving to guide and turn the edge of the blank against the end of the former.



2. In combination, the former-roller, the rollers D E, and concave guides M, substantially as and for the purpose described.

3. In combination with the forming-roller and with a receiving-roller, a guide plate, bar, or pawl, H, substantially as and for the purpose described.

4. In combination with the shafts of the rollers C, D, or E, the adjustable sleeves K, supported in the frame and having eccentric bearings for the shafts, substantially as and for the purpose described.

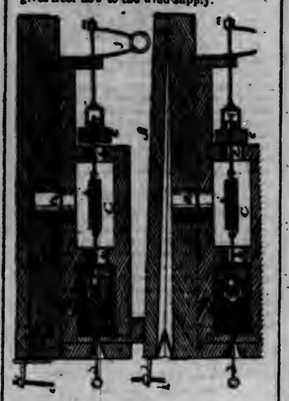


159,703. MACHINES FOR PAINTING BALE-TIES. A. J. Nellis, Pittsburg, Pa. [Filed Jan. 22, 1875.]

Brief.—A paint-trough, having one end inclined upward, has double-hinged brushes at the head of the inclines between which brushes the bale-ties are drawn.

The table A, having a central trough, B, provided with the inclines *b* and wipers *b' b'*, substantially as and for the purpose specified.

159,704. BALE-TIES. A. J. Nellis, Pittsburg, Pa. [Filed Jan. 4, 1875.]



1. In combination with a bale-band and slotted buckle, an eye-headed rivet and U or similar shaped locking device, substantially as specified.

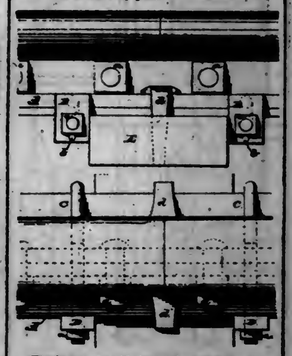
2. In combination with a bale-band and slotted buckle, an eye-headed rivet, said eye or slot being elongated, and a U or similar shaped locking device, one end of which is of an oval or similar form having different diameters, one of which exceeds the smaller diameter of the rivet-eye, substantially as set forth.

3. In combination with a bale-band and its slotted buckle, an eye-headed rivet and a U or similar shaped locking device, said locking device being provided with a shoulder or projection upon the end which engages the band-loop.

159,705. ORGAN PNEUMATIC ACTIONS. R. Nicholls, Philadelphia, Pa. [Filed Aug. 24, 1874.]

Brief.—Between the outer and inner passages of the wind duct or chest, immediately communicating with the pneumatic bellows, an interposed helical spring gives elasticity to the key-touch, and with increased pressure gives freer flow to the wind-supply.

1. The combination, with the pneumatic A and wind-chest B, of the wind-chest C, provided with the holes *b c*, and the pallets *d e*, coupled together, so as to simultaneously open one of said holes and close the other by a single movement.

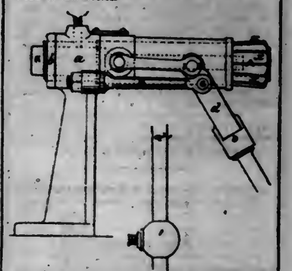


2. In combination with the wind-chest B, the wind-chest C, provided with holes *b c*, and the pallets *d e*, located outside of said wind-chest C, and coupled together, as set forth.

3. In combination with the pallets *d e* and the tension-spring *f*, the differential spring *i*, for the purpose set forth.

4. The combination, with the pallets *d e* and springs *f i*, of the trackway, whereby motion is transmitted from the key-action, substantially as set forth.

159,706. NUT-LOCKS. Burnett J. Noonan, Charleston, Mo. [Filed July 15, 1874.]

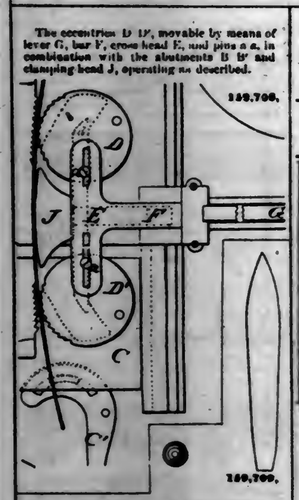


Brief.—The locking-bar is provided with lugs, projecting downward by the side of a sleeper, and perforated to receive cross-bolts having hooked heads, engaging the flange of the rail. The supplementary nuts on the cross-bolts are secured by pins.

The bar A, provided with lugs D D, having holes to receive keys *b b*, and constructed so as to project down on the sides of the sleeper E, in combination with screw-nuts *a' a'* and screw-bolts C C, having hooked heads *c c*, substantially as and for the purpose set forth.

159,707. MACHINES FOR CAPSULING BOTTLES. James Paterson, Leyfenstone, England. [Filed Sept. 23, 1874.]

Brief.—A tube slightly flared near its outer end is slotted to form a series of elastic arms, within which is arranged an elastic tube. A bottle with a capsule over its mouth is inserted within the elastic, and a sleeve moved forward until its end passes over and compresses the elastic arms and tube, thereby pressing the capsule tightly to the mouth and neck of the bottle.



1. In a machine for capsuling bottles the combination, substantially as described, of inclined elastic arms *s s*, an elastic tube, M, within the arms, and a movable sleeve, *e*, by which the said arms may be forced against and caused to contract the said elastic tube, all as set forth.

2. The combination of the inclined elastic arms *s s*, elastic tube M, and sleeve *e*, with the adjustable stop K.

159,708. TIRE-UPSETTERS. Christian J. Reimold and Nolton Stoddard, Saginaw, Mich. [Filed Jan. 2, 1875.]

Brief.—A toothed segmental lever, working in a rack on the bed, operates the slotted cross-head, which is connected to the serrated eccentric clamps. Cam-grooves are cut in the bottom surfaces of these clamps. A plate for clamping the tire (to prevent buckling) is rigidly attached to a bar, which, in virtue of its ends entering the grooves, reciprocates conjointly with the clamps toward or from the tire.

The eccentrics D D', movable by means of lever G, bar F, cross-head E, and pins a a, in combination with the abutments B B' and clamping-head J, operating as described.

159,708.

159,709.

159,709. SELF-LIGHTING CIGARS. Charles L. Ridgway, Boston, assignor of one-half his right to Jos. H. Hatch, Melrose, Mass. [Filed Jan. 16, 1875.]

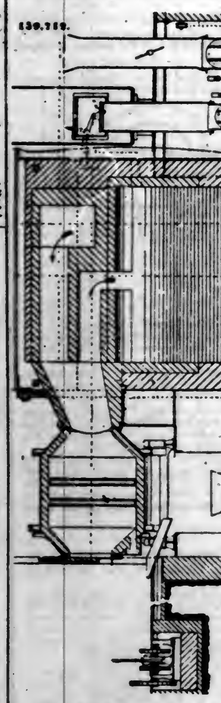
A cigar the end of which is covered with charcoal, held by any suitable adhesive material, and an igniting material exterior thereto, substantially as and for the purposes set forth.

159,710. PAINT-OIL COMPOUNDS AND PROCESSES OF PREPARING THE SAME. Darius S. Robinson, Cleveland, Ohio. [Filed Nov. 10, 1874.]

1. The described process of making an oil compound for paints, by first combining cotton and linseed oils with the oxide of manganese, sugar of lead, soda-ash, and borax, by heating the mass, and next mixing said compound with cotton-seed oil, flaxseed meal, and water, in a retort, subject to the action of steam heat, and then expressing the oil from the mass, substantially as and for the purpose set forth.

2. The paint-oil compound composed of cotton and linseed oils, black oxide of manganese, sugar of lead, soda-ash, and borax, substantially as and for the purpose set forth.

159,711. ADJUSTABLE HOLDBACKS. S. R. Rood, Montello, Wis. [Filed Dec. 8, 1874.]



The combination of the pole provided with a series of slots and the adjustable holdback, consisting of the under block C, top piece D, catch-piece E, and spring K, as and for the purposes described.

159,712. MANUFACTURE OF IRON AND STEEL. Chas. Wm. Siemens, Westminster, England. [Filed May 27, 1873.]

Brief.—The ore to be treated is crushed, mixed with lime, manganese, &c., introduced into the rotary furnace, and heated nearly to the fusing-point, whereupon a quantity of reducing agent, such as coal or coke, is added, and when the resulting reactions are complete the furnace is stopped and the scoria tapped off. The furnace is rotated more rapidly, so as to ball the iron, which is then taken to the squeezers.

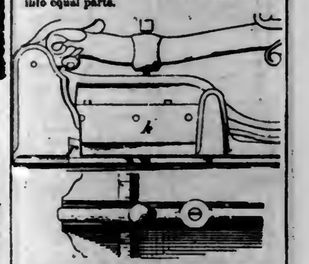
159,712.

1. The method of effecting the separation of metallic iron from heated ore mingled with fluxing materials, by causing carbonaceous matter to be mixed therewith by means of the slow rotation of a rotative furnace, and forming the separated metal, by means of a quicker rotation, into balls, for the production of wrought-iron or puddled steel, or for the production of cast-steel by the employment of a separate furnace, substantially as herein described.

2. The method of separating metallic iron from ore, in the manner and by the means above referred to, and converting the separated metal into cast-iron or cast-steel, in one and the same rotative furnace, by the further addition of solid carbonaceous matter, cast-iron, spiegeleisen, or ferro-manganese, substantially as herein described.

3. A rotative regenerating gas-furnace for the manufacture of iron and steel, wherein the heated air and gas are admitted, and the products of combustion are emitted, at the one end or throat of the rotative furnace, and a working-door is provided at the other end, substantially as hereinbefore described with reference to the accompanying drawings.

159,713. HAY-PRESSES. Henry B. Skillin, Pownal, Me., assignor to Charles A. Shaw, Boston, Mass. [Filed Jan. 18, 1875.]

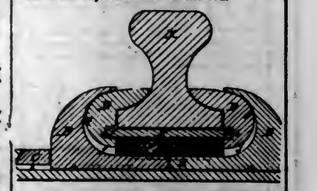


1. In a hay-press substantially such as shown, the door H, provided with the hook L, in combination with a follower provided with the catch M, arranged to operate substantially as and for the purpose specified.

2. In a hay-press substantially such as shown, the curved lever K, in combination with the door H and lever b, as and for the purpose set forth.

3. In a hay-press constructed and operating substantially as shown, the lever K and hook L, made of one piece, in combination with the catch M, door H, and lever b, as and for the purpose described.

159,714. TOBACCO-CUTTERS. W. Smith, Forestville, Ind. [Filed June 8, 1874.]



Brief.—Arranged at right angles to the knife, and extending laterally therefrom upon each side, is a graduated scale that reads outwardly from the knife upon each side thereof, so that the center of a plug of tobacco can be easily ascertained, as it is laid against the scale and under the knife, and hence severed into equal parts.

The graduated scale or measuring-rule e, arranged at right angles to the knife k, and reading outward therefrom on both sides, to provide for dividing and subdividing a plug of tobacco into equal pieces, in the manner herein set forth.

159,715. RAILWAY-RAIL CHAIRS. John L. Stewart, Ellicott City, Md. [Filed Dec. 17, 1874.]

Brief.—A clamping-chair for railway-rails, consisting of a grooved base-plate, into which are secured by wedges metal boxes embracing clamping-hooks, which compress the base of the rail by pressure, the rail resting upon the under ledges of the clamping-hooks, either directly or through an intervening plate, under which is placed a rubber cushion.

1. The combination of the hooks D, the boxes B, the keys C, and the base-plate A, substantially as and for the purpose described.

2. The combination of the grooved base-plate, the sliding boxes, the pivoted hooks, the bearing-plate, and the elastic cushion, substantially as and for the purpose described.

159,716. BREWING BEER. Johannes Stuber and Jacob Stuber, Astoria, N. Y. [Filed Jan. 14, 1875.]

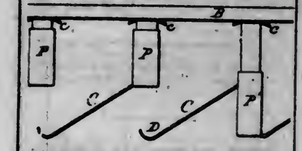
1. In the process of brewing beer, boiling the first wort in a separate kettle, and the second wort, together with the hops, in another kettle, and mixing the two liquids in about equal proportions.

2. The process of fining beer by adding to the beer while in the resting-tanks, one or more times, a quantity of fresh beer, substantially as set forth.

3. The process of fining beer by the action of a mixture of fresh beer with exhausted hops, substantially as described.

159,717. CARRIAGE-FLAP FASTENERS. C. Thomas and W. K. Parker, Boston, Mass., assignors to C. Thomas, D. P. Nichols, and L. B. Nichols, same place. [Filed Dec. 22, 1874.]

Brief.—Improvement on Patent No. 147,861. The improvement consists in the use of a spring, which holds the eccentric lever in place, and keeps it from rattling.

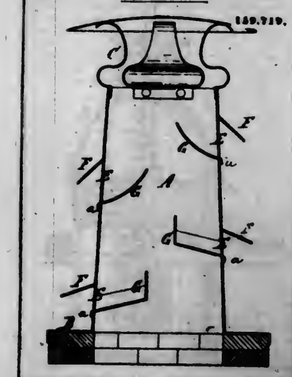


1. The eccentric lever or turning latch, its supporting-plate, and spring-plate, combined substantially as and for the purpose set forth.

2. The supporting-plate c, the spring-plate d, the washer e, and the lever-latch, all combined and operating substantially as described.

3. The combination, with the eccentric lever or turning latch, its supporting-plate, and spring-plate, of the open-eyed loop, all substantially as described.

159,718. REFRIGERATOR-FLOORS. J. Tiffany, Chicago, Ill. [Filed Dec. 5, 1874.]

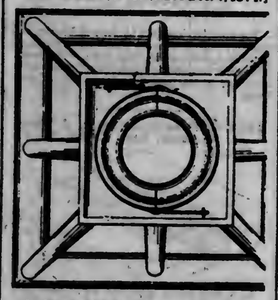


Brief.—The metallic floor is provided with inclines and gutters, for the purpose of carrying off the water of condensation and the drip. In order to control the temperature of the room, cut-offs P are attached to the joists, so as to slide up or down.

1. The ice-floor A', in combination with the inclined plates C and stops or cut-offs P, operating substantially as and for the purpose set forth.

2. The stops or cut-offs P P', in combination with the inclined plates C and the joists A, as and for the purpose specified.

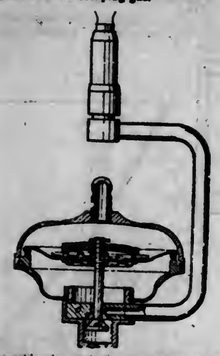
159,719.



159,719. CHIMNEY-COWLS. J. Tomlinson, Mount Vernon, N. Y. [Filed Jan. 2, 1875.]

Brief.—Air admitted through the openings is deflected upward.

The combination, in a chimney cap or cowl having the external deflectors, F, of a width equal to the width of the air-openings, of the inwardly-projecting deflectors G, constructed to connect with the edge of the air-openings alternately with each other, as and for the purpose specified.



159,720. BABY-WALKERS. L. Tommasi, New Rochelle, N. Y. [Filed Dec. 7, 1874.]

An improved baby-walking assistant, having the table portion thereof with an opening of sufficient size to admit of the vertical introduction of the child, and provided with an independent surrounding cushion hinged to the table, and locked in place to support the child, substantially in the manner, and for the purposes herein described.

159,721. GAS-LIGHT GOVERNORS. N. Tufts, Boston, Mass. [Filed June 20, 1874.]

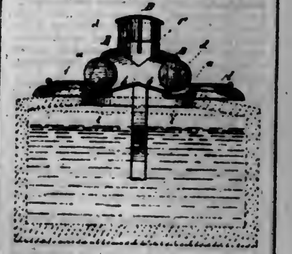
Brief.—The regulator being in close proximity to the burner, and gas liable to escape through the air-opening, the supplementary burner is provided to prevent damage in case of ignition of the escaping gas.

In combination with the exterior casing of a gas-regulator, a supplementary gas-burner arranged in the ordinary air passage of said burner, substantially as described, for the purpose of spreading the flame should gas escape and ignite.

159,722. CANISTERS. R. D. Van de Carr, Rochester, N. Y. [Filed Jan. 30, 1875.]

A case or canister for holding teas, spices, and other merchantable material or articles, having its front panel or door-plate constructed with a seat or socket for receiving and supporting a clock or its representative, substantially as and for the purpose specified.

159,723.



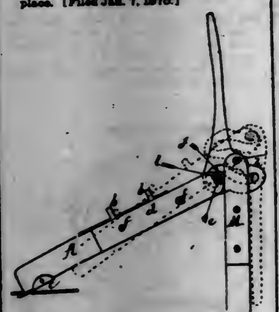
1. The combination, in a grinding apparatus, substantially as described, of a grindstone with a spindle arranged to revolve in fixed bearings, with a combined trough and shield made adjustable in respect to the said spindle.

2. The combination of the shaft B carrying the grinding-disk, the adjustable casing F, and its elongated opening h, with the plate G, made self-adjusting during the adjustment of the casing, as specified.

3. The combination of the frame A, carrying the shaft of the grinding-disk, with the guides e e on the casing, and the bolt D.

159,724. INKSTAND-COVERS. J. N. Wallis, Auburn, N. Y., and F. M. Herbach, Wilkesbarre, Pa., assignors of one-third their right to W. E. Barnham. [Filed Dec. 8, 1874.]

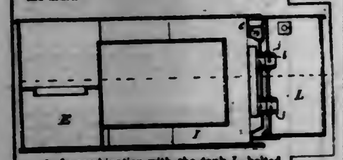
Brief.—Cover has a hood containing balls, which are pushed back to give access to ink.



The combination of the cover A, with openings e and inclined planes b, the hood B, with branch C, having cap D, and the balls d, all substantially as and for the purposes herein set forth.

169,725. STENCIL-PLATES. G. B. Warren, Walcott, Vt. [Filed July 27, 1874.]

The combination of the frame A B, provided with opening *a*, and grooved as described, with the clamp, composed of plates D D', bolt *e*, and thumb-screw *d*, all constructed and arranged to hold the letters in place in the manner set forth.

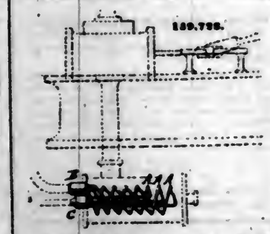


169,726. WAGON-JACKS. J. B. Webster, Genoa, N. Y., assignor of two-thirds his right to M. D. King and L. B. King, same place. [Filed Jan. 7, 1875.]

The lever G, provided with the head h, into which are cut two slots, *i* and *j*, in combination with part A, with guards *b*, and with, part M, all arranged and operating as described.

169,727. COOKING-STOVES. Jas. H. Wentworth, Boston, Mass. [Filed Oct. 3, 1874.]

Brief.—There is a continuous circulation through the chamber and reservoir. The chamber is located in a recess, so as not to obstruct the draft.



1. In combination with the tank I, bolted to or suspended upon the rear wall of the stove, as set forth, the hollow heating-chamber *g*, constructed as specified, located in an enlargement of the draft-flue at the end of the stove opposite the fire-box, and communicating with the interior of the tank I, by means of the pipes *h h* and *i i*, or their equivalents, substantially as described.

2. In combination with the drop or descending flue H, and the heating-chamber, constructed as set forth, the recessed enlargement *f* of said flue to receive the heater, substantially as described.

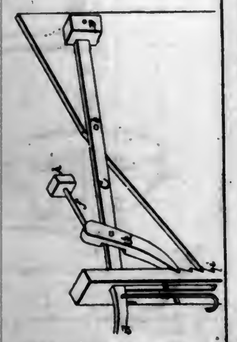
169,728. FEED-WATER HEATERS. Robert Wetherill, Chester, Pa., assignor to Robert Wetherill & Co., same place. [Filed Jan. 12, 1875.]

Brief.—The feed-water is divided into two or more streams, running through as many pipes, forming alternate coils, and supplied from a common inlet-head, the ends of the pipes being brought down through the coil, and terminating in a like head. Said coils are placed within a case, into which the steam from the engine is exhausted, then heating the water.

169,729.

The combination, in a feed-water heater, of the pipe B, two or more pipes, A, extending therefrom, and formed into coils, with their ends brought down through the coils, and terminating in the pipe C, substantially as set forth.

169,730. SLIDE-VALVE SEATS. J. Wheelock, Worcester, Mass. [Filed Dec. 17, 1874.]



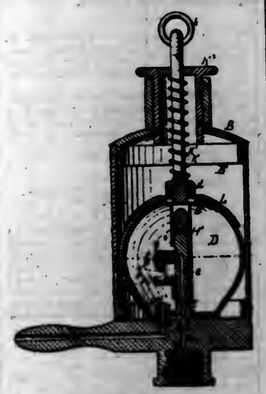
1. A detachable cast-iron valve-seat provided with strengthening-splices of wrought metal, filling grooves on the bars between the ports, substantially as described, whereby the seat is practically prevented from cracking, as set forth.

2. A detachable valve-seat provided with projecting splices on its lower surface between the ports, substantially as described, whereby the seat and cylinder may be connected and a steam-tight joint effected, as set forth.

3. A detachable valve-seat composed of cast-iron, having a chilled valve-surface and strengthening bars of wrought metal, substantially as described.

169,731. HARNESS-HANGING FRAMES. Kury Whiting, Trenton, Wis. [Filed Nov. 12, 1874.]

Brief.—A pivoted lever; hangings, rack, and weighted pawl at one end; counterpoise at the other.



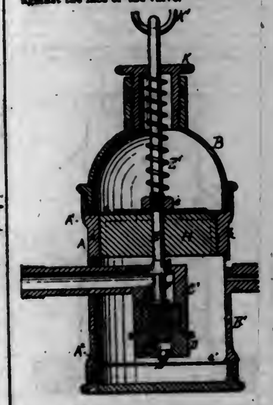
1. The pivoted lever C, having a hook, *d*, formed or attached at one end, and provided at said end with a rod, strap, or wire, *e*, and at the other end with counterbalancing-weight D, substantially as and for the purposes herein set forth.

2. The pivoted lever C, provided with hook *d*, and rod, strap, or wire *e*, in combination with the rack-bar *i* and the pawl G, having arm *f*, with weight h, substantially as and for the purposes herein set forth.

3. The combination of the slotted post B, with rack-bar *i*, pivoted lever C, with hook *d*, rod, strap, or wire *e*, and weight D, and the pawl G, with arm *f* and weight *h*, all substantially as and for the purposes herein set forth.

169,732. GAS-REGULATORS. Frederick W. Wiesebrock, New York, N. Y., assignor to Henry W. Shepard and Robert Seaman. [Filed Jan. 14, 1875.]

Brief.—The valve is connected to and moves with the elastic gas-reception chamber, and is combined with a stationary seat.

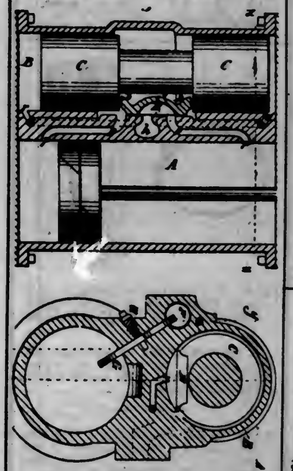


1. The elastic chamber D, inclosed in a suitable outer shell or casing, and having a supply and discharge pipe leading therefrom, in combination with a valve, H, and a valve-seat, G, whose orifice is connected with the channel of the supply-pipe, the whole being combined and arranged to operate as and for the purpose specified.

2. In combination with an elastic chamber, D, and a valve, H, the rod K, spring K', and screw-cap K², the whole being constructed and arranged to operate substantially as described

169,733. GAS-REGULATORS. Frederick W. Wiesebrock, New York, N. Y., assignor to Henry W. Shepard and Robert Seaman. [Filed Jan. 14, 1875.]

Brief.—A plunger attached to the valve-stem serves to counteract the pressure of gas against the face of the valve.

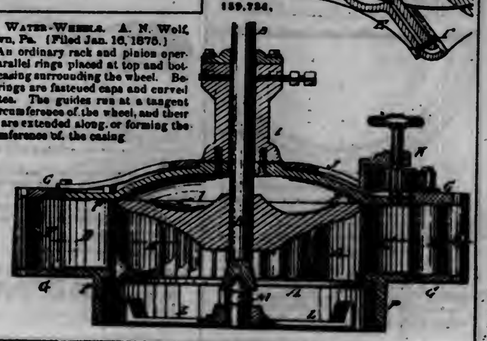


1. In combination with a shell or case, A, the inlet-pipe C, valve F, and plunger F', arranged as shown, whereby while the pressure of the gas in the supply-vessel acts with a tendency to close said valve, the same shall, in a great degree, be neutralized, substantially as described.

2. The valve F, plungers F' H, provided with ground or elastic joints, and connected to the rod E in the manner shown, in combination with the supply-pipe C and opening or valve-seat *c*, the whole being constructed and arranged to operate substantially as described.

3. In a pressure-regulator, a suitable shell or case, having a supply-pipe, C, and discharge-pipe C', stem E, valve F, plungers F' H, provided with ground or elastic joints, spring E', and screw-cap E², the whole being combined and arranged to operate substantially as described.

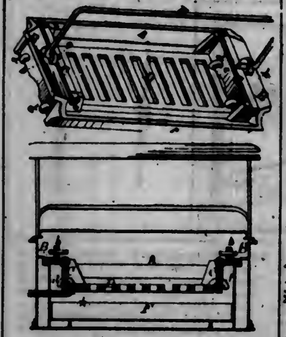
169,735. STEAM-ENGINES. W. C. Wilcox, San Francisco, Cal. [Filed June 1, 1874.]



1. The ports *r r*, opening into the ends of the supplemental piston-chamber, and leading to the main valve-face, in combination with the main valve, with its port-S, for the purpose of admitting steam to cushion the supplemental pistos, substantially as herein described.

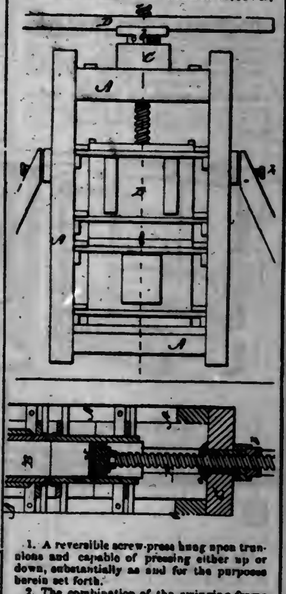
2. The valve F F', with its central enlargement *f*, in combination with the single supply-port *e*, for admitting steam to the center of the valve, and the steam-ports *i*, exhaust-ports *j*, and the operating-levers G, substantially as and for the purpose herein described.

169,734. WATER-WHEELS. A. N. Wolf, Allentown, Pa. [Filed Jan. 16, 1875.]



Brief.—An ordinary rack and pinion operates two parallel rings placed at top and bottom of the casing surrounding the wheel. Between the rings are fastened caps and curved register-gates. The guides run at a tangent with the circumference of the wheel, and their outer ends are extended along, or forming the outer circumference of, the casing

1. The register-gates E, gates D, and caps F, arranged together, in combination with the rings C C, substantially as and for the purposes herein set forth.

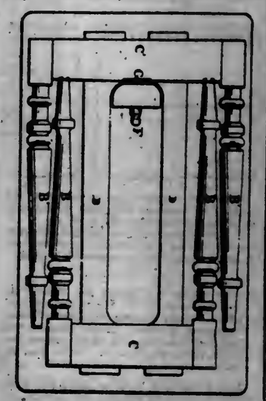


2. The combination of the casing F, water-guides C, gates D, register-gates E, and caps F, all constructed and arranged to operate substantially as and for the purposes herein set forth.

169,736. ASH-SIFTERS FOR STOVES. C. G. Wolfe, Troy, N. Y. [Filed Aug. 1, 1873.]

An ash-sifter having stationary side walls and pivoted swinging end walls, to or from which latter a grated bottom is suspended, and with which said bottom oscillates, substantially as and for the purpose specified.

169,737. HAY AND COTTON PRESSES. W. A. Wright, Griffin, Ga. [Filed Dec. 10, 1874.]

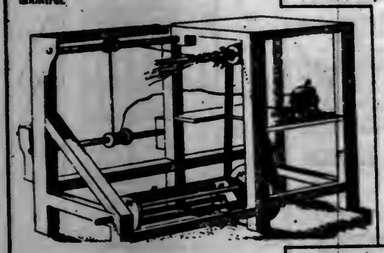


1. A reversible screw-press hung upon trunnions and capable of pressing either up or down, substantially as and for the purposes herein set forth.

2. The combination of the swinging frame A, bale-box B having its sides made in two sections hinged together, screw K, sectional follower G H, trunnions *k k*, braces I I, and bed J, all constructed substantially as and for the purposes herein set forth.

169,738. FOLDING TABLES. Henry York, Philadelphia, Pa. [Filed Oct. 31, 1874.]

Brief.—When the table is folded the inner pair of legs is held by the strip connecting the outer pair of legs, and a spring-latch attached to the under side engages with said strip

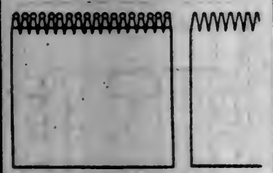


The legs B B', strips C C', and hinged stretcher D, in combination with the latch F, the stretcher D folding under the strips C C', and the legs B folding under the strip C', substantially as and for the purpose set forth.

REISSUES.

6,276. BROOM ALIKERS. Henry Anderson, San Francisco, and Jas. F. Houghton, Sacramento, Cal., assignors, by mesne assignments, to Henry Anderson and J. B. Robinson. Patent No. 150,669, dated May 12, 1874. [Filed Aug. 31, 1874.]

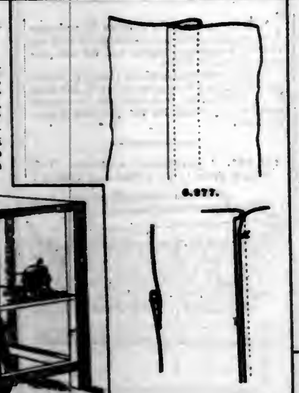
Brief.—The mandrel is provided with a longitudinal groove, in which slides the clamp that holds the tapered broom-socket to the mandrel.



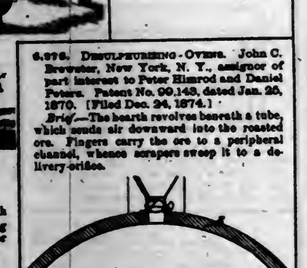
The grooved mandrel F *d*, provided with the spring *g*, having an outwardly-projecting pin, *m*, and knob *k*, substantially as and for the purposes herein specified.

6,276. MANUFACTURE OF MATCHES. Emery Andrews and William Tucker, Pinkedale, Mass., assignors, by mesne assignments, to A. Spring, Saml. H. Spring, and Jas. C. Jordan, Portland, Me. Patent No. 60,197, dated Mar. 26, 1867. [Filed Oct. 1, 1874.]

Brief.—The card from which the matches are made is prepared of the desired width and length, one edge of which is scalloped or notched, so as to form a series of points for dipping in the explosive compound before the matches are cut from the card.



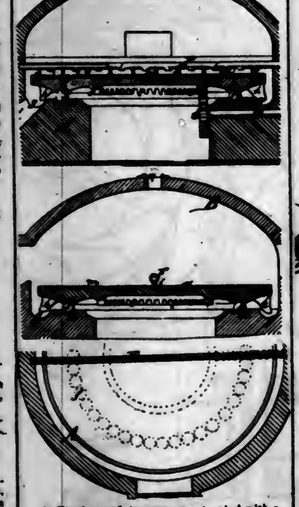
1. In the manufacture of matches, the notched or scalloped and waxed match-card, as herein described, and shown in Fig. 1.



2. Notching and dipping the cards preparatory to cutting the matches therefrom, substantially as and for the purposes specified.

6,277. SEAMS FOR BOOTS, &c. Samuel A. Brockett and W. W. Whitcomb, Boston, Mass., assignors to the Union Patent Seam Company, Hartford, Conn. Patent No. 152,652, dated Dec. 10, 1873; reissue No. 6,251, dated May 6, 1873. [Filed Dec. 21, 1874.]

In the uppers of boots or shoes, the seam formed by stitching together from the outside the two parts to be joined, and then turning the edge of the one part over and stitching it down beyond the edge, and to the main body of the other part, substantially as and for the purposes hereinbefore described.



6,277.

6,278. DEVULPEURISING-OVENS. John C. Brewster, New York, N. Y., assignor of part interest to Peter Elmrod and Daniel Peters. Patent No. 99,143, dated Jan. 25, 1870. [Filed Dec. 24, 1874.]

Brief.—The hearth revolves beneath a tube, which sends air downward into the roasted ore. Fingers carry the ore to a peripheral channel, whence scrapers sweep it to a delivery-orifice.

1. The base of the oven, constructed with a groove for receiving friction-balls, and a seat for the shaft *c*, carrying the pinion *b*, in combination with the rotary table, having the groove *a*, gearing *c*, and a stationary air-pipe having jet-openings, substantially as described.

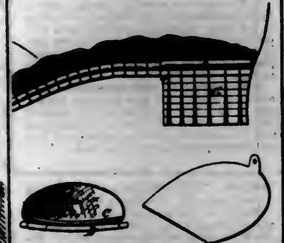
2. The combination, with the revolving table in a furnace, of a receiving channel or trough, and of wipers, for the purpose of automatically removing the ore from the furnace, substantially as shown and described.

6,279. RUBBER-COATED BUCKLES AND RINGS. Ralph C. Dunham, New Britain, Conn., assignor, by mesne assignments, to Andrew Albright, Newark, N. J. Patent No. 56,619, dated Oct. 9, 1866; reissue No. 5,172, dated Dec. 3, 1872. [Filed Dec. 12, 1874.]

1. A buckle or ring composed of a metal core and a coating of rubber or other gum, the said coating being provided with a projecting rib suitable for receiving imitation stitching, substantially as set forth.

2. A buckle or ring composed of a metal core and a coating of composition, provided with a projecting rib suitable for receiving imitation stitching, substantially as set forth.

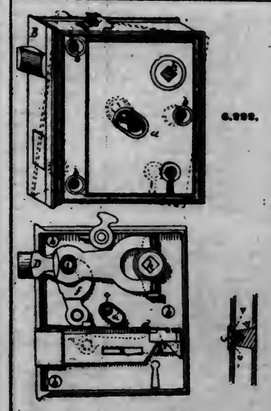
6,279.



6,280. PANTS AND OTHER GARMENTS. G. B. Eager, Boston, Mass. Patent No. 127,760, dated June 11, 1872. [Filed Nov. 18, 1874.]

A hollow waistband for pantaloons and other garments, when provided with a strap and buckle arranged in the manner and for the purpose set forth.

6,280.



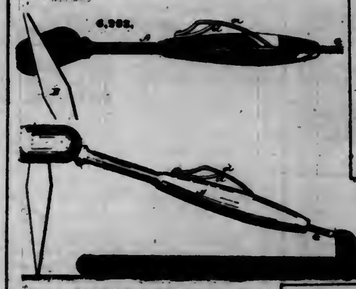
6,281. SHOES. Charles F. Hill, Baltimore, Md., assignor to himself and Geo. D. Hill, same place. Patent No. 156,270, dated Dec. 29, 1874. [Filed Jan. 20, 1875.]

1. A shoe in which a middle sole receiving the lasting-nails is covered by an insole, and the whole united by a line of stitching passing through the outer sole, the upper, the middle, and the insole, substantially as and for the purpose described.

2. The herein-described mode of clinching the heel-nails in the lasting-sole by a removable metallic plate interposed between the lasting-sole and the loose heel part of the stitched insole, substantially as and for the purpose described.

6,282. CARDS FOR REVERSIBLE LATCHES AND LOCKS. J. Elsner, Pittsburg, Pa. Patent No. 123,667, dated Feb. 13, 1872. [Filed Jan. 14, 1875.]

6,283.



1. A sliding T-joint, in combination with a lock-case, having a removable face-plate and a reversible latch-bolt, whereby the face-plate may be attached and detached, and also held in place without the necessary use of other fastening, substantially as set forth.

2. A head, *c*, vertically adjustable, in combination with the removable face-plate of a lock-case and the engaging edges or lips *c c*, between which the shank or stem of the head *c* slides in attaching and detaching, substantially as set forth.

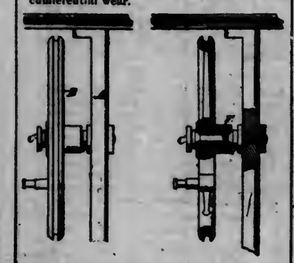
3. A slot or opening, *a*, widened at one end, in combination with the headed rivet or screw *c* and hub *b*, when arranged so that the case-plate turns on the hub as a bearing while it is being fastened or removed, substantially as set forth.

6,283. TOOLS FOR DRESSING MILLSTONES. James Norman, North Springfield, Mo. Patent No. 154,614, dated Aug. 26, 1874. [Filed Jan. 22, 1875.]

Brief.—Along two sides of a steadying bed-plate are arms pivoted near the front, and attached to a back piece having a series of holes to rest the end of the mill-pick handle when in operation, said handle being made longitudinally adjustable by pawl-and-ratchet mechanism.

6,283.

1. In tools for dressing millstones, a ratchet extension-bar for moving the pick-handle out from any given point on guide-bar D, substantially as set forth.



2. The combination of the ratchet extension-bar G and thumb-spring *d*, substantially as shown.

3. The combination of the ratchet extension-bar G, thumb-spring *d*, and spring *b*, substantially as described.

4. The bed-plate C, with the adjustable guide-bar D, said guide-bar being provided with depressions or holes *a a*, for bar G to rest in when in operation, substantially as and for the purposes set forth.

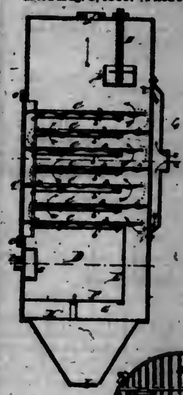
6,284. ANTI-RATTLING JOURNALS FOR BALANCE-WHEELS OF SEWING-MACHINES. P. L. Reese, Mount Sterling, Ky., assignor to the Victor Sewing-Machine Company, Middletown, Conn. Patent No. 124,160, dated Feb. 27, 1872. [Filed Jan. 9, 1875.]

Brief.—The exterior of the journal is screw-threaded. It is provided at its extremity with a conical bearing, and upon its threaded part with a correspondingly-threaded nut. Both the journal and the nut are adjustable in reverse direction, so as to approach each other, whereby the wheel can be adjusted to any position on the line of the journal, and be always kept in line with the band-wheel of the machine, and be compensated both for lateral and circumferential wear.

7. A journal-bearing for balance-wheels of a sewing-machine, provided with a compensating screw-threaded follower or nut, having conical bearing-faces adapted to fit into conical seats in the hub of the wheel, said follower constructed to be advanced along the threaded journal to compensate for lateral and circumferential wear, substantially as described.

2. A screw-threaded journal for the balance-wheels of sewing-machines, provided with followers having conical bearing-faces, either of which may be made to advance along said journal for the purpose of compensating for wear of said wheel upon the bearings, substantially as described.

3. A journal-bearing for the balance wheels of sewing-machines, provided with followers having conical-bearing faces, either of said followers constructed to approach the other, and fit in a conical seat formed in the hub of the wheel for compensating for wear, substantially as described.

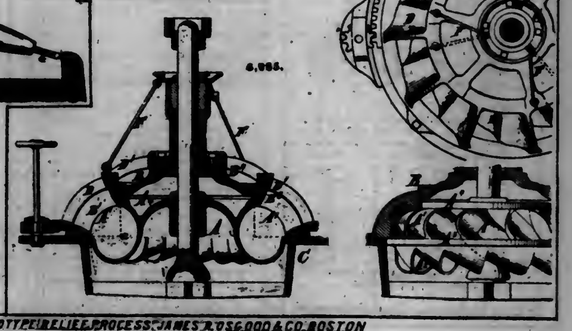


6,285. WATER-HEATING DEVICES. R. R. Stilwell, Dayton, Ohio, assignor, by mesne assignments, to Stilwell & Bierce Manufacturing Company. Patent No. 93,244, dated Aug. 3, 1869. [Filed Jan. 23, 1875.]

1. The wheel A, constructed with buckets concave at the bottom, both longitudinally and transversely, and terminating at the top with the quadrant curve A', substantially as set forth.

2. In combination with the wheel having its buckets terminating above in a quadrant curve, as shown at A', a dome-formed casing, B, having a quadrant concavity, B', adapted to the form of the wheel, substantially as set forth.

3. In combination with the dome-formed casing B, a correspondingly-formed register-gate, having its bearings on flanges or seats formed on the dome B, substantially as shown.



4. The register-gate ring D, in combination with the rods F and stationary collar G, so arranged that when the former is turned, it shall be raised from its seat, substantially as set forth.

6,285.

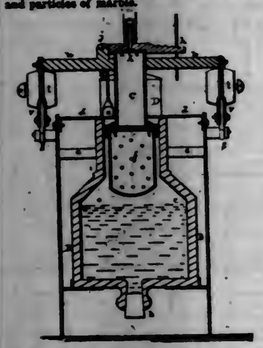
6,285. WATER-WHEELS. John W. Ross, Delphos, Ohio, assignor of one-half interest to Jos. W. Hunt, same place. Patent No. 152,616, dated June 30, 1874. [Filed Jan. 12, 1875.]

Brief.—The buckets are concave at the bottom, both longitudinally and transversely, terminating at the top with a quadrant curve, so as to receive the water as it enters between the guides, and diverting it, so that, bearing against the faces of the buckets, it emerges through the issues and escapes vertically through the tube. The gate is connected by rods to a collar, so that when it is turned it is raised from its seat, and thus relieved of friction.

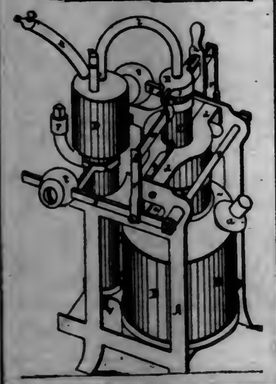
6,286.

1. A heater and feed-water purifier, composed substantially of a series of heating and depositing shelves, a sediment-collecting chamber, and a filter-chamber, arranged in such relation to each other that the water is first passed in thin streams over the shelves for heating by steam for the deposit of crystallizable salts, thence into a sediment-chamber, where the heavier elements settle, and from which it passes through filtering material in a filter-chamber, where the lighter and remaining separable impurities are removed, substantially as herein set forth.

2. The sediment-chamber or mud-receptacle G, in combination with a series of shelves, C, and the upward filter-chamber D, substantially as herein set forth.



3. In combination with a feed-water heater and purifier, which contains a series of shelves, a sediment-chamber, located in the order of operation between the shelves and a filter-chamber, the filter-chamber so constructed that the water must flow upwardly through the filtering material, substantially as herein described.



4. In combination with case A the shelves C, constructed and arranged in sections substantially as and for the purpose specified.

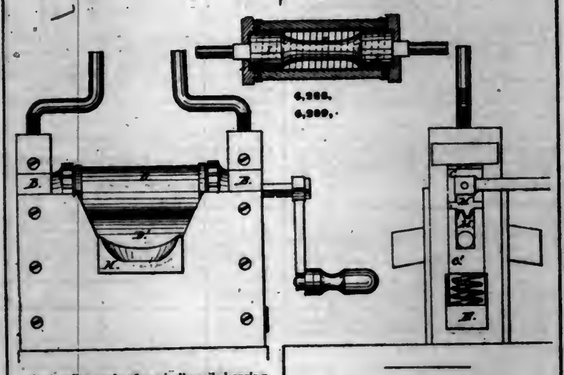
5. The door A' applied to shell A by means of the adjustable bars *c e* and bolts and nuts, substantially as described.

6,927. CARBONIC-ACID-GAS GENERATORS. Otto Zwietusch, Milwaukee, Wis. Patent No. 145,774, dated Dec. 23, 1873. [Filed Dec. 9, 1874.]

Brief.—The neck of the jar is used as a cylinder. The flange upon the edge of the basket and that upon the hollow piston clamp a self-acting packing. Pressure downward is brought upon the piston by levers and weights, and upward by the gas. The gas is drawn off through the marble suspended in the basket above the acid, and through the hollow piston, thus arresting the passage of foam and particles of marble.

1. Generating-jar B, having a narrow cylinder extending at the top, with an inlet at the side and an outlet at the bottom, as specified.

2. A carbonic-acid-gas generator, from which the gas passes off through a piston, substantially as described.



3. Generator B, in combination with the basket *f*, piston C, packing *o o*, packing *x x*, cover E, cleris *h*, cross-bar *u*, and levers *r s*, weights *t t*, and connections *v v*, substantially as described.

4. Cross-bar *c*, cover *d*, and generator B, all in combination with latch *g*, substantially as described.

5. The combination of safety-valve *m*, washer D, and generator B, substantially as set forth.

6. A self-regulating carbonic-acid-gas generator, constructed with a piston and with a basket or bag attached thereto, whereby the alkali is raised out of the acid by means of the piston, substantially as set forth.

6,928. WRINGING-MACHINES. Bailey Washing and Wringing Machine Company, Woonsocket, R. I., assignee, by mesne assignments, of Thomas Allender, (executor of John Allender, deceased.) Patent No. 22,539, dated Jan. 11, 1859; reissue No. 1,709, dated June 26, 1864; reissue No. 1,807, dated Nov. 8, 1864; reissue No. 1,934, dated Apr. 18, 1865; extended seven years. [Filed Dec. 23, 1874.]

1. A roller made of a spirally-coiled spring, arranged on a shaft or roller made smaller at the center than at the ends, as and for the purposes specified.

2. A roller yielding more at its center than at or near its ends, covered with vulcanized rubber, or any other elastic compounds impervious to water.

3. Cog-wheels, in combination with rollers of vulcanized rubber, or any other elastic substance or compound impervious to water, for the purpose set forth.

4. Rollers made of or covered with vulcanized rubber, or any other elastic substance or compound impervious to water, in combination with cog-wheels and a spring or springs around the shaft of the roller, for the purpose set forth.

5. Rollers for washing or wringing machines, made of or covered with vulcanized rubber, or any other elastic substance or compound impervious to water, in combination with adjusting spring or springs.

6. Rollers for washing or wringing machines, made of or covered with vulcanized rubber, or any other elastic substance or compound impervious to water, in combination with adjusting spring or springs and screw or screws, to adjust the pressure to the springs and rollers.

7. The guide or guides, in combination with the squeezing-rollers, made of or covered with vulcanized rubber, or other elastic material impervious to water.

8. Rollers made of or covered with vulcanized rubber, or other elastic material impervious to water, in combination with cog-wheels and a guide or guides, substantially as described.

6,929. WRINGING-MACHINES. Bailey Washing and Wringing Machine Company, Woonsocket, R. I., assignee, by mesne assignments, of Thomas Allender, (executor of John Allender, deceased.) Patent No. 22,539, dated Jan. 11, 1859; reissue No. 1,709, dated June 26, 1864; reissue No. 1,807, dated Nov. 8, 1864; reissue No. 1,934, dated Apr. 18, 1865; extended seven years. [Filed Dec. 23, 1874.]

A portable stand or bench provided with upright standards, in combination with elastic squeezing-rollers impervious to water, substantially as described.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 7.—NO. 7. TUESDAY, FEBRUARY 16, 1875. PRICE { $6,00 per year—single. $5,00 per year in clubs.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date February 16, 1875.]

8,057.—Window-Bracket.—NATHANIEL L. BRADLEY, West Meriden, Conn., assignor to BRADLEY & HUBBARD, same place. Application filed December 5, 1874. Term of patent 7 years.

8,058 to 8,061, inclusive.—Aquariums.—JOSEPH W. FISKE, New York N. Y.—Cases A, B, C, and D. Applications filed January 18, 1875. Term of patents 7 years.

8,062.—Carpets.—ALFRED REUFERN, Philadelphia, Pa., assignor to SAMSON MCDOWELL, same place. Application filed February 4, 1875. Term of patent 3½ years.

8,063.—Spice-Can.—ZACHARIAH R. TRAVER, Detroit, Mich. Application filed December 11, 1874. Term of patent 7 years.

8,064.—Bottles.—FRANK S. UPTON, Rochester, N. Y. Application filed February 3, 1875. Term of patent 3½ years.

8,065.—Gas Fire-Log.—THOMAS N. DIXON, Philadelphia, Pa., assignor to himself, GEORGE B. DIXON, and HENRY P. DIXON, same place. Application filed February 10, 1875. Term of patent 14 years.

8,066.—Alto-Relievo.—WILLIAM B. GLEASON, Boston, Mass. Application filed December 19, 1874. Term of patent 7 years.

8,067.—Coffin-Handle Sockets.—JOHN R. MACKAY, West Meriden, Conn., assignor to O. ROGERS & BROS., same place. Application filed February 5, 1875. Term of patent 7 years.

8,068.—Cigar-Box.—MAX MOLL, New York, N. Y. Application filed February 5, 1875. Term of patent 7 years.

8,069.—Fork and Spoon Handles.—CHARLES OSBORNE, North Attleborough, Mass., assignor to the WHITING MANUFACTURING COMPANY, New York city.—Case B. Application filed February 9, 1875. Term of patent 7 years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each certificate bearing date February 16, 1875.]

2,228.—Cigars.—F. DE BARY & Co., New York, N. Y. Application filed February 1, 1875.

"'Key West Branch' of 'the El Principe de Gales Factory, Havana,' combined with the name and fac-simile signature of the proprietors 'V. Martinez Ybor & Co.'"

2,229.—Salves.—CHARLES HEINRICH, Plainfield, N. J. Application filed February 18, 1875. "'The Good Samaritan.'"

2,230.—Mustards.—JEWETT, SHERMAN & Co., Milwaukee, Wis. Application filed February 3, 1875.

"the representation of a coat-of-arms."

2,231.—Medicine.—JULIUS KAISER, Pittsburg, Pa. Application filed February 4, 1875.

"'Kaiser's Extra Fine Bitters, Elixir of Life.'"

2,232 to 2,236 inclusive.—Clocks.—FLORENCE KROEBER, Hoboken, N. J.—Case A, "'Albatross.'" Case B, "'Oneida.'" Case C, "'Niagara.'" Case D, "'Kansas.'" Case E, "'Polaris.'" Applications filed February 5, 1875.

2,237.—Cigars.—LICHTENSTEIN BROS. & Co., New York, N. Y. Application filed January 25, 1875.

"the representation of an eagle alighting with spread wings on the top of a rocky promontory, beyond which the sun is rising above the horizon of the sea."

2,238.—Medicine.—EPHRAIM G. LEWIS, Pittsylvania county, Va. Application filed February 5, 1875. "'Reboro.'"

2,239.—Packing for Stuffing-Boxes, &c.—WILLIAM HARTLEY MILLER, Philadelphia, Pa. Application filed February 9, 1875.

"a flat pasteboard core for packing for stuffing-boxes, engines, pumps, &c."

2,240.—Cigars and Cigarettes.—GUSTAV SALOMON, New York, N. Y. Application filed February 1, 1875.

"'The Centennials de G. S. Fabrica de Tobacos, Habana.'"

2,241.—Cigars.—JAMES M. SEIP, Allentown, Pa. Application filed December 29, 1874. "'Three Brothers.'"

2,242.—Fertilizers.—WALTON, WHANN & Co., Wilmington, Del. Application filed November 1, 1871.

"'Bahama Soluble Guano.'"

2,243.—Compound for Destroying Rats, Mice, Roaches, &c.—EBHRAIM S. WELLS, Jersey City, N. J. Application filed February 3, 1875. "'Rough on Rats.'"

2,244.—Refined Sugars.—WOODS, WEEKS & Co., Baltimore, Md. Application filed September 29, 1874. "'Cosmopolitan.'"

2,245.—Sewing-Silk.—BRAINERD, ARMSTRONG & Co., New York, N. Y., and Philadelphia, Pa. Application filed December 26, 1874. "'Centennial.'"

2,246.—Bathing-Powders.—FREDERICK RAUCHFUSS, New York, N. Y. Application filed February 12, 1875.

"the figure of an oak tree, surrounded by the arbitrary word-symbol 'TANCATHOLICON.'"

INDEX OF INVENTIONS PATENTED FEB. 16, 1875.

	Class No.	No. of Patent.
Advertising apparatus, T. E. Allison	146	159,881
Alarm and registering stamp, conductor's, L. J. Masterson	42	159,765
Amalgamator, L. Hinckley	3	159,759
Annunciator, electric, Carter and Hewitt	50	159,901
Bale tie, A. A. Goldsmith	7	159,815
Ballot box, F. W. Brooks	146	159,890
Bank check, C. V. Mead	54	159,833
Barrel roller, C. L. Topliff	19	159,864
Bed bottom, spring, J. A Jones	62	159,930
Bedstead, folding, P. B. Viele	62	159,760
Bedstead, wardrobe, H. W. Curtis	62	159,908
Bee hive, J. Bullock	91	159,893
Bill file, W. R. Clough	146	159,796
Bird house, E. A. La Bay	63	159,938
Boiler, wash, A. Becker	91	159,745
Bolt work for safe doors, &c., W. H. Butler	93	159,791
Bolts, manufacture of, W. J. Clark, (reissue)	125	6,291
Bolts, tool for pointing, Hartin and Cummins	100	159,922
Boot and shoe counter stiffeners, apparatus for shaping, J. R. Moffitt	16	159,835
Box, register pepper, T. W. Burger	88	159,895
Brick machine, T. T. Joyce	20	159,931
Bricks, machine for dusting, J. N. Kerper	20	159,934
Broom, G. R. Swingle	22	159,861
Broom head, E. J. Merick	22	159,954
Bullet patching machine, H. Borchardt	32	159,748
Bustle, L. Conigisky	80	159,799
Butter, packages for prints of, A. Robinson	45	159,845
Can opener, J. H. Murphy	88	159,767
Cans, nozzle for, R. T. Bush	136	159,896
Canopy frame, R. F. S. Heath	62	159,925
Car axle box, C. A. Hussey	122	159,824
Car coupling, B. B. Sherfy	122	159,850
Car coupling, J. B. Stamour	122	159,974
Car coupling, W. F. Starr	122	159,975
Car coupling, G. M. Thompson	122	159,862
Car pusher, Bird and Sullenberger	122	159,787

	Class No.	No. of Patent.
Car spring, A. J. Culbertson	122	159,802
Car starter, J. C. Moore	122	159,766
Cars, &c., propelling device for street, Trible & Davis	124	159,980
Carding machines, doffing mechanism for, J. Barker	28	159,742
Carding machines, feeding mechanism for, G. S. Harwood	28	159,923
Carriage, child's, F. L. Hughes	31	159,761
Carriage curtain fastening, H. Foster	31	159,809
Carriage seat, D. Conboy	31	159,798
Carriage shackles, manufacturing, A. McKenzie	31	159,950
Cartridge cases, manufacture of metallic, T. R. Bayliss	92	159,883
Carts, &c., unloading attachment for, Crossley and Bertolette	31	159,907
Casting scale levers, T. Olsen	33	159,957
Chair, W. T. Doremus	62	159,806
Chair, child's walking, G. P. Steinbach	62	159,976
Chuck, scroll, J. H. Westcott	100	159,949
Churn, J. L. Wilson	45	159,878
Cigar box, S. Jacoby	160	159,825
Cigar packing implement, S. Jacoby	160	159,929
Clothes drier, C. Howes	91	159,823
Clothes wringer, P. N. Wollaston	91	159,996
Cock, gage, I. S. Hamilton	148	159,920
Cock or valve, Heale and Gowan	167	159,924
Cock, self-closing hopper, H. Carruthers	8	159,900
Cock, stop, W. H. Beckett	167	159,746
Compound implement, E. L. Price	146	159,841
Copper, &c., refining, S. L. Crocker	99	159,801
Corn cutter, green, V. Barker	88	159,741
Corn sheller, W. S. Brayles	59	159,789
Cornice, window curtain, J. Sowle	62	159,774
Corset, D. H. Fanning	60	159,753
Cranberry separator, D. T. Staniford	63	159,833
Culinary vessel, steam, S. T. Goodwyn	154	159,755
Cultivator, J. H. Rice	43	159,842
Curtain fixture, G. C. Mathers	62	159,944
Dash board, C. C. Schwaner	31	159,848
Dental reflector, F. M. Osborn	46	159,836
Deodorizer for bed vessels, H. M. Small	8	159,773
Drag, W. Gardner	73	159,811
Drawing board, J. B. Webb	51	159,870
Drier for refined sugar, A. F. W. Partz	45	159,769
Drill, rock, H. P. Bell	124	159,885
Drill, rock, S. Ingersoll, (reissue)	124	6,293
Drilling rock, machine for, S. Ingersoll, (reissue)	124	6,292
Drop light, J. C. Love	64	159,941
Ejector, fluid, A. A. Atkins	167	159,739
Elevator, hydraulic, W. B. Le Van	82	159,829
Engine, compound, J. W. Bell	150	159,786
Engine valve gear, steam, G. Westinghouse, Jr	152	159,782
Engines, lubricator for steam, J. Powell	87	159,962
Eyeleting machine, J. Coombe	146	159,904
Faucet, A. Pfand	167	159,960
Faucet, T. Tully	167	159,981
Fence, portable, T. McQuary	52	159,952
File cutting machine, S. and S. M. Hamblin	53	159,756
Fire escape, J. J. F. and J. Arnao, Jr	30	159,738
Flower maker's grass cutting machine, T. and J. Millot, (reissue)	54	6,297
Flower pots and vases, stand for, E. G. Durant	61	159,911
Fork sharpening attachment, Church and Gilbert	44	159,794
Fountain, parlor, H. Wensel	167	159,872
Fruit gatherer, C. A. Werden	63	159,873
Furnace, hot air, D. Boyd, (reissue)	154	6,290
Furnace, hot air, J. G. Weldon, (reissue)	154	6,294
Furnace, smoke consuming, W. L. Powleson	149	159,964
Furnace, steam boiler, H. E. Champion	149	159,902
Game apparatus, V. Klobassa	143	159,937
Garment, knitted, N. H. Bruce	38	159,891
Gas retort, W. W. Goodwin	64	159,816
Generators, joint for steam, H. Whittingham	148	159,992
Governor, steam, M. Machin	69	159,955
Grate, J. C. Weightman	154	159,871
Harness, G. W. Hoover	72	159,927
Harness shaft tug, T. E. Webber	72	159,781
Harvester, W. A. Wood	74	159,879
Harvester, corn, W. N. West	74	159,990
Harvester dropper, C. Wheeler, Jr	74	159,875
Harvester journal bearing, E. F. Herrington	74	159,758
Harvester rake, V. H. Felt	74	159,808
Harvester rake, J. H. Kirton	74	159,936
Harvesters, sickle head for, M. M. Shellaberger	74	159,970
Hat frames, binding and wiring, R. F. S. Heath	76	159,926
Hat, reversible, L. Girbardt	76	159,916
Hats, machine for pouncing, R. Eickemeyer	76	159,912
Heater, M. R. Roberts	154	159,844
Heating drum, F. Proudfoot	154	159,966
Hog ringing nippers, W. E. Bingham	45	159,886
Hoof trimmer, Shirran and Givens	60	159,972
Horseshoe calks, machine for sharpening, Gleason and Hamilton	60	159,918
Horseshoe machine, H. J. Batchelder	60	159,743
Hubs to axles, device for attaching, D. A. Johnson	31	159,762
Hydrocarbons, burning, O. T. Earle	149	159,751
Iron, roll for rolling angle, Swift and York	125	159,978
Kettle, tea, H. Gray	88	159,817
Knitting machine, E. P. Curtiss	89	159,750
Lamp, bracket, C. V. Beat	90	159,747
Lamp holder, J. C. Love	90	159,942
Lamp shade support, S. A. Prescott	90	159,965
Lantern, ship's, F. J. Kenny	90	159,933
Leather strap skiving machine, A. G. Howard	92	159,822
Lightning rod, M. D. Phelps	50	159,961
Liquids, process and apparatus for cooling, L. B. Woolfolk	59	159,997
Loom for weaving piled fabrics, S. Sanford	95	159,847
Loom shuttle, P. Lear	95	159,764
Loom stopping mechanism, J. Bullough	95	159,983
Loom stopping mechanism, J. Bullough	95	159,984
Loom stopping mechanism, J. Bullough	95	159,985
Loom stopping mechanism, J. Bullough	95	159,986
Mechanical movement, D. Williamson	67	159,877
Metals, bit for boring, W. McCreeson	100	159,948
Milk cooling apparatus, O. J. Stickles	45	159,854
Molder's flask, N. M. Chafee	33	156,793
Mowing machine, E. C. Dewers	74	159,804
Nail kegs, manufacture of, S. F. Maxwell	40	159,945
Nail machine, cut, J. T. Westwood	103	159,783
Nail plate feeder, D. W. Keith	103	159,932
Neck tie, W. H. Hart, Jr	38	159,921
Needles, machine for making cutters for grooving, R. Thompson	103	159,863
Oil cloth, &c., apparatus for drying, A. Wilder	56	159,876
Oil, treating, V. G. Bloede	47	159,887
Ordnance, construction of, R. R. Moffatt	105	159 834
Ore, flux for treating, P. N. Mackay	3	159,831
Ornaments, &c., holder for, W. J. Garvey	24	159,813
Padlock, &c., J. Schade	93	159,772
Pail, O. S. Camp	88	159,792
Palls, &c., metallic lip for wooden, S. C. D. Kirtley	40	159,935
Peg or ribbon peg wood, B. F. Sturtevant	16	159,778
Peg or sole fastening, C. and J. G. Rowland, (reissue)	16	6,298
Peg or sole fastening, B. F. Sturtevant	16	159,977
Peg strips, machine for making compressed, C. and J. G. Rowland, (reissue)	16	6,299
Peg wood, ribbon, B. F. Sturtevant	16	159,860
Pegging machine, B. F. Sturtevant	16	159,775
Pegging machine, B. F. Sturtevant	16	159,776
Pegging machine, B. F. Sturtevant	16	159,856
Pegging machine, B. F. Sturtevant	16	159,857
Pegging machine, B. F. Sturtevant	16	159,858
Photographic burnishers, burnishing plate for, J. Bramble, Jr	111	159,889
Pianos, repeating action for, F. Polster	112	159,838
Pigeon starter, H. A. Rosenthal	143	159,946
Pin, Gardner and Blossom	86	159 810
Plane, block, J. A. Traut	29	159 865
Planter, corn, Lawrence and Thomas	133	159,939
Planter, corn, A. M. Manny	133	159,831
Planter, seed, E. M. Potter	133	159,840
Plow, C. G. Cox	114	159,905
Plow, A. Rigby	114	159,967
Plow adjuster, S. T. Ferguson	114	159,913
Plows, sulky attachment to, G. Van Winkle	114	159,779
Printing press, W. E. Gump	117	159,819
Printing press, delivering apparatus for, Mayall and Hartnett	117	159,947
Puddler, revolving, W. and G. H. Sellers	99	159,849
Pulley block, differential, B. F. Warren	79	159,987
Quilting machine, A. Beck	38	159,884
Railway frog, W. L. Lamborn	120	159,763
Rake, garden, F. B. Hedge	77	159,821
Reflector, G. Rosenthal	90	159,969
Refrigerator, J. H. Ridgway	58	159,843
River channels, construction of jetties for improving, Mullett and Schumann	82	159,956
Roll couplings, binder for, J. Gillespie	125	159,814
Roller, anti-friction, E. Gerry	87	159,754
Roller, land, W. Williams	73	159,784
Rotller, E. Powell	134	159,963
Safe deposit box, W. H. Butler	128	159,897
Sandpapering machine, H. W. Merrill	173	159,953
Sash fastener, G. B. Adams	24	159,8-0
Sash fastener, J. N. Withers	24	159,994
Saw frame, band, N. T. Edson	130	159,807
Saw set, J. B. Titus	131	159,979
Sewing machine, J. O'Neil	134	159,958
Sewing machine, boot and shoe, H. Dunham, Jr., (reissue)	134	6,295
Sewing machine button holing attachment, S. J. Baird	134	159,740
Sewing machine for stitching socks, H. P. Garland	134	159,812
Shaft hanger, D. Dierker	87	159,909
Shawl strap handle, Bruen and Gridley	162	159,892
Sheep, holder for shearing, J. R. Virgo	144	159,868
Sheet metal lids, machine for soldering, G. H. Chinnock	136	159,903
Shell, explosive, H. Tyler	105	159,982
Shingle planing machine, P. D. Burgher	174	159,790
Ships, mechanism for trimming, J. McNabb	137	159,951
Shoe nails, machine for making, L. Soule	103	159,852
Shoe peg blank, B. F. Sturtevant, (reissue)	16	6,300
Shoe tip, H. White	16	159,991
Slate frame, N. A. Porter	146	159,839
Snow plow, Twitchell and Parsons	122	159,966
Soda water draft apparatus, W. Gee	1	159,915
Sole fastening, B. F. Sturtevant	16	159,777
Sole fastenings, machine for compressing, B. F. Sturtevant	16	159,859
Spirit level, E. L. Barnes	157	159,882
Spring, door, A. T. Ballantine	24	159,785
Steering apparatus, P. H. Jackson	137	159,826
Stereotype plates, machine for shaving the backs of curved, Mayall and Hartnett	100	159,946
Stool and cane, combined camp, F. A. Byram	165	159,894
Stool, camp, A. W. Hart	62	159,757
Stoops, winter rail for high, R. Le Forte	30	159,830
Stove, L. R. Comstock	154	159,797
Stove, Gram and Nelson	154	159,919
Stove, cooking, E. O. Brinckerhoff	154	159,788

	Class No.	No. of Patent.
Stove drum, W. Boehmer	154	159,888
Stove, heating, J. H. Robinson	154	159,968
Street sprinkler, W. Westerfield	167	159,874
Stump puller, C. C. Hogue	79	159,760
Sugar coating confectionery, pills, &c., apparatus for, W. Cairns	155	159,899
Sugar, drier for refined, A. F. W. Partz	45	159,769
Sugar, manufacture of grape, E. E. Pearse	155	159,837
Table for milliners, &c., lap, J. Duncan	62	159,910
Table, ironing, G. K. Edwards	91	159,752
Telegraph sounder, J. H. Bunnell	50	159,894
Telegraph wires, sending and receiving messages simultaneously over same, M. G. Farmer, (reissue)	50	6,296
Telegraphic signal box, W. H. Sawyer	158	159,771
Textile material, machine for piling, A. Warth	37	159,928
Ticket reel, L. J. Masterson	122	159,943
Timber, flume for conveying, H. G. Parker	82	159,859
Tire heating device, J. Harris, Jr	60	159,820
Torpedo filling machine, Wolfe and Lilliendahl	105	159 995
Toy, A. E. Hotchkiss	143	159,928
Vegetable slicer, A. Vuillier	59	159,809
Vehicle umbrella support, A. Clarke	31	159,795
Vehicle wheel, D. Grim	31	159,818
Vehicle wheel, G. Leverich	31	159,940
Vehicle wheels, spoke socket for, M. Glassbrook	31	159,917
Velocipede, W. Quinn	31	159,770
Ventilator, window, S. W. Couch	166	159,800
Wagon body, C. W. Kiune	31	159,828
Washing machine, D. A. Flummerfeldt	91	159,914
Washing machine, James and Streit	91	159,827
Washing machine, Shipley and Wheeler	91	159,971
Washing machine, T. Stumm	91	159,855
Watch case backs, form for forming, F. H. Wilby	36	159,993
Water closet, W. J. Crow	8	159,906
Weather strip for windows, S. T. Varian	30	159,867
Wedge, iron, C. McDermott	67	159,949
Wells, tubing, W. T. Dobbs	51	159,805
Whiffletree hook, O. J. Smith	31	159,851
Windmill governor, W. L. Oliver	69	159,768
Window shade fixture, C. De Quillfeldt	62	159,803
Window ventilator, S. W. Couch	166	159,800
Window weather strip, S. T. Varian	30	159,867
Windows, quadrant for opening, shutting, and fastening, J. E. Beanland	24	159,744
Wire way, A. A. Smith	120	159,973
Wood boring machine, C. G. Cross	173	159,749

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED FEB. 16, 1875.

	Patent No.
Adams, G. H., Sash fastener	159,880
Allison, T. E., Advertising apparatus	159,881
Arnao, J. F., and J. F., Jr., Fire escape	159,738
Atkins, A. A., Fluid ejector	159,739
Bachman, S. C., assignee	159,948
Baird, S. J., Sewing machine button holing attachment	159,740
Ballantine, A. T., Door spring	159,785
Barker, J., Doffing mechanism for carding machines	159,742
Barker, J. M., assignee	159,965
Barker, V., Green corn cutter	159,741
Barnes, E. L., Spirit level	159,882
Batchelder, H. J., Horseshoe machine	159,743
Bayliss, T. R., Manufacture of metallic cartridge cases	159,883
Beanland, J. E., Quadrant for opening, shutting, and fastening windows	159,744
Beck, A., Quilting machine	159,884
Becker, A., Wash boiler	159,745
Beckett, W. H., Stop cock	159,746
Bell, H. P., Rock drill	159,885
Bell, J. W., Compound engine	159,786
Bertolette and Crossley	159,907
Best, C. V., Bracket lamp	159,747
Bilbrough, J., assignee	159,974
Bingham, W. E., Hog ringing nippers	159,886
Bird, C., and W. H. Sallenberger, Car pusher	159,787
Blakely, J., assignee	159,951
Bloede, V. G., Treating oil	159,887
Blossom and Gardner	159,810
Boehmer, W., Stove drum	159,888
Borchardt, H., Bullet patching machine	159,748
Boyd, D., Hot air furnace, (reissue)	6,290
Bramble, J., Jr., Burnishing plate for photographic burnishers	159,889
Brinckerhoff, E. O., Cooking stove	159,788
Brooks, F. W., Ballot box	159,890
Broyles, W. S., Corn sheller	159,789
Bruce, N. H., Knitted garment	159,891
Bruen, W., and D. Gridley, Shawl strap handle	159,892
Bullock, J., Bee hive	159,893
Bullough, J., Loom stopping mechanism	159,983
Bullough, J., Loom stopping mechanism	159,984
Bullough, J., Loom stopping mechanism	159,985
Bullough, J., Loom stopping mechanism	159,986
Bunnel, J. H., Telegraph sounder	159,894
Burger, T. W., Register pepper box	159,895
Burgher, P. D., Shingle planing machine	159,790
Burkhard, T., assignee	159,899
Bush, R. T., Nozzle for cans	159,896
Butler, W. H., Bolt work for safe doors, &c	159,791
Butler, W. H., Safe deposit box	159,897
Byram, F. A., Combined camp stool and cane	159,898
Cairns, W., Apparatus for sugar coating confectionery, pills, &c	159,899
Camp, O. S., Pail	159,792
Carruthers, H., Self-closing hopper cock	159,900
Carter, F. S., and C. B. Hewett, Electric annunciator	159,901
Chafee, N. M., Molder's flask	159,793
Champion, H. E., Steam boiler furnace	159,902
Chinnock, G. H., Machine for soldering sheet metal lids	159,903
Church, D. M., and W. F. Gilbert, Sharpening attachment to forks	159,794
Clark, W. J., Manufacture of bolts, (reissue)	6,291
Clarke, A., Vehicle umbrella support	159,795
Clough, W. R., Bill file	159,796
Coleman, M. J., Bolt and Nut Company, assignee	159,922
Comstock, L. R., Stove	159,797
Conboy, D., Carriage seat	159,798
Conigisky, L., Bustle	159,799
Converse, B. C., assignee	159,996
Coombe, J., Eyeleting machine	159,904
Cornell, S., assignee	159,951
Couch, S. W., Window ventilator	159,800
Cowell, J. J., assignee	159,880
Cox, C. G., Plow	159,905
Crocker, S. L., Refining copper, &c	159,801
Crompton, G., assignee	159,963, 159,964, 159,985, 159,986
Cross, C. G., Wood boring machine	159,749
Crossley, T., and L. A. Bertolette, Unloading attachment for carts, &c	159,907
Crow, W. J., Water closet	159,906
Culbertson, A. J., Car spring	159,802
Cummins and Hartin	159,922
Curtis, H. W., Wardrobe bedstead	159,908
Curtiss, E. P., Knitting machine	159,750
Davis and Trible	159,980
De Quillfeldt, C., Window shade fixture	159,803
Devinney, C. D., assignee	159,783
Dewers, E. C., Mowing machine	159,804
Dierker, D., Shaft hanger	159,909
Doan, W. H., assignee	159,961
Dobbs, W. T., Tubing wells	159,805
Domestic Sewing Machine Company, assignee	159,963
Doremus, W. T., Chair	159,806
Dryfoos, L., assignee	159,884
Duncan, J., Lap table for milliners, &c	159,910
Dunham, H., Jr., Boot and shoe sewing machine, (reissue)	6,295
Durant, E. G., Stand for flower pots and vases	159,911
Earle, O. T., Burning hydrocarbons	159,751
Earp, W., assignee	159,950
Edson, N. T., Band saw frame	159,807
Edwards, G. K., Ironing table	159,752
Eggo, F., assignee	159,928
Eickemeyer, R., Machine for pouncing hats	159,912
Entrekin, W. G., assignee	159,889
Fanning, D. H., Corset	159,753
Fargo, C. H., & Co., assignees	159,991
Farmer, M. G., Sending and receiving messages simultaneously over the same telegraph wires, (reissue)	6,296
Felt, V. H., Harvester rake	159,103
Ferguson, S. T., Plow adjuster	159,913
Flummerfeldt, D. A., Washing machine	159,914
Foote, T. C., assignee	159,750
Ford, J. B., assignee	159,795
Foster, H., Carriage curtain fastening	159,809
Fuller, T. D., assignee	159,958
Furbish, M. A. and C. A., assignee	159,742
Gardner, W., Drag	159,811
Gardner, W. R., and C. C. Blossom, Pin	159,810
Garland, H. P., Sewing machine for stitching socks	159,812
Garrett, W., assignee	159,814
Garvey, W. J., Holder for ornaments, &c	159,813
Gee, W., Soda water draft apparatus	159,915
Geerhart, N. A., assignee	159,982
Gerry, E., Anti-friction roller	159,754
Gibson, H. B., assignee	159,766
Gilbert and Church	159,794
Gillespie, J., Binder for roll couplings	159,814
Girbardt, L., Reversible hat	159,916
Givens and Shirran	159,972
Glassbrook, M., Vehicle wheel spoke socket	159,917
Gleason, E., and R. Hamilton, Machine for sharpening horseshoe calks	159,918
Goldsmith, A. A., Bale tie	159,815
Goodwin, W. W., Gas retort	159,816
Goodwyn, S. T., Steam culinary vessel	159,755
Gowan and Heale	159,924
Gram, E. W., and J. Nelson, Stove	159,919
Gray, H., Tea kettle	159,817
Gridley and Bruen	159,892
Grim, D., Vehicle wheel	159,818
Gump, W. E., Printing press	159,819
Hale, H. S., J. W., and W., assignees	159,908
Hamblin, S. and S. M., File cutting machine	159,756
Hamilton and Gleason	159,918
Hamilton, I. S., Gage cock	159,920
Harris, J., Jr., Device for heating tires	159,830
Harris, S. J., assignee	159 952
Hart, A. W., Camp stool	159,757
Hart, W. H., Jr., Neck tie	159,921
Hartnett and Mayall	159,946, 159,947
Hartin, P., and W. Cummins, Tool for pointing bolts	159,922
Harwood, G. S., Feeding mechanism for carding machines	159,923
Heale, H. W., and E. D. Gowan, Cock or valve	159,924
Heath, R. F. S., Canopy frame	159,925
Heath, R. F. S., Binding and wiring hat frames	159,926
Hedge, F. B., Garden rake	159,821
Herrington, E. F., Journal bearing for harvesters	159,758
Hewitt and Carter	159,901

	Patent No.
Hinckley, L., Amalgamator	159,759
Hogue, C. C., Stump puller	159,760
Hoover, G. W., Harness	159,927
Hotchkiss, A. E., Toy	159,928
Howard, A. G., Leather strap skiving machine	159,822
Howes, C., Clothes drier	159,823
Hughes, F. L., Child's carriage	159,761
Hussey, C. A., Car axle box	159,824
Ingersoll Rock Drill Company, assignee, (reissue)	6,292, 6,293
Ingersoll, S., Rock drilling machine, (reissue)	6,292
Ingersoll, S., Rock drill, (reissue)	6,293
Jackson, C. H., assignee	159,787
Jackson, P. H., Steering apparatus	159,826
Jacoby, S., Cigar box	159,825
Jacoby, S., Cigar packing implement	159,929
James, J. W., and J. Streit, Washing machine	159,827
Johnson, D. A., Device for attaching hubs to axles	159,762
Jones, J. A., Spring bed bottom	159,930
Joyce, T. T., Brick machine	159,931
Judd, L. S., assignee	159,756
Keith, D. W., Nail plate feeder	159,932
Kenny, F. J., Ship's lantern	159,933
Kerper, J. N., Machine for dusting bricks	159,934
Kilburn, A. and C., assignees	159,908
Kilpatrick, J., assignee	159,943
Kinne, C. W., Wagon body	159,828
Kirtley, S. C. D., Metallic tip for wooden pails, &c	159,935
Kirton, J. H., Harvester rake	159,936
Klobasse, V., Game apparatus	159,937
La Bay, E. A., Bird house	159,938
Lamborn, W. L., Railroad frog	159,763
Lawrence, L. L., and G. S. Thomas, Corn planter	159,939
Lear, P., Loom shuttle	159,764
Le Van, W. B., Hydraulic elevator	159,829
Leverich, G., Vehicle wheel	159,940
Lilliendahl and Wolfe	159,995
Lo Forte, R., Winter rail for high stoops	159,830
Love, J. C., Drop light	159,941
Love, J. C., Lamp holder	159,942
Lyons, P., assignee	159,914
Macdonald, J. A., assignee	159,906
Mackay, P. N., Flux for treating ore	159,831
Manny, A. M., Corn planter	159,832
Masterson, L. J., Conductor's alarm and registering hand stamp	159,765
Masterson, L. J., Ticket reel	159,943
Mathers, G. C., Curtain fixture	159,944
Maxwell, S. F., Manufacture of nail kegs	159,945
Mayall Power Printing Press Company, assignee	159,946, 159,947
Mayall, T. J., and R. W. Hartnett, Machine for shaving curved stereotype plate backs	159,946
Mayall, T. J., and R. W. Hartnett, Delivering apparatus for printing presses	159,947
McCoy, J., assignee	159,844
McCrosson, W., Bit for boring metals	159,948
McDermott, C., Iron wedge	159,949
McKay, G., assignee, (reissue)	6,295
McKenzie, A., Manufacturing carriage shackles	159,950
McLean, J., assignee	159,979
McNabb, J., Mechanism for trimming ships	159,951
McQuary, T., Portable fence	159,952
Mead, C. V., Bank check	159,833
Merrill, H. W., Sandpapering machine	159,933
Merick, E. J., Broom head	159,934
Millot, T. and J., Flower maker's grass cutting machine, (reissue)	6,297
Moffatt, R. R., Construction of ordnance	159,834
Mollitt, J. R., Apparatus for shaping boot and shoe counter stiffeners	159,835
Monitor Plow Works, assignee	159,913
Moore, J. C., Car starter	159,766
Muchin, M., Steam governor	159,955
Mullett, A. B., and F. Schumann, Construction of jetties for improving river channels	159,956
Mundell, J. & Co., assignees	159,991
Murphy, J. H., Can opener	159,767
National Ballot Box Company, assignee	159,890
Nelson and Gram	159,919
Oliver, W. L., Governor for wind mills	159,768
Olsen, T., Casting scale levers	159,957
O'Neil, J., Sewing machine	159,958
Osborn, F. M., Dental reflector	159 836
Osborne, D. M., & Co., assignees	159,808
Parker, H. G., Flume for conveying timber	159,959
Parkhurst, J. P., assignee	159,917
Parsons and Twitchell	159,866
Parts, A. F. W., Drier for refined sugar	159,769
Patent Grape Sugar Company, Limited, assignee	159,837
Patrick, Bunnell & Co., assignees	159,894, 159,901
Payne, B. N. and D. W., assignees	159,920
Pearse, E. E., Manufacture of grape sugar	159,837
Pfund, A., Faucet	159,960
Phelps, M. D., Lightning rod	159,961
Polster, F., Repeating action for pianos	159,838
Porter, N. A., Slate frame	159,839
Potter, E. M., Seed planter	159,840
Powell, E., Ruffler	159,963
Powell, J., Steam engine lubricator	159,962
Powleson, W. L., Smoke consuming furnace	159,964
Prescott, S. A., Lamp shade support	159,965
Price, E. L., Compound implement	159,841
Prondfoot, F., Heading drum	159,966
Putnam, E., assignee	159,889
Quinn, W., Velocipede	159,770
Rice, J. H., Cultivator	159,842
Richardson, L., assignee	159,903
Ridgway, J. H., Refrigerator	159,843
Rigby, A., Plow	159,967
Roberts, M. H., Heater	159,844
Robinson, A., Package for prints of butter	159,845
Robinson, J. H., Heating stove	159,968
Rosenthal, G., Reflector	159,969
Rosenthal, H. A., Pigeon starter	159 846
Rowland, C. and J. G., Peg or sole fastening, (reissue)	6,298
Rowland, C. and J. G., Machine for making compressed peg strips, (reissue)	6,299
Sallsday, L., assignee	159,811
Sammis, J. B., assignee	159,940
Sanford, S., Loom for weaving piled fabrics	159,847
Sawyer, W. H., Telegraphic signal box	159,771
Schade, J., Padlock, &c	159,772
Schumann and Mullett	159,956
Schwaner, C. C., Dash board	159,848
Sellers, W., and G. H., Revolving puddler	159,849
Shellaberger, M. M., Sickle head for harvesters	159,970
Sheffy, B. B., Car coupling	159,850
Shipley, P. A., and A. Wheeler, Washing machine	159,971
Shirran, A., and W. J. Givens, Hoof trimmer	159,972
Small, H. M., Deodorizer for bed vessels	159,773
Smith, A. A., Wire way	159,973
Smith, F. W., assignee	159,938
Smith, G. J., Whiffletree hook	159,851
Soule, L., Machine for making shoe nails	159,852
Sowle, J., Window curtain cornice	159 774
Spencer, C. A., assignee	159,995
Stamour, J. B., Car coupling	159,974
Staniford, D. T., Cranberry separator	159,853
Starr, W. F., Car coupling	159,975
Steinbach, G. P., Child's walking chair	159,976
Stickles, O. J., Milk cooling apparatus	159,854
Streit and James	159,827
Stumm, T., Washing machine	159,855
Sturtevant, B. F., assignee, (reissue)	6,296, 6,299
Sturtevant, B. F., Blank for shoe pegs, (reissue)	6,300
Sturtevant, B. F., Pegging machine	159,775
Sturtevant, B. F., Pegging machine	159,776
Sturtevant, B. F., Sole fastening	159,777
Sturtevant, B. F., Peg or ribbon peg wood	159,778
Sturtevant, B. F., Pegging machine	159,856
Sturtevant, B. F., Pegging machine	159,857
Sturtevant, B. F., Pegging machine	159,858
Sturtevant, B. F., Machine for compressing sole fastenings	159,859
Sturtevant, B. F., Ribbon peg wood	159,860
Sturtevant, B. F., Peg or sole fastening	159,977
Sullenberger and Bird	159,787
Swift, A., and J. E. York, Roll for rolling angle iron	159,978
Swingle, G. R., Broom	159,861
Thomas and Lawrence	159,939
Thomas, C., assignee	159,931
Thompson, G. M., Car coupling	159,862
Thompson, R., Machine for making cutters for grooving needles	159,863
Titus, J. B., Saw set	159,979
Topliff, C. L., Barrel roller	159,864
Traut, J. A., Block plane	159,865
Trible, H., and N. A. Davis, Propelling device for street cars, &c	159,980
Tully, T., Faucet	159 981
Twitchell, H., and G. E. Parsons, Snow plow	159,866
Tyler, H., Explosive shell	159,982
Van Winkle, G., Sulky attachment to plows	159,779
Varian, S. T., Weather strip for windows	159,867
Very, T. S., assignee	159,743
Viele, P. B., Folding bedstead	159,780
Virgo, J. R., Sheep holder for shearing	159,868
Vuillier, A., Vegetable slicer	159,869
Ware, J. A., administrator	159,983, 159,984, 159,985, 159,986
Warren, B. F., Differential pulley block	159,987

TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED FEBRUARY 16, 1875.

159,739. FIRE-ESCAPES. Juan Arnao, José Francisco Arnao, and Juan Arnao, Jr., Brooklyn, N. Y. (Filed Nov. 19, 1874.)

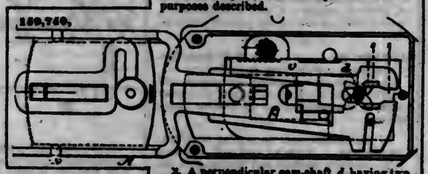
Brief.—A long-range fire-escape, in which the hose-reel is fitted loosely on the elevating-shaft.

1. The central shaft, *f*, provided with hose *h*, windlass I, and ratchets K, in combination with ropes *n*, pulleys *o n*, and bars G, all substantially as and for the purposes set forth.

2. The ways CC, pawls (, shafts E E, flanged wheels D D, in combination with ropes *m*, pulleys *o n*, loose reel K, hose *h*, and windlass I, all constructed and arranged as and for the purpose specified.

159,759. FIRE-REGULATOR. A. A. Athine, St. Petersburg, Pa. (Filed July 15, 1874.)

Brief.—An oil-tube provided with apertures, and operated so as to graduate the flow of oil.



1. The oil-tube B, provided with apertures *b*, in combination with the tube B', constructed and operating as an to allow the graduation and regulation of the flow, as shown and specified.

2. The oil-tube B, having apertures *b*, in combination with the casing A A', and oil-tube B', constructed and operating as and for the purposes herein described and shown.

159,760. BUTTON-HOLING ATTACHMENTS FOR SEWING-MACHINES. Samuel J. Baird, Richmond, Va. (Filed Oct. 23, 1874.)

Brief.—A cam operating in the end of the lever which carries the cloth-clamp vibrates the button-hole while being stitched. The two parts of this lever slide one within the other, and their surfaces are so formed with respect to the longitudinal center line of said lever that when said parts are drawn out or closed together, they swing the lever around on its pivot, carrying with it the clamp, thus bringing the button-hole in position for stitching its opposite sides. The requisite reciprocating feed is communicated to the cloth-clamp by a double internal rack, so arranged that either of its halves may be brought in contact with an intermittently-revolving pinion, receiving motion from the operating parts of a sewing-machine through a reciprocating rod acting in a spiral groove in a shaft carrying a pawl, which actuates a ratchet formed on the lower end of said pinion. The cam which vibrates the lever carrying the cloth-clamp is operated by a gear on the spirally-grooved shaft acting upon a rack which carries arms that move a four-toothed ratchet formed on the cam-shaft.

1. An extension-lever, consisting of the two pieces A and B, the latter having a slot diagonal to the line of its movement upon A and of unequal diameter, with lips or projections at the wider part, substantially as and for the purpose described.

2. A perpendicular cam-shaft, *d*, having two cams of different diameter and throw, in combination with the slot and its projecting lips, substantially as and for the purposes described, whereby the proper vibration and adjustment are accomplished for the successive forming of the sides and baring of the ends of the button-hole.

3. The double rack G and rack-guide F, in combination with the adjustment-cam *h*, substantially as and for the purposes described.

4. A reciprocating driving-shaft and twist-shaft, in combination with the automatic pawl *s* and ratchet-wheel D, substantially as and for the purposes described.

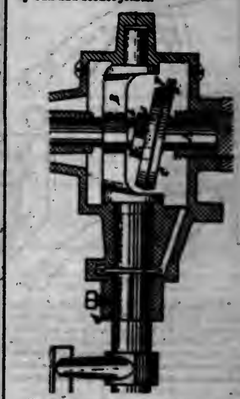
5. The driving-shaft and twist-shaft, in combination with a segment gear, rack, and sliding bars, substantially as and for the purposes described.

6. A four-toothed ratchet, having the two opposite teeth in one plane, and the alternate teeth in another plane, and reciprocating bars, one of which moves in the plane of each pair of teeth, in combination with the cam-shaft and excentric-lever, substantially as and for the purposes described.

7. The feed-bar I, in combination with the pin or cam on the end of a revolving shaft, *r*, to act upon the thread under the cloth, substantially as and for the purposes described.

159,761.

1. The pivoted spring-arms *h*, having the flanges *g*, and the knives *l*, as herein described.



2. The combination, with the trough *c*, slotted for the passage of the rock-bar, of the rod *d* and cutters *l*, all arranged, combined, and operating as herein set forth.

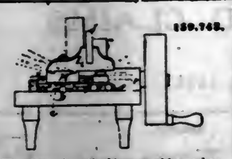
3. The perforated back plate, *i*, provided with the pivoted spring-arms *h*, the knives *l*, and springs *j*, carrying the scrapers *m*, all combined and arranged to operate as herein set forth.

4. The combination of the rod *d*, the adjustable flanges *g* on the pivoted spring-arms, the cutters *l*, and scrapers *m*, as and for the purposes herein set forth.

159,762. DOFFING MECHANISMS FOR CARDING-MACHINES. Jas. Barker, Philadelphia, Pa., assignor to Merrill A. Furbush and C. A. Furbush, same place. (Filed Nov. 9, 1874.)

Brief.—Rotary motion imparted to the vertical shaft and its inclined disk imparts, through the washer, an oscillating motion to the yoke, the horizontal shaft, and the comb, the yoke extending on both sides of the vertical shaft, and being connected to the washer by ball-and-socket joints.

The shaft A, angular disk C, washer F, and yoke B, having ball-and-socket joints *a a' b b*, in combination with the shaft D, and comb E, for the purpose of doffing the silver from a carding-machine, as described.



159,763. HOUSEHOLD-MACHINES. Hiram J. Batchelder, Fitchburg, assignor to T. S. Very, Boston, Mass. (Filed Sept. 24, 1874.)

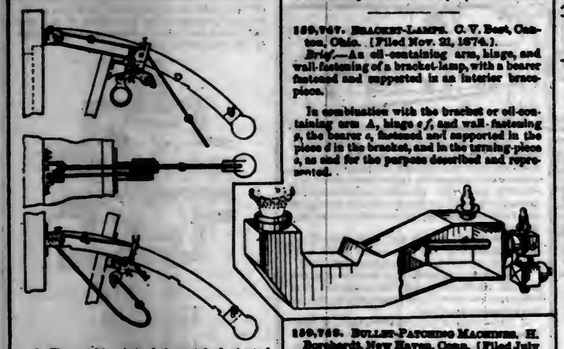
Brief.—Arranged in transverse grooves in the top surface of the crosser-carrier are two friction-rollers, one of which (the inner) is slightly larger in diameter than the other. The object of these rollers is to keep the crosser in a parallel position with the shoe during the crossing operation. The shoe, after having been crossed, is removed from the former and placed upon the "seating-jig," where it is pressed to its ultimate shape by the presser portion of the head-block.

159,764. GUNNY-COAM CUTTERS. Volney Barker, Otisfield, Me. (Filed Nov. 16, 1874.)

Brief.—The trough in which the car rides is slotted at the bottom to allow the passage of the rock-bar which actuates the pushing-rod. The spring-arms which carry the adjustable guides and cutters are hinged and may be turned backward. These arms, together with scrapers, are arranged around a cylindrical plate, having a short tube joining an opening in its center.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

No. 159,745.



1. The above-described improved horseshoe-machine, consisting of the blank-bending mechanism, the crossing mechanism, and the shaping and cooling mechanism, when all are constructed, combined, and arranged together as shown and described, and provided with mechanism for operating them, as set forth.

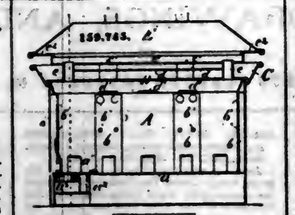
2. In a horseshoe-machine, the combination, substantially as described, of the reciprocating head-block L, former D, swinging die 'F', and the crosser-carrier M, provided with crossers *e e*, as set forth.

3. In a horseshoe-machine, substantially as described, the crosser-carrier M, loosely pivoted to the head-block L, and provided with guides and friction-rolls *g g*, as and for the purpose set forth.

159,746. QUADRANTS FOR OPENING, SHUTTING, AND FASTENING WINDOWS. John R. Beanland, Bradford, England. [Filed Dec. 12, 1874.]

Brief.—On the window is fixed a guide, in which the quadrant works. The bottom part of this guide acts as a stop for the catches formed in the quadrant. On this guide is fitted a lifting-lever, so constructed that the lifting part releases the quadrant from the stop of the guide when pulled by means of a rod placed in an arm formed on the lifting-lever, or by a rope fastened to the arm passing over friction-pulleys.

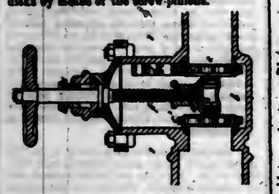
1. The combination of the notched pivoted quadrant, the swing-latch, and the guide-stop J, substantially as, and operating as, set forth.



2. In combination with the notched pivoted quadrant, and with the swing-latch and guide-stop J, the cords and pulleys, applied as shown and described, and the whole operating as set forth.

159,747. WASH-BOILERS. ANY Besbier, Chicago, Ill. [Filed Nov. 18, 1874.]

Brief.—The cover has a condensing-chamber formed by a plate hinged on its under side, to the under side of which plate is attached a secondary plate, with a space between, in which a caged valve operates, the objects of which parts are to regulate, condense, and return the steam and vapor. There is also a false bottom, which permits the descent of water to boiling-chamber only through perforations in a hinged part thereof.

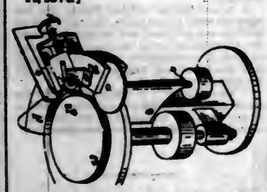


1. The combination of the hinged door *a*, having cages *a'* and floats *a²*, with false bottom *d*, made water-tight, in a boiler, A, as and for the purposes set forth.

2. The combination and arrangement of the top chamber E, having outlets *e' e'*, the tubes *e*, cover D, its movable plate *d*, bottom strips *d'*, with boiler A, having rim C, substantially as shown and set forth.

159,748. STOP-COCKS. Wm. H. Beckett, Chelmsford, England. [Filed July 7, 1874.]

Brief.—The toothed rairo-disks are provided with screw-cut pivots, which take into threaded recesses in the socket. Upon raising said socket the teeth upon the disks take into teeth in the rack, thereby expanding the disks by means of the screw-pinions.



The combination of the toothed rairos *c c'*, racks *d*, socket *e e'*, and screw-spindle *f*, substantially as and for the purpose set forth.

159,749. BRACKET-LAMPS. C. V. Best, Canton, Ohio. [Filed Nov. 21, 1874.]

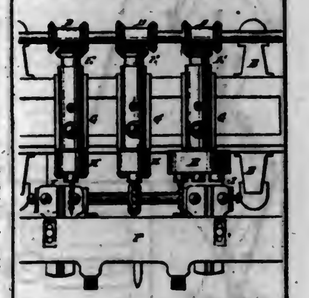
Brief.—An oil-containing arm, hinge, and wall-fastening of a bracket-lamp, with a bearer fastened and supported in an interior brace-piece.

In combination with the bracket or oil-containing arm A, hinge *e f*, and wall-fastening *g*, the bearer *e*, fastened and supported in the piece *d* in the bracket, and in the turning-piece *c*, as and for the purpose described and represented.

159,750. BULLET-PATCHING MACHINES. H. Borchardt, New Haven, Conn. [Filed July 14, 1874.]

1. The combination, in a bullet-patching machine, of the stationary rail *d*, the patch-magazine *f*, and the rolling disk *F* with a feeding device for presenting a series of bullets successively in prescribed position, substantially as set forth.

2. In combination with a magazine for holding slips of paper or patches, substantially in the manner and relation described, a rolling disk having an elastic periphery or face for the purpose of administering an elastic pressure to a bullet while causing it to roll across the exterior of the package of slips, substantially as set forth.



3. In combination with a rolling disk and a stationary rail, substantially such as described, a stationary guide between the rolling disk and the stationary rail, for the purpose of guiding or folding the edge of a patch inward upon the base of a bullet, substantially as set forth.

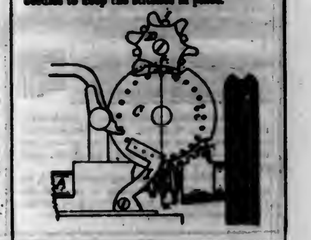
4. The combination of a magazine for holding bullet-patches, substantially in the manner and relation described, with a device for moistening and fastening the package of slips contained in the magazine, substantially as set forth.

5. In combination with a magazine for holding bullet-patches, substantially in the manner and relation described, an automatic follower for regulating the position of the package of slips contained in the magazine, substantially as set forth.

159,749. WOOD-BORING MACHINES. C. G. Orcutt, Chicago, Ill. [Filed Dec. 8, 1874.]

Brief.—The boring-tools are held in adjustable heads, and operated by a system of gearing which admits of a change in their position without interfering with their rotation.

1. The main driving-shaft C, provided with the adjustable gear-wheels D, in combination with reversible spindle-frames G, frames A, gears E, and heads H, all as and for the purpose specified.



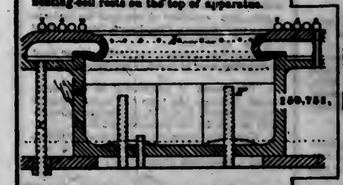
2. The combination of the frame G, shaft F, and head H with one or more bit-stocks, substantially as described.

3. The combination of the brackets *f*, supporting-collars K, vertical screw-shaft, and shaft E, substantially as and for the purpose specified.

4. The combination of the arms O, hangers V, segments T S, racks R, and lever Q with the feed-bed P, substantially as and for the purpose specified.

159,750. KNITTING-MACHINES. Edward P. Curtiss, Cleveland, Ohio, assignee of one-half his right to T. G. Foot. [Filed July 27, 1874.]

Brief.—An improvement on Patent No. 150,223. The cam-wheel is provided with a circular row of pins, which are slid forward, so as to project beyond the face of the wheel, and trip the reversing-lever, by coming in contact with beveled teeth on the adjuster, the latter being driven through a pair of gear-wheels by a worm on the driving-shaft. Curved guard-plates are placed between the needles to keep the stitches in place.



1. In a knitting-machine, the combination of a cam, C, having adjustable stops, with an automatic adjuster, D, and arm L, substantially as described, for the purpose of actuating the reversing-lever.

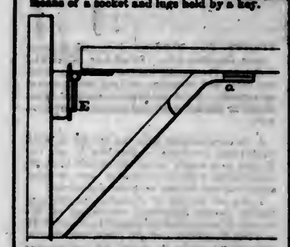
2. In a knitting-machine, guards K, in combination with the needles, substantially as and for the purpose specified.

159,751. BURNING HYDROCARBONS. Oscar T. Earle, New York, N. Y. [Filed Aug. 8, 1874.]

Brief.—The oil floats on water in a tank surrounded by a water-chamber, which will not feed water or generate steam. A superheating-coil rests on the top of apparatus.

No. 159,751.

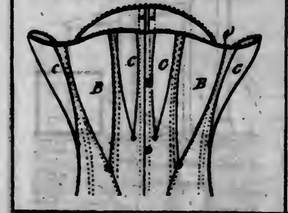
1. Surrounding the chamber in which hydrocarbons are burned by water, so as to keep the walls thereof cool, and prevent their being burned or melted, as described.



2. The chamber E, with inlet-pipe I, outlet-pipe M, and partition K, to hold the water for cooling and protecting the walls of the burning chamber from being burned or melted, and also to serve as a feed-water heater when used in connection with a boiler, as set forth.

3. The chamber E, with pipes L and N, and coil of pipe *l l*, so as to keep the walls of the burning chamber cool, and to produce superheated steam, to be combined with the burning hydrocarbon vapors, as set forth.

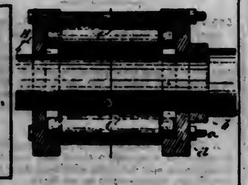
4. The combination of a chamber for burning hydrocarbons, a feed-water heater, or superheated-steam producer, and a heater for an air or steam blast, as described.



159,752. ROUND-TABLES. G. K. Edwards, Philadelphia, Pa. [Filed Dec. 17, 1874.]

Brief.—The table is secured to a wall by means of a socket and lugs held by a key.

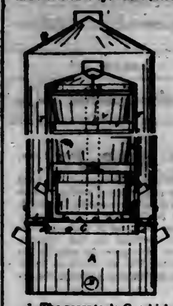
The socket E, with lug F projecting horizontally into the space thereof, the sliding plate C, with horizontally extending notch G, and the key H, entering the socket at one side of the plate C, the socket thus receiving the lug, plate, and key, and all parts constructed, arranged, and operated substantially as set forth.



159,753. CORSETS. D. H. Fanning, Worcester, Mass. [Filed Jan. 4, 1875.]

A corset having in each front at the bust two side gores, C C, and a middle gore, B, the latter extending to and intersecting the seam *a*, substantially as and for the purposes herein set forth.

159,754. ANTI-FRICTION ROLLERS. Edson Gerry, Garden City, Minn. [Filed Feb. 4, 1875.]

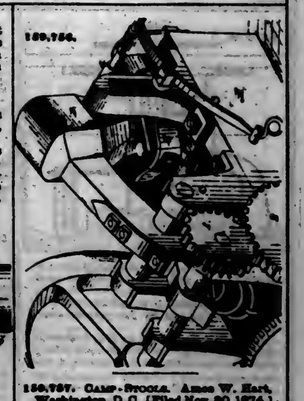


Brief.—The disks are connected by means of bolts. The inner side of each rim has circular recess, open toward the journal, concentric with the rim, in which are inserted the journals of the rollers, freely revolving therein.

The combination, with a shaft or journal, A, of the rims B B, provided with the circular recess *b b*, open toward the journal and connected by means of bolts *a a*, and the rollers C C, provided with journals *d d*, placed in the recesses *b b*, the rollers revolving on their axis and moving with the journal A, substantially as and for the purposes herein set forth.

159,755. STEAM CULINARY VESSELS. S. T. Goodwyn, New Orleans, La., assignor to V. H. Goodwyn. [Filed July 1, 1874.]

Brief.—A receptacle having tubular openings for the passage of steam, and resting upon an inner flange of the boiler near its top, forms a base for the support of the cooker and rack. An additional cylinder inclosing the cooker.



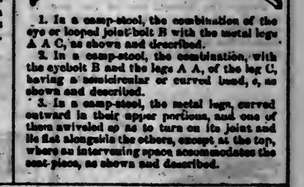
1. The receptacle C, which has a projecting edge, *d*, and tubular openings *e e e*, in combination with the cooker F, as and for the purpose described.

2. The boiler A, receptacle C, cooker F, having rack G and cylinder K, all constructed, arranged, and combined substantially as and for the purpose described.

159,756. FILE-CUTTING MACHINES. Silvanus Hamblin and Stephen M. Hamblin, Pawtucket, R. I., assignors of two-thirds their right to L. S. Judd and A. Wheary, Fairhaven, Mass. [Filed Aug. 14, 1874.]

Brief.—The feed-screw is the shaft of the gear-wheel, the feed being continuous. The cross-head swings on and is adjusted by screws, and carries the cutting-chisel, which, at each stroke, is pressed against the work by the spring on the helve before the hammer strikes. The file is held down to the bed by the spring and binder.

The combination, substantially as herein shown and described, of the feed-screw I, and gear-wheels 1, 2, and 3, hammer B, provided with spring Z, cross-head F, for carrying or supporting the chisel, binder O, and shoe H, as and for the purpose set forth.



159,756.

1. In a camp-stool, the combination of the eye or looped joint-bolt B with the metal legs A A C, as shown and described.

2. In a camp-stool, the combination, with the eye-bolt B and the legs A A, of the leg C, having a semicircular or curved head, *c*, as shown and described.

3. In a camp-stool, the metal legs, curved outward in their upper portions, and one of them articulated so as to turn on its joint and lie flat alongside the others, except at the top, where an intervening space accommodates the cent-piece, as shown and described.

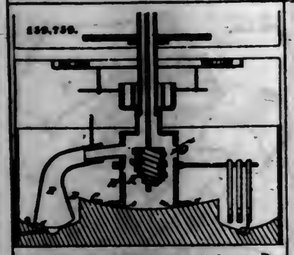
159,757. CAMP-STOOLS. Amos W. Hart, Washington, D. C. [Filed Nov. 30, 1874.]

1. In a camp-stool, the combination of the eye or looped joint-bolt B with the metal legs A A C, as shown and described.

2. In a camp-stool, the combination, with the eye-bolt B and the legs A A, of the leg C, having a semicircular or curved head, *c*, as shown and described.

3. In a camp-stool, the metal legs, curved outward in their upper portions, and one of them articulated so as to turn on its joint and lie flat alongside the others, except at the top, where an intervening space accommodates the cent-piece, as shown and described.

159,758. JOURNAL-BEARINGS FOR HARVESTERS. Ephraim F. Herrington, West Hoosick, N. Y. [Filed Aug. 15, 1874.]



Brief.—When the journal-bearing is in its proper position in the frame, it is secured by pouring in fusible soft metal between the bearing and the frame.

The method herein set forth of securing the journal-boxes of harvesters in their frames, which consists in adjusting the position of the box by means of the gears and shafts, and then casting readily-fusible metal or an alloy between the box and frame.

159,759. AMALGAMATORS. L. Hinckley, Virginia City, Nev. [Filed Nov. 10, 1874.]

Brief.—A hollow cylinder rests loosely on an elevated central amalgamated tray. It revolves horizontally, carrying a scraper of the tray and stirrers of the ore-pulp, and when desired is born for scooping up the ore-pulp, and contains a screw, which also revolves, but in a reverse direction. The ore-pulp fed downward through this hollow cylinder comes outward under its bottom onto the tray; thence is passed into the concave bed, and by the screw is carried back into the hollow cylinder in a continual circuit. A pin rising from an attachment of the cylinder hits cams on each revolution a cap hung from the drip-board, thus feeding from it quicksilver to the ore-pulp.

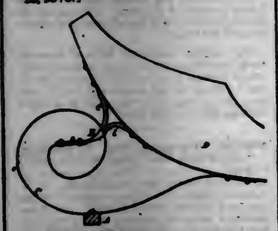
159,760.

1. The vessel A, having the raised center B, forming a trap, with centrally-inclined annular-grooved sides C, in combination with the chamber H, having holes O O, and the screw K, substantially as and for the purpose above described.

2. The vessel A, having its raised center B, and having the concave circular track with its gradually-descending central groove, *d*, and discharge-opening *a*, whereby the material being annularly-grooved is held in contact with the scrapers, substantially as and for the purpose described.

3. In combination with the chamber H and screw K, the loosely-attached hollow horn-shaped scraper E, substantially as and for the purpose above described.

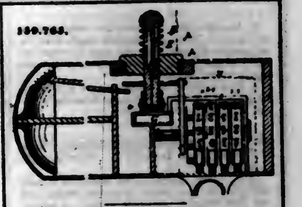
4. The saw U, loosely secured at one end to the lower edge of the rotating chamber H, in combination with the tray B, substantially as and for the purpose described.



159,760. STUMP-PULLERS. C. C. Hogue, Brush Creek, Iowa. [Filed Oct. 16, 1874.]

Brief.—The fulcrum end of the lever is slotted and passed over a double-edged ratchet-bar. Each edge receives alternately a hooked link attached to the lever, one being advanced while the other is used as a fulcrum.

The combination, in a double-acting stump or tree puller, substantially as described, of a slotted lever, A, double ratchet-bar B B, with stirrups C C, closed by spring E.



159,761. CHILDREN'S CARRIAGES. Francis L. Hughes, Rochester, N. Y. [Filed Jan. 13, 1875.]

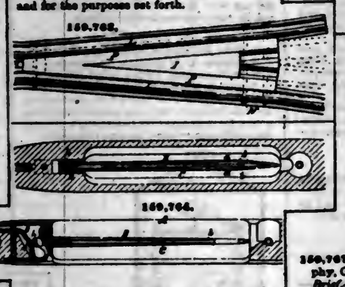
In a child's carriage or perambulator, the metal spring C, having one end hung to the body D, and the other to the offset body-loop B, attached to the body D, and the said spring C being fixed intermediately to the axle A, combined as and for the purpose set forth.

159,762. DEVICES FOR ATTACHING HUBS TO AXLES. Danl. A. Johnson, Boston, Mass. [Filed Jan. 16, 1875.]

159,763.

159,764.

The sponge *e f*, placed at the outer end of the axle A, one on each side of the nut C secured thereto, in combination with the screw-cap D and axle-box B, to operate substantially as and for the purpose set forth.



159,765. RAILROAD-FROGS. WM. L. Lamborn, Steel Works, Pa. [Filed Oct. 30, 1874.]

Brief.—A railroad-frog having flange-bearer and point of one solid piece, the heel of which is grooved to receive the main-track rails, which are secured in position by bolts passing through reversible guard-rails, heel of frogs, and main rails.

1. The solid frog-piece I P, extending from wing-rail to wing-rail, without any separate filling-piece, and provided with heel slots and punchings, substantially as set forth.

2. The reversible wing-rails, in combination with the solid piece I P and the bolts N, passing through the heel of said solid frog-piece, the usual punchings of the track-rails, and also through the wing-rails, thus binding all firmly together, substantially in the manner and for the purposes set forth.

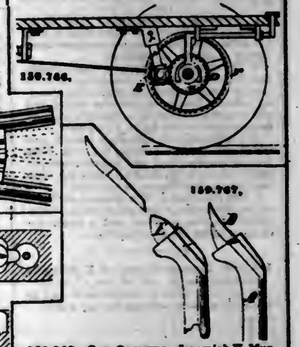
159,766.

159,766. LOOM-SHUTTLES. Peter Lord, Medford, Mass. [Filed Jan. 22, 1875.]

Brief.—The split spindle is expanded to hold the cop by means of a sliding wedge, which is operated as the spindle is raised or lowered, and also held in position, by a forked cam-piece, in which the rear end of the expander works. The cam inclines on the spindle. Bows are so placed as to give the spindle but one taper when expanded, by which an equal pressure is given to the cop through its entire length.

1. In the shuttle, the forked back-stop or holder D, as described, in combination or for use with the expander C, provided with a head, *h*, and arranged with the split spindle B and its cams *b b*, as set forth.

2. The spindle-bow cams *a a*, arranged substantially as described, to cause the spindle, when, by them and the expander, it may be expanded within a cop, to have but one taper therein, all being as and for the purpose specified.



159,768. CONDUCTORS' ALARM AND REGISTERING HAND-STAMPS. Levi J. Masterson, Philadelphia, Pa., assignor of one-third his right to John R. Ford, Washington, D. C. [Filed Jan. 23, 1875.]

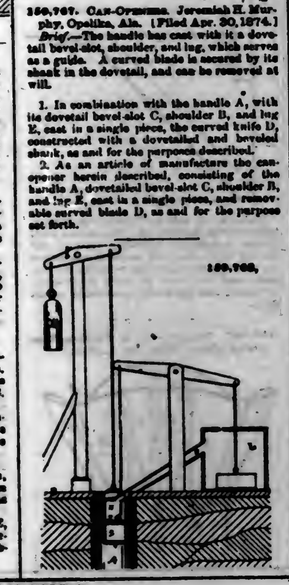
Brief.—The self-inking hand-stamp is constructed with valve in ink-chamber, which is actuated at every operation of the stamp, thus allowing the ink to flow upon the die.

1. The conductors' hand-stamp herein shown, consisting of the self-inking die and an alarm and a registering device, substantially as shown and described.

2. The combination of case A, plunger E, having ink-chamber E', pin *p*, having valve-head *p'*, ribbon C, and ticket-guide bed G, substantially as described.

159,769.

159,767. CAR-OPENERS. Jeremiah H. Murphy, Opelika, Ala. [Filed Apr. 20, 1874.]



Brief.—The handle has cast with it a dovetail bevel-slot, shoulder, and lug, which serves as a guide. A curved blade is secured by its shank in the dovetail, and can be removed at will.

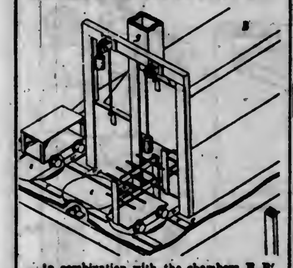
1. In combination with the handle A, with its dovetail bevel-slot C, shoulder B, and lug E, cast in a single piece, the curved knife D, constructed with a dovetailed and beveled shank, as and for the purposes described.

2. As an article of manufacture the can-opener herein described, consisting of the handle A, dovetailed bevel-slot C, shoulder B, and lug E, cast in a single piece, and removable curved blade D, as and for the purpose set forth.

159,768.

159,769.

159,770. GOVERNORS FOR WINDMILLS. W. L. Oliver, Rantoul, Ill. [Filed Jan. 4, 1875.]



Brief.—A governor for windmills used in raising water, and so constructed that the wings of the mill are thrown into the wind when more water is wanted, and thrown out of the wind when a sufficient quantity has been pumped into the tank.

1. The double bucket R R, with a large opening in the partition between them, and under the valve T, to allow the water to rush rapidly through into the lower chamber, S, when the valve T is opened, and the small hole V in the bottom of the bucket, for the purpose of allowing the water to gradually leak out, all in combination with the trough N, substantially as specified.

2. The combination of the closed float-chamber L of the tank, trough N, and closed well A, for the purpose of conducting warm air from the well into the float-chamber, substantially as specified.

159,769. DRYERS FOR REFINED SUGAR. A. F. W. Parts, Oakland, Cal. [Filed Aug. 6, 1874.]

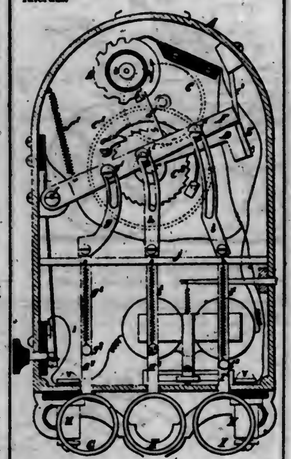
Brief.—The sugar-frames are suspended by their handles on the cross-bars of the cars.

In combination with the chambers B B', through which sugar is passed on cars to be dried, and passed in an opposite direction to the current of heated air, the inner and outer tracks *v w* and *r r'*, and the turn-tables *t t*, the hot-air pipe *p*, with its branches *q q'*, and the exhaust-pipe *p*, all constructed and arranged substantially as and for the purpose set forth.

159,770. VELOCIPEDES. William Quinn, Philadelphia, Pa. [Filed June 16, 1874.]

1. The combination of the frame E, seat F, and spring H, as and for the purpose set forth.

2. The combination of the frame E, vertically-adjustable slide K, and rod L, as set forth.



3. The crank-shaft C, formed of the two tubular crank-shafts provided with capped flanges, and united by the bolt R, holding them in position on the wheel-hub F, all combined as set forth.

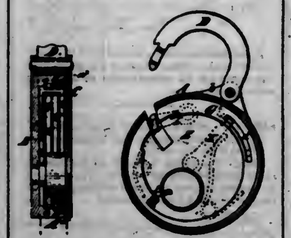
4. The bearings for the front axle, formed of the straps T, blocks U, and wedges V, and bolts W, all combined as and for the purpose set forth.

5. The whistle formed of the casting 1 and tube 5, formed and combined with the cross-bar of the frame O, as and for the purpose set forth.

159,771. TELEGRAPHIC SIGNAL-BOXES. W. H. Sawyer, New York, N. Y. [Filed Dec. 4, 1874.]

Brief.—Through the intervention of rods G' H' I', motion is communicated to a winding-arm, D, which in turn operates a coiled mainspring. The play of the lever is limited by stops placed at different distances from its fulcrum.

1. The combination of the winding-arm D, train of wheel-work C C' C', transmitting-wheel E, and lever F, substantially as herein specified.



2. The combination of motor-train and circuit-breaking or transmitting wheel with lever F, rods G' H' I', and links *g h i*, substantially as and for the purpose specified.

3. The combination of the dog E with the lever F, the former so arranged with reference to the latter and with the winding-arm D as to permit the former to engage with the latter after a complete signal has been transmitted, but at no other time.

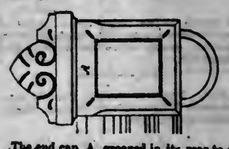
4. The dog E, in combination with the stationary spring *g'* and stop *i'*, substantially as herein described.

5. The arms *g'* H' F, in combination with the lever F and links *g h i*, substantially as herein specified.

159,772. FASTENERS, &c. John Schade, Stamford, Conn. [Filed Sept. 29, 1874.]

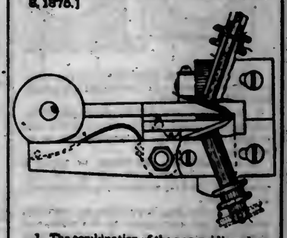
1. The combination, with the inclosing-case of a padlock, of a series of inwardly-projecting steps or ledges, so arranged as to constitute independent seats for a corresponding number of annular tumblers of decreasing external diameters, substantially as and for the purpose herein specified.

2. The combination of the case A B C, hasp D, plate E, ledges *a a' a''*, tumblers G G' G'', actuator K, and spring-tongue L, substantially as and for the purpose herein set forth.



159,773. DEODORIZERS FOR BED-VESSELS. Herbert M. Small, Waltham, Mass. [Filed Oct. 1, 1874.]

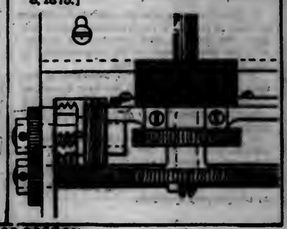
Brief.—A deflecting and distributing strainer; an annular flange; a reservoir provided with discharge-opening, in connection with slide-valve and handle.



In the improved deodorizer, as described, the combination of the deflecting and distributing strainer *f* and the annular flange *h* with the reservoir B, provided with the discharge-opening *c*, slide-valve *d*, and its bar *e*, all arranged and to operate substantially as specified.

159,774. WINDOW-CURTAIN CORNICES. J. Bewis, Boston, Mass. [Filed Apr. 22, 1874.]

The end cap, A, grooved in its rear to correspond with and receive the molding of the connecting-piece B, and lapped on said piece, as and for the purpose set forth.



159,775. PEGGING-MACHINES. Benjamin F. Sturtevant, Boston, Mass. [Filed Feb. 8, 1875.]

1. The combination of the peg-guiding channel or way of a pegging-machine with disk-cutters placed at or inclined to and projecting across the bottom of the channel or way, to cut or point separated pegs, substantially as described.

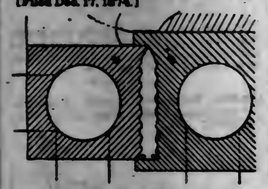
2. In combination, the disk, its shaft and bearing, and nut *n*, to adjust the disk-cutter with relation to the channel or way, substantially as and for the purpose set forth.

159,776. PEGGING-MACHINES. Benjamin F. Sturtevant, Boston, Mass. [Filed Feb. 8, 1875.]

1. The combination, with the peg-guiding channel or way of a pegging-machine, of rotating, compressing, and severing dies, having cavities to receive and mold or compress and sever pegs, substantially as described.

2. The combination of a cross-pointing mechanism with compressing dies, substantially as described, to compress the body of the peg and complete the formation of the point, as set forth.

3. The combination of a peg-guiding channel or way with rotating dies, for compressing the body and point of the peg and severing the peg from the strip, and with a peg-driver operating to drive the pegs from the channel or way, substantially as described.



4. The improvement in the art or process of forming pegs consisting of first forming a wedge-shaped point, or nearly so, by cutting and then completing the point as formed by compressing the wood in opposition to the direction of the edge of the partially-cut point, between dies, substantially as described.

160,777. SOLE-FASTENINGS. Benjamin F. Sturtevant, Boston, Mass. (Filed Feb. 6, 1875.)

A ribbon of sole-fastenings, composed of separate fastenings, united by means of fibrous or metallic strands interwoven, substantially as described.

160,778. PEGS OR RIBBON PEG-WOOD. Benjamin F. Sturtevant, Boston, Mass. (Filed Dec. 17, 1874.)

1. A wooden peg, peg-ribbon, or peg-strip having compressed and corrugated sides, substantially as set forth.

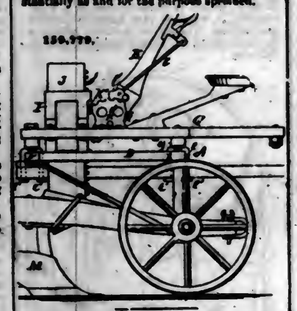
2. A wooden peg, peg-ribbon, or peg-strip having compressed corrugated sides and a head or head forming edge, /, substantially as described.

3. A wooden peg, peg-ribbon, or peg-strip having an enlarged head left by the compressing of the body of the wood, substantially as described.

4. A wooden peg, peg-ribbon, or peg-strip, condensed and corrugated at the sides, and condensed at points or on the point-forming edge, substantially as described.

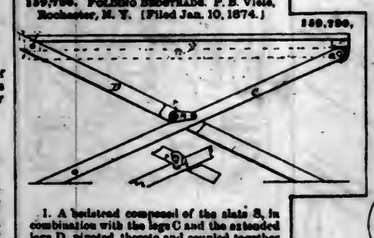
5. The compressers or jaws, provided with the longitudinal corrugations, substantially as described, and for the purpose set forth.

160,779. SOLEY ATTACHMENTS TO PLOWS. Garrett Van Winkle, Avoca, Ill. (Filed July 29, 1874.)



Brief.—A frame carrying the driver's seat and the vertically-adjustable plow is pivoted to the main frame. The tongue is reversible, and the machine may be used as a plow or a straddle-row cultivator.

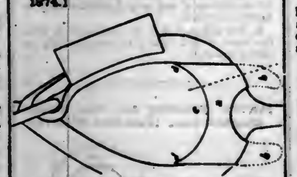
1. The frame C, constructed as described, pivoted to the bar D, and laterally adjustable upon the axle A, and arranged to operate with the plow M and bar E, substantially as and for the purpose specified.



2. The bars B, adjustably attached to the bars c, and combined with the axle A and bar D, for adjusting the plow-frame and attaching cultivators, substantially as described, and for the purpose specified.

3. The draft-pole E, removably and rotatably attached to the bar D and axle A, and arranged to operate with the said parts, and with the cultivator-plows F and frame G, interchangeably, substantially as described, and for the purpose specified.

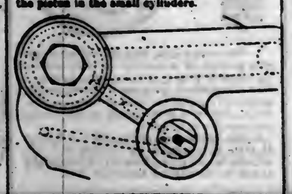
4. The hand-lever K, rocks j, K', and k', bar J, sleeve I, and plow M, in combination with the pivoted frame G, axle A, and bar D', substantially as and for the purpose specified.



160,780. FOLDING BEDSTEADS. P. B. Viele, Rochester, N. Y. (Filed Jan. 10, 1874.)

1. A bedstead composed of the slats S, in combination with the legs C and the extended legs D, pivoted thereto and coupled together by means of the rod or rest r, pivotal links a, and the locking-hooks h, all operating substantially in the manner shown, and for the purpose set forth.

2. In combination with the slats S, legs C, connecting-links a, locking-hooks h, and extended legs D, the elevated or inclined headrest e, for the purposes set forth.

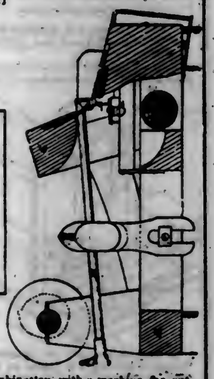


160,781. SHAFT-TUGS FOR HARNESS. Thos. R. Webber, Pittston, Mo. (Filed Nov. 23, 1874.)

A harness-leg lining, formed with the body a, shaft-rest c, protecting ears d d, and clinching-points b b, all substantially as described and shown.

160,782. STEAM-ENGINE VALVE-GEARS. George Westinghouse, Jr., Pittsburg, Pa. (Filed Sept. 15, 1874.)

Brief.—The steam between the differential valve-pistons forces them down. The opposite movement is given by steam entering back of the pistons in the small cylinders.



1. A pair of piston-valves, a a', of different areas, subject to steam pressure, so as to be operated in one direction by a preponderance of pressure, in combination with a third piston, m, of still greater area, arranged to give the piston-valves a reverse stroke, substantially in the manner set forth.

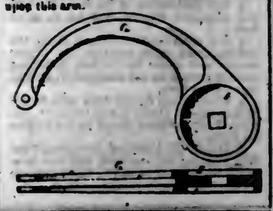
2. The combination of piston-valves, pistons, and slide-valve, the piston-valves and piston having different areas, and the slide-valve being arranged to govern the supply and exhaust to and from the piston, substantially as set forth.

3. Ports s, s', s', and s, in combination with slide-valve a' and piston m, substantially as set forth.

160,783. CUT-NAIL MACHINES. J. T. Westwood, Wheeling, W. Va., assignor to himself and Caleb D. Devinney. (Filed Nov. 19, 1874.)

The combination, with a machine for cutting nails from a heated plate and heading the same, the blast-tube M, used to direct the blast of cold air upon the dies, in order to prevent the same from becoming heated and to remove the scales, substantially as set forth.

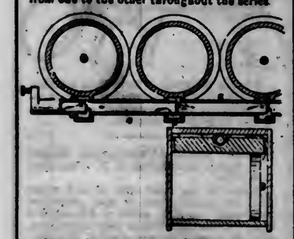
160,784. LAND-ROLLERS. Wm. Williams, New Berlin, Ill. (Filed Jan. 2, 1875.)



Brief.—The roller is made of cast-iron, hollow, with an annular flange upon the inside at each end, to which a wooden journal-box, consisting of a plank, is bolted. Two rollers are mounted in a double rectangular frame.

The wooden journal-blocks D, in combination with the hollow cast-metal rollers U and annular flanges c, substantially as and for the purpose specified.

160,785. DOOR-SPRINGS. A. T. Mellinthin, Titusville, Pa. (Filed May 13, 1873.)



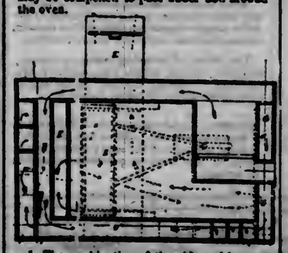
Brief.—A reversible vibrating lever-arm has socket-bearings, which take over the end of the drum, which incases a coiled spring. The chain, which is attached to the door and operates the spring, is wound automatically upon this arm.

The reversible vibrating arm O, having bearings I I, and carrying the chain K, in combination with the drum A, slotted spring B, arbor D, with its pin c, projecting shanks L L, and cap-plate E, all constructed and arranged for operation as herein shown and described.

160,788. COMPOUND ENGINES. J. W. Bell, McKinney, Tex. (Filed July 3, 1874.)

Brief.—A series of engines are connected by a revolving tube, through which steam is admitted to one, and exhausted successively from one to the other throughout the series.

The series of engines A, having their pistons A' connected, by rods B', with the same crank-shaft B, in combination with the rocking tube C, having passage c, steam-inlets a', and outlets a', as and for the purpose specified.

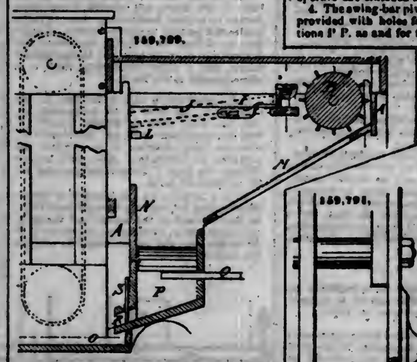


160,787. CAR-PUSHERS. Chas. Bird, Lower Merion Township, Montgomery County, and William H. Sullenberger, Harrisburg, assignors to themselves and C. H. Jackson, Harrisburg, Pa. (Filed May 27, 1873.)

The lever A, having the upper edge of its short arm made in the segment of a circle of the same or about the same diameter as the wheel to be operated on, in combination with the shoe B, to which the lever is hung, and which is adapted to the rail, all as set forth.

160,788. COOKING-STOVES. R. O. Brinckerhoff, New York, N. Y. (Filed Jan. 30, 1875.)

Brief.—The smoke, after passing over the oven, may be allowed to pass into a flue-space communicating directly with the exit, or it may be compelled to pass under and around the oven.

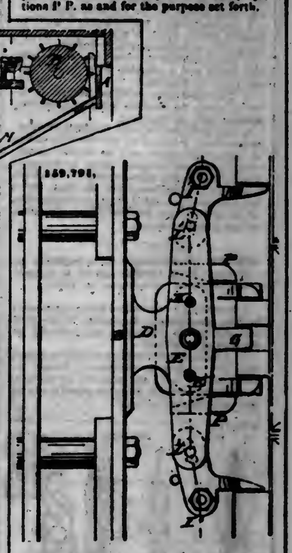


1. The combination of the side and bottom flues F, the side flue-space G, the front flue-space H, the inner side flue-space I, the inner rear flue-space J, and the outer rear flue-space K with each other, with the outer and inner cases A B, and the chimney-flue E, in substantially the manner herein shown and described.

2. The combination of the outer side flues M with the vertical side flues F, the outer rear flue-space K, and the chimney-flue E, in substantially the manner herein shown and described.

3. The combination of the sliding damper L with the set of flues F G H I J K, the set of flues F M K, and the chimney-flue E, substantially as herein shown and described.

160,789. CORN-SHELLERS. W. S. Broyles, Nola Chucky, Tenn. (Filed Oct 17, 1874.)



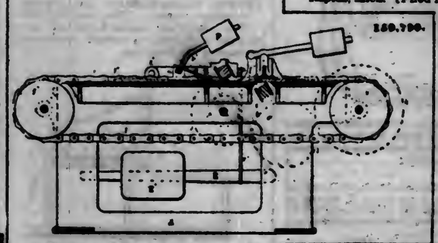
1. The measuring-pit P, provided with spout R and slides Q S, the said pit receiving grain from cylinder, as shown and described.

2. The combination of hinged cut-off N with receiver O and pit P, as and for the purpose specified.

160,790. SHINGLE-PLANING MACHINES. P. D. Burgher, Deep Creek, Va. (Filed Aug. 20, 1874.)

Brief.—The shingles are carried forward by an endless chain put in motion by suitable gearing, and are planed by rotating planing-cylinders, upon both sides, while passing through the machine.

160,791. PAILS. Orrin S. Camp, Grand Rapids, Mich. (Filed Nov. 14, 1874.)



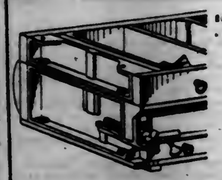
1. The right cylindrical hoop C, recessed into the upper edge of the tin-lined case A, and secured thereto by means of rivets r, driven through the said hoop and clinched upon the inside of the case, substantially as specified.

2. The combination, with the rim C, of the ears F, rigidly soldered to the said rim over the heads of the rivets r, substantially as specified.

160,792. MOLDERS' FLASKS. N. M. Chaffee, Providence, R. I. (Filed Jan. 25, 1875.)

Brief.—A flask composed of three parts—bowel, cope, and movable side pieces or cheeks—for casting columns having sunken panels, or other articles with undercut parts. Sand is packed on the cheeks, which are mounted upon ways, and capable of being withdrawn to relieve the patterns.

160,793. BOLT-WORKS FOR SAFE-DOORS, &c. William E. Butler, Brooklyn, N. Y. (Filed July 20, 1874.)



1. The combination of three or more locks in a safe or other door with the train-bolts, relatively arranged as described, so as to require the unlocking of at least two locks, but not of the whole number of locks, to release the train-bolts, as set forth.

2. The combination of the swing-bar E, with projection G and clutches I' and I', with bracket D, and bar B, so as to permit the withdrawal of the train-bolts by the unlocking of two or more of the locks.

3. The swing-bar E, pivoted upon the bracket D and provided with pins L' and L', so as to operate the clutches I' and I', as set forth.

4. The swing-bar pivoted to the bracket, and provided with holes for pins K K and projections F F, as and for the purpose set forth.

160,795.

1. The combination, in a molder's flask, of a movable exterior cheek, and a movable interior cheek mounted on said exterior cheek, substantially as and for the purposes specified.

2. In combination with a molder's flask, an interior cheek which is mounted on supporting-guides, substantially as described.

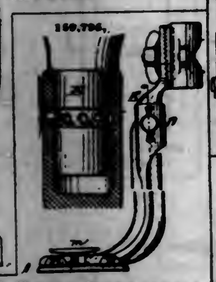
3. The combination, in a flask, of the interior cheek and a movable back board, substantially as described.

4. The combination, with the flask, of an exterior cheek mounted on supporting-guides, substantially as described.

5. The combination, with the flask, of an exterior cheek, mounted on the novel by means of supporting-guides, and an interior cheek, mounted on the exterior cheek by means of supporting-guides, substantially as described.

6. The combination, with the flask and a movable cheek mounted on supporting-guides, of the draft-screws, substantially as described, for the purposes specified.

160,794. SHARPENING ATTACHMENTS TO FORKS. D. M. Church and W. F. Gilbert, Derby, Conn. [Filed Dec. 28, 1874.]



1. A carving-fork provided with a roughened-surface honing-steel A, applied to the fork and carving as the guard, substantially as shown and described.

2. A carving-fork having a guard furnished with two converging sharpening-blades, located near its joint, and adapted for use as a knife-sharpener, both when the guard is carving open and when it is closed.

160,795.

160,796.

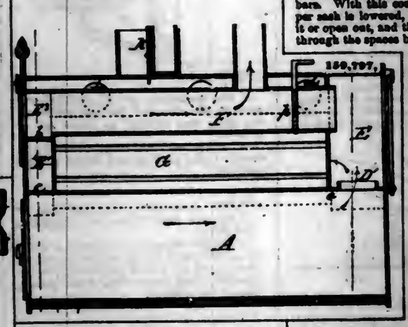
160,795. UMBRELLA-SUPPORTS FOR VEHICLES. Almon Clarke, Sheboygan, Wis., assignor to himself and Chas. A. Spencer. [Filed Jan. 12, 1875.]

1. The combination of the sleeve D, having the threaded boss d, the cheek E, having recesses e e, the loose pin b, and cover-cap H, all constructed to operate substantially as and for the purposes set forth.

2. The combination of the bed-plate A, provided with lugs b and inclined plane c, the foot C, and screw a, combined substantially as and for the purposes set forth.

160,796. BELL-PULLS. William R. Clough, Newark, N. J. [Filed Jan. 23, 1875.]

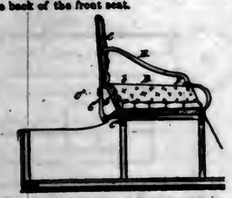
The combination of a spring-clamp and a lever-clamp, having a shoulder or shoulders, and made to pass between the arms of the spring-clamp, and both constructed to be raised together and locked in an elevated position by the shoulder on the lever-clamp, substantially as described.



160,797. STOVES. Levi R. Comstock, Richmond, Va. [Filed Oct. 10, 1874.]

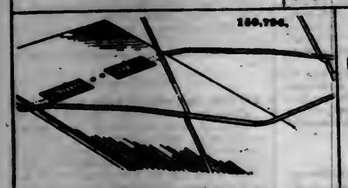
Brief.—The vertical plates extend to the back of the stove, and chambers are there formed by a plate intersecting them at right angles and parallel to the back plate. Chambers are formed in a similar manner at the front of the stove by means of the horizontal plates, and a plate intersecting them in a plane parallel to the front.

1. In combination with a furnace, A, and chamber E, the flues G G, communicating with the front chamber E', the flues G' G', with the rear chamber F', and the flues G² G², with the front chamber E', from which the products of combustion enter and escape through the pipe F, substantially as and for the purpose set forth.



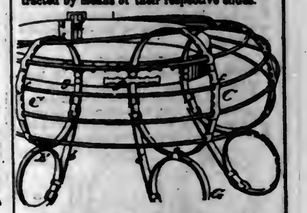
2. In a furnace, the combination of the division-plates b c, forming the chambers E' F', at the front end of the heater, and the division-plates a' c', forming the chambers E F' F' at the rear end, substantially as and for the purpose set forth.

160,797.



160,798. CARRIAGE-SEATS. Daniel Conboy, Uxbridge, Canada. [Filed Jan. 18, 1875.]

Brief.—Back seat may be folded over so as to make its bottom an upward extension of the back of the front seat.



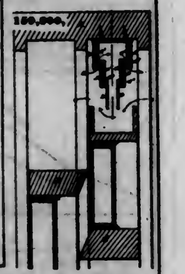
The combination of seat B, bars C' C', seat C, pivoted back D, legs D', side-stays E, and hinge C' and F, substantially as and for the purpose set forth.

160,798.

160,799. BUSTLES. Louis Consigny, Peoria, Ill. [Filed Oct. 24, 1874.]

Brief.—The hoops are expanded or contracted by means of their respective slides.

A bustle composed of bows B, in combination with adjustable hoops C and adjustable supporting-hoops G, substantially as described, and for the purposes specified.



160,800. WINDOW-VENTILATORS. Samuel W. Couch, Cold Spring, N. Y. [Filed Dec. 19, 1874.]

Brief.—To the inner side of each upper plate are attached two or more transverse bars, which are made round or dovetailed in form. To the outer side of each lower plate, near its upper edge, are attached lugs having notches formed in their outer edges of such a shape as to receive and fit upon the bars. With this construction, when the upper sash is lowered, the plates descend with it or open out, and the air passes in and out through the spaces between the plates.

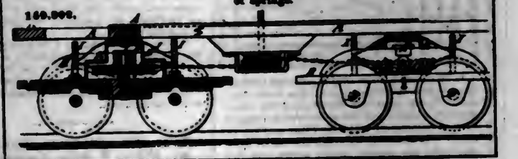
1. The improved ventilator, formed of the two sets of plates, D, provided with the cross-bars d^2 and the notched legs d^3, to adapt them to be applied to a window, substantially as herein shown and described.

2. The combination of the extension-plates E with the end parts of the plates D, substantially as herein shown and described.

160,800.

160,801. EMPLOYING COPPER, &c. S. L. Crocker, Taunton, Mass. [Filed Oct. 12, 1874.]

Brief.—Adds a small quantity of spelter in any form to copper ores, or partly-refined metallic copper containing antimony or arsenic, to remove these impurities during smelting.



The process of removing arsenic, antimony, and other volatile metals from copper in the smelting or refining furnaces by the aid of zinc, substantially as herein described.

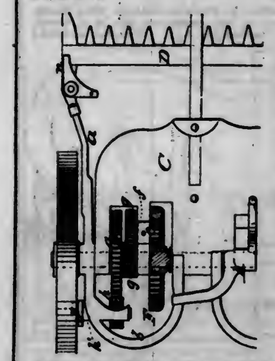
160,802. CAR-SPRINGS. A. J. Culbertson, San Andreas, Cal. [Filed Nov. 7, 1874.]

Brief.—Weight of car rests on plates, which press on bars hung on quadrilateral system of springs.

160,796.

160,802.

The combination, with frame A, of the plates E, bolt F, blocks G, rods H, and springs I J, to support the load, all as set forth.



160,803. WINDOW-SHADE FIXTURES. C. de Guilfeldt, New York, N. Y. [Filed Oct. 24, 1874.]

The combination, in a spring shade-roller, of the cam or brake E', the inclosing-cap E, the recessed hub D, and the pivoted disks D', as and for the purpose specified.

160,804. MOWING-MACHINES. E. C. Dewey, Towanda, Pa. [Filed Feb. 23, 1874.]

Brief.—The two side pieces supporting the cutting apparatus are pivoted on the main axle independent of each other and of the tongue-frame.

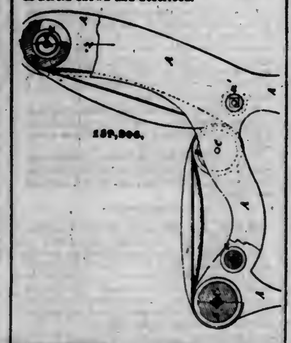
1. The combination of the spur-wheels F G, having their bearings on the axle B, and the spur-wheels e f, having their bearings on a platform, C, which articulates on this axle, and with a pinion, h, which has its bearings in rear of said axle on an independent frame, E, substantially as described.

2. The lifting-lever K, having its bearing on the axle B, in combination with the frames E and platform C, substantially as described.

160,805. METHODS OF TUBING WELLS. W. T. Dobbs, Pana, Ill. [Filed Nov. 22, 1873.]

Brief.—Plastic tubing formed of cements, to shut off obstructions and formations of the earth that give way and slip down in the well, causing a break in the walls, is crammed in its soft state into the cavity, where it soon undergoes a chemical change, and hardens under water, thereby binding and securing all fragments and loose particles, so that being subsequently drilled through it will not cave, but leave a solid and strong wall.

1. The method of stopping or cramming caves or cavities in the bore of a well, consisting in obstructing said bore below the caves or cavities, and lowering and depositing cement in suitable quantity, as herein shown and described.



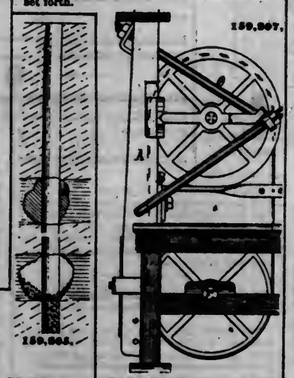
2. The process of cramming, shutting off, and tubing caves, &c., in wells, by cement let down in bags and discharged, or left in the bags and packed in the caves, substantially as specified.

160,806. CHAIRS. William T. Doremus, New York, N. Y. [Filed Nov. 21, 1874.]

1. The combination of one or more torsion-rods, C, secured at one end and free at the other, and one or more rollers, B, secured at one end to the torsion-rods and free at the other, with a frame, A, and the upholstering or cover D, substantially as herein shown and described.

2. The combination of the rod G, secured at both ends, the perforated or hollow roller F, and one or more coiled springs, H, with the frame A and the upholstering E, substantially as herein shown and described.

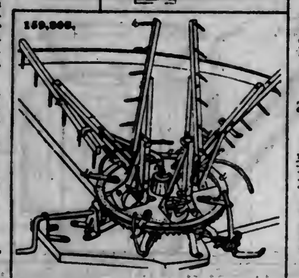
160,806.



160,807. BAND-SAW FRAMES. N. T. Edson, New Orleans, La. [Filed Apr. 7, 1874.]

Brief.—The post carrying the journals of the upper band-pulley is made vertically adjustable by means of clamps and wedges.

1. The combination of posts A and B, when made and operated substantially as hereinbefore set forth.



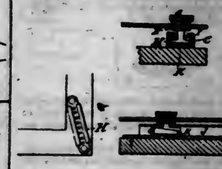
2. The combination of post A, plate Q, and wedge R, substantially as and for the purposes set forth.

160,807.

160,805.

160,808.

160,808. HARVESTER-RAKES. Vanderlyn Howard Felt, Kendall, assignor of one-half his right to D. M. Osborne & Co., Auburn, N. Y. [Filed June 16, 1874.]



Brief.—The rake-arms are changed to rakes or beaters at pleasure by crooked rods and projections upon the reel-head.

1. In combination with the rake-carrying and driving wheel C, and its projections d, the rocking cross-shafts p q, and their respective arms, for the purpose of setting or converting the rake from a beater to a rake, or vice versa, as and for the purpose described and represented.

2. In combination with the wheel C, and the rakes pivoted thereto, the lever latches, and the rocking cross-shafts and their arms, for the purpose of holding the rake from rising when it is to sweep the platform, and so unlock it when it is to rise to pass above the platform, substantially as described.

3. The combination of the tail-pieces 2 of the rake-arms with the spring and bolding plates o n for easing the rakes when raised, and holding them up as they pass the driver's seat, as described.

160,809. CARRIAGE-CURTAIN FASTENINGS. Henry Foster, Westerly, R. I. [Filed Jan. 18, 1875.]

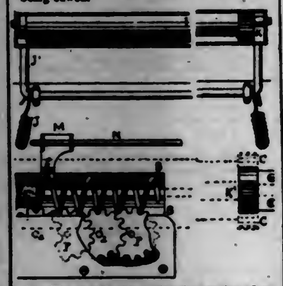
1. The wedge-shaped slide C, having a pin, K, on its under side, in combination with the plate B, having a series of slots or holes, J, constructed and applied in the manner and for the purposes substantially as set forth.

2. Slotted plate or plates L, combined with carriage-curtains as a means of allowing for the shrinkage of the curtains, substantially as set forth.

160,810. PIPES. Wm. R. Gardner and Chas. C. Blossom, New York, N. Y. [Filed Dec. 22, 1874.]

As a new article of manufacture, a pipe consisting of two pin-pointed stocks, S S, connected by the double spring-loop and tongue R H, combined and arranged substantially as shown and described.

160,811. DRAGS. W. Gardner, Wheelersburg, Ohio, assignor to himself and L. Halladay, same place. [Filed Nov. 30, 1874.]



Brief.—A series of angular crushers are secured to side pieces, and at the rear end of the series, upon the under side, is secured a pair of markers, by means of which the ground is laid off ready for planting.

The pulverizers A and furrowers C, connected with the same carriers B, substantially as shown and described, so that ground may be laid off in rows for planting as fast as it is brought into fine filth, and by the same operation.

159,813. SEWING-MACHINES FOR STITCHING SACKS, &c. Howard Pratt Garland, San Francisco, Cal. [Filed Jan. 4, 1875.]

Brief.—The needle, having its exterior surface corrugated, is mounted upon two elastic rollers, from which it receives its motion, being held down in contact with them by means of a third roller, journaled in a swinging frame above. The guide for the thread is arranged upon a rod that is parallel to the axis of the needle, and has a V-shaped notch in its end, the sides of which embrace the sides of the needle, by means of which it is moved along its supporting-rod to supply thread to the needle while on the opposite side are notched disks, which are revolved by the needle, and serve as rests to support the material while being sewed.

1. The combination, with the roughened or notched edges of the spirals of the needle, of the rollers B B I, substantially as herein set forth and specified.

2. The notched disks F, in combination with the spiral needle, substantially as and for the purpose specified.

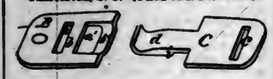
3. The oblong cam H and friction-roller I, in combination with the spiral needle, the rollers B B, and springs J, substantially in the manner as herein set forth and specified.

4. The movable thread-guide, provided with the forked end and hole or opening b, in combination with the spiral needle, substantially as herein specified and set forth.

5. The stationary slotted guide E, provided with the collar E', in combination with the spiral needle, as specified and set forth.

159,814. HOLDERS FOR ORNAMENTS, &c. Walter J. Garvey, St. Louis, Mo. [Filed Dec. 6, 1874.]

Brief.—The device is intended for holding the ornaments which are applied to the ceiling of a room in position while they are being permanently secured.



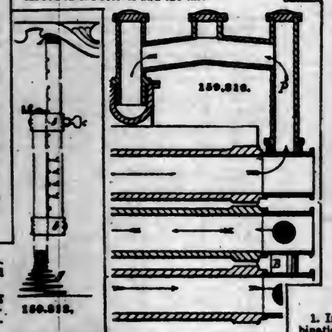
A spring-holder for ornaments, made adjustable as to length, capped with rubber or other soft material, and with a spring at the other end, substantially as described, and for the purpose set forth.

159,814. RESERVE FOR ROLL-COUPLINGS. James Gillespie, Cleveland, Ohio, assignor to himself and Wm. Garrett, same place. [Filed Oct. 21, 1874.]

Brief.—A binder to hold in place the stretchers of roll-couplings, made of wire, coiled at a to give elasticity, and having parts b for convenience of handling, and hook and eye c d for fastening.

The wire binder C, provided with coiled portion a, handles b b, and hook and eye c d, substantially as and for the purpose set forth.

159,815. BALE-TIES. A. A. Goldsmith, Charleston, S. C. [Filed Jan. 23, 1875.]

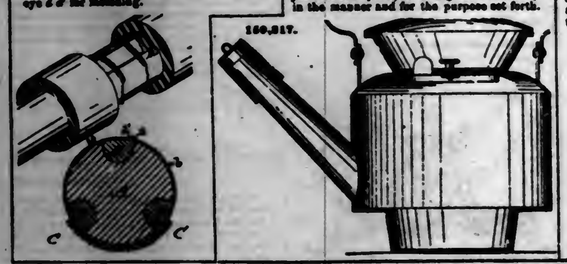


1. In a bale-tie, the combination, with plate B, rigidly secured upon one end of a binder, A, having rectangular slots a a', and a bar, b', struck down below the level of its plate, of the plate C, adjustably applied upon the other end of the said binder, and having slot e, tongue d, with upturned hook e, and stop f, substantially as specified.

2. The plate C, having slot e and tongue d, with upturned hook e and stop or shoulder f, when adapted for use substantially as specified.

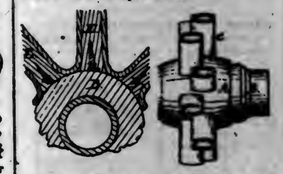
3. The plate B, having slots a a', separated by bar b, and a front bar, b', struck down below its level, as specified, and for the purpose set forth.

159,816. GAS-RETORTS. W. W. Goodwin, Camden, N. J. [Filed Apr. 10, 1874.]



Brief.—Three retorts, arranged as shown, one above the other, with alternate connecting-pipes, are filled with coal, and, after the heat, discharged simultaneously. The gas produced in the lower passes through all three, and is enriched with saving and utilizing of carbon in the retorts and the tar.

The combination of the retorts A, C, and E with the connections D and B and the standpipe F, substantially as described, whereby the gas passing through the highly-heated coal in the retorts prevents the deposition of carbon and tar, and is thereby carbided and increased in volume.

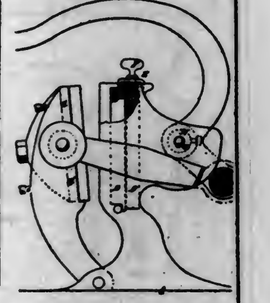


159,817. TEA-KETTLES. Harriet Gray, Marquette, Mich. [Filed Sept. 12, 1874.]

The combination, with a tea-kettle having a funnel-shaped top rim provided with a cover, of an interior perforated cover with adjustable slide-plate, all arranged substantially in the manner and for the purpose set forth.

159,818. WHEELS FOR VEHICLES. David Grim, Pittsburg, Pa. [Filed July 6, 1871.]

Brief.—The spokes are spread within the sockets, and rest upon the hub.



1. A metallic band, A, provided with radial sockets C, each furnished with a wooden spoke, E, and combined with an anmorticed wooden hub, B, so that the inner ends of the spokes will extend through the sockets and rest directly upon the surface of the wooden hub, as set forth.

2. A wooden hub, B, in combination with a metallic band, A, provided with radial sockets C enlarged at their inner ends, as set forth.

3. A wooden hub, B, provided with a metallic band, A, having radial sockets C, in combination with the spokes E, spread within the sockets by means of a wedge, a, as set forth.

159,819. PRINTING-PRESSES. W. B. Gump, New York, assignor to Mrs. M. L. Gump, Garden City, N. Y. [Filed Oct. 31, 1874.]

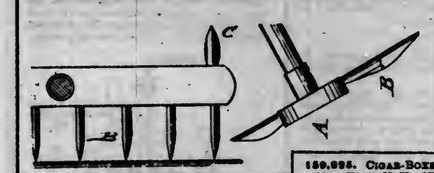
1. In an oscillating printing-press, the combination of the lower platen G having a recessed front face, with the upper platen H, provided with ribs h', fitting into said recess, as and for the purpose specified.

2. The combination of the plate B, rod C, flanged chase D, double clip or clamp E, and screw F, as herein shown and described, for the purpose set forth.

159,820. DEVICES FOR HEATING IRONS. J. Harris, Jr., Boston, Mass. [Filed Jan. 19, 1875.]

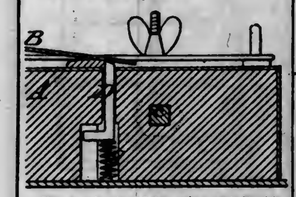
Brief.—A trough, a a, for containing petroleum or other fuel; a flange, B, to act as a conductor of heat from the flame to the fuel; a body, E E, and a top, H K, provided with a deflector, J, for interrupting the escape of the products of combustion.

1. The tire-heating apparatus described, the same consisting of the body E E, trough a a, and top H K, combined and arranged to operate substantially as and for the purpose specified.



2. In a tire-heating apparatus, the trough a a, provided with the vertical flange B, substantially as and for the purpose specified.

3. In a tire heating apparatus, the deflector J, substantially as and for the purpose set forth.

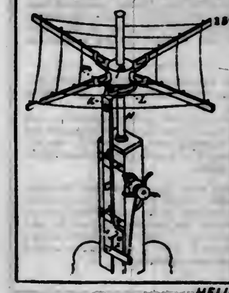


159,821. GARDEN-RAKES. F. B. Hodge, Greenport, N. Y. [Filed Sept. 26, 1874.]

Brief.—The head of the rake is made of thin metal plates. The teeth are also formed of metal plate and U-shaped in cross-section. Upon the opposite side of the head are placed two wider teeth at or near each end, of the same form, which are used for making furrows in which to sow small seeds.

The garden-rake and furrowing implement herein described, consisting of the bandled head A, the series of concave and end-sharpened rake-teeth B, and the larger furrowing-teeth, C, all constructed and arranged as herein shown and described.

159,822. LEATHER-STRAP-SKIVING MACHINES. Albert G. Howard, Farmington, Me. [Filed Jan. 23, 1875.]



The combination of the spring guide D with the knife B and pressure-spring C, substantially as described.
